The royal palace was built by cardinal Richelieu, who made a preſent of it to Lewis XIII. It conſiſts of ſeveral ſets of buildings ſeparated by large courts, and is adorned with fine gardens. Several new apartments have been added to it ſince the cardinal's time, and here queen Anne of Auſtria, mother to Lewis XIV. reſided during the minority of her ſon. In this ſtructure are now held the courts of juſtice, the moſt eminent of which is the parliament.

The royal obſervatory is a very ſtately edifice, built in 1667 upon the higheſt ground in Paris, and as neither iron nor timber has been employed in its conſtruction, except for the ſtaircaſe, it has coſt great ſums. Several aſtronomers, maintained by the king, have apartments in that houſe. The French make their firſt meridian paſs through this obſervatory, which is two degrees thirty minutes more eaſt than London, according to Street's obſervations; or, according to thoſe of Harris, two degrees twenty-five minutes fifty-one ſeconds.

The Gobelins at Paris is a houſe ſo called from one Gobelin, a celebrated dyer, who removing from Rheims to Paris in the reign of Francis I. bought that houſe. He had diſcovered the ſecret of dying the beautiful ſcarlet called from him the ſcarlet of the Gobelins. Lewis XIV. bought that and ſome of the neighbouring houſes, where he eſtabliſhed a manufactory of the fineſt tapeſtries, and alſo ſettled a great number of gold and ſilver-ſmiths, embroiderers, painters, carvers, and other artificers in every branch tending to ſplendor and magnificence. They are all under the direction of the ſuperintendant of the buildings, arts, and manufactures of France. There have been above eight hundred workmen employed here at a time; and though their number be ſince conſiderably decreaſed, yet there are ſtill to be ſeen many things of the moſt curious workmanſhip worthy the curioſity of a traveller.

With reſpect to the churches, the moſt remarkable, after that of Notre Dame, which has been already deſcribed, are the following:

The church and nunnery of Val de Grace was founded by queen Anne of Auſtria, upon the ſuppoſed miraculous birth of Lewis XIV. after ſhe had been married twenty-two years without having any offſpring. Her heart and that of Henrietta Maria of England, ducheſs of Orleans, lie entombed here. The altar and cupola are exceeding fine. The nuns of this convent muſt all be of noble extraction, and chooſe a lady abbeſs once in three years. Madam la Valiere, one of Lewis the XIVth's miſtreſſes, retired to this monaſtery ſoon after her leaving the court. To it is a handſome aſcent by ſeveral ſtone ſteps, which lead into a portico in the front of the church.

In the church which lately belonged to the Jeſuits, and which ſtands in St. Anthony's ſtreet, they have the heart of Lewis the thirteenth incloſed in a gold caſe, ſupported by two angels of ſilver. Here is alſo a fine altar with ſeveral braſs ſtatues, and the monuments of the princes of Condé. This church is a neat and elegant modern ſtructure.

St. Euſtace is a large and beautiful church.

The Theatines have a large church and cloiſter by the ſide of the river, ſome diſtance below the college of the Four Nations. Cardinal Mazarine left a legacy for building this convent.

Clermont college is a ſquare and lofty building, which, till lately, belonged to the Jeſuits, who taught here in ſeveral ſchools about two thouſand boys, many of whom were gentlemen's ſons: theſe boarded here, and had ſeveral halls to dine in. Many of the ſcholars wear coloured gowns, with large round velvet caps when they learn logic, and ſquare caps when they read philoſophy.

The univerſity of Paris is ſaid to be founded by Charlemagne in 791. In this univerſity are upwards of thirty colleges, the moſt conſiderable of which are the Sorbonne, the college of Navarre, the college of the Four Nations, and the faculty or college of phyſic.

The college of Sorbonne was founded in 1250; but was very poor when cardinal Richelieu cauſed it to be rebuilt in 1629. The preſent building is a very magnificent ſtructure, in which are apartments for thirty-ſix doctors, with a library and halls for public lectures and acts. To the three profeſſors chairs the cardinal added three others of a royal foundation. This is thought to be the ſtricteſt college in Europe, the degree of doctor being only given to thoſe who hold the Sorbonnic act, which is to anſwer all diſputants from ſun-riſe to ſun-ſet: on which account the title of doctor of the Sorbonne is of great repute. The doctors wear black gowns, and when exerciſes are performed have white fur hanging acroſs the breaſt.

The college of Navarre was founded by Jane, conſort of Philip the Fair, queen of Navarre, in 1305, for ſtudying divinity; and in 1683 three other chairs were added. Beſides the fellowſhips for ſtudents in divinity, queen Jane founded alſo twenty others for ſtudents in grammar; ſix other fellowſhips have been founded here, and in this college are kept the records of the univerſity.

The college of the Four Nations is the fineſt in the univerſity, and deſigned for the reception of the children of gentlemen, or eminent citizens of four different nations, namely, French, Italians, Spaniards, and Germans. There ſhould be ſixty fellows in this college, by virtue of its original foundation; but they have been reduced to half that number. It is alſo called the college of Mazarine, from the cardinal of that name, who left two millions of livres to it in his laſt will. The univerſity adopted this college upon condition that neither divinity, law, nor phyſic, ſhould be taught in it; nor any academy annexed to it in which ſtudents ſhould be taught to ride, fence, and dance. Beſides the ordinary profeſſors, here is one for mathematics. The doctors of the Sorbonne appoint the principal, who has the title of great maſter, and is always one of their own body. The fellowſhips are at the king's diſpoſal, who gives them to ſuch as are preſented to him by the ſecretary of ſtate of Paris. This college has a ſtately front, in the form of a theatre, facing the Louvre, which is on the oppoſite ſide of the Seine.

The faculty of phyſic has a college built in 1477, in which are five profeſſors, who are annually choſen. The morning profeſſors read lectures on phyſiology, botany, and pharmacy; and the evening profeſſors on pathology and ſurgery. In this college is an amphitheatre, in which are annually given complete courſes of anatomy, ſurgery, pharmacy, and chemiſtry. Every Saturday ſix doctors meet there in order to examine ſuch of the poor who are ſick, and come to conſult them; and the batchelors of

phyſic are obliged to attend, in order to write the preſcriptions of the phyſicians. The faculty is compoſed of all the doctors and licentiates who have taken their degrees in the univerſity of Paris: they have a dean at their head, and a cenſor. Theſe doctors and licentiates have the ſole right of practiſing phyſic at Paris, no phyſician of any other univerſity being ſuffered to practiſe here, unleſs he be phyſician to the king or the royal family. All the profeſſors in the univerſity have ſettled ſalaries, and in moſt of the colleges there are fellowſhips for the ſtudents.

The ſeveral academies deſerve to be particularly mentioned. Theſe are, I. The French academy, founded in 1633, by cardinal Richelieu, for the improvement of the French language, which conſiſts of forty members, who meet on Mondays, Thurſdays, and Saturdays, in a hall of the Old Louvre.

II. The royal academy of inſcriptions and belles lettres, inſtituted for the advancement of polite literature. In this academy ancient monuments are explained, and the tranſactions of the kingdom perpetuated by medals, inſcriptions, &c. It conſiſts of four ſorts of members: theſe are twelve honorary, and twenty penſioners, with twenty-ſix aſſociates and twelve ſtudents. Their meeting-days are on Wedneſdays and Saturdays.

III. The royal academy of ſciences, inſtituted in 1666, has alſo its honorary members, penſioners, aſſociates, and ſtudents.

IV. The royal academy of painting and ſculpture was founded in 1648. The maſter-pieces of the painters and ſculptors admitted into this academy are diſpoſed in three halls, and marked with the names of the ſeveral artiſts. Here are alſo the pictures of a great number of celebrated painters, and among the ſtatues ſeveral of Gyps taken from antiques.

V. The royal academy of architecture was founded in 1671, but was not authorized by letters patent before the year 1717. It is divided into two claſſes: the firſt is compoſed of ten architects, a profeſſor, and a ſecretary; and the ſecond of twelve other architects. The profeſſor, whoſe poſt, as well as that of the ſecretary, is for life, is obliged to read public lectures every Monday and Thurſday in the hall of the Louvre.

The moſt conſiderable of the hoſpitals in this city are, that for diſabled ſoldiers, the Hôtel Dieu, Trinity hoſpital, and the General hoſpital. The Royal hoſpital for diſabled ſoldiers may be conſidered as a large palace, it taking up above ſeventeen acres. Here are four large courts, all of the ſame form, ſurrounded with regular buildings four ſtories high. In the middle is a fifth court, larger than all the four taken together. It is encompaſſed with a double row of arches, one above the other, forming very narrow galleries. The chapel is very beautiful, and its altar adorned in the moſt ſplendid manner. This hoſpital is full of lame and ſuperannuated officers and ſoldiers. The great order and ſtrict diſcipline obſerved in it cannot be ſufficiently admired. It has a governor, a lieutenant of the king, and a major.

The Hôtel Dieu, or the Houſe of God, is the moſt ancient and largeſt hoſpital in Paris. As all poor ſick people are admitted into it, there have been ſometimes four thouſand perſons in it at once. They are attended with the greateſt care by the nuns of the order of St. Auguſtine, who diſcharge the office of nurſes. To the honour of this hoſpital, all manner of patients are admitted, without regard to their country, religion, or diſeaſe; and no ſecurity is required for their burial in caſe of death: nor are thoſe who labour under any incurable diſeaſe ever diſcharged, and ſuffered to periſh in the ſtreets.

In the ſuburbs of St. Victor is the General hoſpital, which alſo goes by the name of La Salpetreria; ſaltpetre having been formerly made here. In it is a noble foundation for the female ſex, near ſeven thouſand of whom are here provided for, and live under the inſpection of ſixty ſiſters, ſubordinate to whom are eighty governeſſes, and a conſiderable number of maid-ſervants. Into this place are received foundlings, who take up one ward: girls and young women, who ſew and knit: a great number of bad women, who are here compelled to ſpin woollen: ſome hundreds of female idiots, who live in little houſes built in the form of a ſtreet: many other poor women, ſome of whom are kept here gratis, and others pay a ſmall matter: delinquents who are confined, but not put to work.

To this admirable foundation alſo belongs the caſtle of Biceſtre, which is ſeated on an eminence at a ſmall diſtance from the above-mentioned houſes, and is on all ſides defended by a wall, which is of very conſiderable compaſs, containing within it many large buildings, and ſeveral open ſquares. In this caſtle are near four thouſand perſons of the other ſex, particularly poor men, who are entertained here gratis, and ſome who pay for their reception into the houſe. Perſons diſordered in their ſenſes, whoſe ward reſembles a village, it being built in regular ſtreets. Twenty-five men and as many women afflicted with the venereal diſeaſe. Common priſoners are kept here in a particular houſe, walled in, and every one in a cell by himſelf: but the moſt remarkable thing here is the large well, which is a modern work: it is of a circular form, and from top to bottom lined with free-ſtone. To the ſurface of the water it is a hundred and twenty-eight feet in depth, and twenty more to the bottom. Round the well, at the water's edge, is a gallery to which a perſon may, on occaſion, be let down. The water is drawn up by means of an engine worked by four horſes, who are relieved every three hours; it is received all day long into huge buckets, each of which contains twelve hundred pounds weight of water, which is diſcharged out of theſe into a leaden baſon, whence it runs into a reſervoir, and is conveyed by means of pipes to all the parts of this vaſt building.

The hoſpital de la Pietie, in St. Victor's ſtreet, conſtitutes alſo a part of the General hoſpital, and is the place where the governors uſually hold their meetings. Theſe three laſt foundations, together with the Hôtel Dieu, have one common fund, amounting to full two millions of livres per annum. Its preſent governors are twelve ſubſtantial citizens appointed by the provoſt of the merchants, and by the echevins; but approved by the parliament, before whom they muſt be ſworn. There are alſo ſeven honorary adminiſtrators, or governors: theſe are the archbiſhop of Paris, the firſt preſident of the parliament, chamber of accounts, and court of aids, the attorney-general, the lieutenant-general of the police, and the provoſt of the merchants.

Trinity hoſpital was founded about the year 1202 by two friars for the reception of poor travellers: but it is now uſed for the maintenance and education of poor children of both ſexes born at Paris in lawful wedlock. They wear blue gowns, and here are an hundred beds for boys, and thirty-ſix for girls, who have different apartments, in each of which there is an infirmary. The youngeſt are taught to read and write; and when they are ſix or ſeven years old, are inſtructed in ſome trade within the hoſpital. In order to encourage mechanics to come and exerciſe their trades here, and teach the children, the parliament has declared, that ſuch journeymen as have taught theſe children ſix years in this hoſpital, ſhall have the freedom of the city, without any expence; and that ſuch children as ſhould be arrived at the age of twenty-five, and ſhould have taught others during ſix years, after they were out of their apprenticeſhip, ſhould enjoy the ſame privilege. This wiſe eſtabliſhment has procured the city a vaſt number of ſkilful artificers. This hoſpital is adminiſtered by five eminent perſons choſen by the parliament, out of ten preſented to them by the attorney-general.

Among the ſquares in Paris the moſt famous is that called La Place de Victoires, or the Square of Victories. In it is a noble ſtatue of Lewis XIV. which is one of the beſt pieces of ſtatuary in Europe: it is of maſſy braſs thirty feet high, clad in his robes, with Victory behind him of the ſame magnitude and metal, putting a crown on his head, and poiſed with her foot on a globe. Under her is a three-headed Cerberus, to repreſent Lewis XIV. triumphing over the triple alliance, with theſe words under it, VIRO IMMORTALI, or the immortal man, alluding to his fame. The whole piece was caſt all at once, and weighs above thirty thouſand pounds. The pedeſtal is twenty-two feet high, and upon it are four ſlaves of braſs, with baſſo relievos of the king's battles and conqueſts.

queſts. Under the pedeſtal is a pavement of marble incloſed within handſome iron rails.

The triumphal arch at Paris is ſaid to exceed every thing of the kind in Europe, whether ancient or modern; this is at leaſt the opinion of the French. The ſtructure is indeed noble, it conſiſting of two faces of an extraordinary height, with three portals, after the manner of the ancient and modern Romans. The orders of the columns are finely deſigned, and the captives and trophies with which this ſtructure is adorned are executed in the moſt admirable manner. On this arch is placed the king's ſtatue on horſe-back. The whole was done from the deſign of the famous Perault.

The other gates of the city and triumphal arches are all pompous pieces of architecture: that of St. Denis, leading to the ſquare of the ſame name, is above ſeventy feet high, and as many over, adorned with columns, baſs reliefs, and trophies, with ſome inſcriptions relating to the paſſage of the French over the Rhine, and their taking of Maeſtricht. The gate of St. Martin is fifty feet high and as many wide, and has on each ſide an inſcription relating to the actions of Lewis XIV. The third gate is that of St. Anthony, erected in the reign of Henry II. but repaired and embelliſhed by the city, with ſome inſcriptions in honour of Lewis XIV.

Among the things worthy of obſervation at Paris is the fair of St. Germain, which begins on the third of February, and holds all Lent. The place where it is kept is a large ſquare building, which has ſix or ſeven rows of ſhops, wherein the cuſtomers play at dice when they come to buy goods; for they are firſt cheapened and bought, and then the people play who ſhall pay for them. The greateſt gaming is after candle-light, and ſometimes the king himſelf comes hither to play. Here is a celebrated picture of our Saviour's aſcenſion, with St. Peter, St. Paul, and two angels in the ſame piece, the work of Antonio Moro: the frame, which is curiouſly carved and richly gilt, is valued at two hundred piſtoles.

On the river Seine are a great number of pleaſure-boats belonging to the king and perſons of quality, in which they ſometimes take the amuſement of ſailing on the water, for the ſake of the air. The water of this river generally looks green and dirty, which is not to be wondered at, as it is commonly filled with covered barges full of waſher-women cleaning their linen: yet it is carried in pails through many of the ſtreets, and ſold as milk is in London. It is a common obſervation, that the French women are the worſt laundreſſes in Europe: they waſh their linen in cold water in the river, and as to ironing and plaiting, they have not the leaſt notion of it. There are here indeed ſome Engliſh women, who will finiſh them pretty neatly, but not ſo white as in England, which may in a good meaſure be owing to the water.

At Paris are ſeveral courts whoſe juriſdiction extends very far. The principal of theſe are the parliament, which is the laſt reſort in all cauſes where the crown does not interpoſe; a general court of the juſtices in eyre, a court of the conſtables and marſhals of France; a court of the admiralty; the bailiwic of the palace; the court of the chatelet, or the ordinary court of juſtice for the civil government of the city, of which the provoſt, or mayor, with the four echevins, or aldermen, and twenty-ſix counſellors, are judges; an election, a ſalt office; a court of the warren of the Louvre, eſtabliſhed for the preſervation of the game ſix leagues round Paris, and to prevent people from hunting in thoſe limits without leave; the court of the Hôtel de Ville, or town-houſe, which takes an account of the city rents, and of the taxes on all proviſions brought into Paris; and the court of the conſuls, which takes cognizance of every thing relating to commerce.

The French condemn malefactors to the gallies, to the gibbet, and to what is called being broke alive upon the wheel: the laſt is uſed only in caſe of murder; but if the evidence leaves only ſome room to doubt the guilt of the perſon accuſed, he is, as in many other countries, cruelly put to the torture to obtain a confeſſion: and here it muſt be obſerved, that malefactors in France receive their ſentence on their knees; which is no ſooner pronounced than the hangman ties a rope about their necks, and conveys them to priſon, whence, after confeſſion, they are generally dragged immediately to the gallows. The common place of execution is the Greve, the ſquare in which ſtands the town-houſe; and we ſhall now give the manner wretches are broke, as it is called, on the wheel, which we ſhall take from Mr. Stephens's Travels through France. "In the middle of the ſquare, ſays he, a ſcaffold was erected; and at half an hour after four the priſoner was brought to it in a cart, attended by the city guard, walking two and two, a prieſt accompanying the dying man. On the ſcaffold was erected a large croſs, exactly in the form of that commonly repreſented for St. Andrew's. The executioner and his aſſiſtants placed the priſoner on it, in ſuch a manner, that his arms and legs were extended agreeably to the form of the croſs, and ſtrongly tied down. Under each arm, leg, &c. was cut a notch in the wood, as a mark where the executioner might with the greater facility break the bone. He held in his hand an iron bar, not unlike an iron crow, and in the firſt place broke his arms, then in a moment after both his thighs. It was dreadful to ſee the poor wretch writhe his body with agony, and to obſerve the diſtortions of his face. It was a conſiderable time before he expired, and it would have been longer, had not the executioner given him what is called the *coup de grace*, or merciful ſtroke, on his ſtomach, which at once put an end to his miſery. They then took the dead body from the croſs, and put it on a wheel, fixed to a long pole, where he was expoſed for ſome time; and this part of the ceremony occaſions the common expreſſion of being broke upon the wheel, though it is performed on a croſs."

The trade of Paris with the other parts of the kingdom is very extenſive. Their commerce with foreigners is alſo conſiderable; for it is obſerved, that one ſingle branch, that of the gold, ſilver, and ſilk ſtuffs manufactured at Paris, is equal to the whole trade carried on at Lyons. They have here likewiſe manufactories of all other ſorts of ſtuffs, of looking-glaſſes, and almoſt every neceſſary for the ſupport and convenience of life.

There are in this city ſix principal companies of tradeſmen, out of which the conſuls, who have the regulation of trade, are choſen; theſe are the drapers, the grocers and apothecaries, the mercers and jewellers, the ſkinners, the hatters and goldſmiths: beſides which there are the bookſellers, the vintners and wine-merchants, the wool-merchants and timber-merchants: but though theſe are eſteemed inferior to the others, they have the ſame privileges, and are capable of being elected conſuls.

The land in the neighbourhood of this capital is in general flat and even, intermixed, however, with a few eminences. Towards the north of Paris the ſoil is fat, and produces a great quantity of very good corn. On the other ſide it is ſandy, marſhy, and wet. The whole is, however, cultivated with great care and induſtry; and the people have carried the art of gardening to ſuch perfection, that in the midſt of winter they raiſe all thoſe ſorts of kitchen ſtuff that ſeem to be the produce of ſummer only. Within the election of Paris they make one year with another about ſixteen thouſand hogſheads of wine, which is all drank at Paris, or in its neighbourhood.

This city has undergone the fate of moſt others; it has been ſeveral times beſieged, twice burnt, and once conſiderably damaged by an inundation of the Seine. Henry VI. king of England, was crowned here, and his court was kept with great ſtate and magnificence at the Louvre in 1422. On the twenty-firſt of Auguſt, 1572, it was in a moſt deteſtable manner ſtained with the blood of ſix thouſand proteſtants; the ſignal for this moſt horrible maſſacre being given by the tolling of the great bell, which is ſtill to be ſeen in the tower of the palace where the parliament ſits. In the civil war Paris took part with the leaguers, and was beſieged in the years 1589 and 1590 in vain by king Henry III. and IV. but in 1594 readily opened its gates to the latter, after his coronation.

In the neighbourhood of Paris are ſeveral palaces and little towns included under the ſame government, the principal of which are the following:

The wood of Vincennes reaches almoſt to the gates of Paris, and is incloſed round with a wall. Within this wood, at the diſtance of three miles to the eaſt of Paris, is a royal palace, or caſtle, which was conſiderably improved and beautified by Francis I. Henry II. Lewis XIII. and XIV. It is an oblong ſquare building, encompaſſed with dry ditches, which are lined and pretty deep. The caſtle is compoſed of ſeveral ſquare towers, the higheſt of which is called the Donjon, and is ſurrounded with a particular ditch, over which there is a draw-bridge. The chapel, though in the Gothic taſte, is not without beauty, it being adorned with ſeveral pyramids and other ornaments; and the pictures on the windows are highly valued. The rooms within the palace are beautiful and ſtately, and the cieling adorned with paintings.

The gate through which you enter the park is a fine piece of architecture, in the form of a triumphal arch, adorned with columns and ſtatues, and ſtands in the middle of a large court, on each ſide of which is a fine ſuite of buildings, and an open gallery ſupported by ruſtic arches.

At the entrance of the park is a place where they uſed formerly to keep wild beaſts, as lions, tygers, and leopards. This park takes up fourteen hundred and ſixty-ſeven acres. The avenue leading to the palace has four rows of elms planted on a ſpot which has been made level for that purpoſe, they having been obliged to ſupport it in ſeveral places by means of high and thick walls. This palace, or caſtle, has ſometimes ſerved as a priſon for perſons of the higheſt rank, and princes of the blood, when they have incurred the ſovereign's diſpleaſure.

About three miles to the weſt of Paris is the royal palace of Madrid, in the wood of Boulogne. This palace was built by Francis I. in 1529, after the model of the palace of Madrid in Spain. It conſiſts of a ſuite of buildings three ſtories high, beſides the ground-floor, and round it is a gallery reaching to the top of the firſt floor, ſupported by coupled columns. The arches have an ornament of a ſingular kind, they being incruſted with a ſort of tiles that gliſten very much when the ſun ſhines upon them. The principal building is flanked on each ſide by two large pavilions, at the angles of which there are ſmaller ones. In the middle of the fronts of each of the large pavilions is a round tower, the top of which is in the form of a dome. The whole is ſurrounded with a narrow ditch.

Ruel is a ſmall town on the Seine, five miles from Paris, where is a very handſome church, and ſome elegant gentlemen's houſes; but it is principally noted for a ſeat built by cardinal Richelieu, which, though not magnificent, is admired for its neatneſs, and its being adorned with very beautiful gardens in the Italian taſte, and curious water-works.

St. Maur de Foſſez, on the river Marne, over which is a ſtone bridge, is about two leagues to the eaſt of Paris. Here is an ancient abbey of St. Maur, which was ſecularized in 1535, and afterwards changed into a collegiate church of canons. Here is alſo a very fine ſeat, with beautiful gardens, belonging to the duke of Bourbon.

Conflans is a fine ſeat thus called, from its being near the confluence of the Seine and the Marne. It owes its beauty both to nature and the elegant taſte of Francis de Harlay, archbiſhop of Paris: it belongs to that metropolitan's ſee, and is the country ſeat of the archbiſhops. The rooms within are extremely magnificent, eſpecially the gallery, which is adorned with pictures done by the beſt maſters. The gardens are very beautifully laid out, and adorned with ſtatues, walks, water-works, groves, and other proper embelliſhments.

SECT. XXX.

Of the Government of the Iſle of France; its Situation, Extent, and Produce; with a particular Deſcription of the Palaces of Verſailles, Trianon, Marly, Fontainbleau, Mudon, St. Cloud, and the principal Cities.

THE government round the Iſle of France is bounded on the north by Picardy, on the weſt by Normandy, on the ſouth by the Orleanois, and on the eaſt by that of Champagne, extending about ninety miles in length, and as much in breadth.

The air is temperate, and the ſoil fertile; it therefore abounds in corn, wine, and fruit, and is divided into ſeveral ſmall diſtricts.

In deſcribing the places in this government we ſhall begin with the palaces, theſe having a nearer relation to the ſubject of the laſt ſection.

The palace of Verſailles, which lies four leagues to the ſouth-weſt of Paris, ſtands on a riſing ground in the midſt of a country fit for hunting, and abounding with game. Lewis XIII. built a caſtle here, to ſerve as a hunting-ſeat; but Lewis XIV. being much pleaſed with the ſituation, converted the village into a fine town, and the caſtle into the moſt noble palace in the world. The ſide fronting the ſtables is not anſwerable in magnificence to the reſt; but that facing the gardens is extremely beautiful. Its roof glittering with gold, affords a noble proſpect at a diſtance, and the gardens, ſtatues, canals, groves, grottos, fountains, and other water-works, far ſurpaſs any thing of the kind to be ſeen in Italy; and its riches and beauty within are altogether anſwerable to its outſide.

The avenue leading to the caſtle divides the town into two parts; that which ſtands on the left hand, in coming from Paris, is called Old Verſailles, and that on the right the New Town. The palace, which is ſeated on an eminence in the midſt of a valley, is encompaſſed with hills. On the ſide towards Paris is a fine avenue of elms, the viſta in the middle being ſixty feet wide, and thoſe on the ſides thirty each. The end of the great royal ſquare is encompaſſed with regular pavilions built by the princes and lords of the court; theſe, with other fine houſes, form the new town. This ſquare has a fountain in the middle of it, with walks like thoſe leading to it.

From thence you aſcend the great court of the palace, which is 480 feet long, with four large pavilions at the corners for officers lodgings. The great court is incloſed with an iron baluſtrade, and two large buildings, that form the wings on each ſide, having balconies ſupported by columns and adorned with fine ſtatues. Theſe wings, together with the pavilions, ſerve for offices to the palace, and have courts with other buildings behind them. There are other double apartments, which, joining thoſe wings, form a communication between the new and old caſtle, and contracting the upper part of the great court end gracefully at the ſmall one.

Out of this court is an aſcent of three marble ſteps into a large landing place, and from thence by five more, into the little court paved with black and white marble. In the middle is a marble fountain and baſon, with ſtatues of gilt copper. The front and wings are of brick and free-ſtone, adorned with marble buſts and brackets. Before this front is a balcony ſupported by eight marble columns of the Doric order, with red and white ſpots like jaſper, and their baſes and capitals of white marble. In the two angles of the wings in the front are hanging pedeſtals, which ſupport two cloſets encompaſſed with gilt iron caſes; and underneath are two baſons of white marble in the form of ſhells, where young Tritons ſpout water. The middle building has three gilt iron doors in the porch, with apartments on the right and left.

In coming out of the great court, and paſſing through an open porch, you aſcend by a large ſtair-caſe eighty-one feet long, and thirty broad. From this porch there is an entrance into two painted halls. The cieling of one of them is ſupported by eight marble columns of the Doric order, that have red and white veins; the capitals and baſes are of a greeniſh colour, and the columns, being four on a ſide, divide the hall into three parts. On the ſides oppoſite to each column are pilaſters of the ſame marble, that ſupport a cornice under the platform, and fronting the windows are niches with ſtatues.

Next to this is another hall ſupported by twelve columns of the Ionic order, with marble pilaſters behind them, that have red, black, violet, and yellow veins; and their capitals and baſes are of fine white marble. From this you enter another hall of the ſame dimenſions, whoſe cieling is an octogon, with twelve double pedeſtals by the windows and doors, of fine marble, on which

are

are placed figures of the twelve months, repreſented by winged young men in gilt copper. The pieces over the doors and windows are of a white or flame-coloured marble. Upon one ſide of this hall is the chamber and cloſet of the baths. All the parts that are not hung with tapeſtry are lined with marble, and the nearer you come to the king's apartments, the more ſumptuous are the marbles, ſculptures, and paintings.

The like order is obſerved in the upper apartments, which are eight on a floor, adorned with different ſorts of marble and curious paintings. The guard hall is ornamented with marble that has black and yellow veins. In the other apartments is a marble with green veins, and others are lined with a fine marble called agate, brought from the Alps. On the ſide towards the green-houſe are other lodgings in the ſame order, with an apartment for the dauphine, under that of the queen, the cieling of which is curiouſly adorned. The queen's apartments are a ſuite of rooms that have the ſame dimenſions with the king's; but of different workmanſhip; the paintings on the cielings repreſent the actions of the ancient heroes.

Oppoſite to the front of the palace is a large plat in the garden, one hundred yards long, and twelve broad: the principal front looks towards a piece of water, and has three balconies, ſupported by four columns each, and a figure upon every column repreſenting a month of the year, and theſe balconies are richly adorned with ſtatues.

It would take up a volume to deſcribe the vaſt variety of paintings and ſtatues with which the apartments of this palace are adorned. The royal cabinet for medals, coins, paintings, and the like curioſities, had the choice of all that Italy could afford. The king's lodgings are enriched with utenſils of maſſy plate, even to the bedſteads, baluſtrades, and rails. The gallery towards the ſide of the garden is perhaps the nobleſt ever beheld, for its delightful proſpect; with the fine ſtatues and looking glaſſes placed between the pannels of the windows. The chapel, built in 1699, is a moſt finiſhed piece of architecture, ſculpture, and painting, performed by the moſt eminent maſters.

Every room has a particular name taken from the principal object painted on the cieling; for inſtance, the hall of Plenty, from Plenty and Liberality being painted on the cieling. Here are ſeveral pictures of the Holy Virgin; one on a column of jaſper, holding the infant Jeſus, and ſurrounded with ſeveral pilgrims, done by Pouſſin; the Virgin Mary and St. Joſeph flying into Egypt, by Guido, &c. The ſaloon of Venus has that goddeſs painted on the cieling, ſeated in a chariot drawn by doves, the gods and heroes adorning her triumph. Here are pictures of Nebuchadnezzar, who gives orders in relation to the gardens of Babylon; of Auguſtus exhibiting a chariot race in the circus; of Cyrus reviewing his army; and of Alexander marrying Roxana.

The hall of war has the cieling adorned with five pictures, the largeſt of which, in the middle, repreſents France holding a thunder-bolt in one hand, and a buckler in the other; the four others are on the ſides of it: the firſt is Bellona in a violent rage; the ſecond repreſents Germany in vain endeavouring to defend the Imperial crown; in the third Spain ſeems to threaten France; but her ſoldiers are put to flight: the fourth ſhews Holland thrown back upon her lion. This room is alſo adorned with ſix heads of the Roman emperors in porphyry; the drapery of the buſts is of gilt braſs, and they are placed on pedeſtals of oriental alabaſter.

The king's bed-chamber is more magnificent than any of the reſt; the carvings are all gilt, on a white ground. The bed is placed in an alcove, where two figures of Fame, who are repreſented ſitting, ſeem to watch for the preſervation of the king. The furniture of the bed is of crimſon velvet, embroidered with gold, and the chamber is adorned with ſeveral fine pictures.

The gardens are no leſs magnificent than the palace. In deſcending from the terrace you ſee two baſons which contain ſeveral water-ſpouts, and in the midſt of each, a collection of ſpouts in the form of a wheat-ſheaf, that riſes twenty-nine feet high. The borders of theſe baſons are each adorned with eight groups of brazen figures, repreſenting river gods and nymphs; and four others of the ſame metal repreſenting Cupids, little nymphs, and genii. In two angles of that parterre are two other baſons of marble, where the water is thrown into two ſheets, that have a fine effect, and on the borders of the baſons are groups of animals in braſs. From this parterre you ſee in a kind of creſcent which is below it, the baſon of Latona, round which are repreſented a groupe of three figuers, Latona, Apollo, and Diana. Latona here ſeems to complain to Jupiter of the cruelty of the peaſants of Lycia, who are repreſented as metamorphoſed into frogs, which throw a vaſt quantity of water upon the groupe.

There are ſeveral other baſons with jets, and other curious water-works, a particular deſcription of which would carry us too far; we ſhall therefore only mention the famous canal, at one end of which is a baſon of an octogonal figure, four hundred and twenty feet in diameter; four of its ſides are circular, three in ſtraight lines, and the other joins the canal. In two of the angles of this baſon is a ſea-horſe with a Triton on his back. The great canal is thirty-two fathoms broad, and eight hundred long, including the baſons at each end. In the middle it is croſſed by another canal about five hundred and twenty fathoms in length. Upon theſe canals the court ſometimes divert themſelves in yachts and galleys.

The orangery, or green-houſe, is a maſter-piece in its kind. It has a ſouthern expoſure, and contains firſt a large gallery, four hundred and eight feet long, with twelve arched windows in the front; and on each ſide are two others, each three hundred and ſixty feet long. Theſe galleries are adorned on the outſide with fine rows of columns. Before this green-houſe is a beautiful parterre, with a fine baſon in the middle, from which a ſpout of water riſes forty feet high. It is embelliſhed with four rows of columns, of the Tuſcan order, groupes of ſtone figures beautifully carved, vaſes, ſtatues of white marble, &c. In ſummer this parterre ſeems a foreſt of orange and lemon trees, myrtles, &c.

The labyrinth is a fine grove, the ſeveral walks of which are ſo interwoven with each other, that it is very difficult for a perſon who enters it without a guide, not to loſe himſelf. At the entrance are two ſtatues, the one of Æſop, the other of Cupid holding a clue of thread in his hand. At every turning of the alleys you meet with a beautiful fountain, in a baſon of fine ſhell-work, where one of Æſop's fables is very naturally repreſented; the ſubject of which is expreſſed in four lines, engraved in gold letters on a braſs plate with a black ground.

Here are a great number of other groves, all beautifully adorned, and at one end of the garden is the place where they breed a variety of foreign beaſts and birds.

In the park of Verſailles is another palace, called Trianon, ſituated at one end of the canal which croſſes the large one. This is both genteel and magnificent; the architecture and ornaments are in an exquiſite taſte, and the front about ſixty-four fathoms broad. The court before it is adorned with a fine periſtile, ſupported by marble columns and pilaſters. The two wings are terminated by two pavilions, and over the whole building is a baluſtrade adorned with ſtatues, urns, &c. In the apartments are fine pictures, and the furniture is very ſumptuous. The gardens are here alſo embelliſhed with fine baſons, caſcades, and groupes of figures, done by the beſt maſters.

In a park contiguous to Verſailles is another royal ſeat, called Marly, delightfully ſituated in a little valley, with a very fine proſpect of the caſtle of St. Germain, and of the neighbouring country. On coming from St. Germain to this palace, you enter firſt a round court, three hundred feet in diameter, where ſtands the guard room, and where terminate the ſeveral courts for ſtables, coach-houſes, &c. The palace conſiſts of a large pavillion, ſtanding detached from any other, as alſo of twelve ſmaller ones, ſix on each ſide: the outſide of the great one is adorned with paintings in freſco. The ſteps are embelliſhed with figures of ſphinxes, groups of children, vaſes, and the like.

In the great hall are ſixteen pilaſters, fine looking-glaſſes, and pictures; and in the king's apartments, and thoſe of the royal family, are beautiful pieces of painting, repreſenting the ſieges which Lewis XIV. carried on in perſon. The ſmall pavilions are joined to each other by arches, through each of which you enter a little arbour. In theſe ſmall pavilions are apartments for perſons of quality.

In the gardens is a large caſcade, which is properly a river falling from a very high place, and forming very beautiful ſheets of water. At the bottom are ſeveral baſons, adorned with groupes, ſtatues, &c. The ſide of the parterre, fronting the large pavilion, preſents a moſt extenſive and beautiful proſpect. From this parterre you deſcend to another, adorned with marble ſtatues, and a baſon in the middle, which has a number of water-ſpouts, forming a wheat-ſheaf. Beyond this is a large baſon ſurrounded with walks and graſs-plats. In going ſtill farther down, you meet with two other baſons, embelliſhed with ſhell-work and groupes of figures, in white marble. The water falling out of theſe baſons, forms ſeveral ſheets, and enters another below. Among the other pieces of water, is another caſcade, which falls from a ſteep hill into a large baſon, in the middle of which is a ſmall one of gilt braſs, ſupported by three Tritons of the ſame metal.

The hydraulic engine of Marly for raiſing of water, ſtands on the river Seine, and is compoſed of fourteen wheels turned by the current, which ſet two hundred and twenty-five pumps going at once, throwing up the water into a tower at the diſtance of ſix hundred and ten fathoms from the river. Thence the water runs into an aqueduct three hundred and thirty fathoms in length, and from thence is conveyed through iron pipes of eighteen inches bore into the reſervoirs of Marly, which are three hundred and fifty fathoms farther, and theſe again ſupply all the water-works of Marly and Verſailles.

Fontainebleau is but a mean town, though it has a particular ſub-governor, a royal prevoté, and a foreſt court. It is thirty-five miles to the ſouth-eaſt of Paris, and is ſolely remarkable for its royal palace, in which the French kings have taken great delight, it being well ſituated for a hunting ſeat. Though it conſiſts of ſeveral ſets of buildings added to one another at different times, without any order or ſymmetry, which conſtitute a confuſed maſs of various kinds of architecture, yet this very confuſion has an air of grandeur, which ſtrikes the eye. Its ſituation is in a bottom, and it is ſurrounded by a large foreſt; but the neighbouring hills are crowned with bare rocks. As the foreſt abounds with game, the court frequently takes the diverſion of hunting in it.

The largeſt room of this palace is that where plays are acted when the court is here. In this room is a large chimney built by Henry IV. twenty-three feet high, and twenty wide, adorned with four lofty Corinthian columns of ſpotted marble, with the baſes and capitals of white marble. In the midſt of the chimney-piece is a table of black marble, on which ſtands the equeſtrian ſtatue of the laſt-mentioned prince; underneath are two baſſo relievos, one repreſenting the battle of Ivry, and the other the ſurrender of the city of Mante. Two marble ſtatues, repreſenting Loyalty and Peace, ſtand on each ſide of this figure, and facing the chimney is a noble theatre for the acting of plays.

The room in which the king dines in public has a very fine cieling, and noble pictures repreſenting Fortitude, Temperance, Juſtice, and Prudence, with ſeveral other ſubjects. The other rooms are alſo adorned with paintings.

The galleries of this palace are likewiſe very fine. Among the reſt the ſtag-gallery, along the orangery, is particularly worthy of notice, it being adorned with paintings of all the royal palaces, between which are ſtags heads ſet off with branches of a very uncommon ſize. Under each ſtag's head is an inſcription, ſhewing in what wood, and by what king the ſtag was killed. Thus many of them are introduced ſpeaking, and very politely ſaying, king Charles, or Lewis, did me the honour of taking me. In the gallery of Diana is the picture of Henry the Great in a hunting-dreſs; and the different kinds of hunting in which he delighted, are repreſented in ſeveral paintings twelve feet high, and twenty broad.

Near this gallery is the aviary, which is extremely large and beautiful, it being ninety feet in length, and nine in breadth. In the middle is a large dome, under which is an artificial rock, made of ſhell-work, from which iſſue ſeveral ſprings, the water running through many little channels made in the ſtone pavement along the whole aviary.

The gardens are adorned with ſtatues and fountains, the largeſt of which ſtands in the middle of the garden, and is called the fountain of the Tiber, from that river being repreſented in braſs. Beyond it are a grotto and caſcades, and at the entrance of the park is a fine canal ſix hundred fathoms long, and twenty broad; it is all lined with ſtone, and has a fountain at each end. Nothing can be more rural and delightful than the alleys of this park, they being all of a vaſt length.

Mudon, in Latin Moldunum, a market town, five miles to the ſouth-eaſt of Paris, remarkable for the royal palace erected there, the favourite reſidence of the only ſon of Lewis XIV. It ſtands in the middle of a foreſt, and has a noble avenue leading to it, three quarters of a mile in length, on the right of which is a fine convent belonging to the Capuchins, and on the left the vineyards of Mudon. At the entrance of the court of the palace is a large pile of buildings on the right, and another on the left, which open in the form of a ſemicircle; but are disjoined from the body of the houſe. In the middle of the front is a lofty advanced building, entered by three doors. Above it runs an order of architecture, conſiſting of arches and columns finely deſigned. Above them is another order accompanied with pilaſters; over all is a fountain containing two ſtatues in a cumbent poſture, admirably well finiſhed. The wings are not ſo high as the principal building, and each of them is terminated by a ſquare pavilion.

The inſide of this palace was adorned with the richeſt furniture, and a fine collection of ſtatues, paintings, medals, and other antiquities. The front towards the garden alſo conſiſts of a lofty advanced building, with wings conſiderably lower, which terminate on the right and left in two pavilions of the ſame height as the body of the building. The gardens are much admired for their fine walks, parterres, and water-works, and adjoining to them is a ſpacious park encompaſſed with a brick wall, and adorned with woods, baſons, and reſervoirs of water; the woods being cut through, and divided by beautiful avenues, among which is one diſtinguiſhed by the name of the Dauphin, which leads to the gates of Paris.

Near Mudon are ſome excellent ſtone quarries.

St. Cloud, a borough, ſeated four miles from Paris, on an eminence near the Seine, and belonging to the archbiſhop of Paris. This place is a duchy and peerage, the archbiſhop bearing the title of duke and peer of St. Cloud. In it is a collegiate church, one convent, and a fine palace belonging to the duke of Orleans, adorned with very beautiful galleries, containing fine paintings and ſculptures, and the garden belonging to it abounds with fountains, caſcades, delightful parterres, with every thing that can pleaſe the eye. This place is much reſorted to by the inhabitants of Paris, on account of its extraordinary pleaſantneſs. It has a manufactory of porcelain, and a fine bridge of ſtone over the Seine. Here Henry III. was murdered in 1589.

Senlis, a city ſeated on an eminence on the little river Nonett, twenty miles to the north-weſt of Paris, in a diſtrict called Valois. It is the reſidence of a governor, a diſtrict court, and a ſalt office. In this city and its three ſuburbs are ſix pariſh churches; among which is the cathedral, which has a ſteeple that is one of the higheſt in France, and the figures which adorn the front of the right wing of this church are very curious. Here are alſo a collegiate church, and a royal chapel. Its biſhop is ſubject to the archbiſhop of Rheims, and has within his dioceſe one hundred and ſeventy-ſeven pariſhes, forty-four chapels of eaſe, three abbies, nine priories with nineteen infirmaries, and his annual revenue

amounts to eighteen thouſand livres, out of which he pays to the court of Rome one thouſand two hundred and fifty-four florins. The city has its own laws, and is defended by a wall, a dry moat, and baſtions.

Soiſſons, the capital of a diſtrict called the Soiſſonnois, and of the whole government, is ſeated in a pleaſant and fruitful valley, on the river Aiſne, ſixty miles to the north-eaſt of Paris. It is a pretty large well built town, and gives the title of Count. It is the reſidence of a governor-general, and the ſeat of a generalité, an intendance, a board of the finances, a ſalt-office, a court of juſtice, a foreſt-court, &c. In this city, beſides the cathedral, which has one of the moſt conſiderable chapters in the kingdom, are three collegiate churches, one college of the fathers of the Oratory, ſix abbies, ſeveral convents, a French academy, and an ancient caſtle. Its biſhop is ſubject to the archbiſhop of Rheims, in whoſe abſence he performs the ceremony of the king's coronation; he has three hundred and ninety-ſeven pariſhes, and twenty-three abbies within his dioceſe, which produces a revenue of eighteen thouſand livres, out of which he pays the court of Rome's taxation of two thouſand four hundred florins. Several councils have been held here.

St. Denis, a town ſeated in a fruitful level country, in the iſle of France Proper, five miles to the north-weſt of Paris, owes its origin to a celebrated abbey of Benedictines, founded there by king Clotaire, in honour of St. Denis, ſo early as the year 600, but greatly improved by his ſon Dagobert. The abbey is now rebuilt with the fineſt free-ſtone, and has a garden laid out in a moſt elegant taſte. The church, though Gothic, is a handſome ſtructure, and not only contains a very rich treaſury, in which are kept the crown jewels; but is likewiſe the place of interment for the kings of France and their families; but no tombs have been erected here, for Henry IV. or any of the ſucceeding kings. The famous marſhal de Turenne has a noble monument here erected by the king's order, in a marble chapel built on purpoſe, where his effigy lies at full length, ſurrounded with laurels and trophies, and a Roman eagle retreating backwards at the ſight of ſo formidable an enemy. Immortality, with a radiant crown on her head, holds in one hand a crown of laurel, while ſhe ſupports with the other the dying hero. Wiſdom and Valour are alſo repreſented in their proper attitudes: the former ſeems aſtoniſhed at the ſtroke which deprives France of that great man, and the latter appears in conſternation. On the altar in this abbey is a croſs, ſaid to be of maſſy gold, ſeven feet high, ſet with diamonds and rich pearls, and by it a table of gold; the altar is plated over with ſilver. The preſent income of the abbey is ſixty thouſand livres, together with the lordſhip of the town, and appeals from his court lie only to the parliament of Paris. Beſides this church here are thirteen others, among which is the collegiate church of St. Paul, and five convents.

Noyon, a very ancient, pretty large, and well built city, in the diſtrict called Noyonnois, on the little river Verſe, twenty-two miles to the north-weſt of Soiſſons. It is the reſidence of a governor, and has a ſalt-office, a foreſt-court, &c. Beſides its cathedral and a royal chapel, it has ten pariſh churches, two abbies, two convents, one community, one ſeminary, and two hoſpitals. Its biſhop, who is alſo ſuffragan to the archbiſhop of Rheims, is a count and a peer of France: his dioceſe conſiſts of four hundred and fifty pariſhes, and ſeventeen abbies; and his revenue amounts to twenty-five thouſand livres, out of which he pays three thouſand florins to the court of Rome. The principal trade of this city conſiſts in corn. Here the celebrated Calvin was born. This city has been ſeveral times deſtroyed by fire.

Laon, a city in the diſtrict called the Laonnois, ſtands on a ſteep eminence in the midſt of a large plain twenty miles to the north-eaſt of Soiſſons. It is well built, and has an old caſtle, and beautiful ſtreets. It has a governor, a ſalt-office, a foreſt-manor, and a court of juſtice. Beſides its cathedral, it has three collegiate churches, five abbies, two convents, a college maintained at the expence of the city, one general hoſpital, and an almshouſe. Its biſhop, who is ſubject to the archbiſhop of Rheims, is the ſecond duke and peer of France. Within his dioceſe are three hundred pariſhes, and twenty-four abbies. His revenue amounts to thirty thouſand livres, out of which he pays four thouſand florins to the court of Rome. The neighbouring country produces excellent wine.

Beauvais, a city in the diſtrict of Beauvaiſis, is ſeated on the river Teraine, ſixteen leagues to the north of Paris, and is almoſt ſurrounded with hills. Cæſar having beſieged and taken this town, is ſaid to have given it the name of Cæſaromagnus. It is fortified, but is of no great ſtrength, it being commanded by the neighbouring mountains. Its cathedral, dedicated to St. Peter, is a magnificent building; it has alſo ſix collegiate churches, thirteen pariſh-churches, three abbies, a general hoſpital, and an alms-houſe. It has likewiſe a manor-court, which, together with the foreſt-court, are dependent on the biſhop. It has likewiſe a province-court, and a ſalt-houſe. The biſhop, who is ſuffragan to the archbiſhop of Rheims, is a count and peer of France, and has a dioceſe conſiſting of twelve chapters, fourteen abbies, forty-eight priories, four hundred and forty-two pariſhes, and three hundred chapels, with an annual revenue amounting to fifty-five thouſand livres, out of which he pays a taxation of four thouſand ſix hundred florins to the court of Rome. In this city is a conſiderable manufacture of tapeſtry, and in it are alſo made great quantities of ſerge and woollen cloth.

The Engliſh beſieged this city in vain in 1443, and in 1472 it made a brave defence againſt Charles duke of Burgundy, when the women ſignalized their courage under the conduct of a brave heroine named Joan Hatchet, whoſe picture they preſerve in the town-houſe; and in memory of this action the women are allowed to march firſt in a proceſſion annually obſerved on the tenth of July. The adjacent country abounds in corn, paſture, and fruit, and affords ſome of the beſt mutton in France.

St. Germain's, or St. Germain en Laye, a well inhabited town, is ſeated on an eminence along the Seine, ten miles to the north-weſt of Paris, and has very good air and water. The Engliſh deſtroyed a palace which ſtood here in 1346; but a new building being raiſed by Francis I. it afterwards received the name of the Old Palace, to diſtinguiſh it from one built there by Henry IV. which was called the New. Lewis XIII. added ſome conſiderable embelliſhments to it, and Lewis XIV. enlarged it by the addition of five ſtately pavilions, whence, though it is no regular building, it makes a grand appearance. The New Palace, as it is called, fronts the Old, and ſtands on the brow of a hill, with a garden of ſix beds of earth ſupported by arches ſloping into the valley. This building is a true image of the tranſitorineſs of all ſublunary things, the galleries in it being turned into granaries, and the paintings ſcarce diſtinguiſhable for filth. The very alcove in which Lewis XIV. was born is now a duſt-hole, and the grand ſtair-caſe leading into the garden is wholly in ruins, while the arches for the beds in the garden are in many places ſunk into the ground. The Old Palace was the reſidence of James II. after his flight from England, and here too he died. The ſtreets of the town are well paved, the houſes are lofty and handſome, with ſome large ſquares and hôtels, though it has only one pariſh-church, three convents, and an hoſpital.

St. Cyr, a convent of nuns of the order of St. Auguſtine founded in 1686 by madame de Maintenon, miſtreſs, if not the ſecret conſort of Lewis XIV. of which ſhe herſelf was abbeſs till the fifteenth of April, 1719, when ſhe died. It contains fifty ladies of quality, thirty-ſix lay-ſiſters, and two hundred and fifty pupils, who muſt be between the age of ſeven and twelve; but muſt prove their nobility for four generations, and have no defect in body or mind. Here they continue till they are twenty years of age, when ſuch of them as are diſpoſed to be nuns are diſtributed among the royal abbies, where they are admitted gratis: the others are married to gentlemen, with a portion of four hundred piſtoles, beſides a certainty of preferment to the bridegroom; or elſe they are ſent back to their parents. On the death of any one of the fifty ladies, her place is filled up by election from among the young ladies. The thirty-ſix lay-ſiſters inſtruct them in every branch of education becoming their ſex. This

foundation

foundation has an annual revenue of a hundred and eighty thouſand livres, a hundred thouſand of which ariſe from the extinction of the abbey of St. Denis, excluſive of its lands and immoveables. The convent is a very ſpacious and ſplendid ſtructure.

SECT. XXXI.

Of the Government of Brittany; its Situation, Extent, Hiſtory, Produce, and principal Cities, namely Rennes, Nantz, St. Malo's, and Breſt; with a conciſe Deſcription of Belleiſle.

THE province of Brittany, called by the French Bretagne, is a kind of peninſula ſurrounded on the ſouth and weſt by the Atlantic ocean; on the north by the Britiſh channel; but towards the eaſt it joins Normandy, Maine, Anjou, and Poitou. Its greateſt length from eaſt to weſt is ſixty leagues, and its greateſt breadth forty-five, but in many places it is very narrow. It received its name from the old Britons, who being driven out of Britain about the middle of the fifth century, by the Angles and Saxons, croſſed the Channel into Gaul, and, after wandering about for ſome time, ſettled in this province, to which they at length gave their name. In ſucceeding times the Britons were obliged to ſubmit to the kings of the Franks. Charles the Great had a fleet here to act againſt the Normans, and under his ſucceſſors, Numenoius, a chief of the Britons, created himſelf king; but his ſecond ſucceſſor was taken off by ſome conſpirators, who made themſelves maſters of the country under the title of counts. The Normans afterwards reduced the country, but were unable to keep the quiet poſſeſſion of it; but at length Conan, count of Brittany, married his only daughter Conſtantia to Gottfried, count of Anjou, the ſon of Henry II. of England, and duke of Normandy; and the daughter and heireſs of this Conſtantia marrying Peter of Dreux, Brittany fell to the royal family of France, Peter being a prince of the blood. It was then governed by the dukes of Brittany, and at length, by marrying their daughters to the kings of France, it became united to that crown in the year 1532.

This province contains ſome very good harbours, but has few navigable rivers, except the Loire and Villaine. The country is in ſome parts level, and in others mountainous, particularly in Upper Brittany, through which runs a chain of mountains called Mont Acré. It produces little corn and wine, but its extenſive and fruitful paſtures enable the inhabitants to carry on a profitable trade in butter. It alſo produces hemp and flax, of which are made great quantities of linen and ſail cloth. At Carnot is a lead mine; but the lead found in it is not near ſo good as that of England. Some places in the dioceſe of Nantes alſo yield pit-coal; but that alſo is much inferior to the Engliſh. Horſes likewiſe are another branch of the trade of this country. On the coaſt are taken great numbers of ſardines and other fiſh.

The inhabitants on the ſea-ſhore are excellent mariners. In Upper Brittany they ſpeak French; but in Lower Brittany Welſh.

This country has its own parliament, which is held at Rennes; as alſo its own laws and particular ſtates, the latter of which conſiſt of the clergy, nobility, burghers, and peaſants, who are ſummoned by the king every two years. The governor is likewiſe admiral of Brittany, and under him are two lieutenant generals, one of whom has the ſuperintendency of eight dioceſes, and the other only of the earldom and biſhopric of Nantes. Beſides theſe there are three ſub-governors. In the meeting of the ſtates, and aſſeſſments of taxes, the country is divided according to its nine biſhoprics, five of which belong to Upper and four to Lower Brittany. We ſhall begin with the former, the principal places in which are the following:

Rennes, the ancient Condate, the capital of the province, is ſeated on the river Villaine, about fifty-five miles to the northward of Nantes, and forty-five to the ſouth of St. Malo's. It is divided by the river into two parts, which have a communication by three bridges. It is pretty large, populous, and the ſee of a biſhop: here is alſo held the parliament of the whole country, an intendancy, a country court, a foreſt court, and a conſulate. It contains many well-built houſes; but the ſtreets are narrow, dark, and dirty. Beſides the cathedral, it has eight pariſh-churches, and ſeventeen convents; the Jeſuits had here a fine college, and the ſtates of the province have erected in this city a noble ſtatue of Lewis XV. The biſhop, who is ſuffragan to the archbiſhop of Tours, has a dioceſe conſiſting of two hundred and thirty-ſix pariſhes, with an income of fourteen thouſand livres, out of which he pays a thouſand florins to the court of Rome.

The biſhopric of Nantes, or Nantz, includes the earldom of Nantois, which is divided by the Loire into two parts. This country is fruitful in wine, corn, good paſtures, and cattle: it likewiſe yields ſalt and pit-coal, and enjoys a flouriſhing trade.

Nantes, or Nantz, the ancient Condivionum, is in rank the ſecond city in Brittany. It is ſeated on the Loire, in the forty-ſeventh degree twenty minutes north latitude, and in the firſt degree thirty-two minutes weſt longitude, thirty-two miles to the eaſt of the ſea, and is one of the greateſt trading cities in the kingdom, it being pretty large, populous, well ſituated, and containing four ſuburbs. It is ſurrounded with ramparts and very deep ditches. Among its other fortifications is an old caſtle, flanked with large round towers towards the city, and with ſome half-moons towards the ſuburbs of St. Clement. This was formerly the ſeat of the dukes of Brittany, to whoſe eldeſt ſon it gave the title of count. It is the ſee of a biſhop, who is ſuffragan to the archbiſhop of Tours, and by virtue of his dignity is a counſellor in the parliament of Rennes. Here is alſo a chamber of accounts, a board of finances, a mint-office, a country court, an admiralty, and a foreſt court. The dioceſe of the biſhop conſiſts of two hundred and twelve pariſhes, beſides chapels of eaſe, and he enjoys a revenue of thirty thouſand livres, out of which he pays two thouſand florins to the court of Rome. The cathedral dedicated to St. Peter is a large antique ſtructure, adorned with high towers. In it are the tombs of ſeveral dukes of Brittany: here is alſo a collegiate church of the Virgin Mary, with eleven pariſh-churches, fourteen convents, a college, an univerſity founded about the year 1460, and two hoſpitals. The town-houſe is built in the modern taſte.

Near the city of Nantz is a famous hermitage, in which the hermits have hewn a handſome chapel out of the rock with their own hands, with cells for their lodging, and other conveniences, to which they have with great labour added a pretty garden; from this retreat they have a fine proſpect of the city, the Loire, and the adjacent country.

The trade of this city to the French colonies in America, and alſo to Spain and Portugal, is conſiderable, without mentioning other European ſhipping which frequent its port; though ſhips of burthen can come no farther up the Loire than to Paimboeuf, a market-town, where the cargoes are put into ſmaller veſſels, and carried up to Nantes. An excellent ſort of brandy, commonly diſtinguiſhed by the name of this city, is exported from thence into foreign countries. One of the ſuburbs called the Foſſe lies near the harbour, and is inhabited by rich merchants. Here is a large quay, along which ſtand very fine houſes, and ſpacious ware-houſes.

In this city is a very particular kind of ſociety, which has been eſtabliſhed above a hundred years between the merchants of Nantes and thoſe of Bilboa in Spain. This ſociety is called the Contractation, and has in each of theſe cities a reciprocal tribunal in the manner of a conſular juriſdiction: ſo that a merchant of Nantes, who happens to be at Bilboa, has a right to ſit and vote in that tribunal; and the merchants of Bilboa have the ſame privilege when they are at Nantes. It is on account of this ſociety that Spaniſh wool pays only a ſmall duty at Nantes; and that, in return, the linens of Brittany are upon the ſame footing at Bilboa. Theſe two cities had even formerly ſhips in common, which traded for the profit of the partnerſhip. They have eſtabliſhed at Nantes a manufacture of cottons, which ſucceeds as well as that which has been long ſince ſet up at Rouen, and

may in time even exceed it, ſince cotton and indigo are much cheaper here than in the latter city.

Here Henry IV. ſurnamed the Great, by the famous edict in 1598, commonly known by the edict of Nantz, granted the Huguenots, or reformed of France, the public exerciſe of their religion throughout the whole kingdom; and though it had been regiſtered in the parliament of Paris, and alſo confirmed and ſworn to by his ſucceſſors Lewis XIII. and XIV. the latter moſt perfidiouſly revoked it in 1685, cruelly perſecuting his Proteſtant ſubjects, and driving them out of the kingdom. But, notwithſtanding this cruel and impolitic ſtep, there are ſtill many Proteſtants, as hath been already ſaid, though they keep themſelves as much concealed as poſſible.

St. Malo, or St. Malo's, in Latin Maclovium, and Maclopolis, is a ſmall but populous city, ſeated on a little rocky iſland, formerly called St. Aaron in the Engliſh Channel, in forty-eight degrees thirty minutes north latitude, and in the ſecond degree fifteen minutes weſt longitude; but is joined to the continent by a long mole, not above thirty fathoms broad, at the head of which is a ſtrong caſtle flanked with large towers. The harbour is ſpacious, and one of the beſt on the coaſt, but of difficult entrance, it being ſurrounded with ſeveral rocks, and at tide of ebb left almoſt dry, ſo that it will not admit large veſſels, though it is very eaſy to build or refit ſuch ſhips as can enter it. On the neighbouring rocks are ten different forts, and the town is ſurrounded with walls, deep ditches, and always guarded by a ſufficient garriſon. As ſoon as the gates are ſhut, they let looſe upon the ramparts twelve or thirteen very fierce bulldogs, which would infallibly tear in pieces any perſon that ventured to come near them, whence it is commonly ſaid that St. Malo is guarded by dogs, though theſe are only deſigned to prevent the garriſon from being ſurprized. This city is alſo ſecured towards the ſea by a ſhoal of ſand that encompaſſes it, and, beſides the rocks, by ſmall iſlands; ſo that the harbour is eſteemed one of the keys of France.

This city is very conſiderable, not only for its ſtrength, but alſo for its trade. The inhabitants, who are ſea-faring people, are famous for their ſkill in maritime affairs, on which account a great number of privateers are fitted out from hence in time of war, which very much diſturb the trade of the Channel, and accordingly made many Engliſh captures during the reign of king William, which brought a bombardment upon the town, though it received but little damage.

But in 1758 a ſelect body of above twenty thouſand Britiſh troops under the command of the late duke of Marlborough, and a powerful ſquadron under commodore Howe, having landed at Cancalle bay between the ſixth and ſeventh of June, they burnt all the ſhips in the harbour to the number of a hundred, great and ſmall; after which, finding the town impracticable, they re-embarked, and arrived ſoon after at Spithead, with little or no loſs.

This city is the ſee of a biſhop ſuffragan to the archbiſhop of Tours; his dioceſe conſiſts of a hundred and ſixty pariſhes; he is lord of the city, and his income amounts to thirty-five thouſand livres per annum, out of which he pays a thouſand florins to the court of Rome. The cathedral of St. Vincent is one of the moſt ancient in all France; here are alſo ſeveral fine monaſteries, and other conſiderable public buildings.

Breſt, in Latin Breſcia, a famous ſea-port in the biſhopric of St. Pol de Leon, ſituated on the north ſide of a large and commodious harbour, which opens to the ocean in the moſt weſtern part of the continent of France, about fifty miles to the north-weſt of Belleiſle, in the forty-eighth degree twenty-five minutes north latitude, and in the fourth degree thirty minutes weſt longitude. It is a ſmall fortified city; the ſtreets are narrow, and it is defended by a ſtrong caſtle which ſtands on a rock, very ſteep towards the ſea; and likewiſe by a tower oppoſite to the caſtle, which guards the entrance into the port on that ſide. 'Tis encompaſſed on the land-ſide with a broad ditch, and ſome other works. It has a ſpacious fine road and harbour, the latter being ſurrounded with very good quays, upon which are built ware-houſes filled with naval-ſtores of all kinds. The harbour lies between the city and the ſuburb of Recouvrance, which is half as big as the city. The road is extremely ſpacious, and might contain five hundred men of war; but the entrance to it on account of its narrowneſs is exceeding difficult, and particularly from the blind rocks which lie under water at high tide. This port is the moſt ſecure retreat for the French ſhips of war, and is the beſt poſſeſſed by this nation on this ſide the Mediterranean; whence this city is one of the grand magazines of the admiralty of France, the other being at Toulon, in the Mediterranean; and therefore in this harbour the greateſt number of the French navy are fitted out. It is ſaid that naval-ſtores and neceſſary proviſions for ſeventy ſail of men of war are conſtantly laid up at Breſt, and ſhips of eighty or ninety guns are built here, which renders the place rich and populous. Here is always a ſtrong garriſon in the caſtle, commanded by ſtaff-officers. Lewis XIV. cauſed an arſenal to be built here, and erected an academy for the marine. There is here a court of admiralty and bailiwic, with only two pariſh-churches, and a convent. The Jeſuits, before their being expelled from France, had alſo a ſeminary here.

In the year 1694 the Engliſh made an attempt upon Breſt, but the deſign perſpired; ſo that the avenues being defended by a numerous train of artillery, and an army ſuperior to that of the invaders, general Talmaſh, who commanded the Engliſh, was mortally wounded in making the deſcent, and the forces were obliged to retire with loſs.

Belleiſle is an iſland about ſix leagues from the coaſt of Brittany, in the forty-fifth degree twenty minutes north latitude, and in the third degree five minutes weſt longitude. The ancients called it Coloneſus, or the Beautiful Iſland, which is the ſignification of its preſent name. It is about ſix leagues long, two broad, and confers the title of marquis. It is ſurrounded on all ſides with rocks, and has only three landing-places, Palais, Sauzon, and Goulſard; every one of which labours under ſome capital defect, either in being expoſed, ſhallow, or dangerous at the entrance. It contains only one little city, called Palais, three country towns, a hundred and three villages, and about five thouſand inhabitants. Palais, the capital, takes its name from a caſtle in its neighbourhood belonging to the duke of Belleiſle, afterwards converted into a citadel. This fortification is ſtrong and regular; it fronts the ſea, and is compoſed principally of horn-works, and provided with two dry ditches, the one next the counterſcarp, and the other ſo contrived as to ſecure the interior fortifications. The citadel is divided from the largeſt part of the town by an inlet of the ſea, over which is a bridge of communication.

In the year 1759 admiral Hawke, with a ſquadron of Engliſh ſhips, off the ſouth coaſt of this iſland, burnt, ſunk, and deſtroyed moſt of the French fleet from Breſt under Conflans, who was himſelf either mortally wounded, or loſt in making his eſcape in his boat to ſhore. Two of the enemy's ſhips ſunk to the bottom with all the men, and the ſhattered remains of his fleet, to the number of ſeven ſail, ran up for ſhelter, after throwing their guns over-board into the river Villaine, in Brittany, and there continued diſabled on account of the ſhallowneſs of the water. The Engliſh indeed loſt two of their men of war by too eager a purſuit of the enemy; but though they run aground, all the crew were ſaved, and their loſs was otherwiſe inconſiderable.

In April 1761, this iſland was attacked by an Engliſh fleet under the command of commodore Keppel, and the land forces under general Hodgſon. The Engliſh fleet after landing their troops and their cannon, which was accompliſhed with the greateſt difficulty, by dragging them up the rocks, laid ſiege to the city; and the garriſon, commanded by the chevalier de St. Croix, a brave and experienced officer, threatened a long and obſtinate defence. The enemy made ſome ſallies, which only animated the Engliſh troops by the difficulties with which they had to contend; but at length, a furious attack being made upon the enemy's lines which covered the town, they were carried with no great loſs; this was principally owing to the uncommon intrepidity of a body of new-raiſed marines. No action of greater ſpirit

and gallantry had been performed during the whole war. However, the garriſon held out till the ſeventh of June, when they capitulated, and marched out with the honours of war. This iſland was kept by the Engliſh till the late peace, when it was reſtored to France.

SECT. XXXII.

Of the Government of Normandy; its Situation, Extent, Produce, and Rivers. A conciſe Hiſtory of the Country, and of the principal Towns, as Caudebec, Dieppe, Rouen, Bayeux, Cherburg, and Havre de Grace.

NOrmandy, which derives its name from the ancient Normans, is bounded on the eaſt by Picardy and the iſle of France; on the ſouth by Beauſſe, Perche, and Maine; on the weſt by Brittany; and on the north by the Britiſh Channel; extending from eaſt to weſt upwards of ſixty leagues, and from north to ſouth thirty.

This is one of the moſt fruitful provinces in the whole kingdom, and one of the moſt profitable to the king. It abounds in corn, flax, hemp, and vegetables for dyeing, but the little wine it produces is very indifferent; it however yields great quantities of apples and pears, of which the natives make cyder and perry for their uſual drink. It is alſo a fine country for cattle, it being full of excellent paſtures. The ſea ſupplies it with plenty of fiſh, and from its water are extracted great quantities of ſalt. The many iron works here are of no ſmall advantage to the country; it has likewiſe ſome mines of copper, and is not without mineral waters.

The principal rivers in this province are the Eure, the Andelle, which riſes in this province, and falling into the Seine, is of great advantage in conveying to Paris wood for firing; the Rille or Riſle, which riſes here, and alſo falls into the Seine; the Dive, which riſes here, and after receiving the Vie, becomes navigable, and diſcharges itſelf into the Britiſh Channel; the Lezon which riſes here, and being joined by the Orbiquet is afterwards called the Tonques, and becoming navigable, loſes itſelf in the Channel; the Carentone, which has alſo its ſource in this province, falls into the Rille; and the Orne, which riſes here, and after receiving ſeveral ſmaller rivers, falls into the Britiſh Channel.

The ancient dukes of this province roſe to great power, both here and in foreign countries, and William, in the year 1066, became king of England. In 1135 the male line of this king became extinct in the perſon of Henry I. and his daughter Matilda marrying Godfrey, count of Anjou, the fruit of this marriage was Henry II. king of England, duke of Normandy, lord of Guienne, Poitou, and Saintonge. He leaving three ſons, Richard, Godfrey, and John; the laſt of them ſeized on the dominions of both his brothers, and even cauſed Arthur, the ſon of Godfrey, to be taken off; for which he was deprived of moſt of his territories in France, and in 1203 Normandy was annexed to that crown. Henry III. of England ceded to Lewis the Pious and his ſucceſſors all his claim to this province; which afterwards, to the end of the fourteenth century, ſome kings beſtowed on their eldeſt ſons, with the title of duke of Normandy, till that of Dauphiné was inſtituted. At length the animoſities between the houſes of Orleans and Burgundy afforded the Engliſh an opportunity of conquering not only Normandy, but a great part of France. This province was ſubject to England about thirty years, till at laſt the Engliſh were driven out by Charles VII. during the minority of that unhappy prince Henry VI.

This country is governed by its own law, which is called the Wiſe, and on this account Normandy is ſtyled *La Païs de la Sapience*, that is, The Land of Wiſdom. Rouen has a parliament, on which all the other courts of the province are dependent. With reſpect to its finances, it has three generalities, namely, at Rouen, Caen, and Alençon, from which the king is ſaid to have drawn twenty millions of livres a year. Hence the government of Normandy is one of the moſt conſiderable in the whole kingdom. Under the governor are two lieutenant-generals, one for Upper and the other for Lower Normandy; and each of the ſeven great diſtricts into which the country is divided has a deputy-governor of its own. Under the archbiſhop of Rouen are the ſix biſhoprics of Normandy, and theſe ſeven dioceſes contain eighty abbies and four thouſand two hundred and ninety-nine pariſhes. The principal places in this province are the following, beginning with Upper Normandy.

Caudebec, in Latin Calidum Beccum, that is, the Hot Bee, is a ſmall but populous town, ſeated on the river Seine, into which, near this place, falls a rivulet which runs through the town, and gives name to it. It is cloſely built, and has walls flanked with towers, and ſurrounded with deep ditches. It has three ſuburbs, and the ſmall river Caudebec being divided into ſeveral canals in the town, turns a conſiderable number of mills, that are very ſerviceable to the tanners and leather-dreſſers ſettled here. In this town is a ſalt and treaſurer's office, with a provincial, an admiralty, and a foreſt court. It contains two convents, one pariſh-church, and an hoſpital. Among other manufactures, the inhabitants make hats, which were formerly in great repute, on account of their not letting in the rain; but this branch of trade has greatly declined. This place is a conſiderable thorough-fare for ſuch as go from Rouen to Havre de Grace, and other parts of the country of Caux, of which it is the capital.

Dieppe, a ſea-port town on the ſhore of the Britiſh Channel, oppoſite to Rye, in England, and much reſorted to, particularly with veſſels from Scotland. It ſtands thirty miles to the north of Rouen, on a level ſpot, between two rocks, or mountains, and the mouth of the river Betune, called at this town the river of Arques, which falling into the ſea forms the harbour. It is fortified with bulwarks next the ſea, with a fortreſs at the ſuburb called Pollet, and a caſtle, which, together with the craggy rocks that lie on the ſouth, render it a place of conſiderable ſtrength, though its fortifications are very irregular. Its natural ſtrength induced Henry the Great to chooſe it for his head-quarters, when oppoſed by the League at his acceſſion to the throne. It has a good harbour, which is long, but narrow, and on this account of difficult acceſs. In time of war it is generally a ſtation for privateers; but has not a ſufficient quantity of water for large ſhips. The town is pretty large and well built; and the pariſh-church of St. James is a very fine ſtructure, and has a tower from which, in fine weather, the coaſt of England may be ſeen. It contains two ſuburbs, and has both a ſalt office and a court of admiralty. It is chiefly inhabited by ſea-faring men, who are eſteemed very expert in maritime affairs, as alſo by mechanics who make curious works in ivory, and by merchants who carry on a conſiderable trade to foreign parts. The inhabitants were moſtly Proteſtants till the perſecution which enſued upon the revocation of the edict of Nantes.

This town has been frequently taken and retaken in the wars betweeen England and France. In 1694 it was almoſt totally deſtroyed by bombs fired into it from the Engliſh fleet commanded by lord Berkeley; and in the wars of queen Anne it was alſo roughly treated, after which the court ſent thither an architect and engineer who rebuilt it in a regular manner: this indeed gives the town an external air of beauty, but is attended with very great inconvenience to the inhabitants.

The chief trade of Dieppe conſiſts in herrings, with which they furniſh Paris and the province of Normandy; they alſo fiſh for whitings, mackerel, and oyſters, which they ſell in the neighbouring provinces; together with their ivory works and laces made here. The ſea-compaſſes made in this town were formerly much eſteemed: but its trade is not ſo conſiderable as it was formerly.

Rouen, the Rothomagus of the antients, afterwards called Rothomum, the capital of Normandy, is ſeated in a diſtrict called Le Vexin Normand, and is environed on three ſides by high hills covered with trees, and on the fourth is ſeated on the north bank of the Seine, in the forty-ninth degree thirty-ſix minutes north latitude, and in the firſt degree ten minutes eaſt longitude. It is alſo watered by two little rivers called Aubette and Robec. The tide flows ſo high up the Seine, that veſſels of above

two hundred tons burthen can come up hither, and load and unload at a large quay, which is built along the city. Its ſituation is ſo very commodious for trade, that Rouen is conſidered as the center of it in the north of France. It had formerly a ſtately ſtone bridge over the Seine, of thirteen arches, but it is now ruined; and there is another of boats of a very artificial ſtructure built near it, and extending two hundred and ſeventy paces in length; it riſes and falls with the tide, and is paved like the ſtreets. This bridge, however, coſts a great deal of money to keep it in repair; and they are obliged in winter to take it in pieces, leſt the ice ſhould damage or carry ſome part of it away. The city has no other fortifications but a wall, with round towers in the antique taſte, and irregular baſtions to defend the gates on the land-ſide, except an old caſtle which was begun in the year 1419, as ſoon as king Henry V. of England had made himſelf maſter of Rouen, and finiſhed in the reign of Henry VI. in 1443. It is an antique building of little ſtrength, flanked with five large round towers, and having a draw-bridge, the whole being encompaſſed with a wet ditch. In this city there is, however, no garriſon, though it has a particular governor.

Rouen is very populous, for it contains ſeven thouſand two hundred houſes, in which are ſixty thouſand perſons; but is not very ſpacious. The ſtreets in general are very cloſe and narrow, and the houſes moſtly of wood and plaſter; it has, however, ſix large ſuburbs, in which are five pariſhes, and thirty in the city: it has alſo fifty convents, and four abbies; the Jeſuits had alſo a college here. Its archbiſhop has ſix ſuffragans, and a province of thirteen hundred and eighty-eight pariſh churches, beſides chapels, and his annual revenue amounts to eighty thouſand livres, out of which he pays twelve thouſand florins to the court of Rome. He ſtyles himſelf primate of Normandy, though he has no archbiſhop in his province ſuffragan to him; but from this title he has no ſuperior in France, and he depends immediately on the holy ſee. The city is adorned with many ſtately piles of building, among which is the cathedral dedicated to the Virgin Mary, the choir of which is lined round with copper. It has three very lofty towers, particularly that of the pyramid, the ſpire of which is only made of wood and covered with lead gilt. It has two hundred ſteps, and the whole edifice upwards of ſix hundred to the top. In this cathedral are to be ſeen the monuments of ſeveral kings, lords, and prelates; and likewiſe the monument of John duke of Bedford, who was regent of France under our Henry VI. In the butter tower, as it is called, which is that juſt mentioned, is a great bell ten feet in height, the ſame in diameter, and weighs thirty-ſix thouſand pounds. On the great gate is a triumphal arch in honour of king Henry the Great, with emblems of his conqueſt over the holy league. The body of the church is ſupported by twenty pillars, and, upon the whole, this church exceeds in beauty and regularity that of Notre Dame at Paris. The other remarkable ſtructures are the church of St. Toin, a very loſty building, chiefly famous for its great bell; the convent of the Cordeliers; the church which lately belonged to the Jeſuits; the church and abbey of St. Owen; and the parliament-houſe; which are all beautiful ſtructures. The archbiſhop's palace is alſo a fine building, adorned with elegant paintings and pleaſant gardens. In the veal market ſtands the image of the celebrated maid of Orleans, whom the Engliſh had the cruelty to burn as a witch, and is repreſented kneeling before Charles VII. And in the New-market is the ſtatue of Lewis XV. erected in 1721; but this is a very ordinary piece of workmanſhip.

The trade carried on in the city and diſtrict of Rouen is very extenſive, conſiſting of woollen and linen cloths, leather, hats, paper, and many other merchandizes. The woollen manufactures, which employ ſeveral thouſand workmen, are particularly advantageous to the whole province; but they are only ſo far profitable to the nation in general, as they prevent the money from being ſent abroad; but the linen manufactures of various ſorts exported to Spain are highly beneficial, and the returns generally made in caſh.

Rouen has undergone various calamities and viciſſitudes of fortune: it has been almoſt entirely burnt thirteen or fourteen different times. In 841 it was taken by the Normans; the Engliſh made themſelves maſters of it in 1418, and in 1449 it was ſurrendered to Charles VII. the French king. It was afterwards ſtormed and taken by the French Proteſtants, and re-taken and plundered in 1562 under Charles IX. Anthony of Bourbon, king of Navarre, received a mortal wound before it; but his ſon Henry IV. took it in 1592. In this city died William I. king of England, commonly ſurnamed the Conqueror.

Caen, in Latin Cadomus, is ſituated in a diſtrict of the ſame name, thirty miles to the ſouth of Havre de Grace, ſixty-five to the weſt-by-ſouth of Rouen, and a hundred and twenty-five to the weſt of Paris. It ſtands in a valley between two large meadows, at the confluence of the rivers Orne and Odon, by the united ſtream of which it is divided into the Upper and Lower Towns, that have a communication by means of the bridges of St. James and St. Peter, on the latter of which is erected a ſtately town-houſe, adorned with four large towers. The Upper Town is defended by a caſtle built upon a rock and very well fortified, and the Lower is entirely ſurrounded with water. It is a place of good trade, veſſels of ſome burthen being able to come up from the ſea to St. James's bridge, and its inhabitants are ſuppoſed to amount to forty thouſand ſouls. It is the ſecond town in Normandy, and contains an intendancy, an admiralty, a provincial and foreſt court, with a ſalt-office. It has twelve pariſh-churches, one collegiate church, two abbies, fourteen convents, with a houſe which till lately belonged to the Jeſuits, and two hoſpitals. King Charles VII. founded an univerſity here about the year 1430, and likewiſe a mint. An academy of ſciences and belles lettres was alſo eſtabliſhed in this city by Lewis XIV. and in the Royal ſquare, which is both ſpacious and regular, with fine houſes on three ſides of it, ſtands a marble equeſtrian ſtatue of that prince, ſurrounded with an iron baluſtrade. The principal trade of this town and its diſtrict conſiſts in cloth and fine linen.

Bayeux, the capital of the country of Beſſin, is ſeated on the river Aure, fifteen miles to the north-weſt of Caen, and contains an admiralty, a ſalt-office, a foreſt and diſtrict court, &c. It has ſeventeen pariſh-churches, nine convents, two hoſpitals, and a college and ſeminary, which lately belonged to the Jeſuits. The biſhop, who is ſuffragan to the archbiſhop of Rouen, has a dioceſe of ſix hundred and fifteen pariſhes, with a revenue of ſixty thouſand livres, out of which he pays four thouſand four hundred and thirty-three florins to the court of Rome. The cathedral, dedicated to the Virgin Mary, is a very ſtately ſtructure, beautified with a tower and two loſty ſpires. The city is divided into Upper and Lower, and manufactures of cloths, ſerges, and ſtockings, were ſet up here, which ſucceeded very well; but the nigh taxes impoſed on them, which the merchants were forced to pay, obliged them not only to abandon thoſe manufactures, but likewiſe to quit the city.

Cherburg, in Latin Cæſaris Burgus, a ſea-port town in the Engliſh Channel oppoſite to Hampſhire, is ſituated fifty miles to the north-weſt of Caen, in a diſtrict called the Coutantin, and lies between Cape La Hogue and Barfleur. It contains an admiralty, a bailiwic, and a viſcounty court: it has alſo one abbey, and a general hoſpital. Here they formerly made very fine glaſs, which, for clearneſs and beauty, even excelled that of Venice; but, for certain political reaſons, the work has been removed to Auxerre, in Burgundy. It was a very ſtrong place, from the fortifications that have been lately erected there, before they were deſtroyed, together with the famous baſon, by the Engliſh in the year 1758. The port is ſmall but pretty good, for veſſels of three hundred tons can come into it, and ſome merchant ſhips are built here.

Off this place the confederate fleet, under admiral Ruſſel, obtained a ſignal victory over that of the French, commanded by M. de Tourville, in 1692, and afterwards burnt, took, or ſunk about twenty of their ſhips of war, near Cape La Hogue; among which was le Soleil Royal, or the Royal Sun, the French admiral's ſhip.

In the laſt war the Britiſh forces, under the command of the late duke of Marlborough and lord George Sackville,

landed here and took the town, which they entered without the leaſt oppoſition in Auguſt, 1758, together with the ſhips in the baſon; demoliſhed the fortifications, and ruined the other works, particularly the baſon and harbour, with the ſluice, and all the forts, carring away twenty-one fine pieces of braſs cannon and two mortars, which were brought to England.

The diſtrict of Havre de Grace conſtitutes the weſtern part of the country of the Caux, in Upper Normandy, and, though a particular military government, is ſubject to the civil and eccleſiaſtical government of this province. The principal places it contains are the following:

Havre de Grace, a ſtrong ſea-port at the mouth of the river Seine, forty-five miles to the weſt of Rouen, was built by Francis I. who alſo called it, after his own name, Ville François, whence it has been alſo called Franciſcopolis; but this name is now ſuperſeded by the other. This is the capital and ſeat of its little government, and contains a naval intendant, a viſcounty, an admiralty, a royal court of juſtice, and a ſalt-office; with one pariſh-church, one ſeminary, and two convents. It has a good harbour between the town and citadel, which is ſmall but regularly fortified, and an arſenal. It is a pleaſant well built town, and a place of good trade, ſeveral merchants reſiding here. In the reign of Charles IX. it was ſeized by the Proteſtants, who in 1562 delivered it to queen Elizabeth, in conſideration of the aſſiſtance that princeſs had given them; but the following year it was vigorouſly beſieged by the French, and with equal courage defended by the Engliſh, under the earl of Warwick; but a peſtilence, which raged in the town, forced them to ſurrender in July, 1563. Afterwards, in 1694, this city was almoſt entirely deſtroyed by a bombardment from an Engliſh fleet.

Harfleur, a ſea-port town, forty miles to the north-weſt of Rouen, and about five to the weſt of Havre de Grace, between two hills, the one on the eaſt, and the other on the weſt. It contains an admiralty court, and a ſalt-office: it is alſo the ſeat of a royal juſtice, and has a ſmall magazine; but has only one pariſh-church, and one convent. It was formerly a conſiderable port; but that of Havre being found more convenient, it has been neglected, and is now only capable of receiving ſmall veſſels. It was twice taken by the Engliſh, namely, in the years 1415 and 1440.

We ſhall treat of the iſlands on the coaſt of Normandy, as Alderney, Guernſey, and Jerſey, in deſcribing the oppoſite coaſt of England.

CHAP. XXIX.

Of GREAT BRITAIN.

SECT. I.

Of GREAT BRITAIN *in general.*

Its Situation, Extent, Climate, and Face of the Country; the Plants, Fruits, Beaſts, Birds, and Minerals.

GREAT Britain is the largeſt iſland in Europe, and one of the moſt populous, rich, and fruitful. It includes England and Scotland, which were united in 1707; only the latter reſerved their peculiar laws. The whole iſland is of a triangular form, the Lands-end, the Dover-head, and Caithneſs ſhooting out into ſo many promontories, and forming the three corners. The ſea its boundary has ſeveral names adapted to the ſeveral coaſts; on the north it is called the Northern ſea; on the eaſt the German ocean; on the ſouth the Britiſh Channel; and on the weſt the Iriſh ſea, or St. George's Channel. Its latitude at the Lizard-point, in Cornwall, is, according to Moll, in the fiftieth degree north, and at the Headland at Caithneſs, or Dungſbyhead, in Scotland, in the fifty-eighth degree thirty minutes; ſo that, according to the geometrical meaſure of Engliſh ſtatute miles, which is ſixty-nine miles and eight hundred and ſixty-four feet to a degree, the true length of the iſland, meaſured in a ſtraight line, without attending to the hills and winding of the roads, is five hundred and eighty-ſeven miles; and the longitude, placing the firſt meridian at Teneriffe, is nine degrees forty-five minutes, at the Land's-end, in Cornwall, and at the South Foreland, in Kent, ſeventeen degrees fifteen minutes, in all ſeven degrees thirty minutes: the parallel there giving thirty-eight miles to a degree of longitude, the true diſtance from eaſt to weſt in a ſtraight line is two hundred and eighty-five miles.

The ſea, which ſurrounds it, is not only a ſecurity againſt an enemy, but againſt the violent cold to which the climate would otherwiſe be expoſed; for the tides and conſtant motion of the ſea ſend us a kindly vapour, which qualifies the natural ſharpneſs of the air, even to ſuch a degree, that in ſome parts of France and Italy more ſevere weather is felt in winter than in England. The climate is indeed infinitely preferable to that of any part of the continent in the ſame latitude, the ſummers being neither ſo hot, nor the winters ſo cold. The harbours in Holland, Germany, and Denmark, are blocked up with ice, while ours which lie in the ſame latitude are open. If we purſue this obſervation ſtill farther, and conſider the ſame latitudes in America, we ſhall find there that in winter the very ſeas are conſtantly frozen, and that even brandy itſelf will freeze.

The air is generally very good and wholeſome, except in the hundreds of Eſſex and Kent, the fens in Lincolnſhire and Cambridgeſhire, and ſome other low marſhes near the ſea. Though the winters are rainy and ſubject to thick fogs, and the weather to great variations, theſe do not impair the health of the inhabitants, who are accuſtomed to them; for they generally live as long as thoſe of any other countries, and ſome die every year at above a hundred years of age. We have inſtances of ſome living even to a much longer period; thus Thomas Parr, of Shropſhire, was a hundred and fifty-two years of age when he died, and Henry Jenkins, a Yorkſhireman, a hundred and ſixty eight. Though the frequent rains ſometimes damage the hay and corn, yet even theſe have their advantages, as they generally occaſion our having good paſtures throughout the year.

The ſoil, indeed, in a great meaſure owes its fertility to the mild vapours juſt mentioned, which, by mollifying the air, nouriſh the vegetable world, and furniſh us with gentle ſhowers in their proper ſeaſon. We have, indeed, as well as other countries, ſtorms of thunder, lightning, and tempeſts; but they are leſs frequent and much leſs violent than in hotter climates.

That part of Great Britain which lies towards the Weſtern ocean is mountainous, as Cornwall, Wales, and many large tracts of Scotland; but the inner parts are generally a plain champaign country, intermixed with hills of eaſy aſcent and gentle acclivities. The moſt remarkable mountain, or rather chain of mountains, as it may be termed, is a continued ridge which extends from north to ſouth, dividing as it were the whole iſland into the eaſt and weſt parts, and is by writers called the Engliſh Appennines. The ſouthern and eaſtern parts of the country chiefly conſiſt of little fruitful hills and vallies, champaign fields, incloſed grounds of arable, paſture, and meadow lands, agreeably intermixed with woods, foreſts, parks, and chaces. The higheſt mountains in England are the Wrekin in Shropſhire, the Plinlimmon

an

and Snowden in Wales, the Cheviot hills on the borders of Scotland, thoſe of the Peak in Derbyſhire, the Pendle, &c. in Lancaſhire, the Wolds in Yorkſhire, Cotſwold in Glouceſterſhire, the Chiltern in Bucks, and Malvern in Worceſterſhire.

This great iſland is ſurrounded by many ſmaller ones, as the Iſle of Wight, the Iſle of Man, the cluſter of iſlands called the Caſſiterides, or Scilly iſlands of Cornwall, the Orcades, the Shetland iſlands, and Æbrides iſlands in Scotland.

Great Britain has on all ſides very convenient harbours, and abundance of navigable rivers that convey the riches of all the nations in the known world into the very heart of the kingdom: the moſt conſiderable of theſe are the Thames, the Severn, and the Trent, in England; the Clyde, the Forth, the Tay, &c. in Scotland.

The country is for the moſt part level, and uncommonly fertile. One favourable year for corn is ſufficient to ſupply three years of plenty to the inhabitants; and even at ſuch times when the ſeaſons prove unfavourable, there is generally a ſufficiency, for after immoderate rains the corn ſown on the hills produce great abundance, and in a time of the greateſt drought the low and fenny parts produce moſt plentiful crops. Hence nothing can prevent that plenty which Providence has been graciouſly diſpoſed to pour out on this happy country, but that immoderate thirſt of gain which excites the avaricious to export ſo great a quantity of corn as to diſtreſs the inhabitants.

This country likewiſe abounds in eſculent vegetables and fruits, both of which are excellent. Our kitchen gardens abound with colly-flowers, artichokes, aſparagus, lettuces of various ſorts, cabbages, peas and beans of different kinds, broccoli, kidney-beans, cucumbers, ſpinage, and pot-herbs of all ſorts; muſhrooms, carrots, potatoes, turnips, onions, beets, &c.

Kent is famous for its orchards of cherries and apples; but none of the countries afford ſuch plenty of apples for cyder as Herefordſhire and Devonſhire. Beſides apples, pears, and cherries, we have a great variety of excellent fruit, as quinces, peaches, apricots, nectarines, plums, grapes, ſtrawberries, raſberries, currants, gooſeberries, barberries, cranberries, bilberries, walnuts, hazle-nuts, &c. but it muſt be acknowledged, that ſome of our fruits have not that delicious flavour which is only to be found in warmer climates. Great quantities of cyder and perry are made from the apples and pears of England. Among its products are excellent ſaffron, ſaid to be ſuperior to any in the world, liquorice, woad, and great plantations of hops; but it produces little flax and hemp.

This country was formerly plentifully provided with timber, and particularly with large oaks fit for ſhip-building; but timber now has become ſcarce, and for want of planting in time we are obliged to be ſupplied with great quantities from abroad. The timber growing in this iſland, beſides oak, are aſh, elm, and beech; we have alſo poplar, maple, walnut-tree, ſycomores, hornbeam, arbeles, hazle, willow, ſallow, and other ſpecies of wood not diſtinguiſhed with the name of timber, but ornamental and exceeding uſeful.

The paſtures of England are excellent, and conſequently the grazing of this country very conſiderable. Here are bred excellent horned cattle; the oxen are the largeſt and beſt that are any where to be met with, and the ſmaller ſort bred in Wales and the north are good for preſent ſpending. The breeding of ſheep is a very principal article; it is computed that there are no leſs than twelve millions of fleeces ſhorn annually; and that the fine Engliſh wool, next to that of Spain and Portugal, is the beſt in the known world; which, with the working of it, amounts to near one-fifth of the revenues of the whole country. King Edward IV. received a preſent of three thouſand ſheep from the king of Spain, ſome of the breed of which are ſtill in being. Our ſheep are indeed valued both for their fleeces and their fleſh; thoſe of Lincolnſhire are remarkably large; but the fleſh of the ſmall down mutton is no leſs admired.

The horſes for the chace and ſaddle are very beautiful, and generally about fifteen hands high, ſwift, and extremely well proportioned. Thoſe of our cavalry are remarkable for their ſize, ſtrength, and ſpirit; and thoſe for draught, either for coaches or waggons, can ſcarcely be paralleled.

This kingdom alſo produces aſſes, ſome mules, but theſe laſt are greatly inferior to thoſe of Spain and Portugal, goats, red and fallow deer, hares, rabbits, dogs, foxes, ſquirrels, ferrets, otters, badgers, weazels, cats, pole-cats, moles, rats, mice, &c.

Our tame-fowl are ſwans, geeſe, turkies, peacocks, common poultry, ducks, and tame pigeons. The wild are woodcocks, pheaſants, partridges, plover, wigeon, teal, wild-geeſe, wild-ducks, buſtards, ſnipes, wood-pigeons, grouſe, quails, eagles, hawks of various kinds, blackbirds, ſtarlings, thruſhes, nightingales, goldfinches, bullfinches, linnets, larks, &c.

We have a great variety of river-fiſh, as ſalmon, carp, tench, pike, trouts, perch, bream, haddock, dace, eels, roach, barbels, flounders, plaice, ſmelts, gudgeons, &c. The ſeas produce cod, mackarel, herrings, pilchards, lobſters, crabs, oyſters, muſcles, cockles, ſhrimps, prawns, &c.

With reſpect to minerals, the copper-mines in Cumberland and Somerſetſhire, and thoſe of iron in Suſſex and Surry, are of no great importance; but this is made up by the vaſt tin and lead-mines in Cornwall, Derbyſhire, and Wales, &c. whoſe metals are ſo far from being ſurpaſſed, that they have not their equal in any other country. The mountains are found to contain marble, and near Plymouth there is marble that nearly reſembles the Egyptian granite; we have alſo alabaſter, fire-ſtone, cryſtal, allum, and vitriol. Our fullers-earth is of ſingular uſe in the cloathing trade. Among other minerals coals ought not to be omitted, ſince the quantity produced in this iſland is greater than in any other country in Europe, and the coals much better. Great Britain alſo produces very conſiderable quantities of ſalt, both from ſalt-ſprings and ſea-water.

SECT. II.

Of the Manners and Diſpoſitions of the Engliſh. Of the Engliſh Tongue, and the Manner in which it received its various Changes, till it arrived at its preſent Degree of Perfection. Of the Religions of the Inhabitants; with a particular Account of the Church of England; the Convocation and the Eccleſiaſtical Courts.

THE number of inhabitants in Great Britain was a conſiderable time ago computed at nine millions; and if the great increaſe of many of the cities and towns in this kingdom be conſidered, it can ſcarcely be doubted that the number at preſent exceeds ten millions, of which it is ſaid there are near ten thouſand Jews. With reſpect to the character of the Engliſh, they have always been allowed to be brave and naturally jealous of their liberties; they are induſtrious, fitted for labour, lovers of the liberal arts, and capable of carrying them to the greateſt perfection. They are alſo generally humane and friendly; but at the ſame time blunt, artleſs, and not fond of compliment; and particularly averſe to ſervility and cringing. Their generoſity and humanity has been frequently ſhewn even to their enemies, in ſuch a manner as to do honour even to human nature: the greateſt fault obſervable amongſt them is, that the lower ſort of people particularly have too contemptible an idea of foreign nations, and are apt to treat the ſtrangers who viſit this country with rudeneſs. As the Engliſh are a mixture of various nations, there is not here that dull uniformity of character that is to be found in other countries; but, on the contrary, the greateſt diverſity appears in their diſpoſitions and manners, which ſerves to enliven converſation, and to render it more agreeable.

The inhabitants of the ſeveral parts are of a different original. Thoſe of Cornwall and Wales are in general the poſterity of the ancient Britons, who, upon the invaſion of the Picts and Saxons, retired to thoſe mountainous borders in the weſt of England, which they have ever ſince retained. The Scots are not without a mixture of the Picts, particularly in the Lowlands, which they poſſeſſed before the former had totally ſubdued them.

But the Highlands, particularly the weſtern, are ſaid by ſome authors to be peopled from Ireland.

The ancient language of Great Britain is generally allowed to have been the ſame with the Gaulic, the iſland being probably firſt peopled from Gallia, as both Cæſar and Tacitus affirm, and prove by their religion, manners, cuſtoms, and the nearneſs of their ſituation; but we have now very ſmall remains of the ancient Britiſh tongue, except in Wales, Cornwall, the iſlands and highlands of Scotland. Some time before the birth of our Saviour Julius Cæſar made a deſcent upon Britain, though he may be ſaid rather to have diſcovered than conquered it; but about the year of Chriſt 45, in the reign of Claudius, Aulus Plautius was ſent over with ſome Roman forces, by whom Codigunus and the brave Caractacus, two Britiſh kings, being overcome in battle, a Roman colony was planted at Malden, in Eſſex, and the ſouthern parts of the iſland reduced to the form of a Roman province; afterwards the iſland was conquered as far north as the firths of Dumbarton and Edinburgh, by Agricola, in the time of Domitian; upon which a great number of the Britons retiring from the conquered countries to the mountains of Wales, carried their language with them.

Thus the greateſt part of Britain becoming a Roman province, the Roman legions who reſided here for above two hundred years undoubtedly diſſeminated the Latin tongue; and the people being governed by laws written in Latin, muſt neceſſarily introduce a mixture of languages. The Britiſh tongue thus continued mingled only with the provincial Latin, till the Roman legions being called home, the Scots and Picts ſeized that opportunity to attack and harraſs England; upon which king Vortigern, about the year 440, called the Saxons to his aſſiſtance, who coming over, repulſed the Scots and Picts, and were rewarded with the iſle of Thanet, and the whole country of Kent; but growing too powerful, they diſpoſſeſſed the inhabitants of all the country to the ſouth of the Severn, and thus the Britiſh tongue was in a great meaſure deſtroyed, and the Saxon introduced in its ſtead.

In the beginning of the ninth century the Danes invading England, got a footing in the northern and eaſtern parts of the country, their power gradually increaſed, and, in about two hundred years, they became ſole maſters of it. By this means the ancient Britiſh obtained alſo a tincture of the Daniſh language; but their government was of no long continuance; for they being driven out, and the Saxons again poſſeſſing the throne, did not make ſo great an alteration in the Anglo-Saxon as the next revolution, when the whole iſland, in the year 1067, was ſubdued by William the Conqueror, duke of Normandy; for the Normans endeavoured to make their language generally received. Thus was the ancient Britiſh tongue in a manner extirpated by the Romans, Saxons, Danes, and after that blended with the Norman French.

But a change in the language has alſo been effected by two other cauſes: the firſt is that of commerce; for as the inhabitants of Great Britain have long applied themſelves to trade, the names of offices, dignities, wares, and terms of traffic, have been introduced and formed according to the genius of our own tongue. The ſecond is that of learning, from which it has received no ſmall improvement; for as to the Greek and Latin, the learned have, together with the arts and ſciences, introduced almoſt all the terms of art in the mathematics, philoſophy, phyſic, and anatomy; and we have entertained many more from the French, &c. ſo that at this day our language, which about eighteen hundred years ago was the antient Britiſh, is now a mixture of Saxon, Teutonic, Dutch, Daniſh, Norman, and modern French, embelliſhed with the Greek and Latin: yet this is undoubtedly ſo far from being a diſadvantage to the Engliſh tongue, as it is now ſpoke, for all languages have undergone changes, that it has ſo enriched it, that it is now become, perhaps, the moſt copious, ſignificant, fluent, and maſculine language in Europe.

The Reformation in England, begun in the reign of Henry VIII. was greatly promoted under his ſon Edward VI. It was, however, checked by queen Mary, but completed by queen Elizabeth, her ſiſter. This Reformation being conducted by the biſhops, the eſtabliſhed church of England became epiſcopal. Calvin indeed uſed many endeavours to obtain a ſhare in the advancement and direction of this eccleſiaſtical reformation; but being deſirous of depriving the biſhops of their temporal grandeur, of baniſhing all external ornaments and pomp from divine worſhip, and introducing the Geneva conſtitution, the biſhops declined his offers of aſſiſtance. Many, however, approving of Calvin's doctrine, formed an eccleſiaſtical government on his plan. Theſe were afterwards termed Puritans, from their avowed deſire of freeing the church from the impurities ſtill retained in it, and Nonconformiſts, from their not conforming to the rules of the eſtabliſhed church. Many of theſe inſtituted preſbyters without biſhops, from whence they obtained the name of Preſbyterians, inſtituting alſo church laws among themſelves, and being governed by ſynods compoſed of the miniſters of ſeveral different churches. Others maintaining, that every Chriſtian congregation ought to be free, and ſubject neither to biſhops nor ſynods; theſe were termed Independents.

The Epiſcopalians and Preſbyterians are the two principal parties, and differ the leaſt from each other; the firſt form the eſtabliſhed religion of England and Ireland, and the latter of Scotland. The moſt numerous of the other religious ſects are the Baptiſts, who do not believe that infants are the proper ſubjects of baptiſm, and in the baptiſm of adults practiſe immerſion. It is here proper to obſerve, that the Engliſh Preſbyterians differ almoſt as much from the church of Scotland, as from the church of England; ſynods growing gradually out of uſe, each ſeparate congregation is become in a manner independent of the reſt. They have moſt of them forſaken the opinions of Calvin, and believing univerſal redemption, maintain that the Univerſal Parent has excluded none of his offſpring from a poſſibility of ſalvation; while the Independents, and many congregations of the Baptiſts, agree with the church of Scotland in the doctrines of particular election and reprobation. It muſt alſo be added, that the Preſbyterians, with the church of England, receive the Sacrament of the Lord's Supper at noon, while the Independents and Baptiſts receive it after the concluſion of the afternoon ſervice.

One of the principal of the other ſects is the Quakers, who profeſs to be guided by an internal revelation dictated by the Spirit of God; they have no regular miniſters, and neither practiſe baptiſm, nor commemorate the death of Chriſt in the Lord's Supper.

The Methodiſts have lately ariſen, and now form a very numerous body; moſt of them are alſo members of the church of England, and profeſs to adhere more cloſely than the other members of that church to the thirty-nine articles, and the greateſt part of them are rigid Calviniſts.

The number of Papiſts here is alſo very conſiderable, and in Ireland it even greatly exceeds that of the Proteſtants.

Many authors have exclaimed with great heat of the many ſects in England; but let it be conſidered, that civil and religious liberty are cloſely connected, and that it does not become any church who makes no pretenſions to infallibility to ſet up the ſtandard of perſecution. May the minds of Britons ever be free, and in affairs which ſolely relate to another life, may they be accountable only to their conſcience and their God! May candor and charity, a love of truth and of liberty, unite thoſe who differ in ſentiment, and then nothing will reſult from diverſity of opinion but peace, order, and harmony.

But to return: the church of England is under the government of two archbiſhops and twenty-five biſhops, who are ſubject to the king as ſupreme temporal head of the church. The archbiſhop of Canterbury is ſtyled the firſt peer and metropolitan of the kingdom; he takes place immediately after the royal family, and conſequently precedes not only all dukes, but likewiſe the great officers of ſtate. In addreſſes to him he enjoys the title of Your Grace, in common with dukes, and alſo that of Moſt Reverend father in God. He has the power of holding juridical courts in church affairs, with many other privileges relating to the granting of licenſes and diſpenſations,

ſations, in all caſes formerly ſued for at the court of Rome, where they are not repugnant to the law of God, or the king's prerogative. He has alſo within his province, by common law, the probate of all wills, where the party dying is worth upwards of five pounds. He has under him twenty-one biſhops, beſides his own particular dioceſe; theſe are the biſhops of London, Winchester, Ely, Lincoln, Rocheſter, Litchfield and Coventry, Hereford, Worceſter, Bath and Wells, Saliſbury, Exeter, Chicheſter, Norwich, Glouceſter, Oxford, Peterborough, Briſtol; and in Wales, St. David's, Landaff, St. Aſaph, and Bangor.

The archbiſhop of York likewiſe takes the precedence of all dukes who are not of the blood royal; as alſo of all the great officers of ſtate, except the lord chancellor, who is immediately next in rank to the archbiſhop of Canterbury. In his dioceſe he is ſtyled Primate of England and Metropolitan; he alſo enjoys the title of his Grace, and Moſt Reverend father in God. Excluſive of his own dioceſe, in his province are Durham, Carliſle, Cheſter, and Sodor and Man; but the laſt biſhop has no ſeat in the houſe of peers. In Northumberland he has the power of a palatine, and juriſdiction in all criminal proceedings.

The twenty-five biſhops are ſtyled Right Reverend and Your Lordſhip; all theſe, except the biſhop of Sodor and Man, walk next after the viſcounts, and precede the barons. In parliament they ſit in a double capacity as biſhops and barons; they alſo enjoy many other privileges, as freedom from arreſts, out-lawries, &c. The principal of theſe biſhops is that of London, next to him is Durham, who being inveſted with a temporal juriſdiction, and the power of hunting, may be eſteemed a temporal prince. The third is the biſhop of Winchester, and the reſt take place according to ſeniority of conſecration. Theſe ſeveral biſhops are ſubordinate to their metropolitan, and in ſpiritual affairs ſubject only to his juriſdiction. Each has alſo a kind of juriſdiction in his own dioceſe, but from their courts lies an appeal to their metropolitan; but criminal cauſes do not fall under their cognizance. They live in great ſtate; their revenues are alſo conſiderable; but where the income is not very large, ſome other lucrative preferment, as a deanery, is generally annexed to it.

The buſineſs of a biſhop is to examine and ordain prieſts and deacons, to conſecrate churches and burying-places, and to adminiſter the rite of confirmation. The juriſdiction of a biſhop relates to the probation of wills; he is to grant adminiſtration of goods to ſuch as die inteſtate; to take care of periſhable goods, when no one will adminiſter; to collate to benefices; to grant inſtitutions to livings; to defend the liberties of the church; and to viſit his own dioceſe once in three years.

Next to the biſhops are the deans and prebends of cathedrals, out of whom the biſhops are choſen. After theſe are the archdeacons, of which every dioceſe has one or more, the whole number in the kingdom of England amounting to ſixty. Their office is to viſit the churches twice or thrice every year. The archdeacons are followed by the rural deans, who were formerly ſtyled archipreſbyters, and ſignify the biſhop's pleaſure to his clergy, the lower claſs of which conſiſts of prieſts and deacons.

Scotland is divided into thirteen provincial ſynods, which conſiſt of ſixty-eight preſbyteries, and theſe again of a number of pariſhes.

With reſpect to the eccleſiaſtical government and courts, it is proper to obſerve, that the principal part of the eccleſiaſtical government was formerly lodged in the convocation, which is a national ſynod of the clergy, aſſembled to conſider of the ſtate of the church, and to call thoſe to an account who have advanced new opinions inconſiſtent with the doctrines of the church of England; but in the reign of his late majeſty they being thought to proceed with too much heat and ſeverity againſt ſome learned divines, and to be too great a check upon free enquiry, they have not been permitted to ſit for any long time ſince. However, they are aſſembled at the ſame time with the parliament by the authority of the king, who directs his writs to the archbiſhop of each province to ſummon all biſhops, deans, archdeacons, &c. to meet at a certain time and place.

The convocation conſiſts of one proctor, ſent from each cathedral and collegiate church, and two from the body of the inferior clergy of each dioceſe. The upper-houſe in the province of Canterbury conſiſts of the archbiſhop, who is preſident, and twenty-two biſhops; and the lower houſe of all the deans, archdeacons, and proctors, in all a hundred and ſixty-ſix. They uſually meet in king Henry the ſeventh's chapel in Weſtminſter. The archbiſhop of York holds his convocation at the ſame time in the city of York. The firſt buſineſs of the lower houſe is to chooſe a prolocutor, who is preſented to the upper houſe by two of the members; one of whom makes a ſpeech in Latin, and the prolocutor they have choſen another, to which the archbiſhop returns an anſwer in the ſame language.

The court of arches is the moſt ancient conſiſtory of the province of Canterbury, and all appeals in church matters from the judgment of the inferior courts are directed to this. The proceſſes run in the name of the judge, who is called dean of the arches, and the advocates who plead in this court muſt be doctors of the civil law. The court of audience has the ſame authority with this, to which the archbiſhop's chancery was formerly joined.

The prerogative court is that wherein wills are proved and adminiſtrations taken out.

The court of peculiars relating to certain pariſhes have a juriſdiction among themſelves for the probate of wills, and are therefore exempt from the biſhops courts. The ſee of Canterbury has no leſs than fifteen of theſe peculiars.

The court of delegates receives its name from its conſiſting of commoners delegated or appointed by the royal commiſſion; but it is no ſtanding court.

Every biſhop has alſo a court of his own called the conſiſtory court. Every archdeacon has likewiſe his court, as well as the dean and chapter of every cathedral.

SECT. III.

Of the Learning, Arts, Sciences, Manufactures, Trades, Commerce, and Coin of the Engliſh.

IN the beginning of the laſt ſection we gave a conciſe account of the manners and diſpoſitions of the Engliſh; and we ſhall here conſider their learning and ſkill in the arts. Great Britain has produced a number of perſons eminent for their learning and their improvement in the ſciences; and among theſe England will ever boaſt a Friar Bacon, a Lord Verulam, a Sir Iſaac Newton, and a Locke. The ſciences are here highly eſteemed, encouraged, and cultivated. With reſpect to ſeminaries of learning, we have indeed only two univerſities in England; but theſe are noble ones: in that of Oxford there are generally two thouſand ſtudents, and in Cambridge fifteen thouſand. As theſe univerſities are entirely of the eſtabliſhed church, the Diſſenters have inſtituted ſeveral academies, where the ſtudents go through a courſe of ſtudies, to prepare them for the miniſtry. In Scotland there are four univerſities, thoſe of Edinburgh, Glaſgow, St. Andrew, and Aberdeen; and there is ſcarce a great town in England where there is not a free-ſchool founded for the inſtruction of the ſons of the citizens, or burgeſſes, in the learned languages.

With reſpect to the polite arts, the Engliſh have long been famous for their ſkill in portrait painting; but we have not yet equalled the Italians in hiſtory painting, or the French in engraving: we have, however, at preſent ſome admirable ſculptors that would do honour to any nation; and both engraving and painting in all its branches are making ſpeedy advances towards perfection. The Engliſh have a good genius for civil architecture, and in ſhip-building are inferior to no nation upon earth. In other elegant and uſeful arts England has alſo produced many able maſters. As this country has produced the greateſt philoſophers, ſo the ſeveral arts dependent on the ſciences have here been greatly improved; the orrery, the air-pump, the wonderful machine for raiſing a perfect river of water from the bottom of coal-pits by means of fire, the vaſt improvement made in the engines formed

for extinguiſhing of fires, were all invented by the Engliſh; and, to the honour of England, the ingenious Mr. Harriſon has lately invented an eaſy method of diſcovering the longitude at ſea.

The Engliſh, ſays Dr. Buſching, were the firſt who ſet on foot that noble manufacture of ſilk and woollen tapeſtry, in which life and nature are imitated with admirable ſkill. Our broad-cloths are the fineſt and moſt beautiful in the world, and are admired and purchaſed in every quarter of the globe; indeed the woollen manufacture is in ſo flouriſhing a condition, that the value of cloths and ſtuffs annually exported amounts to two millions ſterling. The manufactures of flowered ſilk have been greatly improved, and in the beauty of the patterns they excel thoſe of France or any other country. We have lately invented a method of printing on plain ſilk figures in gold. Our printers of linen too greatly excel thoſe of other nations, from the ſuperior ſkill of the pattern-drawers.

In ſhort, there is ſcarce a manufacture in Europe but what is brought to great perfection in England; our locks, edge-tools, guns, ſwords, and other arms, are ſaid to exceed any thing of the kind; houſhold utenſils of braſs, iron, and pewter, are very great articles; and our clocks and watches of price are very much eſteemed; though the miſerable cheap work bought up and ſent abroad has diſhonoured the nation. There are but few manufactures in which we are defective; but in thoſe of bone lace and paper we do not excel. With reſpect to the laſt, an aſtoniſhing improvement has been made in England in writing and printing paper; but the French paper for copper-plate prints is ſtill ſuperior to ours.

Great Britain enjoys a fine ſituation with reſpect to commerce, and is ſurrounded with excellent harbours. Its trade and navigation is greatly ſuperior to what they were formerly, and the inhabitants at preſent carry on an extenſive trade to every part of the globe.

In time of peace we export to France tin, lead, horn plates, great quantities of tobacco, with ſome flannel, and in time of ſcarcity we ſend them corn; and from thence we import brandy, wine, laces, linen, cambrics, lawn. This trade is of very great diſadvantage to England. Our ſmugglers alſo, to the great detriment of Great Britain, convey thither gold, ſilver, and wool.

To Holland we ſend almoſt all ſorts of commodities and manufactured goods, either of our own produce or imported from abroad, and receive from thence ſpices, drugs for dying, vaſt quantities of fine linen, tapes, whale fins, and toys.

To Flanders we ſend tin, lead, hard-ware, ſugar, flannels, a few ſtuffs, ſerges, and tobacco; for which we receive fine laces, linen, cambrics, tapes, and other goods.

To Germany we ſend woollen manufactories of every kind, all ſorts of Eaſt India goods, tin, lead, ginger, ſugar, and tobacco. In return we have from thence linen, thread, goat ſkins, and many other commodities. In many places, however, ſeveral of our manufactories are prohibited; and yet it is thought that the balance of trade is conſiderably in our favour.

We have very little trade with Denmark and Norway, except for a few coarſe woollen goods and tobacco; but we receive from them timber, planks, firs, deer ſkins, and many other articles of commerce, for the greateſt part of which we are obliged to pay ready money. The Swedes alſo buy little of us, and we purchaſe of them copper, iron, deals, timber, and naval ſtores; but not ſo much iron as formerly, ſince its being allowed to be imported from our own plantations in America.

To Ruſſia we ſend tin, lead, worſted ſtuffs, long ells, coarſe cloths, cottons, fuſtians, perpetuanas, lace, thread, allum, copper, and a great quantity of tobacco. From thence we import pot-aſhes, hemp, flax, linen, cable-yarn, bees-wax, iſinglaſs, hides of ſeveral ſorts, and leather; with linſeed, train-oil, flax, hemp, hogs briſtles, caviare, &c. This trade is carried on by a particular company.

We ſend to Italy various kinds of Eaſt India goods, broad-cloth, long ells, bays, druggets, camblets, leather, tin, lead, pilchards, herrings, ſalmon, cod, and various other articles. From thence we import wine, oil, ſope, olives, dying drugs, anchovies, and raw, thrown, and wrought ſilk. From the king of Sardinia's dominions we have the fine ſilk called organzine, which is thrown here by an engine, of which a very curious one has been many years at Derby, and for ſome time in two or three towns in Cheſhire.

To Spain we ſend nearly the ſame commodities as to Italy, many of which are exported from thence to their American dominions. In return we have wine, oil, fruit, wool, indigo, cochineal, and other drugs, with gold and ſilver in ſpecie or bullion.

Portugal takes from us almoſt all kinds of our commodities, and from thence we receive wine, oil, fruit, and ſalt. Though the balance of trade with Portugal is ſuppoſed to be greatly in our favour, yet it is of no little advantage to them, as they would be unable to ſell what we take from them at other markets; and as they ſend great quantities of our goods to Brazil, they are enabled to draw from thence immenſe treaſures.

The African trade is of very great advantage, as we not only ſend many of our own and the Eaſt India manufactures for the purchaſe of ſlaves; but with theſe laſt ſupply our plantations in America, and have alſo from Africa gold duſt, gum ſeneca, malagueta, ivory, red wood, and many other valuable commodities.

To the Eaſt Indies we export ſome woollen cloths, lead, and other Engliſh manufactures, with a very great quantity of ſilver; and import from thence great quantities of tea, china ware, raw and wrought ſilks, calicoe, chintz, cabinets, &c. all the wrought ſilks, calicoes, and chintz, being exported again.

The Hudſon's bay company export woollen goods, haberdaſhery wares, hatchets, arms, and other hard-ware, and import great quantities of ſkins and furs of different kinds.

To the ſugar iſlands in America we export all manner of clothing, both linen and woollen, furniture for their horſes, and hard-ware; and take the produce of thoſe iſlands in return, which beſide ſugar, yield ginger, indigo, rum, molaſſes, coffee, cacao, or the chocolate nut, and pimento, or Jamaica pepper.

To the tobacco plantations on the continent of America, we alſo export clothing, tools, hard-ware, and furniture, receiving tobacco in return, a great part of which is re-exported.

We export the ſame ſpecies of goods to Carolina, and receive from thence vaſt quantities of rice and ſkins, pitch and tar.

To Penſylvania, the Jerſeys, New-York, and New-England, we ſend the ſame articles, and receive in return log-wood, and the produce of Spaniſh America, with which they frequently carry on a clandeſtine trade, and alſo ſhips ready built, mahogany, cedar, drugs, and furs.

In ſhort, to Ireland the merchants export fine broad-cloth, ſilk, ribbons, gold and ſilver lace, hard-ware, pewter, hops, coals, tobacco, ſugar, Eaſt-India goods, and from thence import great quantities of linen, linen yarn, and wool, together with beef, butter, pork, and tallow.

The annual exports of Engliſh and foreign goods amount to between ſix and ſeven millions ſterling, and our imports do not exceed five millions. As a conſiderable part of this is again exported, the annual iſſues from England for foreign merchandize, has been eſtimated at four millions. Yet our foreign trade does not amount to one ſixth part of the inland; the annual produce of the natural products and manufactures of England amounting to above forty-two millions. The gold and ſilver of England is received from Portugal, Spain, Jamaica, the American colonies, and Africa; but great part of this gold and ſilver we again export to Holland, and the Eaſt-Indies; and it is ſuppoſed that two-thirds of all the foreign traffic of England is carried on in the port of London.

In Great Britain money is computed by pounds, ſhillings, and pence, twelve pence making a ſhilling, and twenty ſhillings one pound, which is only an imaginary coin. The gold pieces conſiſt only of guineas, halves, and

and quarters; the silver of crowns, half-crowns, shillings, six-pences, groats, and even down to a silver penny; and the copper money only of half-pence and farthings.

SECT. IV.

A concise View of the History of England; the Titles of the King, his Arms, and Forces by Sea and Land.

THE Britons, the ancient inhabitants of this island, were first invaded, as hath been already observed, by Julius Cæsar, and afterwards subdued by the Romans. In the reign of Valentinian III. they quitted the island, and taking with them all the Roman and British forces, left the kingdom exposed to the excursions of the Picts and Scots. The Britons successively elected several monarchs, who were deposed almost as soon as they were advanced to the throne, till they made choice of Vortigern, who finding it difficult to contend with the Picts and Scots who invaded his dominions, solicited succours from abroad, and accordingly in 449, a large body of Anglo-Saxons arrived, under the conduct of two leaders, Hengist and Horsa, who having obtained a victory over the enemy, settled here; and other bodies of Saxons coming over, extended their dominions, and at length conquered England, which received its name from the Angles. They erected seven monarchies, those of Kent, Sussex, the East-Angles, the West-Saxons, the East Saxons, Northumberland, and Mercia. Egbert, king of the West-Saxons, at length united all the other kings under him. In the ninth century the Danes passed over to England, and proved so troublesome to the Saxon princes, that they were at length obliged to share the kingdom with them. This division lasted till the year 1041, when the Saxons again recovered the whole country. Upon the death of this prince, he was succeeded by Harold; but William duke of Normandy invaded the kingdom, and coming to a battle with Harold near Hastings in Sussex, defeated his rival, who was slain in the engagement, and agreeing to observe the Saxon laws was proclaimed king.

After his decease, and that of his two sons, his descendants of the female line contended for the throne, which Henry II. surnamed Plantagenet, at last ascended in 1154, and transmitted it to his descendants. This prince was by inheritance earl of Anjou, Maine, and Touraine; by marriage, duke of Guienne; and by the success of his arms, lord of Ireland. John, the youngest son of Henry II. was obliged to grant the Magna Charta. Edward I. subdued the principality of Wales, and endeavoured to maintain his superiority in Scotland. Edward III. the eldest son of Edward II. succeeded to the crown in the life-time of his father; the queen and Mortimer during his minority, usurping the administration, governed in his name, and murdered Edward II. But Edward III. afterwards caused Mortimer to be seized in the queen's apartment, and executed. This prince invaded France, and in 1346 obtained the glorious victory of Cressy, and about the same time David king of the Scots was made prisoner. John the French king, and his son Philip were taken prisoners at the battle of Poictiers, by Edward the Black Prince. Richard II. the son of Edward the Black Prince, and grandson of Edward III. succeeded to the throne. He suppressed a rebellion raised by Wat Tyler; but the parliament, disgusted at his administration, raised an army against him and made him prisoner. The duke of Lancaster, the king's uncle, claimed the crown of Castile in right of his wife, and invaded Spain. His son the duke of Lancaster dethroned Richard II. and usurping the crown was styled Henry IV. and being confirmed in the throne by the parliament, Richard was soon after murdered.

Henry V. gained several victories over the French, took many of their towns, and having married Catharine, daughter to Charles VI. king of France, by the convention of Troyes, obtained the reversion of that crown, but died in the midst of all his expectations. His infant son, Henry VI. who was crowned at Paris, inherited both kingdoms; but under him the English arms in France met with a sad reverse, by his losing that kingdom. At this time disputes arose concerning the crown between the houses of York and Lancaster, both which were of the royal blood, and were commonly called, in allusion to their arms, the White and Red Rose; and these disputes soon broke out into a bloody civil war, which was frequently renewed. Edward IV. the eldest son of Richard duke of York, was at length established on the throne, while Henry VI. was confined in the Tower, and at last murdered. Edward V. the eldest son of Edward IV. with his brother Richard duke of York, were also murdered in the Tower, by their uncle Richard duke of Glocester, who ascended the throne by the name of Richard III. but Henry earl of Richmond defeating that unnatural monster at Bosworth, and that murderer, who was the last male of the house of York, being killed in the battle, Henry in 1485, obtained the crown. This was Henry VII. who being of the house of Lancaster, and marrying Elizabeth of the house of York, in him both roses were united. Henry VIII. the son of Henry VII. was remarkable for his numerous marriages, his manner of living, government, and power. On account of his book on the seven sacraments, which was written against Luther, he was dignified by the pope with the title of Defender of the Faith, a title which the kings of England had long before assumed, as appears from several charters granted to the university of Oxford. This king soon quarrelled with the pontiff, and under him the happy reformation of religion began in England; and the parliament enacted an oath of supremacy, by which all ecclesiastics were compelled to acknowlege the king as supreme in all causes both ecclesiastical and civil. Under Edward VI. the Reformation was promoted; but his sister and successor Mary again introduced popery, lighted the fire of persecution, and lost Calais, the only place in France belonging to the crown of England. Under her sister Elizabeth the Reformation was completed, and very considerable improvements made in trade and navigation. She appointed for her successor James I. king of Scotland, who endeavoured to unite both kingdoms, under the name of Great Britain. This weak and pusillanimous prince paid little regard to the constitution of England. His example was followed by his son Charles I. The people rose in defence of their liberties, and that unhappy prince lost his head on the block. The Scots proclaimed his son Charles II. but were defeated therein by Oliver Cromwell, who governed these kingdoms under the title of protector of England, Scotland, and Ireland. In his time the English made themselves masters of Jamaica and Dunkirk. His son Richard was afterwards chosen protector; but being averse to the cares of government, he made little or no opposition to the return of Charles II. who was restored to his throne by his ancestors.

This last prince sold Dunkirk to the French; under his reign a dreadful pestilence ravaged England, and London was destroyed by fire. James, duke of York, married his eldest daughter Mary to William prince of Orange, and Anne his second daughter to prince George of Denmark, and on Charles's decease ascended the throne; he then openly declared himself a Papist, and strenuously endeavoured to bring this kingdom again into subjection to the see of Rome. In the year 1688 was born James the present pretender, whom some affirm to be the lawful son of king James II. by his second spouse, while others deny it. Against this prince the church of England united with the Dissenters, and both applying to his son-in-law the prince of Orange, invited him to assist in the defence of their liberties: on which he landed in England, and the king fled to France; whence the crown, which he had thus abdicated, was in a national convention offered, with certain restrictions, to the prince of Orange and his consort Mary. This prince, who assumed the title of William III. was succeeded by Anne, king James's youngest daughter, and under her, in 1706, was accomplished the union of the kingdoms of England and Scotland, under the general name of Great Britain. On her decease, in 1714, the crown devolved to George Lewis, elector of Hanover, and duke of Brunswic Lunenburg. His reign began with a rebellion, which

was ſoon ſuppreſſed. That prince was peaceably ſucceeded by his ſon George II. in whoſe reign another rebellion broke out, and was quelled by the bravery of his ſon William, duke of Cumberland. His reign was diſtinguiſhed by a number of victories that will do honour to the Britiſh annals, and on the twenty-fifth of October, 1760, he was ſucceeded by his grandſon George III. his preſent majeſty.

The titles of this prince are, George III. by the grace of God king of Great Britain, France, and Ireland, defender of the faith, arch-treaſurer and elector of the holy Roman empire, &c. In addreſſing him he is ſtiled Your Majeſty, or Sir: the eldeſt ſon is from his birth ſtiled duke of Cornwall; but receives the title of prince of Wales by creation, and in both thoſe provinces certain revenues are annexed to theſe titles. All the king's children are ſtyled their royal highneſſes.

The arms of Great Britain are, in the firſt grand quarter gules, three lions paſſant guardant in pale or; the imperial enſigns of England, impaled with the royal arms of Scotland, which are or, a lion rampant with a double treſſure flowered and counter-flowered, with fleurs-de-lis gules. The ſecond quarter is the royal arms of France, azure three fleur-de-lis or. The third, the enſign of Ireland, which is azure, a harp or, ſtringed argent. The fourth grand quarter is his preſent majeſty's own coat gules, two lions paſſant guardant or, for Brunſwic, impaled with Lunenburg, which is or, ſemee of hearts, proper, a lion rampant azure, having ancient Saxony, viz. gules, a horſe current argent, grafted in baſe, and in a ſhield ſur tout gules, the diadem or crown of Charlemagne. The whole within a garter, as ſovereign of that moſt noble order of knighthood, inſcribed with the motto HONI SOIT QUI MAL Y PENSE, that is, "Evil be to him that evil thinks," given by Edward III. the founder of the order. The creſt is a helmet full faced and grated, mantled with cloth of gold, double ermine, and ſurmounted by an imperial crown, on the top of which is a lion paſſant guardant or, crowned. The ſupporter on the dexter ſide is a lion guardant or, crowned, the proper ſupporter of the Engliſh enſign; on the ſiniſter a unicorn argent horned and hoofed or, gorged with a collar of croſſes, pattee, and fleur-de-lis, a gold chain fixed to it; both ſtanding on a compartment, from whence iſſue from one ſtem the two royal badges of his majeſty's chief dominions, namely, on the right a roſe party per pale, argent, and gules, ſtalked and leafed vert, for England; and on the left a thiſtle for Scotland, being ſo adorned by James I. whoſe ſupporters, as king of Scotland, were two unicorns; and England being under him united to that nation, gave occaſion to our carrying one of them on the ſiniſter ſide; and in 1614, as king of Ireland, he cauſed the harp to be marſhalled with the arms of Great Britain.

The land-forces of theſe kingdoms in time of peace amount to about forty thouſand national men, including troops and garriſons in Ireland, Gibraltar, Minorca, and in America; but in time of war there have been in Britiſh pay, natives and foreigners, above a hundred and fifty thouſand. We have alſo a regiſtered militia, conſiſting of near two hundred thouſand men.

The complement of ſeamen in time of peace uſually amounts to twelve or fifteen thouſand. In time of war they have amounted to no leſs than ſixty thouſand men.

The men of war of the line of battle, from a hundred down to fifty guns, amount to no leſs than a hundred and fifty ſail; and the total of the royal navy, including fifth and ſixth rates, with ſloops of war, amount to three hundred and ten; beſides bomb-veſſels, fire-ſhips, and royal yachts.

This navy is commonly divided into three ſquadrons, namely, the red, white, and blue, which are ſo termed from the difference of their colours. Each ſquadron has its admiral; but the admiral of the red ſquadron has the principal command of the whole, and is ſtiled vice-admiral of Great Britain. Subject to each admiral is alſo a vice and a rear-admiral. But the ſupreme command of our naval force is, next to the king, in the lords commiſſioners of the admiralty.

SECT. V.

Of the Civil Government of the King's Court; the great Officers of State; and the Orders of Knighthood.

THE civil government of the court is committed to the lord ſteward of the houſhold, who has authority over all the officers and ſervants of the palace, except thoſe of the king's chapel, chambers, and ſtables. He alſo attends the king at the meeting of parliaments, adminiſters the oaths of allegiance and ſupremacy to all the members of the houſe of commons, and, at the end of the parliament, adjuſts the parliamentary expences, &c. In the king's preſence he carries a white wand; but at other times it is carried by a footman bare-headed.

The next is the lord chamberlain, who preſides over all the affairs belonging to the king's chamber, and all above ſtairs, except the precinct of the king's bed-chamber, which is wholly under the groom of the ſtole. He has alſo the overſight of the ſerjeant at arms; of the chaplains, though he himſelf is a layman; of the phyſicians, ſurgeons, barbers, &c. of the wardrobe, the beds, muſic, comedians, hunting, meſſengers, handicrafts, and artizans, retained in the king's ſervice.

The maſter of the great wardrobe is an officer of conſiderable dignity; he has therefore a ſalary of ſixteen hundred pounds a year, and a deputy under him of four hundred pounds, with other officers. To his office alſo belong ſeveral tradeſmen and artificers, who furniſh ſuch things as are neceſſary for the coronations, marriages, and funerals of the royal family; provide robes for the knights and officers of the garter; coats for the king's heralds and purſuivants at arms.

And laſtly, the maſter of the horſe, who has the management of the king's ſtables and breed of horſes, and preſides over the equerries, pages, footmen, grooms, farriers, ſmiths, coachmen, ſaddlers, and other trades working for the king's ſtables. He has alſo the care of the lands and revenues appointed for the king's breed of horſes, litters, coaches, chairs, &c. The maſter of the horſe has the peculiar privilege of making uſe of the king's coaches, horſes, pages, and footmen, when he goes abroad; and upon any ſolemn cavalcade he rides next the king, leading a horſe of ſtate.

There are alſo ſixteen lords of the king's bed-chamber, including the groom of the ſtole.

Moſt of the other officers and ſervants are under the above four principal officers of his majeſty's houſhold.

The great officers of the crown were originally nine, namely, the lord high ſteward, lord chancellor, lord high treaſurer, lord preſident, lord privy-ſeal, lord great chamberlain, lord high conſtable, and lord high admiral. But theſe have been greatly mutilated and changed, as will appear from the following account:

I. The lord high ſteward is appointed by the king as judge, when a peer is to be tried for high treaſon. This office was anciently the higheſt in the government, and its power ſo extenſive, that it was thought unſafe to truſt it any longer in the hands of a ſubject. The laſt who enjoyed this office by inheritance was Henry of Bolingbroke, afterwards king of England. Since his time it has been revived only upon particular occaſions; as at the king's coronation, or the arraignment of a peer; after which he publicly breaks the white ſtaff, which he bears in his hand as a badge of his office, to ſhew that it is expired.

II. The lord high chancellor, or keeper of the great ſeal, is eſteemed the firſt miniſter of ſtate, and takes place immediately after the archbiſhop of Canterbury; and, by virtue of his office, he is a member of the privy-council. He keeps the great ſeal, and cauſes are referred to him from the other courts, he having the power of judging according to equity, and of moderating the rigour of the common law. His decrees can only be reverſed by the houſe of Lords. Out of this office the lord high ſteward is uſually choſen.

III. The lord high treaſurer was formerly an officer of great power and authority; but ever ſince the Revolution

it has been under the direction of ſeveral commiſſioners, ſtiled lords of the treaſury.

IV. The lord preſident of the privy-council lays before that body ſuch buſineſs as is to be tranſacted there, and, if the king be abſent, makes a report to his majeſty of what has paſſed in council.

V. The lord privy-ſeal, through whoſe hands paſs all grants, charters, and pardons ſigned by the king, before they come to the great ſeal; together with bounties and ſuch other things as do not require the great ſeal. He is, by virtue of his office, a privy counſellor.

VI. The lord high chamberlain of England, whoſe office is to carry the king's coif and gloves at his coronation, with the ſword, ſcabbard, &c. to dreſs the king that day in his royal robes, to ſerve him with water, to waſh his hands, and to undreſs him. To him belongs the care of providing every thing neceſſary in the houſe of Lords during the ſeſſion of parliament. When the king goes to the houſe, he gives the ſword of ſtate to whatever lord he pleaſes, walks on the right hand of it, next the king's perſon; has under his direction the gentleman uſher of the black rod, with the yeoman uſher and door-keeper; and upon ſolemn occaſions, when he enters Weſtminſter-hall, has the keys of that hall and the ſeveral courts in it delivered to him.

VII. The lord high conſtable had ſuch an extenſive power, that it has been long aboliſhed, except at coronations, when an officer is created to aſſiſt at the ceremony, and his power ends with it.

VIII. The earl marſhal on particular occaſions takes cognizance of affairs relative to war, regulates ceremonies, and preſides over the herald's office. This poſt has long been hereditary in the family of the dukes of Norfolk.

IX. The lord high admiral had formerly the ſuperintendance of all maritime affairs; but the office is at preſent, as we have already obſerved, executed by commiſſion, the directors of which are ſtiled the lords of the admiralty.

The orders of knighthood in Great Britain are three, two Engliſh and one Scots, and of all theſe the king is grand maſter. The order of the Garter, or St. George, was inſtituted in 1350, by Edward III. and contains twenty-ſix knights, including the king. Its inſignia or badge is St. George on horſe-back, with a dragon of enamelled gold, bearing the motto, HONI SOIT QUI MAL Y PENSE. This George is worn at a blue ribbon, and this motto is likewiſe embroidered with gold on a blue garter worn on the left leg.

The order of the Bath was conſtituted by Henry IV. and revived with ſome improvements in 1725, by George I. It derives its name from a very ancient cuſtom of inſtituting knights by bathing. This order conſiſts of thirty-five knights, excluſive of the ſovereign. Its enſigns are three crowns in a field or, with this inſcription, TRIA JUNCTA IN UNO, that is, three joined in one; and is worn pendant at a red ribbon.

The order of the Thiſtle, inſtituted in Scotland, was revived in 1703 by queen Anne, and its ſtatutes were enlarged in 1725 by George I. The knights of this order are but twelve in number, beſides the ſovereign, who preſides as grand maſter. Its enſigns are the image of St. Andrew worn pendant to a green ribbon, and the motto NEMO ME IMPUNE LACESSET. The collar is compoſed of thiſtles interwoven with ſprigs and leaves of rue, which are all of gold.

SECT. VI.

Of both Houſes of Parliament; the civil Liberties of the People, the Courts of Juſtice, and the Manner in which the Laws are executed.

THAT auguſt body the parliament of Great Britain conſiſts of two houſes, one of which is called the houſe of Lords, and the other that of the Commons. Before the Union the houſe of Lords conſiſted only of the ſpiritual and temporal peers of England, and the houſe of Commons of five hundred and thirteen knights, burgeſſes, and citizens: but at the Union ſixteen peers of Scotland were added to the houſe of Lords, and forty-five Scots commoners to the houſe of Commons. The firſt of theſe are choſen before the ſitting of every new parliament by the peers of Scotland out of their own body.

The uſe of parliaments is to maintain the conſtitution, and keep inviolable the privileges of the people; they alſo raiſe ſubſidies, make laws, and redreſs all the public grievances. The power of calling a parliament, and of adjourning and proroguing it, is entirely lodged in the ſovereign.

The ſitting of the parliament is appointed by the king's proclamation, with the advice of the privy council, and in chooſing a new one writs are iſſued out by the Lord Chancellor to the Lords, to appear at the time and place appointed. Writs are alſo ſent to the ſheriffs of every county, commanding them to ſummon the electors to chooſe as many knights, citizens, and burgeſſes in their reſpective counties as are to ſit in the houſe of Commons. The writs for Scotland are directed to the Privy Council for ſummoning the ſixteen peers, and for electing the forty-five members. No judge, ſheriff, or clergyman, can be elected; and no gentleman, except he has ſix hundred a year. They always aſſemble in St. Stephen's chapel by Weſtminſter-hall.

The houſe of Lords is alſo ſituated near Weſtminſter-hall, by the painted chamber and court of requeſts. It is a ſpacious and lofty room, hung with tapeſtry, repreſenting the defeat of the Spaniſh armada. At the upper end of the room is the throne, upon which on ſolemn occaſions the king is ſeated in his robes, with the crown on his head, and adorned with all the enſigns of majeſty. On the right hand of the throne is a ſeat for the prince of Wales, and on the left another for the next perſon of the royal family. Behind the throne are places for the young peers who have no votes in the houſe. At a ſmall diſtance below the throne on the king's right hand, are the ſeats of the two archbiſhops, and a little below them the bench of biſhops. On the oppoſite ſide of the houſe ſit thoſe peers who rank above barons. Juſt before the throne are the wool-packs a-croſs the room, on which are ſeated the dignitaries of the law. The lord high chancellor, who is ſpeaker of the houſe of Lords, ſits on that neareſt the throne, with the great ſeal and mace by him. On the other two wool-packs placed parallel to this, ſit the lord chief juſtice, the maſter of the Rolls, and the other judges, who have no vote in the houſe; and are only adviſed with in points of law. They are ſuppoſed to be placed on wool-packs to remind them of the great importance of the woollen manufacture to this nation. When the king is preſent with the crown on his head the lords ſit uncovered, and the judges ſtand till his majeſty gives them leave to ſit. A ſtranger cannot form a more juſt notion of the dignity of this nation, than by attending this auguſt aſſembly when the king is preſent with the crown upon his head, and not only his majeſty, but the Lords are in their robes, and the Commons attending without the bar.

The Commons, as we have already obſerved, meet in a ſpacious room called St. Stephen's chapel. It is wainſcoted up to the cieling, and accommodated with galleries ſupported by ſlender iron columns, adorned with Corinthian capitals and ſconces. At the upper end the ſpeaker is placed on a raiſed ſeat ornamented with Corinthian columns, and the king's arms carved and placed on a pediment; before him is a table, at which the clerk and his aſſiſtant ſit near him at each hand juſt below the chair; and on each ſide, as well below as in the galleries, the members are placed promiſcuouſly. The ſpeaker and clerks always wear gowns in the houſe, but no other of the members, except the four repreſentatives for the city of London, who the firſt day of every new parliament are dreſſed in ſcarlet gowns, and ſit all together on the right hand of the chair next the ſpeaker.

No act is valid without the concurrence of both houſes, and the king's approbation. Any bill for making a new law, or altering an old one, may be brought firſt into the houſe of Peers, except a money bill; but no bill relating to the revenues or public taxes can be brought into the houſe of Peers firſt, or altered when it comes up from the Commons, though it may be totally rejected

by the Lords. Thus, where the Lords might be tempted to purſue their own intereſt to the prejudice of the public, and might receive the greateſt pecuniary advantages from being corrupt, in granting ſupplies, they have only the power of refuſing, while the Commons alone have that of enacting.

It will be proper here to give in one view a ſketch of the conſtitution of Great Britain. The king has all the honours, and all the ſplendor of majeſty; he has the power of doing good in its fulleſt extent, and it is ſurely no diminution to his glory, that he is confined from doing what would render him hated and deſpiſed by his cotemporaries, and infamous to poſterity. Though he has not the power of making laws, yet no law can be enacted without his conſent; and though the execution of them is always entruſted to his care, he cannot ſeize the property of the moſt inconſiderable man in his dominions, except it be forfeited by law: the ſubject may without the leaſt danger ſue his ſovereign, or thoſe who act in his name, and under his authority; he may do this in open court, where the king may be caſt, and obliged to pay damages to his ſubject. He cannot take away the liberty of the leaſt individual, unleſs he has by ſome illegal act forfeited his right to liberty, or except when the ſtate is in danger, and the repreſentatives of the people think the public ſafety makes it neceſſary that he ſhould have the power of confining perſons and ſeizing their papers on a ſuſpicion of guilt; and this power is never given but for a limited time.

The king may pardon, but neither he nor the judges to whom he delegates his authority, can condemn a man as a criminal, except he be firſt found guilty by twelve men, who muſt be his peers or equals. That the judges may not be influenced by the king, or his miniſters, they have their ſalaries for life, and not during the ſovereign's pleaſure. No perſon can be deprived of his liberty even for the higheſt crime, till ſome preſumptive proof be given upon oath before a magiſtrate. If a perſon be charged with a capital offence, he muſt not undergo the ignominy of being tried for his life, till the evidences of his guilt are laid before the grand jury of the town or county in which the fact is alledged to be committed, and not without twelve of them agreeing to find a bill of indictment againſt him. If they do this, he is to ſtand a ſecond trial before twelve other men; he is therefore furniſhed with a pannel or liſt of the jury, who are his true and proper judges, that he may learn their characters, and diſcover whether they want abilities, are bribed, or are prejudiced againſt him. He may in open court object to twenty of the number, and to as many more as he can ſhew any cauſe why they ſhould not be admitted as his judges, till at laſt twelve unexceptionable men are ſworn to give a true verdict according to the evidence produced in court. Theſe only are the judges from whoſe ſentence the priſoner is to expect life or death; and as from their judgment there lies no appeal, they are to be all of one mind, and after they have fully heard the evidence, are confined without meat, drink, or candle, till they are unanimous in acquitting or condemning the priſoner. Our freedom conſiſts in its being out of the power of the judge on the bench to injure us. Indeed juries have always been conſidered as giving the moſt effectual check to tyranny; for in a nation like this, where a king can do nothing againſt law, they are a ſecurity that he ſhall never make the laws, by a bad adminiſtration, the inſtruments of cruelty and oppreſſion. Nothing is here wanting to clear up the cauſe of innocence, and to prevent the ſufferers ſinking under the power of corrupt judges, and the oppreſſion of the great. The racks and tortures that are cruelly uſed in other parts of Europe to make a man accuſe himſelf, are here unknown, and none puniſhed without conviction, but he who refuſes to plead in his own defence.

But as the nobility are always expoſed to popular envy, were they to be judged by the people, they might be in the greateſt danger from their judges, and would want the privilege of being tryed by their peers, a privilege enjoyed by the meaneſt ſubject; they are therefore not to be tried by the ordinary courts of judicature, but by that part of the legiſlature of which each is a member.

On the other hand, the houſe of Commons can ſearch into the conduct of the higheſt peer in the realm, and in the name of the people impeach the favourite or miniſter of the king. They can call the judges to an account for the mal-adminiſtration of their office. Thus the Commons are the grand jury of the nation; but as it would be improper that thoſe who are impeached in ſo high a court ſhould be tried by a lower, which might be overawed by the power of the houſe of Commons, therefore, to preſerve the dignity of the peers, and the ſecurity of the ſubject, thoſe whom they impeach are tried by the Lords, whoſe ſuperior dignity ought to ſet them above all influence, and who are influenced neither by the ſame intereſts nor moved by the ſame paſſions.

The courts of juſtice ſitting at Weſtminſter are open four times a year; that is, at Eaſter, Trinity, Michaelmas, and Hillary terms. There are four courts, the court of chancery, the king's bench, common pleas, and the court of exchequer; beſides that of the duchy of Lancaſter, which takes cognizance of all the cauſes relating to the revenue of that duchy, which has been long annexed to the crown; the chief judge of that court is called the chancellor of the duchy of Lancaſter.

The court of chancery, which is a court of equity, is next in dignity to the high court of parliament, and is deſigned to relieve the ſubject againſt frauds, breaches of truſt, and other oppreſſions; and to moderate the rigour of the law. The chief judge is the lord chan ellor, or lord keeper; and the form of proceeding is by bills, anſwers, and decrees, the witneſſes being examined in private: however, the decrees of this court are only binding to the perſons of thoſe concerned in them, for they do not affect their lands and goods; and conſequently, if a man refuſes to comply with the terms, they can do nothing more than ſend him to the priſon of the Fleet. This court is not like the others, which have no power except in term-time, this being always open; and if a man be ſent to priſon, the lord chancellor, in any vacation, can, if he ſees reaſon for it, grant a habeas corpus. At theſe times he may alſo grant prohibitions.

The lord chancellor has twelve aſſiſtants, called maſters in chancery, who take depoſitions upon oath, for which they have an office in Chancery-lane: they alſo examine accompts depending in that court, and decide diſputes referred to them by the lord chancellor in their ſeparate offices. Beſides theſe there are ſeveral maſters extraordinary to take affidavits in the country.

The principal of the twelve is the maſter of the rolls, who has the cuſtody of all charters, cuſtoms, commiſſions, deeds, and recognizances; which being made on rolls of parchment, gave occaſion to his name. In his office are kept all the rolls ſince the beginning of the reign of Richard III. This officer uſually hears cauſes in chancery in the abſence of the chancellor, and in his court hears and determines the cauſes brought before him; he has the gift of the offices of the ſix clerks, who enrol all patents, commiſſions, licences, pardons, and other inſtruments that paſs the great ſeal. Under the ſix clerks there were formerly ſixty, but now there are ninety, and theſe, with their under clerks, perform the buſineſs of their office.

The court of king's bench is the higheſt court in England at common law, except the houſe of Lords; it takes cognizance of treaſon, felony, breaches of the peace, oppreſſion, &c. and can examine and correct the judgments and proceedings of all the inferior courts, except that of the exchequer, not only in pleas of the crown, but in thoſe that are perſonal; errors committed by juſtices of the peace come alſo under its cognizance. In this court are four judges, who hold their places for life; the principal of whom is ſtiled the lord chief juſtice of the king's bench. His juriſdiction is very extenſive, and his warrant is of force in any part of the kingdom. This court grants prohibitions to other courts, both eccleſiaſtical and civil, when they exceed the bounds of their juriſdiction.

The court of common-pleas is ſo called becauſe the pleas uſually here debated are between ſubject and ſubject. Here all civil cauſes are tried, and real actions are pleadable in no other court. There are four judges belonging

ing

ing to it, the firſt of whom is called lord chief juſtice of the common-pleas. None but ſerjeants at law can plead in this court, and all facts are tried by a jury.

The court of exchequer formerly received its name from a ſtriped or checquered cloth ſpread over the table; it conſiſts of two courts, one of which tries cauſes according to law, and the other according to equity. The court of equity is held in the exchequer-chamber before the lord treaſurer, the chancellor of the exchequer, the lord chief baron, and the three barons of the exchequer; beſides a curſitor baron: but the two firſt ſit very ſeldom, and the five laſt almoſt always. Here are tried all cauſes relating to the king's revenue. All judicial proceedings, according to law are tried only before the barons.

In the different counties in England aſſizes and ſeſſions are held twice a year for the more regular diſtribution of juſtice; and for this purpoſe the twelve judges are commiſſioned by the king to go the circuits. At theſe aſſizes all civil and criminal cauſes are determined. The firſt is called Lent aſſizes, and begins ſoon after Hillary term; and the other, called the ſummer aſſizes, after Trinity term. There are ſix of theſe circuits, beſides thoſe in Wales, in which principality two diſtinct judges are appointed; and both in England and Wales all cauſes are determined by a jury.

The commitment of malefactors is made by a juſtice of the peace, who examines witneſſes to the fact upon oath; and if the evidence appears plain, he makes a mittimus, and ſends the malefactor to priſon, where he continues till the next aſſizes.

There are juſtices of the peace in every county, and ſuch in whom the king is ſuppoſed to have a greater confidence are ſtiled juſtices of the quorum, becauſe in their dedimus there are theſe words, *quorum* A. B. *unum eſſe volumus*; which ſignifies, that no buſineſs of conſequence muſt be tranſacted unleſs with the concurrence of one of theſe. Their office is to call before them, examine, and commit to priſon all murderers, thieves, vagabonds, and all diſturbers of the peace.

Every city and corporation in England chooſe their own magiſtrates, who regulate all affairs belonging to their reſpective corporations, and try perſons ſuppoſed guilty of ſmall crimes, but cannot exerciſe their power out of their own liberties.

Beſides the above courts, there are court leets and court barons, which properly belong to the lords of the manors, who appoints ſtewards to hold them in their name. The firſt is a court of record; it being reputed the king's court, becauſe its authority is derived from the crown. It is kept twice a year, and in it enquiry may be made of riots and other criminal matters; but all great offences muſt be certified to the juſtices of aſſize.

A court baron is held in every manor, though the other is not, and is thus called from the lord of the manor, who was anciently ſtiled baron. All tenants belonging to the manor are ſummoned to this court, part of whom are ſworn for a jury, and the ſteward ſits as judge. The jury is directed to enquire after the deceaſe of copy-holders and free-holders, and to bring in their next heir, and alſo of the encroachments of any tenant. They likewiſe make orders and laws among themſelves, with a penalty for tranſgreſſions, payable to the lord of the manor.

There are alſo ſheriff-courts, and hundred courts, held every month in all parts of England, where ſmall cauſes are determined.

The laws of England are eſteemed more merciful with reſpect to offenders, than thoſe which at preſent ſubſiſt in any other part of the known world. However, the puniſhment of ſuch who at their trial refuſe to plead guilty or not guilty, is very cruel. In this caſe the priſoner is laid upon his back, and his arms and legs being extended with cords, and a conſiderable weight laid upon his breaſt, he is allowed only three morſels of barley-bread, which is given him the next day without drink, after which he is allowed nothing but foul water till he expires. This puniſhment is however ſeldom inflicted; but ſome offenders have choſe it, in order to preſerve their eſtates for their children. Thoſe guilty of this crime are not now ſuffered to undergo ſuch a length of torture; but have ſo great a weight placed on them, that they ſoon expire. In caſe of high treaſon, though the criminal ſtands mute, judgment is given againſt him, as if he had been convicted, and his eſtate is confiſcated.

All capital crimes are in England included under high treaſon, petty treaſon, and felony; the firſt conſiſts in plotting, conſpiring, or riſing up in arms againſt the ſovereign; or in counterfeiting the coin. The traitor is puniſhed by being drawn on a ſledge to the place of execution, when after being hanged on the gallows for ſome minutes, the body is cut down alive, the heart taken out and expoſed to public view, and the entrails burnt: the head is then cut off, and the body quartered, after which the head is uſually fixed on ſome conſpicuous place. All the criminal's lands and goods are forfeited, his wife loſes her dowry, and his children both their eſtates and nobility. But though the ſentence paſſed upon all traitors is the ſame, yet with reſpect to perſons of quality, it is generally changed into beheading. Though coining of money is adjudged high treaſon, the criminal is only drawn upon a ſledge to the place of execution, and there hanged.

The puniſhment for miſpriſion of treaſon, that is, for neglecting, or concealing it, is impriſonment for life, the forfeiture of all the offender's goods, and the profits ariſing from his lands.

Petty treaſon, which includes a child's killing his father, a wife her huſband, a clergyman his biſhop, or a ſervant his maſter or miſtreſs, is puniſhed by being drawn on a ſledge to the place of execution, and there hanged. Women guilty either of this crime or high treaſon, are ſentenced to be burnt alive; but inſtead of ſuffering the full rigour of the law, they are ſtrangled at the ſtake, before the fire takes hold of them.

Felony, which includes murders, robberies, forging notes, bonds, &c. is puniſhed by hanging, only murderers are to be executed ſoon after the ſentence is paſſed, and then delivered to the ſurgeons, in order to be publicly diſſected, or their body hung up in chains. Perſons guilty of robbery, when there are ſome alleviating circumſtances, are frequently tranſported for a term of years to his majeſty's plantations; and in ſuch caſes where the benefit of the clergy is allowed, the criminal is burnt in the hand with a hot iron.

Manſlaughter is the unlawful killing a perſon without premeditated malice, but with a preſent intent to kill; as when two perſons quarrelling, one kills the other; in this caſe the criminal is allowed the benefit of the clergy for the firſt time, and only burnt in the hand.

Chance-medley is the accidental killing of a man, without an evil intent, for which the offender is alſo to be burnt in the hand, unleſs he was doing an unlawful act, which laſt circumſtance makes the puniſhment death.

Shop-lifting and receiving goods knowing them to be ſtolen, are puniſhed with tranſportation, or burning in the hand.

Perjury and keeping diſorderly houſes are puniſhed with the pillory and impriſonment.

Petty-larceny, or ſmall theft, under the value of twelve-pence, is puniſhed with whipping.

Striking, ſo as to draw blood, in the king's court, ſubjects the criminal to the loſs of his right hand.

Striking in Weſtminſter hall while the courts of juſtice are ſitting, is impriſonment for life, and the forfeiture of all the offender's eſtate.

Drunkards, vagabonds, and looſe, idle, diſorderly perſons, are puniſhed by being ſet in the ſtocks, or by paying a ſmall fine.

Formerly in ſeveral parts of England ſcolding women were ſet in a vehicle called a ducking-ſtool, where they were placed on high, and drawn through the town to ſome deep water, into which they were three times plunged, and then again carried about and expoſed to the deriſion and contempt of the populace.

With reſpect to the courts of juſtice and the puniſhments of Scotland, we ſhall give an account of them when we come to give a more particular deſcription of

that country; and ſhall conclude this ſection with the diviſions of the whole iſland, and the repreſentatives they ſend to parliament.

In England there are forty counties, which ſend up to parliament eighty knights.

Twenty-five cities, of which London ſends four and Ely none, fifty citizens.

A hundred and ſixty-ſeven boroughs, who ſend two each, three hundred and thirty-four burgeſſes.

Five boroughs, which are Abingdon, Banbury, Bewdley, Higham Ferrars, and Monmouth, one each, five burgeſſes.

Two Univerſities, who ſend four repreſentatives.

Eight Cinque ports, as Haſtings, Dover, Sandwich, Romney, Hythe, and their three dependents, Rye, Winchelſea, and Seaford, two each, ſixteen barons.

In Wales are twelve counties, which ſend twelve knights.

Twelve boroughs, which ſend twelve burgeſſes.

In Scotland, thirty ſhires, which ſend thirty knights.

And fifteen boroughs, who ſend fifteen burgeſſes.

In all five hundred and fifty-eight repreſentatives.

We ſhall now proceed to give a particular deſcription of the counties of England, beginning at the ſouth-eaſt.

SECT. VII.

Of ENGLAND.

Of the County of Kent; its Name, Situation, Extent, Air, Produce, and principal Rivers. The Inhabitants have particular Privileges. A Deſcription of Canterbury, Rocheſter, Chatham, Maidſtone, Dover, Tunbridge, Deal, Iſle of Thanet, Graveſend, Woolwich, Greenwich, and Deptford.

AS this part of the iſland lies neareſt the continent, it was firſt invaded by the Romans from thence, when it was called by Cæſar Cantium, which it is thought they derived from the Britiſh word Caine, a green leaf, to expreſs the verdure of the woods, or to ſhew the ſituation of the country, which projects into a point eaſtward. The county of Kent is bounded on the north by the river Thames, which divides it from Eſſex and Middleſex; on the eaſt by the Downs; on the ſouth-eaſt by the Engliſh Channel; on the ſouth by Suſſex; and on the weſt by Surry. Its extent from the utmoſt point in the eaſt to its weſtern extremity is ſixty miles, its breadth from Rye in Suſſex to the mouth of the Thames is thirty-ſix, and it is a hundred and ſixty-ſix miles in circumference.

The air of this county is ſubject to be unhealthy; however, the higher parts enjoy a very healthful air, but are not ſo rich as the lower. As the county lies much upon the ſea, the air, though generally thick and foggy, is pretty warm, and often purified by ſouth and ſouth-weſt winds. The whole ſhore, from Woolwich to Graveſend, is low, and ſpread with marſhes and unhealthy grounds, except ſome places where the chalk-hills almoſt join the river.

The county in general abounds with plantations of hops, fields of corn, paſtures, fine orchards of cherries, and pippins; woods of oak, beech, and cheſnuts; and in ſeveral places are woods of birch, from whence the broom-makers in Kent-ſtreet, Southwark, are ſupplied. Here are mines of iron, pits of marl and chalk, and the cattle here are larger than in the neighbouring counties. Here are ſeveral parks of fallow deer, and warrens of grey rabbits. The chief commodities are corn, fruit, particularly pippins and cherries, woad and madder for dying, hops, flax, ſaintfoin, ſamphire, cattle, fowl, and fiſh, eſpecially trout, for which the town of Fordwich on the river Medway is famous.

The chief river of Kent is the Medway, which riſes in the weald of Suſſex, and enters Kent near Penſhurſt, running chiefly to the north-eaſt by Tunbridge, Maidſtone, and Rocheſter, below which, being of proper breadth and depth, it forms the noble dock of Chatham, where it is navigable for the largeſt men of war, and then falls into the mouth of the Thames. In this county is alſo the famous medicinal ſprings of Tunbridge.

The inhabitants juſtly value themſelves on their courage and reſolution in defending their liberties againſt the ſeveral invaders of Britain; they in particular ſurpriſed William the Conqueror, and with the utmoſt bravery offered him battle, unleſs he conſented to confirm their ancient privileges, on which he prudently choſe the latter. The principal of theſe privileges is, that of gavelkind, which conſiſts in the following particulars: 1. The heirs-male ſhare all the lands equally. 2. The heir at fifteen is at full age to ſell or alienate. 3. When a man is convicted of treaſon, his ſon cannot on that account be deprived of his birth-right. and 4. The lands of a brother, if he has no iſſue, ſhall be ſhared by all the ſurviving brethren.

This county contains a hundred and ſixty-three vicarages, four hundred and eight pariſhes, and above eleven hundred and ſeventy villages. It is divided into five lathes, under each of which are ſeveral hundreds, in which are ſaid to be about forty thouſand houſes, and two hundred thouſand inhabitants. It ſends ſixteen members to parliament, two knights for the ſhire, and two for each of the following cities and boroughs, Canterbury, Rocheſter, Maidſtone, Queenborough, Dover, Romney, and Sandwich. The principal places in this county are the following:

Canterbury, the metropolitan ſee of all England, ſituated fifty-ſix miles to the ſouth-eaſt of London, and fifteen to the north-weſt-by-weſt of Dover. It is ſaid, with little appearance of truth, to have been built nine hundred years before the birth of our Saviour: however, it is probable that it was a place of ſome note at the landing of Julius Cæſar, as it has ſeveral marks of antiquity of about that time. After the Romans left Britain, Vortigern, king of the Britons, reſided here, till he ſurrendered it up to the Saxons, who made it the capital of the kingdom of Kent, in the Saxon heptarchy. In this condition it was when St. Auguſtine, the monk, being ſent from Rome, firſt preached the Chriſtian faith to the Engliſh. It was then made an archiepiſcopal ſee, and flouriſhed greatly, from its being the ſource from whence the doctrines of the church of Rome were ſpread to the reſt of the Saxon kingdoms.

This city is a county of itſelf, and the corporation conſiſts of a mayor, a recorder, twelve aldermen, a ſheriff, twenty-four common-council-men, a mace-bearer, a ſword-bearer, and four ſerjeants at mace. A court is held every Monday in the guild-hall for civil and criminal cauſes, and every other Tueſday for the government of this city.

The cathedral has been twice burnt down; the preſent ſtructure, which was begun in the reign of king Stephen, and finiſhed in that of Henry V. is a noble Gothic pile, five hundred and fourteen feet in length, ſeventy-four in breadth, and eighty in height, from the nave to the roof; its middle tower, which may be ſeen at a great diſtance, is two hundred and thirty-five feet in height. In this church are interred the bodies of ſeven kings and ſeven archbiſhops of Canterbury, including Auguſtine, whom they immediately ſucceeded, and who lie buried in one vault. The immenſe wealth offered by votaries and pilgrims from all parts for ſeveral ages to Becket's ſhrine was ſo great, that, according to Eraſmus, his chapel ſhone with the richeſt jewels, and gold was one of the meaneſt things that adorned his ſhrine. King Henry VIII. ſeized all this wealth, with the lands and revenues both of the monaſtery and church, except thoſe he annexed for the maintenance of a dean, an archdeacon, twelve prebendaries, and ſix preachers, whom he placed in it on his turning out the monks.

Under the cathedral is a large church of foreign Proteſtants, given by queen Elizabeth to the Walloons who fled hither from the Netherlands on the perſecution raiſed againſt them by the duke of Alva, and their congregation has been ſince much increaſed by the Proteſtants who fled from France in the reign of Lewis XIV. ſo that it is computed that here are no leſs than two or three thouſand French Proteſtants. The houſes of the prebendaries, with many other good buildings, ſtand in a very ſpacious cloſe, where are ſeveral ruins of religious houſes.

This city has undergone many changes, both by war and fire: it had ſtrong walls, built chiefly of flint, with many towers, a deep ditch, and a great rampart. The caſtle, whoſe decayed bulwarks appear on the ſouth ſide of the city, is ſuppoſed to have been built by the Saxons. The two gates of St. Auguſtine's monaſtery that were next the town are remaining, and are both very ſtately. The ſite of this monaſtery, which took up a great compaſs of ground, is encompaſſed with a very high wall.

The city has ſix wards, denominated from its ſix gates, and, beſides the cathedral, has fifteen pariſh churches, two charity-ſchools, and ſeven hoſpitals, with a jail for criminals. Here is alſo a ſumptuous conduit, that is of great benefit to the inhabitants. Though this city appears round at a diſtance, it is an exact croſs, and conſiſts of four ſtreets, which center at St. Andrew's church in the middle, and is about three miles in circumference, including the gardens and cathedral. Its buildings are not very grand; but there is a good market-houſe, over which are rooms where the mayor, aldermen, &c. tranſact the affairs of the corporation. What has added moſt to the advantage of the city are the hop-grounds round it, which cover ſeveral thouſand acres; ſo that till it was equalled by Farnham, it was eſteemed the only great plantation of hops in the whole iſland. This city and Shrewſbury are the two moſt noted places in England for collars of brawn.

Rocheſter, an ancient city, ſtands in a valley on the banks of the river Medway, which waſhes its weſt ſide, twenty-ſeven miles to the north-weſt-by-weſt of Canterbury, and thirty to the ſouth-eaſt-by-eaſt of London. It is the ſee of the moſt ancient biſhopric of England, next to Canterbury; and to its cathedral belong a dean and ſix prebendaries. The city is governed by a mayor, recorder, and eleven aldermen, twelve-common councilmen, a town-clerk, three ſerjeants at mace, and a water-bailiff. The ſtone bridge of twenty-one arches over the river is a very fine one, and has ſtrong iron-work on the copings; it being built by Sir John Cobham and Sir Robert Knowles, who employed the rich ſpoils they had acquired by their valour in France in this noble work. It has only three pariſh-churches, beſides the cathedral; the town-houſe and charity-ſchool are two of the beſt buildings: in the town here is alſo a mathematical ſchool, founded by Sir Joſeph Williamſon, and an alms-houſe founded by Sir Richard Watts, for the relief of ſix poor travellers, who are ſupplied with a ſupper, a bed, and breakfaſt, with four-pence to carry them forward on their journey. The town, which chiefly conſiſts of one broad, but ill-built ſtreet, is encompaſſed on ſome of its ſides with walls, but they are not very ſtrong. The ancient military-way called the Watling-ſtreet, runs directly through it to Dover.

In ſeveral of the creeks and branches of the Medway, within the juriſdiction of this city, there is an oyſter-fiſhery, which is free to every one who has ſerved ſeven years apprenticeſhip to any fiſherman, or dredger, that is free of that fiſhery. The mayor and citizens hold what is called an admiralty-court once a year, or oftener, for regulating the fiſhery, at which courts they appoint when oyſters ſhall and ſhall not be dredged and taken, which they term *opening and ſhutting the grounds*. Perſons who dredge for oyſters without being free of the fiſhery are called cablehangers, and are tried and puniſhed by that court.

Chatham may be conſidered as a ſuburb to Rocheſter, it lying on the other ſide of the river, and is famous for its being a ſtation of the royal navy. The dock was begun by queen Elizabeth, and improved by her ſucceſſors, who have added new docks, maſt-houſes, boat-houſes, and ſeveral ſtore-houſes, one of which is ſix hundred and ſixty feet in length, boat-yards, anchor-yards, forges, founderies, canals, and ditches for preſerving the maſts and yards in the water; ſo that there is not a more complete arſenal; and the ware-houſes and ſtore-houſes are formed into ſtreets of great length. Here are two commiſſioners, with other officers, to take care of the navy, the ſtore-houſes, rope-yards, &c. and all the places ſet apart for the works belonging to the ſhipping reſemble a well ordered city; ſo that with all the appearance of hurry there is not the leaſt confuſion. The private buildings, as the houſes of the ſea-officers, directors, inſpectors, and workmen of the royal navy, are well built, and ſome of them very ſtately. This place gives the title of baron to his grace the duke of Argyle and Greenwich. The cheſt of Chatham is ſupplied by a portion of each man's pay in the navy, which furniſhes a fund, out of which ſuch diſabled ſeamen as receive no benefit from Greenwich hoſpital have a ſmall annual annuity. An hoſpital has been alſo erected here for the relief of ten or more aged and maimed mariners or ſhipwrights.

It ought not to be omitted that the entrance into the river Medway is defended by Sheerneſs and other forts, and that in the year 1757, by the late duke of Cumberland's direction, ſeveral additional fortifications were begun at Chatham; ſo that now the ſhips are in no danger of an inſult either by land or water. This town has a church, a chapel of eaſe, and a ſhip uſed as a church for the ſailors. The houſes, which are moſtly low, amount to only about five hundred. The ſtreets are narrow and paved, and it contains about three thouſand inhabitants.

Maidſtone received its name from the river Medway, which is navigable hither by large barges and hoys of about fifty or ſixty tons burthen, and is a large, populous, and neat town, twenty-four miles to the weſt of Canterbury, and thirty-ſix ſouth-eaſt-by-eaſt of London. From its ſituation in the center of Kent, it is very proper for the county buſineſs, which is all tranſacted here. It ſends two members to parliament, and is governed by a mayor, twelve aſſiſtants called jurats, and twenty-four commoners. Its chief trade is in linen-thread, and in hops, of which there are large plantations about the town, as well as orchards of cherries. It gives the title of viſcount to the earl of Winchelſea and Nottingham, who is lord of the manor. It has a fine ſtone bridge, and four charity-ſchools. The town and the adjacent country enjoys ſuch plenty of proviſions, that London is ſupplied from hence with more commodities than from any ſingle market-town in England, particularly with large Kentiſh bullocks, wheat, great quantities of hops, apples, and cherries, timber, a ſort of paving-ſtone about eight or ten inches ſquare, and the fine white ſand for glaſs-houſes and ſtationers.

Dover, which is ſituated fifteen miles to the ſouth eaſt of Canterbury, and ſeventy-one from London, has for many ages been a famous paſſage between this iſland and France, and ſtill ſubſiſts chiefly on that account. It was anciently rendered a place of great importance by a ſtrong caſtle built on the high cliff, ſaid to be begun by Julius Cæſar, and completed by Arviragus, a Britiſh king, in the reign of the emperor Claudius. The additions made to this fortreſs were ſo remarkable, and its ſituation ſo ſecure by nature, that before the Conqueſt it was eſteemed the bulwark and key to the whole iſland. When this place was at the height of its magnificence it had ſeven churches, which are now reduced to two, and twenty-one wards, each of which furniſhed a ſhip of war, and maintained it forty days at its own expence. In conſideration of this ſervice each ward had a licence packet-boat, and the fare, according to the Tower records, was ſettled in the reign of Edward II. for a ſingle perſon in ſummer ſix-pence, in winter one ſhilling: for a horſe in ſummer eighteen pence, and in winter two ſhillings. Dover is likewiſe famous as a cinque-port, in which the buſineſs of the other four, and their dependencies, is tranſacted: their privileges are very extenſive, and were granted them in conſideration of the ſhips of war they were obliged to furniſh. The other cinque-ports are Haſtings, Hythe, Romney, and Sandwich. Among other privileges the burgeſſes of the cinque-ports are ſtiled barons; they carry the canopy at the coronation, which they have afterwards for their fee; and at the feaſt have a table at the king's right hand. This town conſiſts of one ſtreet a mile long, very ill paved. One of the other ſtreets is called Snare-gate, from the dreadful rocks of chalk which hang over it. A well in the caſtle is ſixty fathoms deep, and is round, large, and lined to the bottom with free-ſtone. The remains of the royal palace, the chapel, ſtables, and offices, ſhew the whole

whole to have been very magnificent. Here is a braſs gun of excellent workmanſhip, ſaid to be the longeſt in the world, it being no leſs than twenty-two feet in length. It was preſented by the ſtates of Utrecht to queen Elizabeth, and is called her pocket-piſtol; it requires fifteen pounds of powder, and the people here ſay will carry a ball ſeven miles.

Tunbridge received its name from the ſtone bridges over the five branches of the Medway, of which the Tun is one, and is ſeated twenty-nine miles ſouth-eaſt-by ſouth of London. This place is remarkable for its wells, which are four or five miles ſouth of the town, but in the ſame pariſh, and are reſorted to by the nobility and gentry in June, July, and Auguſt; and which are ſituated for the moſt part in the pariſh of Tunbridge, between two hills, named Mount Sinai and Mount Ephraim, both covered with good houſes, and gardens abounding in fruit. The principal well is walled in, and neatly paved like a ciſtern. From it run two paved walks, one of which forms a long gallery covered over, in which the band of muſic play, and here the company walk in bad weather. Here is alſo a row of ſhops and coffee-rooms, where is card-playing and the like, and alſo a dancing-room. On the other ſide is a good market, and behind the wells is a large chapel, where divine ſervice is performed twice a day, during the ſeaſon of drinking the water. When the company have taken their draught at the wells they go home about nine o'clock to dreſs, and at ten ſome of the company reſort to the chapel, and others to the coffee-houſes; but after prayers they all appear on the walks in the greateſt gaiety and ſplendor, the muſic playing all the time, while the gentlemen and ladies divert themſelves with raffling, hazard, drinking of tea, and walking till dinner-time: in the afternoon the bowlers divert themſelves on the green. At night the company return to the ſhops on the walks, where many play till midnight: there are alſo balls four times a week, and any gentleman that pleaſes may dance. In the chapel juſt mentioned ſeventy poor children are taught and maintained by the contributions of the company at the wells. The water is a chalybeate, which operates by urine and perſpiration, and is of great efficacy in cold, chronical diſeaſes, weak nerves, and bad digeſtion. The air is here excellent, and proviſions of all ſorts very reaſonable. There is plenty of wild-fowl, as pheaſants, partridges, woodcocks, ſnipes, quails, and particularly the little delicious bird called the wheat-ear; and as for fiſh they have excellent of almoſt every kind.

Deal, called Dola by Julius Cæſar, who landed here in his ſecond deſcent upon Britain, is a handſome large town, ſeated near the ſea, and a member of the cinque-port of Sandwich, from which it is ſeven miles diſtant, and ſeventy five to the eaſt-by-ſouth of London. Here almoſt all ſhips bound from foreign parts to London, or from thence to foreign parts, by way of the Channel, generally ſtop. The town carries on ſome foreign trade, and is defended by two caſtles; that of Sandown on the north is compoſed of four lunettes of very thick arched work of ſtone, with many port-holes for great guns. In the middle is a great round tower, with a ciſtern at the top, and underneath it an arched cavern bomb-proof. It has a church, a chapel, and about a thouſand houſes, which are moſtly low and built with brick; theſe form three long but narrow ſtreets, and the inhabitants amount to about four thouſand five hundred. Here is a charity-ſchool for twenty-ſeven boys and girls, who are taught and clothed at the expence of the inhabitants.

As no manufacture is carried on here, the trades-people chiefly depend on the ſea-faring men who reſort thither.

The Iſle of Thanet is on the north and eaſt bounded by the ſea, and on the ſouth and weſt by a branch of the Stour. It is eight miles in length, and four in breadth. The ſoil is chalk, and is very fruitful in co[illegible] and graſs; it is therefore a fine country, and has t[illegible] title of an earldom. It contains ſeveral villages, wit[illegible]he ſea-port towns of Margate and Ramſgate; but th[illegible]gh it has fifteen or ſixteen hundred families, it has hard[illegible] any gentlemen's houſes. On the north-eaſt point of this iſland is the promontory of the North Foreland, which, by a line drawn due north to the Naſe in Eſſex, makes the mouth of the river Thames, and all the towns and harbours from hence, whether on the Kentiſh or Eſſex ſhore, are called members of the port of London.

Graveſend, a town twenty-two miles to the eaſt of London, is ſituated on the Thames oppoſite to Tilbury-fort, about ſix miles to the eaſt of Dartford, and about the ſame diſtance from Rocheſter. In the reign of Richard II. the French and Spaniards ſailed up the Thames to this town, and having plundered and burnt it, carried away moſt of the inhabitants. To remedy this loſs the natives of Graveſend and Milton were allowed the ſole privilege of carrying paſſengers by water from hence to London at two-pence per head, or four ſhillings the whole fare; but the fare is now raiſed to nine-pence per head in the tilt-boat, and one ſhilling in the wherry. The former muſt not take in above forty paſſengers, and the latter no more than ten. The watermen's company of London are obliged to provide officers at Billingſgate and Graveſend, who at every time of high water, by night and day, are, at their reſpective places, to ring publicly a bell ſet up for that purpoſe, during fifteen minutes, to give notice to the tilt-boats and wherries to put off; and coaches ply at Graveſend at the landing of people from London to carry them to Rocheſter. King Henry VIII. raiſed a platform here, and at Milton, and theſe towns were incorporated by queen Elizabeth by the name of the portreve, the jurats, and inhabitants of Graveſend and Milton; but the name of portreve has been changed to that of mayor. The whole town being burnt down in 1727, the parliament granted five thouſand pounds for rebuilding its church. This pariſh, with that of Milton, contains about ſeven hundred houſes, which are moſtly ſmall and built with brick; the ſtreets are alſo narrow, but paved with flints, and it has a great number of houſes of entertainment. Here is a handſome charitable foundation, Mr. Henry Pinnock having, in 1624, given twenty-one dwelling-houſes, and a houſe for a maſter weaver to employ the poor, and a good eſtate is alſo ſettled for the repairs.

Great improvements have been made in the lands near this town, by turning them into kitchen-gardens, with the produce of which Graveſend not only ſupplies the neighbouring places for ſeveral miles round, but alſo ſends great quantities to the London markets, particularly of aſparagus, that of Graveſend being preferred to that of Batterſea. As all outward-bound ſhips are obliged to anchor in this road till they have been viſited by the cuſtom-houſe officers, and as they generally ſtay here to take in proviſions, the town is full of ſeamen, and in a conſtant hurry.

Woolwich, a town ſituated on the Thames, nine miles to the eaſt of London, is famous for its fine docks and yards, where men of war are built, as alſo for its vaſt magazines of great guns, mortars, bombs, cannon-balls, powder, and other warlike ſtores. The docks are encompaſſed with a high wall, and there is a long rope-walk, where the largeſt cables are made for the men of war. On the lower part of the town is the warren, where between ſeven and eight thouſand pieces of ordnance have been laid up at one time for ſhips and batteries; beſides innumerable mortars and bomb-ſhells. Here is alſo the houſe where the fire-men and engineers prepare their fire-works, charge bombs, carcaſſes, and grenades for the public ſervice. The town has been of late years much beautified and enlarged with fine docks, rope-yards, and ſpacious magazines. It has an academy where the mathematics are taught, and young officers inſtructed in the art of navigation. The pariſh-church has been rebuilt in a handſome manner, as one of the fifty new churches erected in purſuance of the bounty of queen Anne for that purpoſe.

Greenwich, a very pleaſant town, is ſituated on the Thames, five miles from London, and has been the birth-place of ſeveral of our monarchs, particularly queen Mary and queen Elizabeth, and here king Edward VI. died. Their palace was firſt erected by Humphrey duke of Glouceſter, who named it Placentia: this palace was enlarged by Henry VII. and completed by Henry VIII. but was afterwards pulled down by king Charles II. who began another, a moſt magnificent edifice, and lived to ſee the firſt wing of it finiſhed. Of this palace

we ſhall ſoon give a particular deſcription in treating of the hoſpital, of which it is a part. The ſame prince alſo enlarged the park, walled it round, planted it, and cauſed a royal obſervatory to be erected on the top of a ſteep hill. This ſtructure was erected for the uſe of the celebrated Mr. Flamſtead, and it ſtill retains the name of that great aſtronomer. King Charles alſo furniſhed it with mathematical inſtruments for aſtronomical obſervations, and a deep dry well for obſerving the ſtars in the day-time. That which is at preſent called the palace, is an edifice of no great extent, and is now converted into apartments for the governor of the royal hoſpital, and the ranger of the park. The park is well ſtocked with deer, and affords a noble and delightful view of the fine hoſpital, the river Thames, and the city of London.

Greenwich is ſaid to contain one thouſand three hundred and fifty houſes, and its pariſh church, which was rebuilt by the commiſſioners for erecting the fifty new churches, is a very handſome ſtructure dedicated to St. Alphage: at the end of the town is a college fronting the Thames, for the maintenance of twenty decayed houſe-keepers, twelve out of Greenwich, and eight who are to be alternately choſen from Snottiſham and Caſtle-Riſing in Norfolk. It is called the duke of Norfolk's college, though founded and endowed by Henry earl of Northampton, the duke of Norfolk's brother, and by him committed to the care of the Mercers company. The penſioners, beſides meat, drink, and lodging, are allowed eighteen-pence a week, with a gown every year, linen every two year, and hats once in four. Here is alſo an hoſpital called queen Elizabeth's college, which was built and founded by Mr. Lambard; and in this pariſh are two charity ſchools, one founded by Sir William Boreman, knt. for twenty boys, who are clothed, boarded, and taught; they wear green coats and caps; and the other by Mr. John Roan, who left his eſtate for teaching alſo twenty boys reading, writing, and arithmetic, and allowed two pounds per annum for each of the boy's cloaths. Theſe wear grey coats.

The firſt wing of the noble and ſuperb edifice called Greenwich hoſpital was, as hath been obſerved, erected by king Charles II. for a palace, and indeed the whole can ſcarcely be taken for any thing leſs than the palace of a great monarch. King William III. however, being very deſirous of promoting the trade, navigation, and naval ſtrength of this kingdom, by inviting great numbers of his ſubjects to betake themſelves to the ſea, gave this noble ſtructure, and ſeveral others, with a conſiderable ſpot of ground, for the uſe of thoſe Engliſh ſeamen and their children, who by age, wounds, or other accidents, ſhould be diſabled for farther ſervice at ſea, and for the widows and children of ſuch as were ſlain in fighting at ſea againſt the enemies of their country. The ſame prince alſo appointed commiſſioners for carrying on his noble views, and deſired the aſſiſtance of his good ſubjects to enable him to carry them on. In conformity to this requeſt, many benefactions were made to this noble charity, which, according to the tables hung up at the entrance of the hall, amount to fifty-eight thouſand two hundred and nine pounds, and afterwards the eſtates of the earl of Derwentwater, who bore a principal part in the rebellion in 1715, amounting to ſix thouſand pound per annum, were given by parliament to this hoſpital. The firſt range had coſt king Charles II. thirty-ſix thouſand pounds, and another was ordered to be built on the ſame model oppoſite to it: this has been completed with equal magnificence.

The front facing the Thames conſiſts of theſe two ranges of ſtone buildings, with the governor's houſe in the back part in the center, behind which the park, well planted with trees, riſes with a noble aſcent. Theſe buildings, between which is a large area, perfectly correſpond with each other, and each range is terminated by a very noble dome. In each front to the Thames two ranges of coupled Corinthian columns finely wrought, ſupport their pediments, and the ſame order is continued in pilaſters along the building. In the center of each part between theſe ranges of columns is the door, which is of the Doric order, and adorned above with a tablet and pediment. Within the height of theſe lofty columns are two ſeries of windows enlightning two floors. The undermoſt, which are the ſmalleſt, have ruſtic caſes, crowned with pediments; while the upper ſeries, which are larger and more lofty, are adorned with the orders, and with upright pointed pediments. Over theſe is an Attic ſtory; for the entablature of the Corinthian columns and pilaſters ſupports a regular Attic courſe, in which the windows are regularly diſpoſed, and the top is crowned with a handſome baluſtrade. The buildings continued from theſe, and facing the area, correſpond with them, though in a finer and more elegant manner. In the center of both is a range of columns ſupporting a pediment, and at each corner a range of Corinthian pilaſters, the front is ruſticated, and there are two ſeries of windows. The domes at the end, which are one hundred and twenty feet high, are ſupported on coupled columns, as are the porticos below, and under one of theſe is the chapel, which is adorned on the inſide with the greateſt elegance and beauty. In the center of the area is a ſtatue of his late majeſty fixed on a pedeſtal; and on the ſides of the gate which opens to theſe buildings from the park, are placed a large celeſtial and terreſtrial globe, in which the ſtars are gilt.

The hall of this hoſpital is finely painted by Sir James Thornhill, particularly the cieling and upper end; on the latter are repreſented in an alcove, the late princeſs Sophia, king George I. king George II. queen Caroline, the queen dowager of Pruſſia, Frederic prince of Wales, the duke of Cumberland, and the five daughters of his late majeſty. On the cieling of the alcove are king William and queen Mary, with ſeveral fine emblematical figures. All ſtrangers who ſee this fine hall pay twopence each, and this income is applied to the ſupport of the mathematical ſchool for the ſons of ſailors.

For the better ſupport of this hoſpital, every ſeaman, both in the royal navy and in the merchants ſervice, pays ſix-pence per month, which is ſtopped out of the pay of all ſailors, and delivered in at the ſix-penny receiver's office on Tower-hill; whence any ſeaman who can produce an authentic certificate of his being diſabled by defending any ſhip belonging to his majeſty's Britiſh ſubjects, or in taking any ſhip from the enemy, has a right of being admitted into this hoſpital, and receive the ſame benefit from it, as if he had been in the king's immediate ſervice. There are at preſent near two thouſand old or diſabled ſeamen, and an hundred boys, the ſons of ſeamen, inſtructed in navigation, and bred up for the ſervice of the royal navy; but there are no out-penſioners as at Chelſea. Each of the mariners has a weekly allowance of ſeven loaves, weighing ſixteen ounces each, three pounds of beef, two of mutton; a pint of peaſe, twenty ounces of cheeſe, two ounces of butter, fourteen quarts of beer, and one ſhilling a week tobacco money; the tobacco money of the boatſwains is two ſhillings and ſix-pence a week each; that of their mates eighteen-pence, and that of other officers in proportion to their rank. Beſides which, each common penſioner receives once in two years a ſuit of blue clothes, a hat, three pair of ſtockings, two pair of ſhoes, five neck-cloths, three ſhirts, and two night caps. The hoſpital has about one hundred governors, compoſed of the nobility and great officers of ſtate.

Deptford, anciently called Weſt-Greenwich, is ſaid to have derived its name from its having a deep ford over the little river Ravenſborne, near its influx into the Thames, where it has now a bridge. It is a large and populous town four miles eaſt of London, and is divided into Upper and Lower Deptford, which together contain two churches, ſeveral meeting-houſes, and about one thouſand nine hundred dwelling houſes. It is moſtly remarkable for its noble dock, where moſt of the royal navy were formerly built and repaired, till it was found more conv[illegible] at to build the larger ſhips at Woolwich, Chatham, a[illegible] of Portſmouth; there is a greater depth of water: yet [illegible] yard is enlarged to more than double its former dim[illegible]ions, and a great number of men are conſtantly em[illegible]yed. It has a wet dock of two acres for ſhips, and [illegible]nother of an acre and an half; with vaſt quantiti[illegible] of timber and other ſtores, There are alſo extenſi[illegible] buildings, as ſtore-houſes and offices, beſides dwelling

dwelling houſes, for thoſe officers who are obliged to live upon the ſpot, in order to ſuperintend the works. It had a victualling houſe built in 1745, which in 1749 was burnt down, with great quantities of proviſions and naval ſtores. The royal yachts are generally kept here, and near the dock is the ſeat of Sir John Evelyn, called Say's Court, where Peter the Great, Czar of Muſcovy, reſided for ſome time, and in this yard completed his knowledge in the practical part of naval architecture.

In this town are two hoſpitals, one of which was incorporated by king Henry VIII. for the uſe of ſeamen, and is called Trinity-Houſe. This contains twenty-one houſes, and is ſeated near the church. The other, called Trinity Hoſpital, has thirty-eight houſes fronting the ſtreet. This is a very handſome edifice, and has large gardens belonging to it. Though this laſt is the fineſt ſtructure, yet the other has the preference on account of its antiquity; and as the brethren of the Trinity hold their corporation by that houſe, they are obliged at certain times to meet there for buſineſs. Both theſe houſes are for decayed pilots, or maſters of ſhips, or their widows, the men being allowed twenty ſhillings, and the women ſixteen ſhillings per month.

SECT. VIII.

Of the County of Suſſex; its Situation, Extent, Air, Soil, and face of the Country. Its produce, with a Deſcription of the little Bird called a Wheatear; its Rivers, and principal Towns, as Chicheſter, Lewes, and Arundel.

SUSSEX received its proper name from the Saxons; for this being the moſt ſouthern part of the iſland, they called it and Surry the kingdom of the South Saxons, whence this county has by abbreviation been called Suſſex. It is bounded on the north by Surry, on the north-eaſt and eaſt by Kent, on the ſouth by the Engliſh channel, and on the weſt by Hampſhire. It is about fifty-three miles in length, ſixteen in breadth, and one hundred and ſeventy-two in circumference.

The air in this county is very various: along the ſeaſhore it is thought agueiſh; but it has a much greater effect on ſtrangers than on the natives, who are generally very healthful. In the Weald, which is a rich deep ſoil, it is apt to be foggy, yet not unwholeſome; but upon the Downs the air is extremely ſweet and healthy. The ſoil is likewiſe various; that of the Downs, and from them to the ſea, is very fertile, both in corn and graſs, the latter feeding ſheep whoſe wool is remarkably fine; the middle of the county abounds with meadows and rich arable ground, and the north ſide is ſhaded with extenſive woods, that ſupply fuel for the iron works. This plentiful county therefore ſupplies numerous commodities, the chief of which are corn, malt, cattle, wool, wood, iron, chalk, glaſs, fiſh, and fowl. It is particularly famous for its wheatear, a ſmall delicious bird, of the ſize of a lark, not much inferior to an ortolane, and is taken on the ſouth-eaſt downs in the following manner: a turf is cut up about a foot long and half a foot broad; in the cavity is placed a ſnare of horſe hair, and the turf turned with the graſs downwards to cover the greateſt part of the hole. Theſe birds are naturally ſo timorous, that the ſhadow of a cloud, or any thing that moves on the ground, makes them fly into theſe little pits for ſhelter, where they are taken. The ſeaſon for them is when the wheat ripens; but they are ſo very fat that they cannot be carried many miles without being tainted, and even in plucking them great care muſt be taken to handle them as little as poſſible.

The chief manufactures of this county are great guns, and ſeveral ſorts of work made in caſt or wrought iron; the beſt gunpowder in the world is ſaid to be made at Battle.

This county has few ports on account of its rocky ſhore, and its ſhelves and ſand-banks, which the ſouth-weſt winds, ſo common upon our coaſt in the winter, are continually augmenting.

It is divided into ſix rapes, each of which has its particular caſtle, river, and foreſt, and is ſub-divided into ſixty-five hundreds, in which are computed one city, eighteen market-towns, one hundred and twenty-three vicarages, three hundred and twelve pariſhes, one thouſand and ſixty villages, hamlets, and chapelries, twenty one thouſand five hundred and thirty-ſeven houſes, and about one hundred twenty-nine thouſand ſouls.

The principal rivers are the Arun, the Adur, the Ouſe, and the Rother. The Arun riſes in St. Leonard's foreſt, not far from Horſham, in the north-edge of the county, and after running a little way to the weſtward, turns due ſouth, paſſing by Arundel, about three miles below which it falls into the ſea. This river has lately had a new outlet cut for it in order to improve its navigation, which carries barges above Pulborough, and ſhips of a hundred tons as high as Arundel. Here are caught the mullets ſo much eſteemed; they come from the ſea in the ſummer ſeaſon in vaſt ſhoals, and feeding upon a particular weed in this river, acquire that high luſcious taſte which renders them ſo great a dainty. The Adur, alſo called the Beeding, has likewiſe its ſource in St. Leonard's foreſt, forming its courſe on the ſame points of the compaſs as the Arun; but on its approaching the ſea, turns four or five miles to the eaſt, and then forms the harbour of New Shoreham. The Ouſe riſes from two branches, one of which has its ſpring in St. Leonard's foreſt, near the ſource of the Arun, the other in the foreſt of Worth, but they ſoon unite to the ſouthward by Lewes, and run to the ſea, forming the harbour called New-Haven. The Rother riſes near Rotherfield, and runs moſtly eaſtward; but about ſix miles to the north of Rye, makes an angle to the ſouthward, and falling into the ſea, forms Rye-Haven. From ſo many rivers one good harbour at leaſt might be expected for the largeſt ſhips; but none of them will admit of a veſſel of five hundred tons. The principal places in this county are the following:

Chicheſter, by the ancient Britons called Caercei, and by the Saxons Ciſſanceaſter, is ſeated in a plain on a little rivulet called Lavant, ſixty-three miles to the ſouth-weſt of London. It is a compact neat town, encompaſſed by a ſtone wall, the four gates anſwering to the four cardinal points, from whence the ſtreets have their names, and meet in the center of the city, where is the market-place, which affords a view of the four gates. The cathedral is adorned on one ſide with pictures of all the kings and queens from Ciſſa, the ſon of Ella, the firſt king of the South Saxons, to the preſent time; and on the other are placed the portraits of all the biſhops. The ſpire is deſervedly admired for its workmanſhip, and ſome years ago afforded a convincing proof of the ſkill of the architect; for a flaſh of lightning ſtriking upon it, about forty-five feet from the top, made a very large breach, by driving out the ſtones, and carrying ſeveral of them, which were even of a ton weight, to a conſiderable diſtance; but notwithſtanding this ſhock the ſpire ſtood firm, which ſaved the body of the church, and it is now well repaired. Beſides the cathedral there are ſeven ſmall churches, built with flint ſtone. What is now called the Friars, was formerly a convent of Franciſcans, but was originally a caſtle and ſeat belonging to the earls of Arundel. The ſtreets are generally pretty broad, the houſes uniform, and tolerably well built. Chicheſter is a city and county of itſelf, and the corporation conſiſts of a mayor, recorder, fourteen aldermen, ſix bailiffs, twenty-ſeven common-council men, and a portreve; four juſtices of the peace are choſen out of the aldermen, and the mayor is annually elected by ballot of the aldermen and common-council, who put up two perſons, and is attended by four ſerjeants at mace and a cryer. The market-place is adorned with a ſtately croſs, and on Saturdays furniſhed with plenty of all proviſions, eſpecially fiſh, and great quantities of corn. Every Wedneſday fortnight here is alſo one of the greateſt cattle markets in England. This city, as well as Southampton, gives title of earl to the duke of Cleveland, and has two charity ſchools, one for forty-two boys, and the other for twenty girls, who are taught and clothed. There are ſeveral houſes of the nobility near this city, which have a delightful proſpect of the ſea.

Lewes, a town ſaid to receive its name from the Saxon word Leſwa, or Paſture, is a place of great antiquity,

as appears from king Athelſtan's having appointed his royal mint to be kept here. It is pleaſantly ſituated, fifty miles to the ſouth of London, on the edge of the ſouth Downs, on one of the moſt delightful ſpots that England affords, and contains ſix pariſh churches, built with flint ſtone, and about ſix thouſand two hundred inhabitants. It is adorned with the ſeats of the Pelhams, the Gages, the Shellys, and other perſons of rank and fortune, whoſe gardens join to each other, though for the moſt part up and down hill. Near it are the remains of its ancient caſtle. The ſtreets are handſome, and it has two ſuburbs, the one called Southover, which is the largeſt, and the other on the eaſt ſide of the river called Cliff, from its lying under a chalky hill. A little river runs through the midſt of the town, bringing goods in boats and barges from a port at eight miles diſtance. On this river are ſeveral iron works, where cannon are founded for merchant ſhips. Public horſe races are run here almoſt every ſummer; but the road from hence to Tunbridge is ſo deep and dirty, that it is ſaid the ladies are ſometimes drawn to church in their coaches by ſix oxen. Lewes is governed by two conſtables; it ſends two members to parliament, and has a good market on Saturdays.

Here, in 1264, a bloody battle was fought between king Henry III. and his barons, when the latter entered and plundered the town.

From a windmill near the town is a proſpect of the ſea for thirty miles weſt, and an uninterrupted view of Banſted Downs, which is full forty miles. Between this town and the ſea is good winter game for a gun, and ſeveral gentlemen here keep packs of hounds; but the hills are ſo ſteep, that it is dangerous following them.

Arundel, a town eight miles to the eaſt of Chicheſter, and fifty-five ſouth-weſt-by-ſouth of London, ſeems to derive its name from the river Arun, on which it is ſeated, and from whence it is ſupplied with the excellent mullets already mentioned. It is pleaſantly ſituated on the ſide of a hill, and has a ſtately wooden bridge over the river, at a convenient diſtance from the ſea. It gives title of earl to the duke of Norfolk, and is governed by a mayor, twelve burgeſſes, a ſteward and other officers, and ſends two members to parliament. The ancient caſtle is ſeated on the river Tame, and is ſaid to be a mile in compaſs. The town has two ſtreets paved with ſtone, in which are about two hundred houſes alſo built of ſtone, and about 800 inhabitants.

Horſham is a town about three miles out of the main road to Arundel, and has its name from Horſa, brother to Hengiſt the Saxon, and is one of the largeſt towns in the county: it has ſent members to parliament ever ſince the thirtieth of king Edward I. and is the place where the county jail is held, and ſometimes the aſſizes. It has a handſome pariſh-church, and a free-ſchool well endowed. A great number of poultry are brought up to its weekly market on Saturdays, and bought up for London. Here is a quarry of very good ſtone fit for flooring.

Rye, a pretty populous ſea-port town ſeated on the ſide of a hill, ſixty-four miles to the ſouth-eaſt-by-ſouth of London, and has a delightful proſpect of the ſea. It was walled in the reign of Edward III. and was well fortified by William d'Ypres, earl of Kent; a tower called by his name is the priſon of the town. It has one of the largeſt pariſh-churches in England, and enjoys the ſame privileges as the other cinque-ports; but the port is ſo choaked up with ſand, that it hardly affords entrance for the ſmalleſt veſſels. The corporation conſiſts of a mayor and jurats, and ſends two members to parliament. It has a town-hall, and three ſtreets paved with ſtone. One ſide of the town is walled in, and the other guarded by the ſea. It has two gates, and is a place of conſiderable trade, particularly in hops, wool, timber, kettles, cannon, chimney-backs, &c. The houſes are pretty well built, tho' generally old faſhioned; but there are ſome very neat ones of the modern taſte. In the reign of king Richard II. the French landed and burnt this town; but the people of Rye ſoon fitted out ſome ſhips, and, in conjunction with thoſe from other ports, took ſeven of their veſſels richly laden.

Winchelſea was once a conſiderable town, built in the time of king Edward I. after a more ancient town of the ſame name, that ſtood at two or three miles diſtance, and had eighteen pariſhes, but was ſwallowed up by the ſea in a terrible tempeſt. New Winchelſea was never equal to the Old; it was encompaſſed with a rampart, and afterwards with a wall; but no ſooner began to flouriſh, than it was ſacked by the French and Spaniards, and being abandoned by the ſea, which retired a mile diſtant, ſuddenly fell to decay. Though the ſtreets are paved, the graſs which grows in them is ſome years let for four pounds, and little more at preſent remains than the ſkeleton of a very handſome town: the ſtreets ſtanding all at right angles, were divided into thirty-two ſquares, or quarters. Some of the ſtone-work of three gates is ſtill to be ſeen, though they are three miles aſunder over the fields, and in many places of the town are vaults arched with ſtone. Near the town are large marſhes, which the inhabitants are at great expence in defending from the encroachments of the ſea, by great banks of earth and walls. Here were formerly three pariſh-churches; but only the chancel of one of them is now ſtanding, which is more than large enough for the inhabitants. This borough is incorporated by the name of the mayor, jurats, and commonalty; and though there are only a few houſes remaining in the upper part of the town, it ſends two members to parliament, and gives the title of earl to the noble family of the Finches.

SECT. IX.

Of the County of Surry; its Name, Situation, Extent, Air, Soil, Produce, and Rivers; with a Deſcription of its principal Towns and Seats, and particularly of the Palace and Gardens of Richmond.

THIS county obtained its name from its ſituation on the ſouth ſide of the Thames, and is bounded on the eaſt by Kent; on the ſouth by Suſſex; on the weſt by Hampſhire and Berkſhire; and on the north by the river Thames, which divides it from Middleſex. The country, which is almoſt ſquare, is thirty-four miles in length, twenty-one in breadth, and a hundred and twelve in circumference, containing about thirty-five thouſand houſes, a hundred and forty pariſhes, eleven market-towns, including Southwark, thirty-five vicarages, four hundred and fifty villages and hamlets, and a hundred and ſeventy-one thouſand inhabitants.

It is a healthy pleaſant country, on which account there are many of the nobility and gentry who have their ſeats there. The ſoil is very different in the extreme parts from that in the middle, whence it has been compared to a coarſe cloth with a fine liſt: for the edge of the county on all ſides has a rich ſoil, extremely fruitful in corn and graſs, particularly in Holmeſdale, and on the north towards the Thames; but it is far otherwiſe in the heart of the country, where are wide tracts of ſandy ground and barren heath, and in ſome places are long ridges of hills, with warrens of rabbets and parks for deer. However, we meet here and there with ſome delightful ſpots interſperſed in the middle of Surry, and it is not to be doubted that a great deal of the waſte ground might, by proper management, be greatly improved. This country produces corn, box-wood, walnuts, hops, and fullers-earth; and near Darking grows a wild black cherry, of which a very pleaſant wine is made, little inferior to French claret. It has been obſerved of this part of Surry, that the natives are generally of a pale complexion, reſembling the people of Picardy in France; and that even the cattle are of a lighter colour than is uſual in other parts of England.

The rivers in this county, beſides the Thames, are the Molſey, the Wey, and the Wandle. The Molſey, or Mole, riſes in the ſouthern border of Surry, and forms a courſe moſtly ſouth-eaſt and ſouth, till it reaches the Thames at Molſey. It is remarkable of this river, that at the foot of Box-hill, near a village called Mickleham, it works its way under ground like a mole, riſing again at or near the town of Leatherhead, where its ſtreams are united, and form a pretty large river running under Leatherhead bridge; and thus purſues its courſe to the

Thames,

Thames, which it joins at Molſey, and from this circumſtance it obtained the name of the Mole. The Wey riſes in Hampſhire, and enters this county near Farnham, winding very much till it has paſſed Godalming, when it begins to run moſtly ſouthward. This river has been made navigable to Guilford, by which means all the neighbouring parts are plentifully ſupplied with commodities from London, particularly coals, which have been much wanted here. The Wandle is a ſmall clear ſtream famous for its trouts; it riſes near Carſhalton, and runs ſouthward to the Thames, into which it diſcharges itſelf at Wandſworth. The principal places in this county are the following:

Guilford, or Guildford, is a conſiderable market-town thirty miles to the ſouth-weſt of London, where the aſſizes are ſometimes held, and always the elections for members of parliament for the county, the town itſelf returning two. The river Wey being made navigable to this town, as hath already been obſerved, adds greatly to its trade; and a conſiderable quantity of timber being brought from the woody parts of Suſſex and Hampſhire to this town by land-carriage, is conveyed from thence by this river to London. It has three pariſh-churches: that which is called the Upper Church, by the fall of the ſteeple, had its roof beat in, on the twenty-third of April, 1740; the ſteeple had been repaired not long before; but a farther decay being diſcovered, the workmen had begun to take it down, but luckily for them it was a fair-day, and they had leave to divert themſelves that afternoon; the roof was ſtruck in with ſuch impetuoſity, that by the ſudden preſſure of the air all the glaſs-windows were blown out, as if it had been done by a blaſt of gun-powder. Here is a ſchool founded by Edward VI. and an alms-houſe by George Abbot, archbiſhop of Canterbury, for the maintenance of a maſter, twelve brethren, and eight ſiſters, who have each half a crown a week. There are here alſo two charity-ſchools for thirty boys, and twenty girls. Here are likewiſe the ruins of an old caſtle, and ſome of the remains of a palace of great extent, which appears by the beſt authorities to have been the reſidence of Ethelwald, one of the Saxon kings. Here were formerly two or three convents, one of which was not long ago the ſeat of Daniel Coſwell, Eſq; and had a delightful park adjoining to it. Here is a fine circular courſe for horſe-races, which begin when the Newmarket races are ended. Guilford had formerly a conſiderable manufacture of cloth, of which there are ſtill ſome remains. The great road from Chicheſter and Portſmouth lies through the town, which has always been famous for good inns, clean linen, and other excellent accommodations.

The road from hence to Farnham is very remarkable, it running along the ridge of a high chalky hill no wider than the road itſelf, and the declivity begins on either hand at the edge that bounds the highway, and is very ſteep and high. From this hill is a ſurpriſing proſpect to the north and north-weſt over Bagſhot-heath; to the ſouth-eaſt into Suſſex; and to the weſt it is ſo unbounded, that the view is only terminated by the horizon. On this hill, which is called St. Catharines, ſtands the gallows in ſuch a poſition, that the inhabitants of Guilford may, from the High-ſtreet, ſit at their ſhop-doors and ſee the criminals executed.

In the road from Guilford to Epſom, which is fifteen miles, you meet with a town almoſt at every two miles diſtance, in or near which is a handſome ſeat. The road is always good, it being a very hard gravel. On the right hand of the road lie the Downs, which have conſtantly a great number of ſheep feeding on them; and on the left the parks, gardens, and cultivated fields belonging to the ſeveral gentlemen who inhabit thoſe ſeats, all which render the road extremely agreeable.

Cobham is a ſmall town ſituated on the river Mole, ſix miles from Epſom, and eight to the ſouth-weſt of Kingſton, in the road from Guilford to London. Near this town are ſeveral fine ſeats, particularly one belonging to the lord Ligonier; and another the ſeat of Mr. Bridges, which is built in a ſingular taſte, ſomewhat after the manner of an Italian villa, though very plain on the outſide. The principal rooms are richly ornamented; the cielings are gilt; and the offices below are not only convenient, but contrived with great judgment, ſo as to anſwer the purpoſes for which they were deſigned. As the houſe is ſituated on an eminence, it commands a view of the adjacent fields, which are kept in good order. The river Mole paſſes along by the ſides of the gardens, and being made here four times broader than it was naturally, has a happy effect, eſpecially as the banks are diſpoſed into a ſlope, with a broad graſs walk planted on each ſide with ſweet ſhrubs. At one end of this walk is an elegant room, which is a delightful retreat in hot weather, it being ſhaded with large elms on the ſouth ſide, and having the water on the north and eaſt ſides, is extremely cool and pleaſant.

Darking, a town twelve miles to the eaſt of Guilford, and twenty-four to the ſouth-weſt of London, is famous for its meal-trade and its market for poultry, particularly for the fatteſt geeſe and largeſt capons, which are brought hither from as far as Horſham in Suſſex, it being the buſineſs of all the country on that ſide, for many miles, to breed and fatten them; and ſome are ſo large as to be little inferior to turkies. The town ſtands on a rock of ſoft ſandy ſtone, in which are dug convenient cellars. The great Roman highway called Stony-ſtreet paſſes through the church-yard, and is plainly traced two miles to the ſouth of Okeley, and appears to be made of flint and pebbles. This is a prodigious work, it being from ſeven to ten yards broad, and near a yard and a half deep, which is the more remarkable, as in ſome places there is not a flint ſtone to be ſeen within a great diſtance.

In the neighbourhood is a hill which affords a moſt enchanting proſpect, and is much reſorted to by the gentry from Epſom: it is called Box-hill from the abundence of trees, arbours, and labyrinths of box upon it, eſpecially to the ſouth, though on the north ſide it is almoſt covered with yew trees; it was firſt planted with box trees by that famous antiquary Thomas earl of Arundel.

About ſix miles from Box-hill and five miles to the ſouth of Darking, is Leith-hill, which projects about two miles beyond a range of hills that terminates the North Downs to the South. "When I ſaw, ſays a late writer, "from one of thoſe hills, at about two miles diſtance, that "ſide of Leith-hill which faces the Northern Downs, "it appeared the beautifulleſt proſpect I had ever ſeen; "but after we conquered the hill itſelf, I ſaw a ſight "that would tranſport a ſtoic: a ſight that looked like "inchantment and viſion. Beneath us lay open to our "view all the wilds of Surrey and Suſſex, and a great "part of that of Kent, admirably diverſified with woods "and fields of corn and paſture, being every where a-"dorned with ſtately rows of trees. This beautiful vale "is about thirty miles in breadth, and about ſixty in "length, and is terminated to the ſouth by the majeſtic "range of the ſouthern hills: and it is no eaſy matter to "decide, whether theſe hills, which appear at thirty, "forty, and fifty miles diſtance, appear more awful and "venerable, or the delicious vale between you and them "more inviting. About noon in a ſerene day you may, "at thirty miles diſtance, ſee the very water of the ſea "through a chaſm of the mountains. And that which "above all makes it a noble proſpect, is, that at the ſame "time you behold to the ſouth the moſt delightful rural "landſcape in the world; and by a little turn of your "head towards the north you look full over Box-hill, "and ſee the country beyond it; and between that "and London, and over the very ſtomacher of it, ſee "St. Paul's at twenty five miles diſtance, and London "beneath it, with Highgate and Hampſtead beyond it."

The vale beneath Box-hill is for many miles to the eaſt and weſt called Holmeſdale, which is now chiefly overgrown with furze; but was famous for producing ſuch quantities of ſtrawberries, that they were carried by horſe-loads to market.

Kingſton, alſo called Kingſton upon Thames, to diſtinguiſh it from ſeveral other towns of the ſame name, is thus called from its having been the reſidence of ſeveral of our Saxon kings, ſome of whom were crowned on a ſtage in the market-place. It is a populous and well-built town, and in the reigns of Edward II. and III. ſent members to parliament. It has a ſpacious church with eight bells, and in it are the pictures of the Saxon kings

who were crowned here, and alſo that of king John, who gave the inhabitants of this town their firſt charter. Here is alſo a wooden bridge of twenty-two arches over the Thames; a free ſchool erected and endowed by queen Elizabeth; an alms-houſe built in 1670 by alderman Clive for ſix men and as many women, and endowed with land to the value of eighty pounds a year; and a charity-ſchool for thirty boys, who are all cloathed. The ſummer aſſizes for this county are generally held here. Beſides the above bridge, is another of brick over a ſtream that flows from a ſpring, which riſes four miles above the town, and within the diſtance of a bow-ſhot from its ſource forms a brook, that turns two mills. On the top of a hill is a gallery that overlooks the town. A houſe in this town, called Kircomb's Place, was the ſeat of the famous earl of Warwick, ſtiled The Setter up and Puller down of Kings. Here is a good market for corn, and the town carries on a conſiderable trade.

Eſher, a village ſituated near Walton upon Thames, and affording a fine proſpect of Hampton-court and other parts of Middleſex, is famous for the noble ſeats in and near it, particularly Eſher-Place, which was the ſeat of the late Henry Pelham, Eſq; The houſe is a Gothic ſtructure of a browniſh red brick, with ſtone facings to the doors and windows. This houſe was originally one of thoſe built by cardinal Wolſey, but the late Mr Pelham rebuilt the whole, except the two towers in the body of the houſe, which are the ſame that belonged to the old building; and the whole is rebuilt in the ſame ſtile of architecture. There is a fine ſummer-houſe erected upon a hill on the left hand as you enter, which commands a view of the houſe, park, and country round, on both ſides the Thames, for many miles. The park, in which the houſe is ſituated, appears plain and unadorned; but in one part of it is a little wilderneſs laid out in walks, and planted with a variety of evergreen trees and plants, with a grotto in it, and ſeats in different places. The wood in the park is well diſpoſed, and conſiſts of fine oaks, elms, and other trees; and the whole country round appears finely ſhaded with woods.

Richmond, which ſtands twelve miles from London, is eſteemed the fineſt village in the Britiſh dominions, and hence has been termed the Freſcati of England. It was anciently the ſeat of our monarchs, and the palace, for its ſplendor, was called Shene, which in the Saxon tongue ſignifies reſplendent. Here king Edward III. died of grief for the loſs of his brave ſon Edward the Black Prince; and here died Anne the wife of Richard II. who firſt taught the Engliſh ladies the uſe of the ſide-ſaddle; for before her time they rode aſtride. Her dying here gave Richard ſuch a diſlike to the place, that he defaced it; but it was repaired and beautified by king Henry V. In 1497 this palace was deſtroyed by fire, when king Henry VII. was there; but in 1501 that prince cauſed it to be rebuilt, and commanded that the village ſhould from thence forward be called Richmond, from his having borne the title of earl of Richmond, before he obtained the crown. That prince died there, as did alſo his grand-daughter, queen Elizabeth.

The preſent palace, which is finely ſituated, is a plain edifice, erected by the duke of Ormond, who obtained a grant of a conſiderable ſpace of land about Richmond from king William III. as a reward for his military ſervices; but it devolved to the crown on that duke's attainder, in the beginning of the reign of king George I. His late majeſty took great delight here, and made ſeveral improvements in the palace; while queen Caroline amuſed herſelf at her royal dairy, Merlin's cave, the hermitage, and other improvements which ſhe made in the park and gardens of this delightful retreat. Though the palace is unſuitable to the dignity of a king of England, the gardens are extremely fine, without offering a violence to nature, and almoſt every thing here has an agreeable wildneſs, and a pleaſing irregularity, which affords a much higher and more laſting ſatisfaction than the ſtiff decorations of art, where the artiſt loſes ſight of nature, which alone ought to direct his hand.

On entering theſe rural walks you are conducted to the dairy, a neat but low brick building, to which there is an aſcent by a flight of ſteps, and in the front is a handſome pediment. The walls on the inſide are covered with ſtucco: the houſe is furniſhed ſuitably to a royal dairy, and the utenſils for the milk are of the moſt beautiful china. On paſſing by the ſide of a canal, and through a grove, the temple preſents itſelf to view, ſituated on a mount. It is a circular dome, crowned with a ball, and ſupported by Tuſcan columns, with a circular altar in the middle, and to it is an aſcent by very ſteep ſlopes.

Returning by the dairy, and croſſing the gravel walk which leads from the palace towards the river Thames, you come to a wood which you enter by a walk terminated by the queen's pavilion, a neat elegant ſtructure. In another part of the wood is the duke's ſummer-houſe, which has a lofty arched entrance. On leaving the wood you come to the ſummer-houſe on the terrace, a light ſmall building, with very large and lofty windows, to give a better view of the country, and particularly of the noble ſeat called Sion-houſe. In this edifice are two good pictures repreſenting the taking of Vigo by the duke of Ormond.

On paſſing through a labyrinth you ſee near a pond Merlin's cave, a thatched Gothic ſtructure, within which are the following figures in wax; Merlin, an ancient Britiſh enchanter; the learned queen Elizabeth, and a queen of the Amazons. Here is alſo a library, conſiſting of a choice collection of the works of modern authors, neatly bound in vellum. On leaving this ſtructure, which has an antique and venerable appearance, you come to a large oval five hundred feet in diameter, and turning from hence have a view of the hermitage, a groteſque building, which appears to have ſtood many hundred years, though it was built by order of her late majeſty. It has three arched doors, and the middle part, which projects forward, is adorned with a kind of ruinous angular pediment; the ſtones of the whole edifice appear as if rudely laid together, and the venerable look of the whole is improved by the thickneſs of the ſolemn grove behind, and the little turret on the top, with a bell, to which you may aſcend by a winding walk. The inſide is in the form of an octogon, in which are the buſts of the following great men, who by their writings were an honour not only to their country, but to human nature. The firſt on the right hand is the incomparable Sir Iſaac Newton, and next to him the juſtly celebrated Mr. Locke. The firſt on the left hand is Mr. Woolaſton, the author of The Religion of Nature diſplayed; next to him is the Rev. Dr. Samuel Clarke, and in a kind of alcove the honourable Mr. Robert Boyle.

Upon leaving this ſeat of contemplation, you paſs through fields clothed with graſs, corn fields, and a wild ground interſperſed with broom and furze, which afford excellent ſhelter for hares and pheaſants, and here there are great numbers of the latter very tame. From this pleaſing variety, in which nature appears in all her forms of cultivation and barren wildneſs, you come to an amphitheatre compoſed of young elms, through which you paſs to the foreſt walk, which extends about half a mile, and then paſſing through a ſmall wilderneſs you leave the gardens.

At the extremity of the garden on the north-eaſt, is another houſe that belonged to her late majeſty, and near it the houſe of his late royal highneſs Frederic prince of Wales, which is on the inſide adorned with ſtucco. Oppoſite the prince's houſe is the princeſs Amelia's, built by a Dutch architect, the outſide of which is painted. To the weſt of the gardens is ſeen the fine houſes of ſeveral of the nobility and gentry, particularly the lady Buckworth's, and Mr. Geoffrey's, and on the other ſide of the Thames appears Iſleworth.

To return to the village of Richmond. The green is extremely pleaſant, it being ſurrounded with lofty elms, and adorned on each ſide with the houſes of perſons of diſtinction. Among theſe is a handſome edifice that formerly belonged to Sir Charles Hedges, and ſince to Sir Matthew Decker, in the gardens of which is ſaid to be the longeſt and higheſt hedge of holly ever ſeen, with other hedges of evergreens, viſtas cut through woods, grottos, fountains, a fine canal, a decoy, ſummer-houſe, and ſtove-houſes, in which the anana or pine-apple, ſo often mentioned in our treating of Aſia, was firſt brought to maturity in this kingdom. On the north-eaſt ſide of the green is a fine houſe, which belonged to the late Mr.

Heydigger,

Heydigger, and a little beyond it that of the late duke of Cumberland, on paſſing which you come to a ſmall park belonging to his majeſty, well ſtocked with deer, and oppoſite to it is the entrance into the gardens. On the ſide of this green has alſo been erected a theatre, in which plays are acted during the ſummer ſeaſon.

The village runs up the hill to the New-Park, and with the royal gardens ſlopes towards the Thames. There is here an alms-houſe, built by Dr. Duppa, biſhop of Wincheſter, in the reign of king Charles II. in purſuance of a vow made by that prelate, during that prince's exile, for ten poor widows. There is another alms-houſe endowed with above 100l. a year, which, ſince its foundation, has been conſiderably encreaſed by John Mitchell, eſq. Here are alſo two charity ſchools, one for fifty boys, and the other for fifty girls.

On the aſcent of the hill are wells of a purging mineral water, frequented during the ſummer by a great deal of good company. On the top is a moſt extenſive and beautiful proſpect of the country, interſperſed with villages and incloſures; the Thames is ſeen running beneath, and the landſcape is improved by the many fine ſeats ſcattered along its banks.

New-Park is ſituated between Kingſton and Richmond, and was made in the reign of king Charles I. It is the largeſt of any within the environs of London, except that of Windſor, for it is ſaid to be eleven miles in compaſs, and encloſed with a brick wall. In this park is a ſmall hill caſt up, called king Henry's Mount, from which is a proſpect of ſix counties, with a diſtant view of the city of London and of Windſor caſtle. The new lodge, built by the late earl of Orford, is an elegant ſtructure built of ſtone, in a ſquare form, with wings on each ſide of brick. It ſtands on a riſing ground, and affords a good proſpect of the park, eſpecially of a fine piece of water that is in it. Though this park has little more than a wild variety of natural beauties, yet theſe are ſuch as cannot fail of pleaſing thoſe who are as much delighted with views in their rudeſt appearance, as in all the elegance of art and deſign.

Walton, a village ſituated on the Thames, eight miles to the weſt of Kingſton, and oppoſite to Shepperton in Middleſex. It is ſaid that the laſt mentioned county was joined to this town, till about three hundred years ago, when the old current of the Thames was changed by an inundation, and a church deſtroyed by the waves. There is here a curious bridge over the Thames, erected by that public-ſpirited gentleman Samuel Decker, eſq. and completed in the year one thouſand ſeven hundred and fifty. It conſiſts of only four ſtone piers, between which are three large arches of beams and joiſts of wood, ſtrongly bound together with mortiſes, iron pins, and cramps; under theſe three arches the water conſtantly runs; beſides which are five other arches of brick-work on each ſide, to render the aſcent and deſcent the more eaſy; but there is ſeldom water under any of them, except in great floods; and four on the Middleſex ſide are ſtopped up, they being on high ground, above the reach of the floods. The middle arch, when viewed from the river, affords an agreeable proſpect of the country, beautifully diverſified with wood and water, which is ſeen through it to a conſiderable diſtance. The prodigious compaſs of this great arch fills a perſon below with an uncommon ſenſation of awe and ſurpriſe; and his aſtoniſhment and attention are increaſed on his obſerving, that all the timbers are in a falling poſition, for there is not one upright piece to be diſcovered; and at the ſame time conſiders the very ſmall dimenſions of the piers by which the whole is ſupported. In paſſing over the bridge, when you have proceeded paſt the brick-work, the vacant interſtices between the timbers, yield at every ſtep a variety of proſpects, which at the center are ſeen to a ſtill greater advantage. But though each ſide is well ſecured with braces, and rails eight feet high, yet as it affords only a parapet of wide lattice-work, and the apertures ſeem large enough to admit the paſſage of any perſon to go through, provided he climbs or is lifted up, and as the water is ſeen through every opening at a great depth below, thoſe unuſed to ſuch views can hardly approach the ſide without ſome apprehenſions. Theſe openings are purpoſely left to admit a free paſſage for the air, in order to keep the timbers the more ſound, and that the leaſt decay may be the more eaſily perceived, and repaired.

Epſom, a handſome well built town, ſixteen miles from London, abounds with genteel houſes, which are principally the retreats of the merchants and citizens of London, and is a delightful place, open to Banſtead Downs. The town extends about a mile and a half in a ſemicircle, from the church to lord Guilford's fine ſeat at Durdan's; and as Mr. Whatley obſerves, there are ſo many fine fields, meadows, orchards, and gardens, that a ſtranger would be at a loſs to know, whether this was a town in a wood, or a wood in a town. Its mineral waters, which iſſue from a riſing ground nearer Aſhſted than Epſom, were diſcovered in 1618, and ſoon became very famous; but though they have not loſt their virtue, they are far from being in the ſame repute as formerly; however, the ſalt made of them is valued all over Europe. The hall, galleries, and other public apartments, are now run to decay, and there remains only one houſe on the ſpot, which is inhabited by a countryman and his wife, who carry the water in bottles to the adjacent places. Horſe-races are annually held on the neighbouring downs, and there are many fine ſeats in this neighbourhood, beſides Durdan's already mentioned, as the earl of Berkſhire's, lord Baltimore's, the lady Fielding's, &c.

Croydon, a pleaſant town on the edge of Banſtead Downs, ten miles to the ſouth of London, is pretty large, and inhabited by many citizens from London. Among the other buildings is the ancient palace of the archbiſhops of Canterbury, ſeveral of whom have been interred in the church, particularly archbiſhop Whitgift, who built and endowed an hoſpital for a warden and twenty-eight men and women, and a ſchool for ten boys, and as many girls, who are clothed and taught. This town has a great corn-market on Saturdays, chiefly for oats and oatmeal, for the ſervice of London.

Southwark, a borough of conſiderable extent, contains nine pariſhes, and ſends two members to parliament; but as it may rather be conſidered as a ſuburb to London, we ſhall therefore defer any farther deſcription of it till we come to that city.

Dulwich, a very pleaſant village in Surry, five miles from London, where is a ſpring of medicinal water. The fine walk oppoſite to the Green Man, through the woods, affords from the top of that houſe a very noble proſpect; but it is much exceeded by that from a hill behind the houſe, where under a tree, diſtinguiſhed by the name of The Oak of Honour, you have a view of the houſes, churches, and other edifices, from Chelſea to Putney, with all the adjacent villages, together with Weſtminſter, London, Deptford, Greenwich, and over the metropolis as far as Highgate and Hamſtead.

Dulwich is moſt famous for its college, founded and endowed in 1619, by Mr. William Alleyn, who named it The College of God's Gift. This gentleman being a comedian and principal actor in many of Shakeſpeare's plays, it is ſaid, he once perſonating the devil, was ſo frighted at his imagining that he ſaw a real devil on the ſtage, that he from that moment quitted the theatre, devoted the remainder of his life to religious exerciſes, and founded this college for a maſter and warden, who were always to be of the name of Alleyn, or Allen; with four fellows, three of whom were to be divines, and the fourth an organiſt; and for ſix poor men, as many poor women, and twelve poor boys, to be educated in the college by one of the fellows as ſchoolmaſter, and by another as uſher. To this college belongs a chapel, in which the founder himſelf, who was ſeveral years maſter, lies interred. The maſter of this college is lord of the manor for a conſiderable extent of ground, and enjoys all the luxurious affluence and eaſe of the prior of a monaſtery. Both he and the warden muſt be unmarried, and are for ever debarred the privilege of entering that ſtate, on pain of being excluded the college; but as the warden always ſucceeds upon the death of the maſter, great intereſt is conſtantly made by the unmarried men of the name of Allen, to obtain the poſt of warden.

The original edifice is in the old ſtyle of building;

but part of it has been lately rebuilt with greater elegance, out of what has been ſaved from the produce of the eſtate. The maſter's apartments are very richly adorned with noble old furniture, which he is obliged to purchaſe on his entering into that ſtation; and for his uſe there is a library, to which every maſter generally adds a number of books. The college is alſo accommodated with a very pleaſant garden, adorned with walks, and a great profuſion of fruit trees and flowers.

Lambeth, a village ſeated on the Thames, near the ſouth-end of Weſtminſter-bridge, is particularly famous for its containing for ſeveral ages, the palace of the archbiſhop of Canterbury. This ſtructure was firſt erected by Baldwin, archbiſhop of that ſee in 1188, and was rebuilt by archbiſhop Boniface in 1250; but ſeveral of the ſucceeding prelates have added additional buildings. Hence, as the preſent ſtructure has been erected at different periods, it is not at all ſurpriſing, that it has but little appearance of uniformity. However, the edifice, though old, is in moſt parts ſtrong; the corners are faced with ruſtic, and the top ſurrounded with battlements: the principal apartments are well proportioned, and well enlightened. As it is ſituated on the bank of the Thames, it affords a fine view up and down the river, and from the higher apartments, a proſpect of the country each way. This palace has a fine library, and a ſpacious garden abounding in fruit trees.

Vauxhall, a hamlet in the pariſh of Lambeth, is particularly famous for the beauty of the gardens, that have for many years been converted, during the ſpring and ſummer ſeaſons, into a place of genteel entertainment. In the midſt of the garden is a ſuperb orcheſtra, containing a fine organ and band of muſic, with ſome of the beſt voices, and the ſeats or boxes are diſpoſed to the beſt advantage with reſpect to hearing the muſic. In moſt of the boxes are paintings from the deſigns of Mr. Hayman; and in a large and ſuperb pavilion, are ſeveral paintings by the hand of that ingenious artiſt. The trees are ſcattered here with a pleaſing confuſion. At ſome diſtance are ſeveral noble viſtas, where the ſpaces between each are filled up with neat hedges, and on the inſide are planted flowers and ſweet ſmelling ſhrubs. Some of theſe viſtas terminate in a view of ruins; others in a proſpect of the adjacent country, and others are adorned with a painted repreſentation of triumphal arches. There are here ſeveral ſtatues, particularly a good one in marble by Mr. Roubiliac, of the late Mr. Handel, in the character of Orpheus, playing on a lyre. When it grows dark, the garden is inſtantly illuminated with about fifteen hundred glaſs lamps, which glitter among the trees, and render it extremely light and brilliant. Soon after a very extraordinary piece of machinery is exhibited on the inſide of one of the hedges, near the entrance into a viſta; by removing a curtain is ſhewn a fine landſcape, illuminated by concealed lights, in which the principal objects that ſtrike the eye are a caſcade and a miller's houſe. The exact appearance of water is ſeen flowing down a declivity, and turning the wheel of a mill; it riſes up in foam at the bottom, and then glides away. This moving picture attended with the noiſe of the water, has at once a ſurpriſing and pleaſing effect; but the author of London and its Environs, a very uſeful and entertaining work, juſtly obſerves, that "here people being obliged to wait till the curtain is "drawn, and after beholding it for a few minutes, having it again ſuddenly concealed from the view, "when the exhibition is ended for that night, has too "much the air of a raree-ſhew. He adds, that if it "could be contrived to make its appearance gradually "with the riſing of the moon in the ſame picture, which "might ſeem to enlighten the proſpect, and at length "by degrees become obſcured by the paſſing of a cloud "before that luminary, the effect would perhaps be "much more agreeable."

Farnham, a large populous market town, ſeated on the river Wye, on the eaſtern extremity of Surry, and forty-one miles to the weſt-ſouth-weſt of London, was once the greateſt corn-market in England, except Hempſtead and London, particularly for wheat, of which vaſt quantities uſed to be brought here every market-day; but though its corn-market is dwindled, its plantation of hops are ſo much improved, that its trade in that article is ſuperior to that of Canterbury, Maidſtone, and many of the places in Kent; and the hops here being of ſuperior goodneſs, yield a better price than any other in England: indeed all the country about Farnham may be conſidered as one general hop-ground. At this town is a caſtle built by a biſhop of Wincheſter, which is ſaid to have been poſſeſſed in a conſtant ſucceſſion by the biſhops of that dioceſe, ever ſince the reign of king Stephen. This palace is a magnificent ſtructure in the Gothic taſte, deeply moated, and ſtrongly walled in, with towers at proper diſtances. It ſtands upon the edge of a hill, and has a fine park ſtocked with about ſeven hundred head of deer, the property of the biſhop, who has them ſent, together with fruit from the gardens, to ſupply his table at Chelſea. One large and broad ſtreet of the town at the bottom of the hill, fronts the caſtle, in which is an elegant muſic room. The reſt of the town principally conſiſts of a long ſtrait ſtreet, which croſſes it at right angles.

About two miles from Farnham, is More-Park, formerly the ſeat of Sir William Temple, who in his laſt will ordered his heart to be put into a china baſon, and buried under a ſun-dial in the garden, which was accordingly performed. This houſe is ſituated in a valley, ſurrounded on every ſide with hills, and having a running ſtream through the gardens. Going from this ſeat on the left-hand under a high cliff, is a famous natural grotto, which they call Mother Ludloe's Hole, through which runs a ſtrong rill of water. The grotto is large; but diminiſhes and winds away as the ſpring ſeems to have directed. The owner has paved the bottom with a kind of Moſaic tile, and has ſeparated the wider part from the narrower behind, by a little parapet, through which iſſues the ſtream of water, which glides through marble troughs one below another, till it is conveyed out of the grotto, and there murmuring down a conſiderable declivity over many artificial ſteps, falls into the river on the right-hand. From this grotto you command a fine proſpect of the meadows and woods, which lie below and over againſt it, and theſe are again bounded by hills, which render the whole one of the moſt romantic ſituations imaginable.

SECT. X.

Of Hampſhire or Hants; its Situation, Extent, Diviſions, Climate, Produce, Rivers, and principal Places.

THIS county, though called Hampſhire, or Hants, is properly the county of Southampton, and is bounded on the eaſt by Surry and Suſſex, on the ſouth by the Britiſh channel, on the weſt by Wiltſhire and Dorſetſhire, and on the north by Berkſhire. It extends ſixty-four miles in length from north to ſouth, thirty-ſix from eaſt to weſt, and is about one hundred and fifty miles in circumference. It is divided into thirty-nine hundreds, and contains nine foreſts, twenty-nine parks, one city, eighteen market-towns, 253 pariſhes, above thirty-ſix thouſand houſes, and by the moſt modeſt computation a hundred and eighty thouſand inhabitants, who elect twenty ſix members of parliament, two for the county, two for the city of Wincheſter, and two for each of the following towns, Southampton, Portſmouth, Petersfield, Yarmouth, Newport, Stockbridge, Andover, Whitchurch, Lymington, Chriſtchurch, and Newtown.

The air is mild and wholeſome; but a ſmall part, which conſiſts of the low grounds next the ſea, is ſubject to the ſea vapours; but without the bad effects uſually experienced in other countries. The ſoil is generally rich, and the county affords plenty of corn, cattle, wool, bacon, wood, iron, and honey. The ſheep are remarkably good, but ſmall, and valued both for their fleſh and wool. The bacon of this county is eſteemed the beſt in England, and its honey, except that gathered on the heaths, bears a high price; and of this the inhabitants make moſt excellent mead and metheglin. The excellency of the Hampſhire bacon is attributed to the ſwine being ſupplied with plenty of acorns from the New Foreſt and other woods, in which they are ſuffered to run at large. The ſea coaſt here furniſhes oyſters, lobſters, and

other

other ſea-fiſh, and its rivers abound in freſh fiſh, eſpecially trouts. There is no county in England ſo well wooded as this; and though the vaſt conſumption of timber at Portſmouth, Southampton, Redbridge, and other places, ſince the Revolution, in building men of war and ſmaller veſſels, has conſumed great quantities, yet there is no want of timber, a great deal being ſtill left growing; and in New Foreſt there are oaks of ſeveral hundred years growth.

The rivers of this county are the Avon, which enters it at Charford, and running ſouthward diſcharges itſelf into the ſea below Chriſtchurch: the Teſe, which riſes in the northern part of Hampſhire, and running alſo ſouthward forms ſeveral iſlands at Stokebridge, and falls into an arm of the ſea called Southampton-water: the other rivers are the Stowre, and the Itching.

The gentry here delight much in fox-hunting, the woods and downs being proper for breeding and hunting theſe animals; and the beſt fox-hounds are ſaid to be bred in this county. Kerſeys and cloth are made here, though not in ſuch plenty as in the neighbouring counties of Wiltſhire, Somerſetſhire, and Glouceſterſhire; yet enough is made not only for home conſumption, but to ſpare ſome for exportation. The convenient ports and harbours in this county have brought a good foreign trade to it. The principal places in it are the following:

Wincheſter, or Winton, a very ancient city, called by the Britons Caer-Gwent, which ſignifies the White Town, from the chalky hills near it; and by the Saxons Wintanceſter. It is pleaſantly ſituated in a valley between hills on the river Itching, ſixty-ſeven miles to the weſt-by-north of London. This city at a diſtance has a venerable appearance, and yet has many modern buildings, ſome of them very handſome ſtructures, as the college-ſchools, with the epiſcopal palace, built by biſhop Morley. It has one ſpacious ſtreet; but the reſt are moſtly narrow, and the walls greatly decayed. The town-hall is built like an old chapel, ſupported by pillars, and in it are two ailes. Over the court of Niſi Prius, above the judge's ſeat, is fixed againſt the wall the pretended round table of king Arthur, with the names of the knights upon it, in ſuch Saxon characters as no man can read. This is ſaid to be a piece of antiquity of twelve hundred years ſtanding; but Camden, and other authors, imagine it to be of a much later date. In former times there were in this city no leſs than thirty-two pariſh-churches, which are at preſent reduced to five, excluſive of the cathedral; and even theſe are more than are wanted. This laſt church is very plain on the outſide, there not being, except one at the weſt end, either a ſtatue, or a niche for a ſtatue, to be ſeen on the outſide. The tower is carried up but a very little height above the roof, and has no proper finiſhing, but is covered in, as if the building had been left off, which was probably the caſe, it being ſtrong enough to ſupport a very high ſpire. On entering at the weſt door, the church makes a venerable and majeſtic appearance; the vaulting of the roof is beautiful; but the pillars on each ſide are much too thick for the ſpaces of the arches. The entrance into the choir is by a noble flight of ſteps the whole breadth of the middle aile; and the ſcreen, which was deſigned by Inigo Jones, is a fine piece of architecture of the Compoſite order. But his thus joining the Roman to the Gothic ſtile is certainly a ſoleciſm in architecture. The ſtalls in the choir are of fine Gothic workmanſhip, to which the biſhop's throne, erected at the expence of biſhop Mew, would have been a great additional ornament, had it been Gothic and of a piece with the reſt. The ſtone ſcreen, where the high altar is placed, is a fine piece of Gothic work; but the angles of the niches, where formerly were images, being chipped away in order to make room for a number of urns, diſgrace this fine piece.

Within this cathedral are many things worthy of obſervation. It was for ſome ages the burying-place of the Saxon, Norman, and Engliſh kings: the relics of ſome of theſe were collected by biſhop Fox, and being put together into ſix large wooden cheſts, lined with lead, were placed on the great wall in the choir, three on one ſide, and three on the other, with an account whoſe bones are in each cheſt, namely, thoſe of Egbert, Adulphus, Edredus, Edmundus, Canutus, and queen Emma. The tomb-ſtone of William Rufus is in the midſt of the choir, and his bones in a wooden cheſt that ſtands on the top of the ſeptum, which parts the choir and the ſide ailes. The tomb of William of Wickham, who built this cathedral, is very ſpacious, lofty, and magnificent; as is alſo the tomb of cardinal Beaufort, brother to king Henry IV. with ſeveral others.

In the ſouth ſuburb ſtands the college, erected by William of Wickham, which is a noble foundation. The building conſiſts of two large courts, in which are lodgings for the maſters and ſeventy ſcholars, and in the center is a very elegant chapel. In the ſecond court are the ſchools, with a large cloiſter beyond them, and ſome incloſures laid open for the diverſion of the ſcholars. There is alſo a great hall, where the ſcholars dine, and in the middle of the cloiſters is a library, which is a ſtrong ſtone building, well contrived to prevent fire. The ſcholars, after ſtaying here a certain time, may remove to New College, Oxford, which was built by the ſame prelate. Not far from hence is St. Croſſes, an hoſpital for thirteen brothers, with a daily allowance of bread and beer for poor travellers. There is here an infirmary for the reception of ſick and lame, which is a very handſome modern ſtructure, built of red brick, and ſupported by voluntary ſubſcription.

In the place where the antient caſtle ſtood, which was at the ſouth ſide of the weſt gate, upon an eminence commanding the town, king Charles II. began a ſtately palace, upon which he had expended twenty-five thouſand pounds, when his death put a ſtop to the deſign. The ſouth ſide extends two hundred and ſixteen feet, and the weſt three hundred and twenty-ſix; and this ſtructure was ſo far proſecuted, that it was carried up to the roof, and covered. The principal floor of this edifice is a noble range of apartments twenty feet high, and the whole building contains no leſs than a hundred and ſixty rooms. His late majeſty king George I. made a preſent to the duke of Bolton of the fine columns of Italian marble, which were to have ſupported the grand ſtair-caſe, and were ſaid to have been a preſent from the great duke of Tuſcany. This ſtructure was fitted up for the French priſoners taken during the late war.

Wincheſter is about a mile and a half within the walls; but it has no trade, except what is naturally occaſioned by the inhabitants of the city and the neighbouring villages one with another. Here is a great deal of good company, and the many gentry in the neighbourhood add to the ſociableneſs of the place: the clergy are alſo generally very rich and numerous.

The city is governed by a mayor, a recorder, ſeveral aldermen, ſix of whom are always juſtices, with a ſheriff, two bailiffs, and four conſtables. On St. Giles's-hill, near this city, is held, on the 12th of September, one of the greateſt fairs in England for horſes, cheeſe, and leather; and another on Magdalen-hill, Auguſt the ſecond, for the ſame.

Southampton, the county town, is ſituated ſeventy-eight miles to the weſt-ſouth-weſt of London, between two rivers, the Itching on the eaſt, and the Teſe, or Anton, on the weſt, which falls into an arm of the ſea called the Southampton-water, that is very deep, ſo that ſhips of five hundred tons have been built in it. The town has quays for the loading and unloading of merchandize, which renders it a place of good trade, and it is well inhabited by merchants and ſhop-keepers. It is ſurrounded with ſtrong walls and a double ditch, with ſeven gates, and ſeveral watch-towers: it had alſo a ſtrong caſtle to defend the harbour, placed on a high mount; but it is now in ruins. The walls of this old caſtle conſiſted of little white ſtones like the honey-comb on the back of oyſter-ſhells, extremely hard, and gathered from the beach of the ſea, which encompaſſes near half the town. At the ſouth-eaſt corner near the quay is a fort called the Tower, defended by ſome guns. Here is ſaid to be one of the broadeſt ſtreets in England, three quarters of a mile long, well paved and flagged on each ſide, terminating in the fine quay. It contains five pariſh-churches, with one for the French refugees; and an hoſpital called God's-houſe; alſo a free-ſchool founded by king Edward VI. and a charity-ſchool ſupported by ſubſcription for thirty boys, who are cloathed and

taught reading, writing, arithmetic, &c. In the town are four public conduits, to which water is conveyed from the neighbourhood by leaden pipes. Formerly all the Canary brought into the kingdom was obliged to be firſt landed here, till the London merchants, finding this an inconvenience, purchaſed that privilege of the corporation, and had their wines afterwards brought directly to London. Some merchants trade in Port and French wines; but their greateſt dealings are with Jerſey and Guernſey, and to Newfoundland for fiſh. The town is governed by a mayor, and the aſſizes are uſually kept in the town-hall. This place is memorable for the expedient taken by king Canute to ſilence the flattery of his courtiers: for this purpoſe he ſeated himſelf on the bank of the river, dreſſed in all his regal ornaments, and commanded the tide not to approach his footſtool; but it ſoon wetting his feet, he cenſured their impiety and ſervility in ridiculouſly pretending that his power was boundleſs.

About a mile from the town, on the bank of the Itching, is a vaſt pile of earth riſing in the form of a cone from a wide foundation, and called Bevis Mount. This is ſuppoſed to have been an ancient fortification thrown up by the Saxons under the command of Bevis, a Saxon lord, to oppoſe the paſſage of the Danes over the river, who lay encamped on the other ſide. The river is not very large, but the tide forms a kind of bay juſt under the mount, which being contiguous to an eſtate belonging to the late earl of Peterborough, his lordſhip purchaſed it, and converted it into a kind of wilderneſs; and, as it was full of trees and brambles, cut through them ſeveral circular intricate walks and labyrinths. The mount terminates above like Parnaſſus in a kind of fork, and between the two peaks is a bowling-green, or paſture, adorned with fine Italian marble ſtatues. On one ſide of this parterre, declining from the top of one of the peaks to the green, is planted a little vineyard expoſed to the ſouth; and on the very ſummit of the other ſtands a ſummer-houſe elegantly built, with a good cellar under it. There are as many things here fabled of Bevis, as there are in Wales and Cornwall of king Arthur; but both of them have ſuffered much from legendary writers.

Portſmouth, a ſtrong ſea-port town, ſeventy-two miles to the ſouth-weſt of London, in the fiftieth degree forty-eight minutes north latitude, and in the firſt degree ſix minutes weſt longitude. It is the key of England on that ſide, and a regular fortification, at the entrance of a creek of Portſey iſland, which is about fourteen miles in circuit, and ſurrounded at high tides by the ſea-water, of which ſalt is here made: it is alſo joined to the continent by a draw-bridge, where was anciently a ſmall caſtle and town called Port Perus, or Port Cheſter, at which Veſpaſian landed: this town and caſtle ſtood at the upper end of the creek; but upon the retiring of the ſea, the inhabitants followed it, and this gave riſe to the building of the preſent town. Portſmouth is one of the principal places for building and laying up the royal navy, it being furniſhed with wet and dry docks, and vaſt magazines of naval and military ſtores: the rope-houſe in particular is one continued room eight hundred and ſeventy feet, or almoſt a quarter of a mile in length. The yard is defended by a good counterſcarp, double moat, with ravelins in the ditch, double paliſadoes, and works for covering the place where moſt acceſſible.

In Portſmouth haven a thouſand ſail of the largeſt ſhips may ride at anchor. The mouth, which is not much broader than the Thames at Weſtminſter-bridge, is ſecured on the Goſport ſide by Charles's fort, James's fort, Borough fort, and Block-houſe fort, which has a platform of twenty great guns level with the water; on the other ſide by Portſmouth ſtands South Sea caſtle, and a number of additional works have been lately raiſed, ſo as to render the place impregnable. The harbour is ſo ſecured from winds, that they cannot blow from any point of the compaſs to the detriment of the ſhips at anchor in it; and is ſo deep, that a firſt rate man of war can ride at the loweſt ebb without touching the ground; on the other hand, there is a boom, or chain, at its entrance, that in caſe of danger can be raiſed and faſtened immediately on both ſides, ſo as to ſtop any naval force; and if attacked by ſea the enemies ſhips muſt come directly under South Sea caſtle, and afterwards be expoſed to a long train of cannon from the town and the block-houſe, which muſt rake them fore and aft, for a mile together, before they reach the haven's mouth.

A capital convenience to the harbour of Portſmouth is the ſafe and ſpacious road of Spithead, which lies between the continent of Hampſhire and the Iſle of Wight, and is about twenty miles in length, and in ſome places no leſs than three in breadth. It is defended from all winds blowing from the weſt to the ſouth-eaſt by the high lands of the Iſle of Wight, and from the winds of the oppoſite quarter by the main land of Hampſhire, the town of Portſmouth fronting the middle of the road. The very ſands in its neighbourhood contribute to its ſafety; as for inſtance, the Spit lying to the north breaks the ſea on that ſide, as the Horſe's Bank does on the eaſt, and No Man's Land and the Mother Bank on the ſouth. As to the bottom, it is perfectly ſound and good, and the flux and reflux of the ſea repairs all the injuries done by the anchors. The limits of this road are alſo exactly diſtinguiſhed by buoys properly placed.

The town is ſtrong on the land-ſide, it being encompaſſed by a wall, and the many additional works that have been lately made. The men continually employed in the yard amount to at leaſt a thouſand, and their number is greatly increaſed in time of war. The docks and yards are, in ſhort, a kind of marine corporation within themſelves.

The ſituation of Portſmouth is low, and ſo full of water and ditches, as to be eſteemed aguiſh. The ſtreets are dirty, and have conſequently a diſagreeable ſmell; but the continual reſort of ſeamen and ſoldiers render it always full of people, eſpecially in time of war, when the inns and taverns are perpetually crowded; but the landlords bills are generally not the moſt moderate. The place is in want of freſh-water; and, though ſeated in a plentiful country, the great conſumption makes all ſorts of proviſions dear; as are alſo lodgings and fuel. Here is a garriſon and deputy-governor; the church is a large and handſome ſtructure, and from the watch-houſe on the top of the ſteeple is a fine proſpect of the harbour, as well as of Spithead, where ſhips ride before they come in, lying between Portſmouth and the Iſle of Wight. Here is a fine new quay for laying up cannon; and alſo a ſchool, founded by the government, for the inſtruction of youth in mathematics and navigation, to qualify them for the ſea-ſervice.

On the adjoining heath a ſuburb has been built, which, for number of inhabitants, and beauty of the houſes, is like to exceed the town itſelf. It has a church, a chapel, and ſeveral meeting-houſes.

The government of Portſmouth is by a mayor and aldermen, and the civil government is no more interrupted by the military than if there were no garriſon; ſo that there are ſeldom any complaints, either for want of diſcipline among the ſoldiers, or want of prudence in the magiſtrates.

It ought not to be omitted, that on the third of July, 1760, a dreadful fire broke out at twelve in the morning in the dock-yard, in a fine pile of building; in the lower part of which were pitch, tar, oil, and turpentine; in the upper, cables, ſails, and canvas: the next ſtore-houſe was the ſpinning-houſe, and above it hemp: the next, where the bell hung, was a long lane piled up with decayed ſtores: the next to that were the rope-makers laying walk and tarring-walk, over which were ſails, canvas, and ropes. The flames raged with ſuch fury, that all theſe buildings were deſtroyed. It rained very hard all that night, and it is thought the ſtores caught fire by the lightning, which was very terrible, the element appearing all on a blaze. In the ware-houſes that were conſumed were depoſited a thouſand and fifty tons of hemp, five hundred tons of cordage, and about ſeven hundred ſails, beſides many hundred barrels of tar and oil; yet with all this devaſtation, ſuch was the diligence exerted, and ſuch the quantity of ſtores at Chatham, and in other magazines, that the loſs was ſoon ſupplied without much affecting our public concerns, though in the midſt of a heavy, glorious, and expenſive war.

Goſport

Goſport is parted from Portſmouth by a narrow arm of the ſea, and is a pretty large town that has a good trade in time of war; and has lately been improved by an hoſpital and ſome ſtrong fortifications added to thoſe already mentioned.

Andover, a large borough, ſixty-two miles to the weſt-by-ſouth of London, is a great thorough-fare on the direct weſtern road, as well from Newbury to Saliſbury, as from London to Taunton, and all the manufacturing towns in Somerſetſhire, by which means it is greatly enriched. It is very healthy, and pleaſantly ſituated on the borders of the downs commonly called Saliſbury-plain, and is a thriving, handſome, well-built, and populous town. Here is an hoſpital for ſix men, and a free-ſchool.

Near this town is the village called Wey-hill, where the open down-country begins, and where is held the greateſt fair for ſheep in this nation, principally of ewes, for ſtore-ſheep; for the farmers of many of the neighbouring counties come here to buy: at the ſame time are ſold great quantities of leather, hops, and cheeſe. This fair is held on the tenth of October.

We ſhall now deſcribe the Iſle of Wight, which is generally included under Hampſhire. This iſland extends from eaſt to weſt, in ſomewhat of an oval form: it is twenty-one miles in length, twelve in the middle where broadeſt, and ſixty in circumference; but the ſea breaks in ſo far on the north ſide, as almoſt to divide it into two parts. The moſt eaſterly point of the iſland lies oppoſite to Portſmouth, and the moſt weſterly oppoſite the little borough of Chriſtchurch. It is encompaſſed with rocks, eſpecially towards France, of which the moſt noted are the Shingles and the Needles in the weſtern point. Theſe rocks render it in moſt places inacceſſible; and where the ſhore is almoſt level and lies expoſed, as it does towards the ſouth-eaſt, it is fortified by caſtles, forts, and block-houſes.

The air is very healthy, and the ſoil fruitful, it producing corn enough in one year to ſerve the inhabitants ſeven; and this enables them to export great quantities to England and elſewhere. There is every where plenty of hares, rabbets, partridges, pheaſants, lapwings, and variety of wild-fowl; it has two parks ſtocked with deer; but only one ſmall foreſt, ſo that the inhabitants are obliged to fetch their wood from the neighbouring coaſts. Through the middle of the iſland runs a long ridge of hills, which afford paſture for ſheep, whoſe wool being very fine, is in great repute among the clothiers. In the north part is very good paſturage and meadow ground. The ſouthern is in a manner all a corn country, incloſed with hedges and ditches. Here is found the beſt tobacco-pipe clay, and fine white ſand, of which drinking-glaſſes are made. The inhabitants have alſo abundance of fiſh from the ſea.

The natives are generally long lived, vigorous, and able to undergo much labour. The iſland contains four market-towns, of which three ſend members to parliament; four caſtles, fifty-two pariſhes, above three thouſand houſes, and near twenty-ſeven thouſand ſouls, of which it is ſaid five thouſand are fit to bear arms. The militia are ſo well diſciplined by their officers, that they are reckoned as good ſoldiers as any in the kingdom. They are divided into eleven bands, over each of which is a centurion, and the inferior officers are called vintons. There are ſeveral beacons in the iſland, at which continual watch is kept to give notice of the approach of an enemy.

The government of the iſland, which is a poſt of great truſt, is always lodged in a general of the army, an admiral of the fleet, or ſome other perſon of high rank; and under him are all the governors of the forts and caſtles in the iſland, where a regiment, and ſometimes more, are commonly kept in garriſon. In eccleſiaſtical affairs it is ſubject to the biſhop of Wincheſter, and in civil affairs to the county of Southampton. The parliamentary boroughs, which all lie on the north ſide of the iſland, are the following:

Newport, which is the principal town, and is ſeated in the middle of the iſland, eighty-five miles to the ſouth-weſt of London. It was formerly called Medena, and Meden, from whence the whole adjacent country, to the eaſt and weſt of the bay, is called Eaſt and Weſt Meden. It is a very ancient borough by preſcription, but did not ſend members to parliament till the reign of queen Elizabeth; and its charter, by which it is now governed, was granted by king James I. It has a mayor, twelve aldermen, a recorder, and twelve burgeſſes. The town is large and populous, yet its church is only a chapel of eaſe to Cariſbrooke. It is ſeated on the river Cowes, which falls into the ſea near the town and caſtle of Cowes. Veſſels of ſmall burthen come up to the quays, but the larger ſhips are unloaded, and the merchandize brought up hither in barges. The houſes are built of ſtone, the ſtreets are clean, and it has a charity-ſchool well endowed.

Yarmouth is ſeated upon a creek about a mile from its entrance, eight miles to the weſt of Newport, and is governed by a mayor, recorder, aldermen, bailiffs, and common-council. It is defended by a caſtle which has a garriſon, and the houſes, which are handſome, are generally built of ſtone.

Newtown, or Newton, is a little borough at the end of another ſmall creek on the ſame ſide of the iſland, and is governed by a mayor and burgeſſes; but though it has a convenient haven, it is the moſt inconſiderable of all the three boroughs.

The other places of moſt importance are two pretty towns, both named Cowes, one on the eaſt and the other on the weſt ſide of the river of the ſame name. Weſt Cowes is the moſt flouriſhing town in the iſland; it is ſituated in fifty degrees forty-two minutes latitude, and in one degree twenty-ſix minutes weſt longitude, and has a caſtle built by Henry VIII. Here maſters of ſhips, and merchants homeward or outward bound, are furniſhed with money for bills, and the ſhips ſupplied with ſtores of freſh proviſions. Several merchants live here, and have handſome houſes; but the town lying low is not eſteemed very healthy. The caſtle of Eaſt Cowes has been neglected; but in that of Weſt Cowes is conſtantly kept a garriſon, under the command of the deputy-governor of the iſland. This is a place of general rendezvous for merchant ſhips that wait for convoys.

In the Engliſh Channel are four other iſlands oppoſite this county and ſubject to England; theſe are Jerſey, Guernſey, Alderney, and Sark, which, though they lie much nearer to the coaſt of Normandy than to that of England, are within the dioceſe of Wincheſter. They lie in a cluſter in Mount St. Michael's bay, between Cape La Hogue in Normandy and Cape Frebelle in Brittany. The computed diſtance between Jerſey and Sark is four leagues, between that and Guernſey ſeven leagues, and between the ſame and Alderney nine leagues.

Jerſey, the largeſt of theſe iſlands, lies fartheſt within the bay, in forty-nine degrees ſeven minutes north latitude, and in the ſecond degree twenty-ſix minutes weſt longitude, eighteen miles to the weſt of Normandy, and eighty-four to the ſouth of Portland in Dorſetſhire, and in the time of the Romans was called Cæſarea. It is not above twelve miles in length, nor much above ſix where broadeſt, which is at the two extremities. It is defended by rocks and dangerous quickſands. On the north ſide the cliffs riſe forty or fifty fathoms high, which render it inacceſſible on that ſide; but on the ſouth the ſhore is almoſt level with the water. In the weſt part of the iſland is a large tract of land once cultivated and very fertile, but now a barren deſart, cauſed by the weſt winds throwing up ſand from the bottom to the top of the higheſt cliffs. The higher lands are diverſified by gritty, gravelly, ſtoney, and fine mold; the lower by a deep, rich, and heavy ſoil. The middle part of the iſland is ſomewhat mountainous, and ſo thick planted with trees, that at a diſtance it reſembles one entire foreſt, though in walking through it there is hardly a thicket or any thing to be ſeen but hedge-rows and orchards of apple-trees. The valleys under the hills are finely watered with brooks, and have plenty of cattle and ſmall ſheep, with very fine wool, and very ſweet meat, which is aſcribed to the ſhortneſs of the graſs. The horſes are good for draught; but few fit for the ſaddle. The iſland produces variety of trees, roots, and herbs; but not corn enough for the inhabitants, who therefore ſend for it to England and France, and ſometimes to Dantzic. The fields are in-

incloſed by great mounds of earth, raiſed from ſix to eight or ten feet high, proportionably thick and ſolid, planted with quickſets and trees.

There is no place in the world of the ſame extent that produces ſo much cyder, it being computed that in ſome years they have made twenty-four thouſand hogſheads, on which account, and from the cheapneſs of French wine and brandy, it is not worth their while to ſet up malting and brewing. Though the whole iſland is in a manner one entire rock, there is ſcarce a houſe, even on the higheſt hill, but has ſome ſpring near it.

Here are abundance of hares and rabbets; the country alſo abounds with ſea-fowl, and the common ſorts of land-fowl, both tame and wild, eſpecially barnacles, or Soland geeſe, which come only in very cold weather. The partridges of this iſland have red feet and eyes, like a pheaſant, and feathers of various colours. This is indeed a beautiful bird; but the fleſh is not more delicate than that of the grey partridges in England. They have alſo a great variety of ſea fiſh, ſome of which are ſeldom ſeen on our coaſts.

As the air of this iſland is very healthy, thoſe of the inhabitants who are temperate live to a great age; but the coaſt is very ſubject to ſtorms by weſterly winds, from which they have no land to ſhelter them nearer than North America; and there is a vaſt chain of rocks about the iſland, among which the tides and currents are ſo ſtrong and rapid, that the navigation is extremely dangerous to thoſe who are not perfectly acquainted with the coaſt.

The inhabitants, who are computed to amount to above twenty thouſand, have a mixture of Engliſh and French; but French is moſt generally the language both of the pulpit and the bar.

The buildings of this iſland are generally of rag-ſtone; but ſome of the wealthy inhabitants have their houſes fronted with a reddiſh white ſtone, capable of being poliſhed like marble, and of which there is a rich quarry on a hill called Montmado. Their churches and ſome of their edifices are covered with blue ſlate; but the ordinary dwellings are thatched.

The ſtaple manufacture is knit ſtockings and caps, many thouſand pair of which are weekly ſold at St. Helier to the merchants. Their principal foreign trade is to Newfoundland, whither, particularly in 1732, they ſent twenty-four ſhips; theſe proceed from thence to the Mediterranean to diſpoſe of their fiſh.

The chief officer is the governor, who has the cuſtody of his majeſty's caſtles, with the command of the garriſons and the militia of the country, which conſiſts of two troops of horſe-guards, and five regiments of foot, in which are included all the men in the iſland. The civil government is adminiſtered by a bailey, aſſiſted by twelve jurats. They have here alſo what they call an aſſembly of the ſtates, which reſembles in miniature the parliament of Great Britain.

The iſland is divided into twelve pariſhes, which are ſo laid out that each has a communication with the ſea; theſe are ſubdivided into fifty-two vintaines, ſo called from the number of twenty houſes, which each is ſuppoſed to have formerly contained, juſt as in England ten houſes anciently made a tything. The principal places in the iſland are,

St. Helier, the capital, is ſeated in the bay of St. Aubin, where it has an harbour and a ſtone pier. Its ſituation is both commodious and pleaſant, having the ſea on the ſouth-weſt, with a full proſpect of the road for ſhips, and hills on the north that ſhelter it from the cold; on the bottom of theſe hills are meadows refreſhed by a rivulet, that enters the ſtreets and the very houſes, ſo that the water is eaſily brought up by buckets let down through a trap-door, or by pumps. Another large hill projects in a manner over the town, and has an agreeable walk and an extenſive proſpect. The town conſiſts of above four hundred houſes, and the ſtreets are wide and well paved. The ſeat of juſtice ſtands in a large ſquare, with handſome ſtructures on each ſide. Its market, which is on Saturday, reſembles a fair, it being reſorted to by people from all parts of the iſland. The town is chiefly inhabited by ſhop-keepers, artificers, and retailers of liquor, it wanting ſcarce any thing that is either neceſſary or convenient. The corn-market is within a piazza, and the ſhambles in a ſpacious room. The number of the inhabitants is computed to amount to at leaſt two thouſand. In the church, prayers are read alternately in Engliſh and French.

St. Aubin is chiefly inhabited by merchants and maſters of ſhips, who ſettled here for the ſake of its port, which is the beſt and moſt frequented in the iſland; but is too much ſtraitened between hills and the ſea, on which account it is not half ſo large as St. Helier; but the houſes are as neat. Its market is rather an exchange for the merchants. Its pariſh-church, dedicated to St. Brelande, is at ſuch a diſtance, and there is ſuch a bleak hill to paſs over to it, that the better ſort of inhabitants have by contribution erected a handſome chapel in the town. There is a fort here with cannon planted on its baſtions, and a ſtrong pier has been run out into the ſea, which joining that fort, renders the harbour very ſafe, for no ſhips can paſs within the pier without permiſſion. Into this port a veſſel of a hundred and thirty tons may enter at half flood; but larger ſhips and men of war muſt keep without in the road, where is good anchorage.

Guernſey extends from eaſt to weſt in the form of a harp, and is thirteen miles and a half from the ſouth-weſt to north-eaſt, and twelve and a half, where broadeſt, from eaſt to weſt. The air is very healthful, and the ſoil naturally more rich and fertile than that of Jerſey; but the inhabitants neglect the the cultivation of the land, for the ſake of commerce: they are, however, ſufficiently ſupplied with corn and cattle, both for their own uſe, and that of their ſhips.

The iſland is well fortified by nature with a ridge of rocks, one of which abounds with emery, uſed by lapidaries in the poliſhing of ſtones, and by various other artificers. Here is a better harbour than any in Jerſey, which occaſions its being more reſorted to by merchants; and on the ſouth ſide the ſhore bends in the form of a creſcent, encloſing a bay capable of receiving very large ſhips. The iſland is famous for a beautiful flower called *lilium ſarnienſe*, the leaves of which are covered with ſpangles reſembling gold duſt. It is full of gardens and orchards, whence cyder is ſo plentiful, that the common people uſe it inſtead of ſmall-beer, and the more wealthy drink French wine.

The only harbour is at St. Peter le Port, a little market-town on the ſouth-eaſt ſide of the iſland, which has only one long and narrow ſtreet. The mouth of the harbour is well ſet with rocks, and on each ſide defended with a caſtle, one called the Old Caſtle, and the other Caſtle Cornet. This is generally the reſidence of the governor of the iſland, who has the command of the garriſon in this and all the other caſtles. The harbour has a good road, from whence ſhips may ſail with any wind, and from the road paſs under the guns of the caſtle to the pier, cloſe up to the town. This pier is a noble work formed of vaſt ſtones, joined together with great art and regularity: it is not only a ſecurity to the ſhips, but being contiguous to the town is handſomely paved at the top with large ſmooth flag-ſtones, guarded with parapets, and being of a great length and breadth, forms a pleaſant walk, it affording a free proſpect of the ſea and the neighbouring iſlands. Cornet caſtle, which commands both the town and the harbour, ſtands on a rock, is ſeparated from the land by an arm of the ſea, no leſs than ſix hundred yards wide, and not fordable but at low-water in great ſpring tides.

Alderney is about eight miles in compaſs, and is by much the neareſt of all theſe iſlands to Normandy, from which it is ſeparated by a narrow ſtreight called the Race of Alderney, which is a dangerous paſſage in ſtormy weather, when the two currents meet, otherwiſe it is ſafe, and has depth of water for the largeſt ſhips.

The iſland is healthy, and fruitful both in corn and paſture; but has only one church and one town, in which are about two hundred houſes, and a thouſand inhabitants. The iſland is a dependence of Guernſey, and has but one harbour to the ſouth, called Crabbie, which is at a conſiderable diſtance from the town, and capable of receiving only ſmall veſſels. From hence to the weſt is a range of rocks extending three leagues, which having ſeveral eddies are dreadful to mariners, who call them all by

by the name of the Caſquets, from the principal rock at the head of the reſt.

Sarke, or Serke, is another ſmall iſland dependant on Guernſey, and in the middle of all the reſt. The air is ſerene, and generally free from fogs and clouds; and though they have no phyſicians in the iſland, it is common to meet men of upwards of four-ſcore years of age. It contains ſix fine ſprings, and the ſoil, though for the moſt part hot and ſandy, is ſo fruitful as to afford all neceſſaries for its inhabitants, and particularly bears all kinds of roots, as turneps, carrots, &c. and is well ſtocked with apple-trees, of which is made excellent cyder: it alſo produces moſt kinds of grain; but not in any extraordinary quantity. Their paſture is ſhort, though exceeding ſweet, and therefore they have fine mutton; but no more cows than are ſufficient to ſupply them with milk and butter; for they have generally their cheeſe from England. The iſland alſo abounds in ducks, mallard, woodcocks, teal, and other wild fowl; and the cliff-pigeons, at ſome ſeaſons, almoſt cover the whole iſland. Of rabbets they have great plenty, and alſo of a variety of ſea-fiſh.

The trade here extends no farther than to Briſtol and ſome of the weſtern ports, and the chief if not the only manufacture in the iſland is knitting of ſtockings, gloves, and waiſtcoats, in which the men, women, and children are employed. Theſe they trade with to the ports of England, and return with neceſſaries; for which purpoſe they have ſeveral ſmall veſſels.

SECT. XI.

Of Berkſhire; its Situation, Extent, Diviſions, Air, Soil, Produce, Rivers, and principal Towns; with a particular Deſcription of Windſor Caſtle.

BERKSHIRE is bounded on the north by the Thames, which divides it from Buckinghamſhire and Oxfordſhire; on the eaſt by Middleſex and Surry; on the ſouth by Hampſhire; and on the weſt by Wiltſhire and Glouceſterſhire. It is thirty-nine miles in length, twenty-nine in breadth, and a hundred and twenty in circumference, containing about ſeventeen thouſand houſes, eighty-five thouſand inhabitants, ſixty-two vicarages, a hundred and forty pariſhes, ſix hundred and ſeventy-one villages, and twelve market-towns.

The whole county is divided into twenty hundreds, and ſends nine members to parliament, namely, two for the county, two for New Windſor, two for Reading, two for Wallingford, and one for Abingdon.

The air is generally exceeding healthy, the ſoil fertile enough, where cultivated, and the whole county, which is one of the moſt pleaſant in England, is well ſtocked with cattle and timber, particularly with oak and beech in the weſtern parts, and in Windſor foreſt, which alſo abounds with wild-fowl and other game. The weſtern part is the moſt fruitful, eſpecially what is called the Vale of White-horſe, ſo named from the bare ſide of a chalky hill, made to repreſent that animal, which, leſt it ſhould loſe its ſhape, the neighbouring inhabitants once a year take ſome pains in trimming, and then conclude the day with merriment.

The chief produce of the country is corn of all kinds, particularly barley, they having great crops in the above vale, of which they make conſiderable quantities of malt. The rivers Thames and Kennet, the one on the north and the other on the ſouth ſides of the county, ſupply it with fiſh, eſpecially fine large trouts and cray-fiſh. It is ſaid that land in this county bears a better price than in any other at the ſame diſtance from London. Its principal manufactures conſiſt of woollen cloth and ſail cloth.

The rivers of Berkſhire are the Iſis, which here falls into the Thames, and is of great ſervice in conveying its produce to London. The Kennet, which at Reading receives barges of a hundred and ten tons burthen, and is navigable as high as Newbury; and the Lamburn, which indeed is very ſmall, but, contrary to the other rivers of this iſland, is always higheſt in ſummer, and gradually decreaſes as the winter approaches, till at laſt it is entirely dry. The principal places in this county are the following:

Windſor, whoſe delightful ſituation on the winding ſhore of the Thames occaſions its name, is a well inhabited borough twenty-four miles to the weſt of London, ſeated on the ſouth bank of that river, in the midſt of delightful valleys. Its church is a ſpacious ancient building, which ſtands in the high ſtreet of the town, in which is alſo the town-houſe, a neat regular edifice ſupported with columns and arches of Portland ſtone, having at the north end a niche in which is the ſtatue of queen Anne, and on the ſouth the ſtatue of prince George of Denmark, her majeſty's conſort. In the area underneath the town-hall the market is kept every Saturday, and is plentifully ſupplied with corn, meat, fiſh, and all other proviſions.

Many gentlemen of fortune and family conſtantly reſide in the town and its neighbourhood. The duke of St. Alban's has a handſome large houſe on the eaſt part of the town, with pleaſant gardens that extend to the park; and at the ſouth ſide of the town is the houſe of Sir Edward Walpole, a neat regular ſtructure, with large gardens beautifully laid out and deſigned, where marſhal Belleiſle reſided while priſoner in England.

This town is moſt celebrated for its caſtle, the delightful palace of the Engliſh monarchs. It was firſt built for a hunting-ſeat by William the Conqueror, ſoon after his being eſtabliſhed on the throne. It was greatly improved by Henry I. who added many additional buildings. Our ſucceeding ſovereigns reſided in this ſtructure till king Edward III. employed William of Wickham, afterwards biſhop of Wincheſter, to rebuild the whole, which he accompliſhed, and encloſed it with a ſtrong wall. Great additions were, however, made to the caſtle by ſeveral of our monarchs, particularly by Edward IV. Henry VII. and VIII. Elizabeth, and Charles II. This laſt prince entirely repaired the caſtle, and as he kept his court there during the ſummer ſeaſon, he ſpared no expence in rendering it worthy the royal reſidence.

This venerable caſtle is divided into two courts, or wards, with a large round tower between them. The whole contains above twelve acres of ground, and has many towers and batteries for its defence. It is ſituated upon a high hill, which riſes by a gentle aſcent, and enjoys a moſt delightful proſpect: in the front is a wide and extenſive vale, adorned with meadows and corn-fields, with groves on each ſide, and the Thames winding through it; and behind are every where hills covered with woods, as if deſigned by nature for game and hunting. On the declivity of the hill is a fine terras faced with a rampart of free-ſtone eighteen hundred and ſeventy feet in length, which is one of the nobleſt walks in Europe, both with reſpect to its ſtrength, its grandeur, and the fine and extenſive proſpect over the Thames of the adjacent country on every ſide, where, from the variety of fine villas ſcattered about, nature and art ſeem to vie with each other in beauty. From this terras you enter a fine park, which ſurrounds the palace, and is called the little park, to diſtinguiſh it from another much larger. This little park is four miles in circumference, and ſurrounded by a brick wall. The turf is of the moſt beautiful green, and it is adorned with many ſhady walks, eſpecially that called Queen Elizabeth's, which on ſummer evenings is frequented by the beſt company. This park is well ſtocked with deer and other game, and the lodge at the farther end is a delightful habitation.

To return to the caſtle. In the upper court is a ſpacious and regular ſquare, containing on the north ſide the royal apartments and St. George's hall; on the ſouth and eaſt ſides are the royal apartments, thoſe of the prince of Wales, and the great officers of ſtate; and in the center of the area is an equeſtrian ſtatue in copper of king Charles II. in the habit of one of the Cæſars, ſtanding on a marble pedeſtal. The round tower, which forms the weſt ſide of this upper court, contains the governor's apartments: it is built on the higheſt part of the mount, and there is an aſcent to it by a large flight of ſtone ſteps: theſe apartments are ſpacious and noble, and among the reſt is a guard-room or magazine of arms.

The lower court is larger than the other, and is in a manner divided into two parts by St. George's chapel, which

which ſtands in the center. On the north or inner ſide are the houſes and apartments of the dean and canons of that chapel, with thoſe of the minor canons, clerks, and other officers; and on the ſouth and weſt ſides of the outer part are the houſes of the poor knights of Windſor.

The royal apartments in the upper court are uſually termed the ſtar building, from a ſtar and garter in gold in the middle of the ſtructure, on the outſide next the terras. The entrance is through a handſome veſtibule ſupported by columns of the Ionic order, with ſome antique buſts in ſeveral niches. This leads to the great ſtaircaſe, which is finely painted with ſeveral fabulous ſtories from Ovid's Metamorphoſes: in the dome Phaeton is repreſented entreating Apollo to let him drive the chariot of the ſun: in large compartments in the ſtaircaſe are the transformation of Phaeton's ſiſters into poplar-trees, and Cycnus into a ſwan. In ſeveral parts of the cieling are repreſented the ſigns of the zodiac ſupported by the winds, with baſkets of flowers beautifully diſpoſed: at the corners are the four elements, each expreſſed by a variety of figures. Aurora is alſo repreſented with her nymphs giving water to her horſes. The whole is beautifully diſpoſed, and from this ſtaircaſe you have a view of the back ſtairs painted with the ſtory of Meleager and Atalanta.

On the top of the ſtaircaſe you firſt enter the queen's guard-chamber, which is completely furniſhed with arms, beautifully ranged and diſpoſed into various forms. On the cieling is Britannia in the perſon of queen Catharine of Portugal, conſort to king Charles II. ſeated on a globe, bearing the arms of England and Portugal, with the four grand diviſions of the earth making their ſeveral offerings; and on different parts of the cieling are heathen deities, with zephyrs, cupids, and other embelliſhments.

You next enter the queen's preſence-chamber, on the ceiling of which is repreſented queen Catharine, attended by the Virtues, while Fame ſounds the happineſs of Britain, and below Juſtice is driving away Envy, Sedition, &c. The room is hung with tapeſtry repreſenting the perſecution of the primitive Chriſtians.

The cieling of the queen's audience-chamber is painted with Britannia in the perſon of queen Catharine in a car drawn by ſwans to the temple of Virtue, attended by Flora, Ceres, Pomona, &c. The room is hung with tapeſtry, and the canopy is of fine Engliſh velvet ſet up by queen Anne.

On the cieling of the ball-room king Charles II. is repreſented giving freedom to Europe by the figures of Perſeus and Andromeda. The tapeſtry, which was made at Bruſſels, and ſet up by king Charles II. repreſents the ſeaſons of the year; and both this room and all the former are adorned with ſeveral pictures by the greateſt maſters.

The next is the queen's drawing-room, where on the cieling is painted the aſſembly of the gods and goddeſſes: it is hung with tapeſtry repreſenting the twelve months of the year, and adorned with pictures of Lot and his daughters after Angelo, and ſeveral other pieces by the great maſters.

In the queen's bed-chamber the bed of ſtate is of rich flowered velvet, made in Spitalfields by order of queen Anne, and the tapeſtry, which repreſents the harveſt ſeaſon, was alſo made at London. The cieling is painted with the ſtory of Diana and Endymion, and the room adorned with the pictures of the Holy family, by Raphael; Herod's cruelty, by Giulio Romano; and Judith and Holofernes, by Guido.

The next is the room of beauties, ſo named from the portraits of the moſt celebrated beauties in the reign of king Charles II. They are fourteen in number, and all original paintings, by Sir Peter Lely.

Queen Elizabeth's, or the picture-gallery, is adorned with a great number of fine paintings, among which are Rome in flames, by Giulio Romano; the pool of Betheſda, by Tintoret; a Roman family, by Titian; and two uſurers, an admired piece, by the famous blackſmith of Antwerp. There is here likewiſe queen Caroline's china-cloſet, filled with a great variety of curious china, elegantly diſpoſed. This cloſet is finely gilt and ornamented, and likewiſe adorned with ſeveral pictures done by Holbein.

On the cieling of the king's cloſet is painted the ſtory of Jupiter and Leda; and among other curioſities this room contains a large frame of needle-work ſaid to be wrought by Mary queen of Scots, and it is alſo adorned with ſeveral fine paintings, particularly Titian's daughter, by herſelf; a German lady, by Raphael, &c.

It would carry us to too great a length were we to deſcribe the numerous paintings and ornaments of the king's dreſſing-room, bed-chamber, drawing-room, audience-chamber, preſence-chamber, and guard-chamber; the cielings being painted and the rooms adorned with admirable pictures.

St. George's chamber, which is ſet apart for the honour of the moſt illuſtrious order of the Garter, ought not, however, to be omitted, it being one of the nobleſt rooms in Europe. In a large oval in the center of the cieling king Charles II. is repreſented in the habit of the order, attended by England, Scotland, and Ireland; Religion and Plenty hold a crown over his head; Regal Government is ſupported by Religion and Eternity, while Juſtice, attended by Fortitude, Temperance, and Prudence, beat down Rebellion and Faction. To the throne is an aſcent by five ſteps of fine marble, to which the painter has added five more, with ſuch perfection, as to deceive the ſight, and induce the ſpectator to think them equally real. This noble room is a hundred and eight feet in length, and the whole north ſide is taken up with the triumphant entry of Edward the Black Prince, while Edward III. the founder of the order of the Garter, is ſeated on a throne receiving the captive kings of France and Scotland.

The king's chapel is no leſs richly adorned: on the cieling is finely repreſented our Lord's Aſcenſion; the altar-piece is adorned with a noble painting of the Laſt Supper, and the north ſide with the repreſentation of our Saviour's raiſing Lazarus from the dead, his curing the ſick of the palſey, and other miracles, by Verro. The canopy, curtains, and furniture are of crimſon velvet; and the beautiful carved work is done by Gibbons.

St. George's chapel has always been eſteemed for its neatneſs and beauty, and in particular the ſtone roof is accounted an excellent piece of workmanſhip; but what appears moſt worthy of notice is the choir: on each ſide are the ſtalls of the ſovereign and knights companions of the moſt noble order of the Garter, with the helmet, mantling, creſt, and ſword of each knight ſet up over his ſtall, on a canopy of ancient carving curiouſly wrought; and over the canopy is affixed the banner or arms of each knight properly blazoned on ſilk, and on the back of the ſtalls are the titles of the knights, with their arms neatly engraved and blazoned on copper.

The ſovereign's ſtall is on the right hand of the entrance into the choir, and is covered with purple velvet and cloth of gold, and has a canopy and complete furniture of the ſame rich materials; his banner is likewiſe of velvet, and his mantling of cloth of gold. The prince's ſtall is on the left, but has no diſtinction from thoſe of the reſt of the knights, they being all companions and collegues equal in honour.

This chapel has alſo the monuments of ſeveral princes and of the nobility, ſome of which are very magnificent.

Having now finiſhed our deſcription of Windſor caſtle, we ought to take ſome notice of the great park, and the foreſt: the former lies on the ſouth ſide of the town, and opens by a noble road in a direct line to the top of a delightful hill at near three miles diſtance. This road leads through a double plantation of trees on each ſide to the ranger's lodge, the reſidence of the late duke of Cumberland, who greatly improved the natural beauties of the park, and by large plantations, extenſive lawns, new canals, and rivers, rendered this villa an habitation worthy of a prince. This park is fourteen miles in circumference, well ſtocked with deer and other game, with foreign beaſts and birds. The new erected building on Shrub's hill is adorned beneath with a beautiful rural landſcape; a noble piece of water, produced at a great expence from a ſmall ſtream, capable of carrying barges and pleaſure-boats, terminates in a grotto and large

caſcade, and over it his royal highneſs erected a noble bridge conſiſting of one arch, a hundred and ſixty-five feet wide.

The duke alſo greatly improved Windſor foreſt, which joins to the park, and has been rendered famous whereever the Engliſh tongue is underſtood, by the pen of the celebrated Pope. It is indeed generally barren and uncultivated, yet is finely diverſified with hills and vales, woods and lawns, interſperſed with pleaſant villas, towns, and villages.

We ſhall now proceed to the principal towns, and ſhall begin with

Reading, which is ſo called from the Britiſh word Rhedim, that is Fern; which formerly grew in great quantities there. This is a very large and wealthy town, ſeated on the river Kennet, forty miles to the weſt of London, and ſeventy-five to the eaſt of Briſtol; but is ſo near the Thames, that the largeſt barges which they uſe may come up to the town bridge, where they have wharfs to load and unload them. The inhabitants carry on a very great trade, which chiefly conſiſts in this water-navigation to and from London; and they have neceſſarily a great trade into the country for the conſumption of the goods brought by their barges from London, particularly coals, ſalt, grocery-wares, oils, and all heavy goods. By theſe barges they ſend from hence to London great quantities of malt, meal, and timber. There are here three churches, which are St. Mary's, St. Laurence's, and St. Giles's, built of flint and ſquare ſtones in the quincunx faſhion, with tall towers of the ſame materials. Here are alſo two large meeting-houſes, beſides that of the Quakers. Reading contains about eight thouſand people, including a little hamlet at the bridge over the Thames.

This town had formerly a famous abbey, in which the parliament of England has been ſometimes held; it ſtood in a fine ſituation, and large ruins of it are ſtill viſible, built of flint: the walls which remain are about eight feet thick, though the ſtone that faced them is gone. There are many remnants of arched vaults, and the abbey gate is yet pretty entire. This ſtructure was built by king Henry I. on an old abbey formerly erected by a Saxon lady: that prince was buried in it, with his queen, but their monuments are not now to be found. The town is governed by a mayor, twelve aldermen, twelve burgeſſes, and other officers.

Newbury is ſituated fifty-ſix miles from London, in a moſt fruitful plain, watered by the river Kennet, which is made navigable up to the town. The ſtreets are ſpacious, and the market-place large, in which is ſold a great deal of corn, and it contains a hall in which the buſineſs of the corporation is tranſacted. It is governed by a mayor, high-ſteward, aldermen, and burgeſſes. It has a charity-ſchool for forty boys, and the place is noted for good trout and cray-fiſh: all ſorts of proviſions are here likewiſe very reaſonable. Part of Newbury is known by the name of Speenham-land, it riſing out of the ruins of an old town called Spine, the remains of which join to Newbury, in reſpect to which it was called New Borough, and for ſhortneſs Newbury. This town was anciently very famous for making woollen cloth, and the people now are generally employed in making ſhalloons.

Here lived the famous Jack of Newbury, the greateſt clothier in England, he having a hundred looms at work in his own houſe. He flouriſhed in the reign of Henry VIII. and marched at the head of a hundred of his own men, all cloathed in one uniform, and maintained at his own expence, to the battle of Flodden-field, where he behaved with great bravery.

Near this town were fought two bloody battles between the army of king Charles I. and the parliament's forces, the king himſelf being preſent at both.

Maidenhead is an ancient town, twelve miles from Reading, and twenty-eight from London, under the government of a high-ſteward, a mayor, and ten aldermen, out of whom they annually elect two bridge-maſters, to look after the large timber bridge which here croſſes the Thames, for the repair of which the town has three trees annually allowed them out of Windſor foreſt. Maidenhead is ſaid to be ſo called from one of the eleven thouſand virgins which the legend tells us were martyred with St. Urſula. The town is a great thorough-fare, and has many good inns, with a weekly market on Wedneſdays.

Wallingford is an ancient, large, and well-built town, forty-ſix miles to the weſt of London: in the town-hall the aſſizes are ſometimes held, and there the quarter-ſeſſions are always held for the borough. It is ſeated on the Thames, over which is a ſtone bridge of nineteen arches, and four draw-bridges. It has been ſurrounded with a wall a mile and a half in circumference, and had a ſtrong caſtle, but it is now demoliſhed. It had likewiſe four pariſh-churches, but two of them were deſtroyed during the civil wars. It has a free-ſchool, and a handſome market-houſe, in which the magiſtrates keep the ſeſſions, it being governed by a mayor, burgeſſes, &c.

Abingdon, a handſome well-built town, where the aſſizes, ſeſſions, and other public meetings of the county are generally held. It has a ſtately market-houſe built on high pillars, over which is a large hall for the aſſizes. Here are alſo two churches, and the town conſiſts of ſeveral well-built ſtreets, which center in an open and ſpacious place, where the corn-market is kept. The inhabitants make great quantities of malt, which they ſend in barges to London. Here is a good free-ſchool, and a charity-ſchool founded in 1563. The corporation conſiſts of a mayor, two bailiffs, and nine aldermen. This place was famed for religious houſes in the time of the ancient Britons.

SECT. XII.

Of Wiltſhire, or Wilts; its Name, Situation, Extent, Air, Soil, Produce, Rivers, Diviſions, &c. and principal Towns; with a particular Deſcription of Stonehenge, and whatever is moſt curious in this County.

WILTSHIRE receives its name from Wilton, once its capital, which was ſo called from its ſituation on the river Willy, it being from Willy-town contracted to Wilton. It is bounded on the north-eaſt and eaſt by Berkſhire, laſt deſcribed; on the ſouth-eaſt by Hampſhire; on the ſonth-weſt by Somerſetſhire; and on the north-weſt and north by Glouceſterſhire. Its length from north to ſouth is near fifty-four miles, its breadth from eaſt to weſt thirty-eight, and it is about a hundred and forty-two in circumference.

The air is ſweet and healthy, though ſomething ſharp on the hills in winter; but it is mild during that ſeaſon in the vales. The land in the northern parts is generally hilly and woody; in the ſouthern it is rich and fertile; in the middle it chiefly conſiſts of downs, that afford the beſt paſture for ſheep; and in the valleys, which divide the downs, are abundance of corn-fields and rich meadows. In ſome places is found knot-graſs near twenty feet in length, with which hogs are fed, eſpecially about Market Lavington. Its chief commodities are ſheep, wool, wood, and ſtone; of this laſt there are excellent quarries at Chilmark, on the banks of the river Nadder, where ſome of the ſtones are twenty yards in length, and four in thickneſs, without a flaw. The chief manufactures are thoſe relating to the cloathing trade.

The principal rivers in Wiltſhire are the Upper and Lower Avon, the Nadder, the Willy, the Bourne, and the Kennet. The Upper Avon riſes near the center of the county, and running ſouthward enters Hampſhire. The Lower Avon riſes in the northern edge of Wiltſhire. paſſes by Malmſbury, and at length enters Somerſetſhire. The Nadder riſes in the ſouth-weſt point of the country, and flowing eaſtward to Saliſbury, there joins the Avon. The Willy has its ſource on the weſtern ſide of Wiltſhire, and running towards the ſouth-eaſt falls into the Nadder, near Saliſbury. The Bourne has its ſpring in the eaſtern limits of Wiltſhire, and running to the ſouthward joins the Avon a little below Saliſbury; and the Kennet has its ſource near the middle of the county, and running eaſtward enters Berkſhire. Thus is all Wiltſhire ſupplied with rivers, which not only afford great

plenty of fiſh, but add to the beauty and fertility of the country in their ſeveral courſes between the hills and the downs.

This county, which lies in the dioceſe of Saliſbury, contains twenty-one market-towns, a hundred and ſeven vicarages, three hundred and four pariſhes, and nine hundred and fifty villages. It is divided into twenty-nine hundreds, which contain near twenty-eight thouſand houſes, and a hundred and ſixty-eight thouſand inhabitants. It ſends thirty-four members to parliament, namely, two knights for the ſhire, and two burgeſſes for each of the following boroughs: New Sarum, Wilton, Marlborough, Old Sarum, Wooton-Baſſet, Luggerſhall, Great Bedwin, Cricklade, Malmſbury, Chippenham, Devizes, Calne, Weſtbury, Heyteſbury, Hinton, and Downton. The principal places in this county are the following:

Saliſbury, or New Sarum, is pleaſantly ſeated at the confluence of the rivers Avon and Willy, eighty-four miles from London; it roſe out of the ruins of Old Sarum, which ſtands on a hill a little to the north of this city, which is large, well built, and very pleaſant; but its founders ſeem to have run from one extreme to another, for as the old city was in great want of water, this has rather too much, the water running through the middle of every ſtreet, which keeps them always wet and dirty, even in the midſt of ſummer. The cathedral is famous for the height of its ſpire, which is ſaid to be the moſt lofty in England, it being four hundred and ten feet from the ground, and yet the walls are ſo exceeding thin at the upper part of the ſpire, that, upon a view made by the late Sir Chriſtopher Wren, they were found to be leſs than five inches thick; on which that great architect ordered it to be ſtrengthened with bands of iron plates, which have ſo effectually ſecured it, that it is ſaid by the beſt architects to be ſtronger now than when it was firſt built. This venerable ſtructure is in the form of a croſs, and coſt an immenſe ſum of money; but the work on the inſide is not anſwerable to the numerous decorations without. The painting in the choir is mean, it being probably performed when that art was but in its infancy in this kingdom; but the carving is well executed. However, the author of the Tour through Great Britain obſerves, that it is rather a fine church, than finely adorned. The following lines ſhew the number of its windows, pillars, and gates:

As many days as in one year there be,
So many windows in one church we ſee;
As many marble pillars there appear,
As there are hours throughout the fleeting year;
As many gates as moons one year do view:
Strange tale to tell, yet not more ſtrange than true!

There are ſome very fine monuments in this church; particularly in what is called the Virgin Mary's chapel, is a noble one of the late duke and ducheſs of Somerſet. The cloyſter is a hundred and ſixty feet ſquare, and the inner cloyſter thirty feet wide. Over the eaſt part of the cloyſter is a ſpacious library. The cathedral, with the cloſe adjoining, where the prebendaries live, make a noble appearance. The chapter-houſe is an octagon no leſs than a hundred and fifty feet in circumference, yet the roof has no other ſupport in the center than a ſmall marble pillar. The corporation conſiſts of a mayor, recorder, aldermen, &c. and the town-houſe, which makes a noble appearance, is adorned with a very fine original picture of queen Anne, done by Dahl.

Wilton, an ancient borough town, once ſo conſiderable that it gave name to the county, ſtands near the junction of the Nadder with the Willy, ſeven miles from Saliſbury, and eighty-ſix from London, but is now a mean town, though it ſends two members to parliament, and is the place where the knights of the ſhire are choſen. It has, however, a manufacture of carpets, which is carried to great perfection, and many of the carpets made there, being very beautiful, are ſold in London at a good price.

Wilton houſe is ſituated in a pleaſant vale, with the town of Wilton on one ſide, and a ſpacious park on the other. The canal before the houſe lies parallel with the river, and on entering the court-yard you ſee a noble column of porphyry, on the top of which is a fine marble ſtatue of Venus, of excellent workmanſhip. The houſe is a noble pile of building, deſigned by the celebrated Inigo Jones, and the rooms are adorned with the moſt beautiful ſtatues and paintings. The great geometrical ſtair-caſe has been deſervedly admired, it being the firſt of the kind in England; and the grand apartment is a ſuperb piece of architecture, particularly the ſaloon, which is ſixty feet long, thirty high, and thirty broad. "When you have entered theſe grand apartments, ſays "a late writer, ſuch varieties ſtrike upon you every way, "that you ſcarce know to which hand to turn: on one "ſide you ſee ſeveral rooms adorned with paintings, ſo "curious and various, that you leave them with reluc-"tance; and looking another way, you are called off by "a vaſt collection of buſts and pieces of the greateſt an-"tiquity of the kind, both Greek and Roman. At one "end of the grand room is the celebrated family pic-"ture, by Vandyke, twenty feet long, and twelve feet "high, containing thirteen figures as big as the life." This room is alſo adorned with a great number of family pictures.

In moſt of the apartments the marble chimney-pieces are of the moſt exquiſite workmanſhip, all carved in Italy, with many curious ſtatues, baſſo relievos, and pictures, by the greateſt maſters. The loggio in the bowling-green is ſupported by beautiful pillars, and adorned with niches and ſtatues. The grotto has its front curiouſly carved, and all the inſide is caſed with marble; it has black columns of the Ionic order, with capitals of white marble, and four fine baſſo relievos from Florence.

The front of the houſe next the gardens is eſteemed one of the beſt pieces of the celebrated Inigo Jones, and is a hundred and ninety-four feet in length. The gardens are on the ſouth ſide of the houſe, and extend beyond the river, a branch of which runs through a part of them. To the ſouth of the gardens is the great park, which reaches beyond the vale, and the view opens into Saliſbury-plain. Here is alſo a hare warren, as it is called, which has been for many years a ſanctuary for the hares; but the neighbouring gentlemen complain that it ſpoils their ſport, for if they put up a hare within two or three miles of it, ſhe always runs to the warren, and an end is put to their purſuit: beſides, theſe animals are of great prejudice to the corn.

Saliſbury-plain is very delightful, as well as extenſive, the numerous flocks of ſheep all round are a pleaſing ſight, and it is not uncommon for theſe flocks to contain from three to five thouſand, all belonging to one man.

On this plain are a great number of barrows, or little hills, thrown up over graves; alſo the remains of temples, and the traces of many old Britiſh, Roman, Saxon, and Daniſh camps and fortifications. But the greateſt curioſity in this county is that noble monument of antiquity called Stone-henge, which Inigo Jones endeavoured to prove to be the remains of a temple of the Tuſcan order, built by the Romans to the god Cœlum, or Terminus; but the learned doctor Stukeley has endeavoured to prove it to be a temple built by the ancient Britons. It received its name from the Saxon Rode-hengenne, or hanging-rocks; and in Yorkſhire hanging rocks are ſtill called henges.

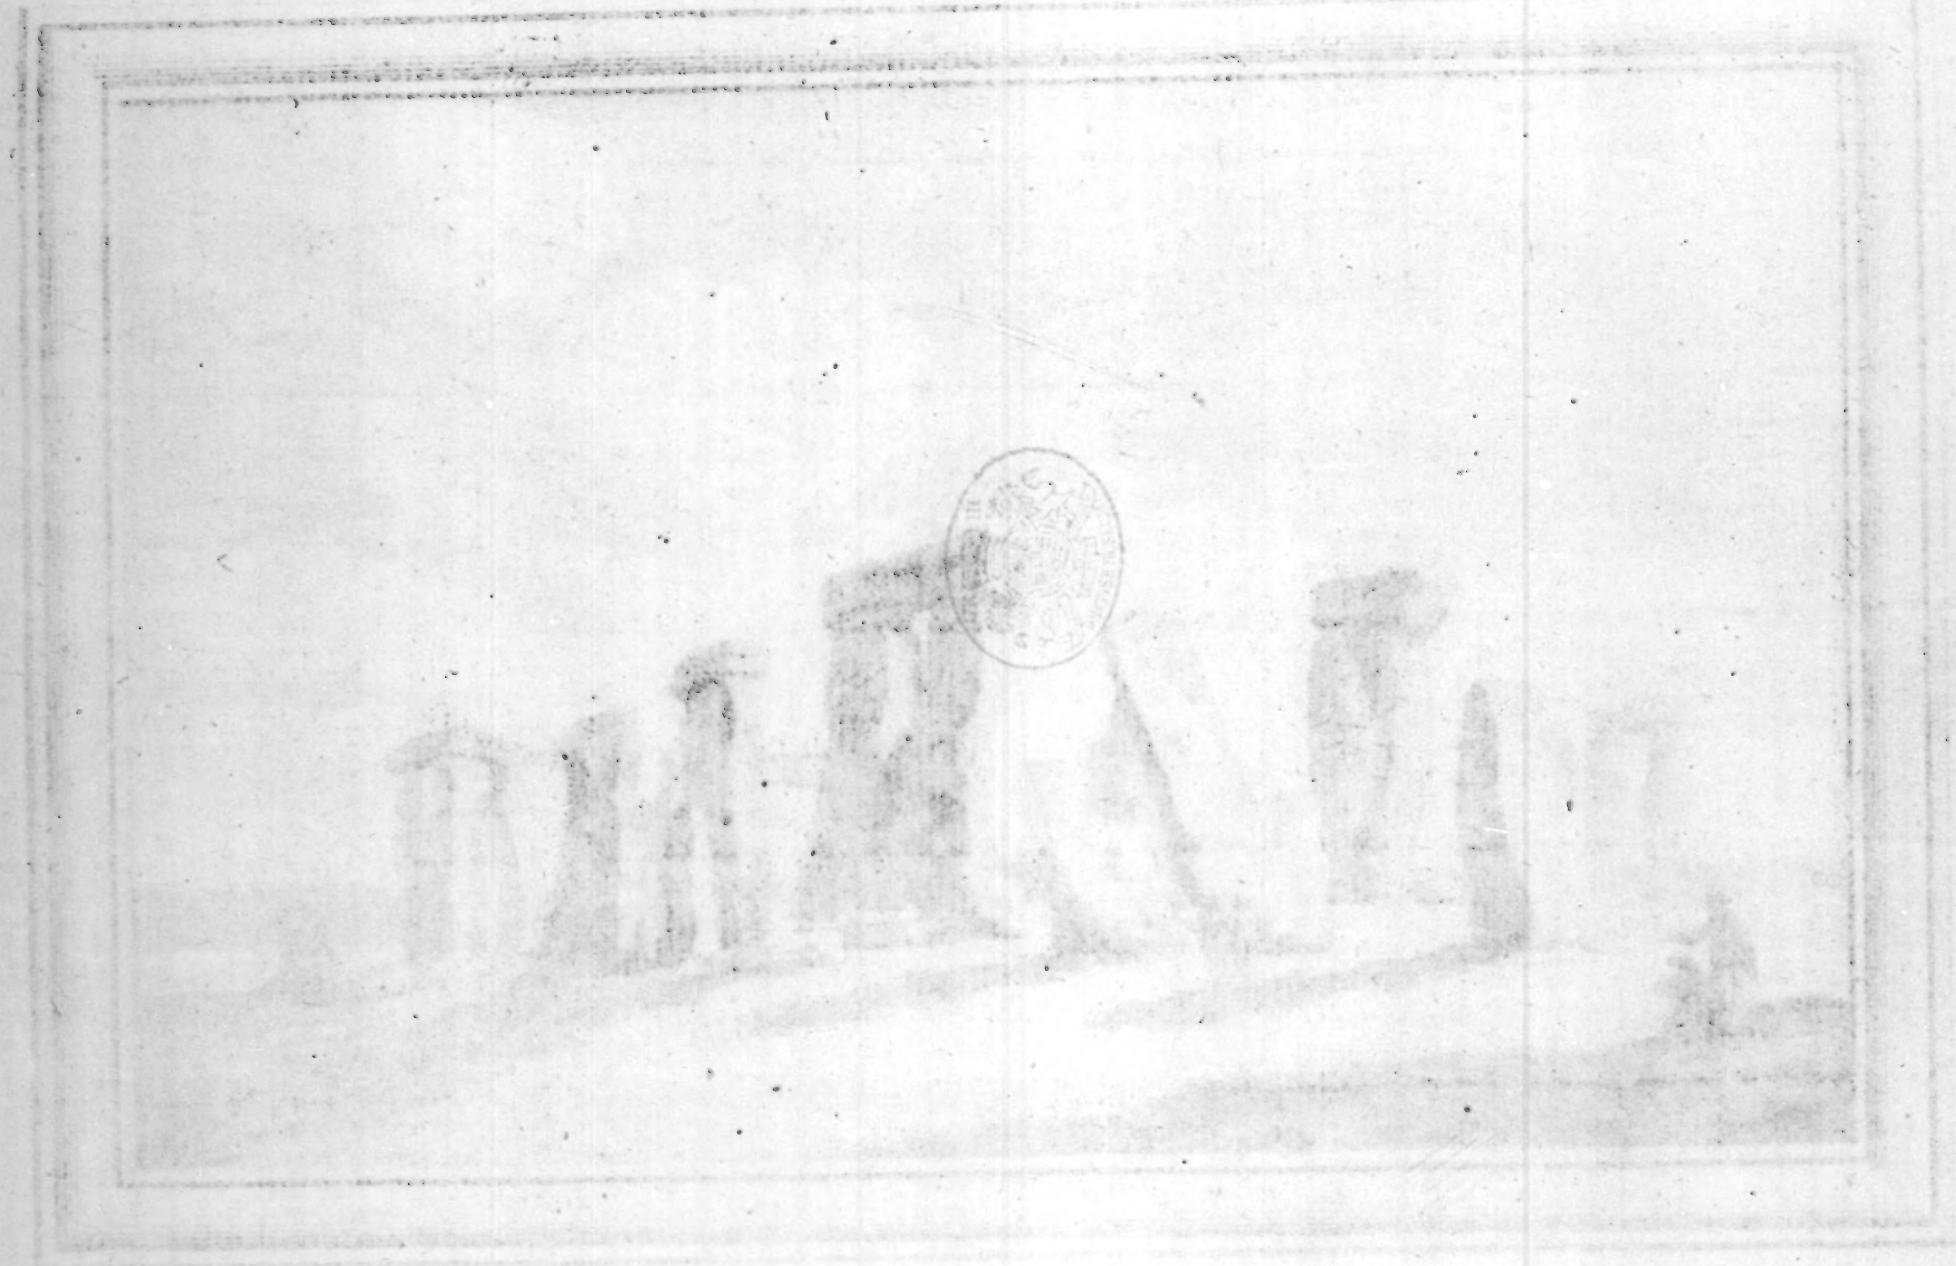
Stone-henge is ſituated in Saliſbury-plain, ſix miles to the north of Saliſbury. It has the river Avon to the eaſt, and a brook that runs into the Willy on the weſt, which ſtreams encompaſs it half round, at the diſtance of two miles, forming as it were a circular area of four or five miles diameter, compaſſed by gentle acclivities. This antiquity ſtands on the ſummit of a hill, which riſes with a very gentle aſcent.

At the diſtance of about half a mile it has a ſtately and auguſt appearance, and as you advance nearer, eſpecially up the avenue on the north-eaſt ſide, where the remains of this wonderful ſtructure are moſt perfect, it fills the eye in an aſtoniſhing meaſure. It is encompaſſed with a circular ditch, and after this is paſſed you proceed a hundred and eight feet to the work itſelf, which is a hundred and eight feet in diameter. "When we enter the build-

"ing,

Stone-henge

Hooker sc.



"ing, says Dr. Stukeley, whether on foot or on horse-"back, and cast our eyes on the yawning ruins, we "are struck with an extatic reverie, which none can "describe, and they only can be sensible of that feel it. "When we advance farther, the dark part of the pon-"derous imposts over our heads, the chasm of sky be-"tween the jambs of the cell, the odd construction of "the whole, and the greatness of every part, surprizes. "If you look upon the perfect part, you fancy entire "quarries mounted up into the air: if upon the rude "havock below, you see, as it were, the bowels of a "mountain turned inside outwards."

The stones are supposed to have been brought from the Grey Wethers, upon Marlborough downs, which is sixteen miles distant from the place; but the difficulty in bringing them hither must appear inconceivable. The stone at the upper end of the cell, which is fallen down and broke in half, is, according to Dr. Hales, twenty-five feet in length, seven in breadth, and at a medium three and an half in thickness, and amounts to six hundred and twelve cubic feet. Rude as the work seems, there is not a stone that has not felt more or less the chissel. The upright stones are made to diminish a little every way, by which means the imposts project two feet seven inches, which is very considerable in a height of eighteen feet. On the top of each of the upright stones is a tenon ten inches and a half in diameter, and made exactly to fit the mortises made in the imposts. On the outside the imposts are rounded a little, to humour the circle, but within they are straight and make a polygon of thirty sides, which, without injuring the beauty of the work, adds to its strength. The height of the uprights and imposts is ten cubits and an half, the uprights being nine cubits, and the imposts one and a half.

Of this outer circle, which in its perfection consisted of sixty stones, thirty uprights, and thirty imposts; there are seventeen uprights left standing, eleven of which remain contiguous by the grand entrance, which is somewhat wider than the rest, with five imposts upon them. One upright at the back of the temple leans upon a stone of the inner circle, and six others lie upon the ground, whole or in pieces. Somewhat more than eight feet from the inside of this exterior circle is another of forty smaller stones, without any imposts, which, with the outer circle, form as it were a circular portico. These are a cubit thick, and four cubits and a half in height, being every way half of the outer uprights. Of these nineteen are only left; of which eleven are only standing. But besides this outer portico, which is three hundred feet in circumference, there is an inner one, which originally composed about two-thirds of an oval; the outer part of this is formed of certain compages of stones, which Dr. Stukeley calls *trilithons*, because each of these compages is formed of two upright stones, with an impost on the top. The stones of which these *trilithons* are composed are really stupendous, and cannot fail of filling the beholder with surprize. These stones diminish very much towards the top, probably to take off from their weight, and they rise in height and beauty of the stones from the lower end on each side next the principal entrance to the upper end, and are, upon a medium, twenty feet high; but the imposts on the top are all of the same size.

On the inside of the oval is a lesser oval of nineteen stones, somewhat of a pyramidical form; these are two feet six inches in breadth, one foot and an half thick, and upon a medium eight feet high; they rising in height as they approach the upper end of this inclosure. The space within it has been called the *adytum*, or the Holy of holies, it being supposed that none entered it but the druids, or British priests, who offered their sacrifices on the altar at the upper end. This altar is composed of a kind of blue coarse marble, twenty inches thick, four feet broad, and, according to Mr. Webb, sixteen feet in length. All the stones added together, with which this whole temple was built, make just a hundred and forty. This is the solution of the mighty problem that has so much perplexed the vulgar.

As the most early method of building temples, says our author, was to make them open at the top, this is a proof of the prodigious antiquity of this fabric. It must be owned, that they who had a notion that it was degrading the Deity to pretend to confine him within a limited space, could not easily invent a grander design for sacred purposes. Here space indeed is not marked out and defined, but with the utmost freedom. Here the presence of the Deity is intimated, but not bounded.

On the downs, about two or three miles from Marlborough, are abundance of loose stones, lying scattered about the plain, of the same kind with those of Stonehenge, and some larger, they are called by the country people the Grey Wethers, they appearing at a distance not unlike sheep straggling upon the downs. They are found to be a sort of white marble, and lie upon the surface of the earth in infinite numbers, and of all dimensions. They are loose and detached from any rock, and Dr. Stukeley imagines that they have lain there ever since the creation.

Marlborough, so called from its hills of chalk, which was anciently called Marl, is seated on the river Kennet, in a chalky soil, seventy-five miles to the west of London, and contains two parish-churches and about five hundred houses. The streets are broad and paved, and it is governed by a mayor, aldermen, and burgesses. It had formerly a castle at Marlborough Mount; this Mount was the key of the castle, and is now converted into a pretty spiral walk, on the top of which is an octagonal summer-house, from whence you have a pleasant view over the town and country. Near Marlborough are the remains of several religious houses, particularly of a priory, the gate-house of which is still standing.

Between Marlborough and Newbury is Savernack forest, which is about twelve miles in circumference, well stocked with deer, and rendered delightful by the many vistas cut through the woods and coppices with which it abounds. Eight of these vistas meet like so many rays of a star in a point near the middle of the forest, where the late earl of Ailesbury, to whom it belonged, prepared the ground for erecting an octagon tower, whose sides were to correspond with the vistas; through one of which you have a view of the seat at about two miles distance, called Tottenham, from a park of that name, in which it is situated, contiguous to this forest. This is a stately edifice, erected after the model and under the direction of our modern Vitruvius, the earl of Burlington, who, to the strength and convenience of the English architecture, has added the elegance of the Italian. The house has four towers and four fronts, each differently beautified; to which are now added four wings, in which are rooms of state, a noble and capacious library, containing a collection of several thousand volumes in all languages, especially the modern. The beauty and delightfulness of the buildings are much augmented by the large canals, the spacious and well-planted walks, with which it is surrounded.

The Devizes is seated on high ground about two miles from the bottom of hills that keep off the eastern winds, in a rich soil eighty-nine miles to the west of London. It is a large town, consisting chiefly of two long parallel streets, the houses mostly of timber, but of a very good model. It has two churches, besides a chapel and a dissenting meeting house. The corporation consists of a mayor, a recorder, eleven masters, and thirty-six common council. On the utmost part of the Rundway hill, which overlooks the town, is a square single-trenched camp; and there have been discovered in its neighbourhood several hundred pieces of ancient Roman coin of different emperors, and in 1714 was dug up a large urn with Roman coins, and a number of little brass statues of several of the heathen gods and goddesses. The inhabitants make a great deal of malt; their principal manufacture is woollen cloth, especially druggets, and the market is much frequented for all sorts of cattle, wool and horses; but it has great scarcity of water.

SECT. XIII.

Of Dorsetshire; its Name, Situation, Extent, Air, Soil, Produce, Rivers, and principal Towns; with a Description of the Peninsulas of Portland and Purbec.

THIS county was anciently called Durotriges by the Romans, and by the Britons Dwn Gwyr, both of which signifies Dwellers by the Water-side. This county

county is bounded on the north by Somerſetſhire and Wiltſhire; on the eaſt by Hampſhire; on the ſouth by the Britiſh channel; and on the weſt by Devonſhire and part of Somerſetſhire, extending about fifty miles in length from eaſt to weſt, where broadeſt about thirty, and near one hundred and fifty in circumference.

The air is for the moſt part very good and wholeſome. on the hills it is however ſomewhat bleak and ſharp, but it is very mild and pleaſant near the coaſt.

The ſoil is generally rich and fertile, though in ſome parts exceeding ſandy; the northern part, which was formerly divided by a range of hills from the ſouthern, was anciently overſpread with foreſts, but now affords good paſture for cattle, while the ſouthern part chiefly conſiſts of fine downs, and feeds incredible numbers of ſheep. The inhabitants have not forgot what king Charles ſaid of Dorſetſhire, that he never ſaw a finer country either in England or out of it. Indeed the downs and hills are covered with great flocks of ſheep, whoſe fleſh is ſweet and delicate, and wool ſo fine, that it is much covetted by the clothiers, and the valleys abound with other cattle. The huſbandman reaps an ample return for his toil and labour, his grounds generally producing a profuſion of corn, or of flax and hemp, which laſt is allowed to be the beſt that grows in all his majeſty's dominions. Here are alſo plenty of fowl, as poultry of all ſorts, ſwans, woodcocks, pheaſants, partridges, field-fares, &c. The chief commodities are corn, cattle, wool, fiſh, fowl, hemp, fine Portland ſtone, and ſome marble. The iſle or rather peninſula of Purbec alſo furniſhes a particular kind of ſtone, called by its name, and tobacco-pipe clay. This county is alſo famous for its linen and woollen manufactures, and fine ale and beer.

The principal rivers of this county are the Stour, which riſes in Somerſetſhire, but ſoon enters into this county, running ſouth to Sturminſter, where making an angle, it forms a courſe nearly weſt-ſouth-weſt, and leaves Dorſetſhire about five miles below Winborn in Hampſhire, and ſoon after falls into the ſea. The Froom riſes in the eaſt end of the county, and running chiefly weſtward, falls into the bay called Pool-harbour. Both theſe rivers afford plenty of fiſh; but the tench and eels of the Stour are particularly famous.

The coaſt of Dorſetſhire is very diſſimular, it being in ſome places bounded with high lands and cliffs, and in others with only a beach of pebbles; the cliffs are in ſome parts compoſed of ſand, earth, and loamy clay, in others they conſiſt of chalk, but very few of ſtone, except in the iſlands.

This county lies in the dioceſe of Briſtol and contains ſixty-eight vicarages, two hundred and forty-eight pariſhes, upwards of twenty-one thouſand nine hundred houſes, and about one hundred and nine thouſand ſeven hundred inhabitants. It is divided into twenty-eight hundreds, and ſends twenty members to parliament, of which two are knights of the ſhire, and two for each of the following towns, Dorcheſter, Pool, Lime, Bridport, Shaftſbury, Wareham, Corfe-Caſtle, Weymouth, and Melcomb-Regis; for though theſe two laſt are united each ſends two. The principal places in this county are the following:

Dorcheſter, the county town, is clean and regularly built, and is ſituated one hundred and twenty-eight miles to the ſouth-weſt of London, is encompaſſed by the foundations of an ancient Roman wall; but to the eaſtward a ſtreet is built upon it, and the ditch filled up; for on that ſide the town is ſwelled out into a conſiderable ſuburb or village, named Fordington or Farington, which has a church. There are three other churches in the town, and the ſtreets are wide and handſome. On the ſouth and weſt ſides, without the walls, is planted an agreeable walk of ſycamores. The banks of the river are here ſteep, the town ſtands on high ground. Beyond the river are meadows and warm ſandy lands. At a ſmall diſtance is the noble Roman amphithreatre called by the vulgar Maumbury, and the terras on the top is a common place of rendezvous, it affording an agreeable circular walk, which has a proſpect of the town and of wide plains of corn fields all round.

Weymouth is a clean and agreeable town, conſidering its low ſituation, it ſtanding cloſe to the ſea. It is ſituated eight miles to the ſouth of Dorcheſter, and one hundred and thirty-two to the weſt-ſouth-weſt of London. It is well built, and has an excellent harbour, defended by two forts. Many ſubſtantial merchants reſide here, who have a conſiderable number of ſhips, and carry on an extenſive trade, not only to France, but to Portugal, Spain, Newfoundland, and Virginia, and they have a cuſtom-houſe, and a good quay. Without the harbour ſtands Sandfoot caſtle, and oppoſite to them is Portland-caſtle, ſeated in the iſle of that name. It is joined to Melcomb Regis by a wooden bridge over the little river Wey. The united towns have a church, and about four hundred houſes. In Weymouth is a chapel upon a ſteep rock, and there are ſixty ſteps to go up to it. They are governed by a mayor, ſeveral aldermen, and a recorder, and each ſends two members to parliament.

Portland, which was formerly an iſland, is now joined to the continent by a ſhelf of ſand, thrown up by the ſea. It is ſituated in the fiftieth deg. thirty min. latitude, and in the ſecond deg. forty-eight min. weſt longitude. It is about ten miles in circumference, and thinly inhabited, yet affords plenty of corn, and paſture for ſheep; but wood and coals are ſo ſcarce that the inhabitants, are generally obliged to make uſe of cow dung dried in the ſun for fuel. The natives are for the moſt part ſtone-cutters, for from this peninſula come our beſt and whiteſt free-ſtone, with which the cathedral of St. Paul, and all the moſt magnificent edifices in the city of London, are principally built.

The whole iſland is little more than one continued rock of free-ſtone, and the height of the land is ſuch that when the weather is clear and ſerene one may ſee from thence above half over the Channel to France, though it is here very broad.

Thoſe who are delighted with natural curioſities are greatly amuſed here with ſeeing in the midſt of the ſtone a great number of ſhells of oyſters, muſſels, cockles, &c. and above all ſpirals, or ſcrews as they are vulgarly called, which every where abound in the ſtone; they are perfectly ſolid, and nicely coiled about as it were an imaginary axis. Theſe being of the ſame ſubſtance as the ſtone, are very brittle, and generally break in taking out.

In ſome quarries on the ſouth-weſt part of the iſland is found a ſort of ſtone which they call ſugar-candy ſtone, of which there are two ſorts, one pale like white ſugar-candy; and the other of an amber-colour like brown ſugar-candy; and indeed they ſo reſemble ſugar-candy in the lump, that any perſon might be impoſed upon by them till his tongue and teeth convinced him that they were only an inſipid exudation of juices petrefied and cryſtallized by nature in this form.

To prevent any ſhips being embayed to the weſt of Portland, and driven a-ſhore on Portland Race, which extends to the main land, two light houſes are erected on the two points of the peninſula. Not far from theſe light houſes, on the ſouth ſide of the iſland, is a very remarkable hole through the earth, wide on the top and narrowing about ſeven or eight feet downwards where it opens into a large ſubterranean cavern, where you ſee the waters of the ſea, the ſight and noiſe of which in boiſterous weather fill the mind with terror: ſo large is this cave, that ſome ſmall craft with their ſails up have been driven from the ſea into it.

Not far from Portland lies the peninſula of Purbec, which was formerly full of heaths, woods and foreſts, well ſtocked with fallow deer; but there is at preſent good lands towards the ſouthern part of it, and under ground there are veins of marble and different kinds of ſtone. This peninſula is ten miles in length; but not more than five or ſix in breadth, and there is a good paſſage to it by land. At the firſt entrance into this peninſula is a plain of barren heathy ground, repleniſhed with red deer, diſjoined from the reſt by an almoſt continued ridge of high hills, which when once paſſed there are grounds that afford excellent paſture for ſheep and other cattle, with plenty of good corn as alſo quarries of a laſting kind of flat ſtone, uſed in London for paving the foot-ways or ſides of London and Weſtminſter bridges, and of the ſides of the ſtreets; alſo ſpotted and blue marble.

Pool, the moſt conſiderable ſea-port in all this part of England, is ſeated one hundred and ten miles to the weſt-by-ſouth of London, and twenty-four to the eaſt of Dorcheſter, at the bottom of a great bay or inlet of the ſea, which entering at a narrow mouth, opens to a great breadth, and comes up to the very ſhore of the town. It alſo runs almoſt weſt to Wareham, a little below which it receives the Froom and Peddle. At the entrance of this large bay is an iſland called Brankſey, which lying in the very mouth of the paſſage divides it into two, and has an old caſtle, built to defend the entrance. The town conſiſts of a church, and about ſix hundred houſes, diſpoſed into broad paved ſtreets, and has a manufactory of knit hoſe. It was formerly only a place inhabited by a few fiſhermen; but was greatly enlarged in the reign of Henry VI. when the inhabitants had the privilege of walling it round. It was alſo made a county of itſelf, and allowed to ſend two members to parliament; but ſince that time it has much decayed, though it has ſtill ſome trade, and a number of merchants, who every year ſend ſhips to the Newfoundland fiſhery. This place is famous for the beſt and largeſt oyſters in all this part of England, which the people of Pool pickle, and, barrelling them up, ſend them not only to London, but to Spain, Italy, and even the Weſt-Indies. The town is governed by a mayor, a ſenior bailiff, four other juſtices, and an indeterminate number of burgeſſes.

Wareham, a town ſeated between the rivers Froom and Peddle, where they fall into the Luckford lake, one hundred and nine miles from London, and twenty miles from Dorcheſter. It was once a very large place and had ſeveral churches, which are now reduced to three. It was alſo walled round, and had a caſtle, but it has ſuffered ſo much by the various turns of fortune, and particularly by having its harbour choaked up, that it is at preſent only the ſhadow of what it was.

Lyme, a ſea-port town, one hundred and forty-four miles from London, and twenty-three miles from Dorcheſter, is ſituated on the ſea-ſhore, and though it has neither creek nor bay, road nor navigable river, has a good harbour; but it is ſuch a one as is not to be found perhaps in any other part of the world. It is formed by a maſſy pile of building conſiſting of high and thick walls of ſtone raiſed at firſt with great art, and maintained ſtill with very little difficulty. Theſe walls are raiſed in the main ſea at a good diſtance from the ſhore. There is one ſolid wall of ſtone large enough for carts and carriages to paſs on the top, and to admit houſes and warehouſes to be built on it, it being as broad as a ſtreet: oppoſite to this, but farther in the ſea, is another wall of the ſame workmanſhip which croſſes the end of the firſt, and after winding runs parallel to it. The entrance into the port is between the point of the firſt wall and the ſecond, or oppoſite wall, which breaks the violence of the ſea from the entrance, and ſhips there go into the baſon, where they ride as ſecure as in a wet dock. This work is called the Cobb, and the cuſtom-houſe officers have a lodge and warehouſe upon it. As the ſhore is convenient for batteries, ſome guns are planted in proper places for the defence of the Cobb and town, which is large and well built. It is a place of good trade, and is under the government of a mayor and aldermen.

In 1685 the duke of Monmouth landed here with a handful of men, which was ſoon increaſed to ſix thouſand, and he was proclaimed king; but being defeated by king James's army, was taken priſoner and beheaded.

SECT. XIV.

Of Somerſetſhire; its Situation, Extent, Air, Soil, Produce, Mountains, Caverns, Minerals, and particularly ſeveral beautiful kinds of Ochres. Of its Rivers, and principal Towns.

THIS county probably takes its name from Somerton, once the capital, but now obſcured by Bath, Wells, &c. Some indeed have derived the name Somerſetſhire from Summer, alleging that the largeſt ſhare of that ſeaſon is enjoyed in this county above any other in England. It is bounded on the north by Glouceſterſhire and Briſtol Channel; on the eaſt by Wiltſhire; on the weſt by Devonſhire; and on the ſouth by Dorſetſhire. It is computed to be ſixty-two miles in length, thirty-two in breadth, and two hundred and four in circumference.

Somerſetſhire, which is ſituated in the dioceſe of Briſtol, and in that of Bath and Wells, is divided into thirty-ſeven hundreds; and contains about one hundred and thirty-two vicarages, three hundred and eighty-five pariſhes, thirty-five market towns, fifty-ſix thouſand houſes; three hundred thouſand inhabitants, and ſends eighteen members to parliament, namely, two knights of the ſhire; and two burgeſſes for the following towns, Briſtol, Bath, Wells, Taunton, Bridgewater, Minehead, Ivelcheſter, and Milborn Port.

The air of Somerſetſhire is, in the lower grounds, univerſally mild, and generally wholeſome. The ſoil is various; the lower grounds, except where it is boggy, yield great quantities of corn and graſs; the hilly parts are leſs fertile, yet in many places, by the help of art and induſtry, good crops of corn are raiſed, and where they are moſt barren they afford paſture for ſheep, though where there are mines the graſs is diſcoloured, and the ſheep that feed upon it are ſmall and big-bellied. The country about Taunton is exceeding rich, and affords the greateſt plenty of corn, graſs, and rich fruit for cyder. Within the mountains are mines of lead and lapis calaminaris. The commodities produced by this county are therefore corn, cattle, lead, woad for dying, Chedder cheeſe, lapis calaminaris, and Briſtol ſtones. It is alſo one of the greateſt clothing counties in England: the manufactures are chiefly on fine Spaniſh medley cloths, druggets, ſerges, cantaloons, knit ſtockings, &c. in which vaſt numbers are employed.

In deſcribing this county it will be proper to take notice of its mountains, mines and caverns.

The ridges of Mendip hills run confuſedly, but moſtly extend eaſt and weſt, and are of a very unequal height. The ſoil is barren, and the air cold, moiſt, thick, and foggy. The ſurface is in a great meaſure covered with heath, fern, and furze, and conſequently affords but little food for the cattle, which are for the moſt part ſheep. The ore in theſe mountains runs in veins, ſometimes it is alſo diſperſed in banks, and ſometimes lies between the rocks. About the ore is ſpar and chalk, with another ſubſtance called croots, which is a mealy white and ſoft kind of ſtone. The ſpar is white, tranſparent, and as brittle as glaſs; the chalk is alſo white, and heavier than any ſtone. The vein lies between theſe coats, and is of different breadths; it ſometimes alſo riſes near the ſurface, and at others lies very deep in the earth.

About two miles from Wells, on the ſouth ſide of this ridge of mountains is a famous grotto called Wokey, or Okey hole, which is much reſorted to by ſtrangers. You aſcend the hill about thirty yards to the mouth of a cave, which is about fifteen or twenty-feet high, and opens into a ſpacious cavern that reſembles the body of a cathedral; the upper part is very craggy, abounding with pendant rocks that ſtrike terror into a timorous ſpectator, eſpecially as they appear by candle light, by which they may be plainly ſeen. From all parts of the roof, a clear water is conſtantly dropping, forming a number of ſtony cones reſembling iſicles. The bottom of this vault is extremely rough, ſlippery, and rocky.

From this grotto you proceed by a gradual deſcent, through a very narrow and even paſſage, into another ſpacious vaulted cavern; but not quite ſo high, though nearly as wide, and in other reſpects much like the firſt. From this you paſs through a long low rocky paſſage into a third vault, with a cylindric roof; on one ſide it has a fine ſandy bottom, about fifteen or twenty-one feet wide, and on the other a rivulet about eight or ten feet wide, and two or three deep; the water of which is extremely clear and cold. This rivulet, after its courſe thro' the rock, deſcends forty or fifty feet to the level ground, where it turns a paper-mill at a ſmall diſtance from the foot of the hill. The loudeſt noiſe made by a number of people in theſe caverns cannot in the leaſt be heard by thoſe on the

outside of the hill over them. The air within them is very cold and damp.

About five miles to the north-west of Okey hole lies Chedder, a village famous for its cheese, which excels, in high relish and delicate flavour, all other cheese in England. This village is famous for the stupendous chasm, or cleft, through the body of Mendip hills near this place. It seems as if the hills had been split asunder by the shock of an earthquake: the impending tremendous rocks on either side are very astonishing; some standing on the bottom, reach near the height of the cliff, and yet are entirely severed from the body of the rock. The passage between is but narrow, yet is the road from this part of the country to Bristol. At the entrance of the cleft is a most remarkable spring of water, rising as it were upright out of the rocky basis of the hill, with so large and rapid a stream, that it drives a mill within a few yards. This stream, and that of the cavern just mentioned, are the sources of a river named Ax.

At a small distance from Chedder is another cavern, but smaller than that we have mentioned: Mr. Beaumont, however, mentions a still more extraordinary cavern than any of those yet described, and of which he has given an account in the Philosophical Transactions. This is on a hill called Lamb. "Much ore, says that "gentleman, has been formerly raised on this hill; and "being informed that a great vault was discovered "there, I took six miners with me and went to see it. "First we descended a perpendicular shaft about seventy "fathoms, when we came into a leading vault, which "extends about forty fathoms in length, and as it does "not run upon a level, but descends, when you come "to the end of it you are twenty-three fathoms deep "by a perpendicular line. The floor is full of loose "rocks, and its roof vaulted with rocks of lime-stone, "among which are flowers of all colours hanging from "them, which appear extremely beautiful, and are al-"ways kept moist by the distilling waters. In some "parts the roof is about five fathoms high, in others, "so low that it was difficult to pass through by creep-"ing. The width for the most part is about three fa-"thoms. This cavern crosses many veins of ore. A-"bout the middle of it, on the east side, is a passage into "another, between forty and fifty fathoms in length. "At the end of the first another vast cavern opens. I "fastened a cord about me, and ordering the miners to "let me down; after descending twelve or fourteen fa-"thoms, I came to the bottom. This cavern is about "twenty fathoms in height, fifteen in length, and sixty "in circumference. I afterwards caused the miners to "drive forwards the breast of this cavern, which termi-"nates to the west, and after they had driven about ten "fathoms, they happened into another about one hun-"dred fathom in length, and eight or ten in height. "The frequency of caverns on these hills, he adds, "may easily be guessed at, by the frequency of swallow "pits, which are made by the falling in of the roofs of "caverns. Some of these pits are of a large extent, and "very deep. Sometimes our miners sinking in the bot-"tom of these swallows, have found oaks, fifteen fa-"thoms deep in the earth."

There are several other hills in this county besides those of Mendip. On each side the river Avon the hills form a most beautiful prospect; but are of little advantage to their possessors; for they are neither fertile in herbage, nor timber; but are in general filled with rocks, and are in a manner covered with fern and furze; nor do the few trees scattered upon them flourish like those in a better soil. From the redness of the earth and stones they seem to abound with iron, and in the cracks of the rocks is found ochre, which is greatly superior to that in the shops, and considerable advantage might doubtless be made of it, by collecting the purest parts, and sending it to this metropolis, where it might be sold to great advantage to the colourmen.

The late Mr. Owen, who made very curious observations on the natural productions about the city of Bristol, observes, that there are two principal kinds of earth of the nature of ochre, the one red and the other yellow, which here often crumbled to dust in the places where they lie. The red is of a deep colour, between crimson and purple, and of a strong body: the yellow, of a fine gold colour, light, dusty, and of so strong a body, that a dram of it is equal to an ounce of common ochre, and is besides of a better colour. They both tinge the fingers very much on being touched; and being ground with oil, prove excellent colours for painting. In some of the creeks and crevices of the yellow iron ores is a fine sort of ochre like meal, as fine to the touch as powder for the hair: this is of a lemon colour, and nearly resembles French ochre; but is finer, and can be had but in small quantities. These several kinds of ochre are found not only in crevices of the rocks, but adhering to lumps of various kinds of ore, which being broken shew a variety of colours. Here are also lumps of emery and manganese, and in the same rocks are also veins of lead ore; but they are small. Some of these veins are pure, others are intermixed with a brown stone of the nature of calamine, and some have small clusters of yellowish or white spars, accompanying them in beautiful forms.

The chief rivers belonging to this county, besides the mouth of the Severn, commonly called the Bristol Channel, are the Avon, the Brent, and the Parret. The Avon enters this county about five miles to the south-east of Bath, and soon becomes the northern boundary between Somersetshire and Gloucestershire, and passing by Bristol, discharges itself into the mouth of the Severn. It ought not to be omitted, that about two miles from the Hot Wells, near Bristol, this river is bounded on each side with high, rough, and craggy rocks, the cliffs of which are in some places above two hundred feet high, hanging over in an astonishing manner; and many of these being covered with tufts of grass, small shrubs, tall plants, and and chumps of short trees, seem to form little hanging woods, and afford a most agreeable and romantic prospect.

The Brent rises in the eastern edge of the county, and runs to the westward by Glastonbury, below which it forms a large lake, and then falls into the river Parret near Bristol Channel.

The Parret rises in the south edge of Somersetshire, and running to the northward, receives in its course the Yeovil and the Tome, then passing by Bridgwater, falls into the Bristol Channel. This county is also watered by abundance of smaller streams, which furnish it with plenty of all sorts of fish; but one particular species in the river Avon deserves our notice: they are called elvers, and resemble a diminutive eel: in the spring the river is in some places covered with them, and even looks black with the prodigious multitudes of them on the surface of the water, they being in size about the thickness of a goose-quill. When taken they are made, by a particular management, to cast their skins, and then appear very white; after which they are kneeded into a kind of cake, and then fried.

The principal towns in this county are the following:

Bath, a celebrated city, seated in a plain of moderate extent, surrounded with hills, which form a kind of amphitheatre, and supply the springs that render this city so famous. It is situated a hundred and eight miles to the west of London, nineteen to the north-east of Wells, and twelve to the south-east of Bristol. This city arose from its salutary springs, which in the time of the Romans were greatly celebrated, and is now become a city of pleasure, it being justly esteemed the most polite, gay, and agreeable place in the world. It is encompassed with verdant meadows, hills, and pleasant walks; and perhaps there is no other place where such a number of delightful and variegated landscapes rise to the view. The buildings are magnificent, and many of them in a grand taste; the streets are large, well paved, and clean; the market-place spacious, open, and supplied with the best meat, fish, vegetables, fruit, &c. The grove, the squares, the parades, are worthy of notice; but the most extraordinary buildings are that circular range of magnificent structures built of stone, called the Circus. Nothing can be more singular, and at the same time more beautiful, than a number of noblemen's houses magnificently built, formed into a fine circle, with a noble and spacious area in the middle. But more than all this the wretched and miserable are here frequently delivered from their painful

painful diſorders, by the healing qualities of the waters of the different baths, or relieved, and have the advantage of being directed by the advice of gentlemen the moſt eminent in the profeſſion of phyſic.

With reſpect to the baths, it is proper to obſerve, that in ſome places the hot and cold ſprings riſe very near each other, and in one place within two yards. In this city the hot ſprings exhale a thin kind of miſt, and ſomething of an ill ſmell proceeding from the ſulphureous particles mixed with the water. Theſe hot ſprings are always the ſame, for the longeſt and heavieſt rains do not make them diſcharge more water, nor the drieſt ſeaſons make them diſcharge leſs.

Of theſe ſprings that called the Croſs-bath, from a croſs formerly erected in the middle of it, is of a moderate warmth, and a perſon may ſtay much longer in it than in any of the others. It is encloſed with a wall, on the ſides of which are ſeats, and at the ends galleries for the muſic and ſpectators, under which are ranges of ſmall dreſſing-rooms; one of which ranges is for the gentlemen, and the other for the ladies, who being dreſſed in linen habits go both together into the water, the men keeping on one ſide and the women on the other.

The Hot-bath, ſo called from its being much hotter than the Croſs-bath, is fifty-eight feet and a half diſtant from it. This bath has a well, the water of which not only ſupplies its own pump, but is conveyed by pipes to the pump in the Croſs-bath.

The King's-bath, which is much the largeſt, is accommoded with many dreſſing-places, ſome of which are appropriated to the men, and others to the women, both of whom bathe in linen-drawers and ſhifts. There is here a ſpring ſo hot, that they are obliged to turn moſt of it away, for fear of heating the bath too much. However, the heat of the hotteſt ſpring is not ſufficient to harden an egg.

The Queen's-bath has no ſpring of its own, but is ſupplied by water conveyed from the King's.

There is likewiſe a bath for lepers, into which none go but ſuch as the phyſicians ſuppoſe to have the leproſy, or ſome other diſeaſe of the ſame kind: this is made by the overflowing of the Croſs-bath. The poor who bathe in it have an allowance for their ſupport from the town; but are chiefly relieved by the generous contributions of the gentlemen and ladies who come to enjoy the benefit of the other baths.

That nothing may be wanting to complete the circle of pleaſures in this city, there are ſpacious and lofty rooms for balls and aſſemblies; the ſtudious have here an eaſy ſupply of all kinds of books; two large and elegant theatres have been erected, and a large ſtone bridge built over the river. The ſtone with which the fine buildings in this city are erected is dug out of the quarries upon Charlton down, and brought from thence down a ſteep hill, by a four-wheeled carriage of a particular form and ſtructure; the wheels are of caſt iron, broad and low, with a groove in the perimeter to keep them on the pieces of wood on which it moves down hill, with four or five ton weight of ſtone, very eaſily, without the help of horſes, the motion being moderated by means of a friction lever bearing more or leſs on the hinder wheel, as occaſion requires.

The walls of Bath are almoſt entire; the ſmall circuit of ground encompaſſed by theſe walls is in the form of a pentagon, with four gates, beſides a poſtern. Without the walls is a handſome ſquare, in the center of which is an obeliſk ſeventy feet high. The market-houſe is a large ſtone building, ſupported by thirty-one ſtone pillars, and over it is the town-hall. Here is a general hoſpital for the the reception of the ſick and lame poor from all parts of the kingdom, erected in 1738, by the contributions of the nobility and gentry, and is capable of containing a hundred and fifty patients. Another new ſquare has been laid out in the gardens adjacent to the public walks on the ſouth ſide of the city by the Avon, where is a noble room for balls and public aſſemblies. Bath is the ſee of a biſhop, who is alſo prelate of Wells. St. Peter's cathedral is a lofty venerable pile, with a handſome tower in the middle, and a good ring of eight bells; beſides there are likewiſe three other churches, with two ſchools, one for fifty boys, and the other for as many girls. Near the Croſs-bath is St. John's hoſpital for poor ſick people, which has a chapel of white free-ſtone. Here are alſo two other hoſpitals and an alms-houſe. In this city is a manufactory of cloth; and it is under the government of a mayor, aldermen, and common-council.

Wells is ſituated at the foot of Mendip-hills, a hundred and twenty miles weſt of London, and nineteen ſouth-weſt of Briſtol, and has its name from the wells and ſprings about the city, which is but of ſmall extent, tho' well inhabited. The public and private buildings are very neat, and the cathedral one of the handſomeſt in England, it being a ſtately pile, whoſe frontiſpiece at the weſt end is adorned with images and carved work. The cloſe, which contains the biſhop's palace, is walled in like a little fortification, and encompaſſed by a moat. The dignified clergy live in the inſide of it, and the prebendaries and canons have very agreeable dwellings. The market-houſe is a handſome ſtructure ſupported by columns, and the city is governed by a mayor, a recorder, ſeven aldermen, and ſixteen common-councilmen. The chief manufactures of this city are making of bone-lace, and knitting of hoſe.

Briſtol, called by the Saxons Brightſtow, is ſituated in fifty-one degrees twenty minutes north latitude, and in two degrees forty-nine minutes weſt longitude, partly in this county, and partly in Glouceſterſhire; but being a county of itſelf, is independent of them both. It is divided by the river Avon which runs through it, and ſeparates the two counties; but that part which is on the Glouceſterſhire ſide is the largeſt and moſt populous; for, according to a ſurvey made in the year 1736, the circumference on the Glouceſterſhire ſide was four miles and a half, and on the Somerſetſhire ſide two miles and a half. This city has a ſtone bridge of four broad arches over the Avon; and here is one of the moſt commodious quays in England for ſhipping and landing merchants goods, which lies along the river Froom, and is half a mile in length, from the bridge on the Glouceſter ſide of the city, to the place where that river falls into the Avon. This is the ſecond city in Great Britain for trade, wealth, and number of inhabitants. The trade of many nations is drawn hither by the convenience of commerce, and the harbour, which receives veſſels under ſail into the heart of the city. The Avon ſwells ſo high by the coming in of the tide, that ſhips upon the ſhallows are borne up eleven or twelve fathoms. The merchants here, as well as thoſe of London, have an Exchange; but it was formerly a cuſtom with them to meet, walk, and tranſact mercantile affairs in the open ſtreet, and pay their money on large braſs baſons on the tops of poſts, in that part of the ſtreet called the Tolzey. They were the firſt adventurers to the Weſt Indies, and about forty years ago it was computed that they employed two thouſand ſail of ſhips, in trade, to the ſeveral parts of the world. By the Severn and the Wye the inhabitants of this city have almoſt the whole trade of South Wales to themſelves, and the greateſt part of that of North Wales; and by land-carriage they ſend goods to Exeter, Bath, Wells, Froom, and all the principal towns from Southampton to the banks of the Trent. Here are conſiderable manufactures of woollen ſtuffs, particularly cantaloons, carried on chiefly by French refugees; and here are no leſs than fifteen glaſs-houſes, which are ſupplied with coals from Kingſwood and Mendip-hills; ſome are for glaſſes, others for crown-glaſs, and others for bottles, for which there is a great demand at the hot well in its neighbourhood, which lies about a mile and half from the city down the Avon, and alſo at Bath, for exporting their mineral waters.

The city with its ſuburbs is very compact, being almoſt as broad as long, and no way above a mile; yet the houſes are computed at about thirteen thouſand, and the ſouls at ninety-five thouſand. Beſides the cathedral there are eighteen churches, and ſeven or eight meeting-houſes of Proteſtant Diſſenters: and, according to Mr. Whatley, there are eighteen hoſpitals, beſides charity-ſchools, a guildhall, and a very large council-houſe; and its cuſtom-houſe ſtands on the ſide of Queen's-ſquare, which is adorned with rows of trees that lead to a curious equeſtrian ſtatue of king William III. On the north-weſt ſide of the city is Brandon-hill, under which is Jacob's-well,

where plays are acted almoſt every night in the ſummer ſeaſon by comedians from London. The College-green is juſtly admired for its ſituation, as it commands a moſt delightful proſpect over the whole city and harbour; and here ſtands the cathedral, with a ſtately croſs, which is a fine Gothic ſtructure ſurrounded with the effegies of ſeveral kings of England. It is remarkable, that though the city carries on ſuch a prodigious trade, no carts are admitted into it, for fear of damaging the arches of the vaults and thoſe of the gutters made under ground for carrying off the ſoil into the river; ſo that the goods being conſtantly drawn through the ſtreets upon ſledges, the pavement is neceſſarily rendered exceeding ſlippery.

Bridgwater is ſeated about twelve miles from the Start-point, where the Parret runs into the Briſtol Channel, a hundred and forty-three miles from London. The ſpring-tide here flows twenty-two feet at leaſt at the quay, and comes in with ſuch an impetuous torrent, and ſuch a noiſe, that it is called The Raging Bear. Ships of two hundred tons come up to its quay, and from its convenient ſituation for commerce the inhabitants have a pretty good coaſting trade to Briſtol, and carry coals to Wales, and ſlate, &c. to Cornwall, twenty ſhips at leaſt being conſtantly employed. Its foreign trade is principally to Newfoundland. It is a large well frequented place; has ſeveral good inns, and the market is well ſupplied with corn, cattle, hogs, and ſheep, and particularly excellent cheeſe.

Somerton, once the moſt celebrated town in the county, and that from whence it took its name, is now but a poor place, a hundred and twenty-nine miles to the weſt of London, but has a conſiderable market for corn, proviſions, and cattle.

Glaſtonbury is ſeated one hundred and twenty miles from London, and is famous for its abbey, ſome magnificent ruins of which are ſtill remaining, but are daily diminiſhed for the ſake of the ſtones: however, the curious ſtructure called the Abbot's Kitchen, is ſtill pretty entire, and of a very unuſual contrivance. It is pretended that the bodies of Joſeph of Arimathea, of king Arthur, and of king Edward the Confeſſor, were buried here. The town is pretty large and well built; near it, on a high ſteep hill, named the Tor, is placed a tower that commands an extenſive proſpect, and ſerves as a land-mark to ſeamen. The laſt abbot of this place was hanged on the top of the Tor, by order of king Henry VIII. for not acknowledging his ſupremacy. The holy thorn, or haw thorn, in the church yard upon the hill, ſaid to have taken root from a ſtaff ſtuck in the ground by Joſeph of Arimathea, and to bloſſom only on Chriſtmas-day, has brought a vaſt number of people to viſit this town, though it is very dubious whether Joſeph was ever in Britain. Dr. Gibſon ſays it has been cut down for many years, yet there are ſtill ſome growing in the county from branches of it, particularly in the garden of Mr. Stroud, the poſſeſſor of the ground where the other ſtood; and another in the garden now belonging to an inn there. Theſe branches, however, do not always bloſſom on Chriſtmas-day; for they ſometimes bloſſom three or four days after, and ſeldom ſo ſoon as Chriſtmas-day, except the weather be extremely mild. Glaſtonbury, about fifteen years ago, was for ſome time famous for its mineral waters, but for want of proper caution they proved fatal to ſeveral who drank them, but have been found ſerviceable in the aſthma and dropſy, in the cure of ſcorbutic diſorders, ulcers, and even cancers.

Taunton, a handſome, neat, well-built town, a hundred and forty-eight miles to the ſouth-weſt of London, received its name from its being ſeated on the river Thone. The ſtreets are ſpacious, and it has two pariſh-churches, beſides ſeveral meeting-houſes of Proteſtant Diſſenters, and it is ſurrounded by delightful meadows, orchards, and gardens. This town is very populous, and ſome thouſands are employed in the manufacture of ſerges, duroys, ſagathies, ſhalloons, &c. for weaving of which eleven hundred looms have been employed at a time. The river is navigable for barges within three miles of the town, where there is a handſome bridge, and it once had a caſtle.

SECT. XV.

Of Devonſhire; its Situation, Extent, Diviſions, Repreſentatives in Parliament, &c. Its Air, Soil, Produce, Rivers, and Curioſities; with a Deſcription of the principal Towns.

DEVONSHIRE is bounded on the north by Briſtol Channel; on the eaſt by Somerſetſhire; on the ſouth by he Engliſh Channel; and on the weſt by Cornwall, and has the title of a duchy. It extends ſixty-one miles in length, fifty-four in breadth, and contains fifty-ſix thouſand three hundred and ten houſes, three hundred and thirty-ſeven thouſand eight hundred and ſixty inhabitants, three hundred and ninety-four pariſhes, thirty-eight market-towns, and about ſeventeen hundred and thirty villages. This county, which is ſubdivided into thirty hundreds, ſends twenty-ſix members to parliament: theſe are two knights for the ſhire, and two members for each of the following places; Exeter, Plymouth, Totneſs, Plympton, Okehampton, Honiton, Barnſtaple, Taviſtock, Aſhburton, Tiverton, Beralſtone, and Clifton-Dartmouth-Hardneſs.

The air of this county is very mild and healthful in the valleys; but exceſſively cold and bleak upon the mountains. The ſoil is various, for the lower grounds are naturally fruitful, and yet are made much more ſo by the art and induſtry of thoſe who poſſeſs the lands; but the hills are very barren. In the eaſtern parts there is plenty, not only of good corn, but of fine paſturage for ſheep, where the grounds are dry and chalky. The ſouthern part of the county is remarkably fertile, and is as juſtly called The Garden of Devonſhire, as Italy The Garden of the World. The trees are in as great variety here, as in any other part of the kingdom; and fruit-trees are particularly plentiful, eſpecially apples, with which they make a great quantity of cyder. The merchants who go long voyages to ſea find this a very ſerviceable drink in their ſhips, and therefore lay in great ſtores of it; for it is ſaid one ton of cyder will go as far as three of beer, and it is found by experience to be much more wholeſome in hot climates.

On the coaſt in this county is found plenty of a peculiar rich ſand, which proves of ſingular ſervice to the huſbandmen, as thoſe who live at a diſtance from the ſea purchaſe it in order to improve their poor lands, for it renders the moſt barren ſoil fruitful, and, as it were, impregnates the glebe. However, thoſe huſbandmen who live at too great a diſtance from the ſea-ſhore, and whoſe circumſtances are too narrow to purchaſe a ſufficient quantity of this valuable manure, are reduced to the neceſſity of uſing marl, lime, and the turf of the ground pared off and burnt to aſhes.

Though the inhabitants are in no want of horſes, kine, hogs, goats, ſheep, or rabbets, yet their principal commodity is fowl, which they enjoy in the greateſt profuſion. In the weſtern parts of Devonſhire are great quantities of game, eſpecially hares, woodcocks, and pheaſants, in ſuch abundance as to render them very cheap. And in that part of the country is a bird ſo very ſmall that it is reputed a humming-bird, and like that hangs its neſt on the extreme branches of the trees. The inhabitants inſiſt that no venomous creature, of what nature or ſpecies ſoever, will live among them.

In the ſouth-weſt parts of Devonſhire are great quantities of marble, and in many places marble rocks are found to be the baſis of the road on which people travel; this marble, when poliſhed, is little inferior to ſome we have from abroad, and accordingly is much uſed by the gentry in thoſe parts.

This county abounds with a greater variety of rivers than any other can boaſt of, yet there are only two, namely the Tamar and the Ex, that are peculiarly worthy of the reader's attention. The former, which ſeparates this county from Cornwall, has its ſource in the hills near Welcomb, and runs nearly from north to ſouth till it reaches the Engliſh Channel at Plymouth. This river is particularly remarkable for the goodneſs of the ſalmon caught in it. The Ex forms a courſe upon the ſame points, and, paſſing by Exeter, alſo falls into the Channel.

Channel. Great plenty of ſalmon is alſo found in this river, where they come in great quantities in the ſpawning ſeaſon. From theſe two rivers the country is ſtocked with a great variety of common fiſh; but the moſt beneficial are herrings and pilchards, for by trading with them they obtain all ſorts of commodities from the adjacent counties and foreign nations.

In ſeveral places in Devonſhire are mineral waters that have been of ſingular ſervice in dangerous epidemic diſeaſes.

Among the curioſities of this county is Lay-well, which ebbs and flows near eleven times every hour.

The river Tamar, juſt mentioned, receives into it a ſmall river called the Lid, which is peculiarly remarkable for being pent up with rocks at the bridge, and running ſo far below it, that the water is ſcarcely to be ſeen, or the murmurs of it to be heard, to the aſtoniſhment of all ſtrangers who have the curioſity to attend to theſe uncommon circumſtances; for the bridge is level with the road, and the water runs near ſeventy feet below it.

Within a mile of this place is a cataract, where the water falls above an hundred feet; it comes from a mill at ſome diſtance, and after a courſe upon a deſcent of near an hundred feet from the level of the mill, it arrives at the brink of the precipice, from whence it falls in a beautiful manner, and ſtriking upon a part of the cliff, ruſhes from thence in a wider cataract to the bottom, where falling with great violence, it makes a deep and foaming baſon in the ground. This wonderful fall of water fills the air all round at the bottom with ſuch an atmoſphere of aqueous particles, that a perſon approaching it finds himſelf in a miſt. The principal places in this county are the following:

Exeter, thus called by contraction from Exceſter, a caſtle on the river Ex, was the Auguſta of the Romans; it is ſituated a hundred and ſeventy-three miles from London, on the top of an eaſy aſcent on the eaſtern bank of that river. The walls are in pretty good repair, and form an agreeable walk round the city, with the view of a fine country, hills covered with trees, fields, orchards, villages, and gentlemen's ſeats. The principal part of the city conſiſts of four ſtreets centering at a handſome conduit. The High-ſtreet particularly makes a noble appearance, it being broad and ſtraight; and the houſes are of a very old but good model, ſpacious, commodious, and not inelegant. This ſtreet is full of ſhops well furniſhed, and all trades are briſkly carried on. In the northern angle of the city, and the higheſt ground, ſtands Rugemont caſtle, once the reſidence of the Weſt Saxon monarchs, and afterwards of the earls of Cornwall. It is of a ſquare figure, not very large, but environed with a high wall and a deep ditch. It has a rampart of earth parallel to the top of the wall, and forming a terrace that over-looks the city and country. In this caſtle the aſſizes are held, and it alſo contains a chapel. The bridge over the Ex is of great length, and has houſes on both ſides, with a conſiderable vacancy in the middle.

The cathedral was about four hundred years in building, and is yet very remarkable for the uniformity with which it was carried on; for the whole ſeems the workmanſhip of one and the ſame architect. The altar-piece, which was done a hundred years ago, is the repreſentation of the church in perſpective, a very fine piece of painting. The fine painted glaſs, of which there is a great deal, was much damaged during the time of the civil wars, in the reign of king Charles I. and the carved figures of the patriarchs and prophets were greatly defaced. On the ſouth ſide of the high altar are three ſeats adorned with Gothic carvings to the height of about twenty-five feet, ſupported by braſs pillars. In one of the towers of this church is a very large bell of about three ton weight, and in the other a fine ring of ten large ones.

The other buildings of a public nature are the chapter-houſe and cloiſters, the biſhop's palace, the houſes belonging to the dean, the chancellor, treaſurer, and other dignitaries of the church, the guild-hall, with the hoſpital of St. John the Baptiſt. There are within the city and liberties twenty pariſh-churches; to which may be added ſome chapels and alms-houſes, with the ruins of ſeveral others. There are likewiſe three or four meeting-houſes, a quay for landing goods, and a cuſtom-houſe.

The city is governed by a mayor, twenty-four aldermen and common-council, a recorder, a ſheriff, four ſtewards, a chamberlain, and town-clerk, who are attended by a ſword-bearer, who wears the cap and carries the ſword given by king Henry VII. before them in all public proceſſions. There are alſo in this city twelve incorporated trades, who on public occaſions walk in the mayor's train, dreſſed in gowns, each company having a beadle in a laced coat bearing the enſigns of their ſeveral profeſſions.

Plymouth is ſituated in the fiftieth degree twenty-ſix minutes north latitude, and in the fourth degree twenty-ſeven minutes weſt longitude, two hundred and fifteen miles from London, between two very large inlets of the ſea, in the bottom of a ſpacious ſound, or bay, encompaſſed on every ſide with hills; the ſhore is generally ſteep and rocky, though the anchorage is good, and it is pretty ſafe riding. In the entrance of the bay is a large and dangerous rock, which at high water is covered, but at low tide lies bare. Upon this rock, which is called the Eddy-ſtone, the ingenious Mr. Winſtanley firſt built a light-houſe for the direction of ſailors; this work, conſidering its height and the magnitude of the building, ſtood to admiration ſeveral dreadful ſtorms. Mr. Winſtanley, who often viſited it, ſtrengthened the building by new works, and was ſo confident of its ſtability, that he uſually ſaid to thoſe who doubted its ſtanding in hard weather, that he only deſired to be in it when a ſtorm ſhould happen; but in the dreadful tempeſt of November 27, 1703, when he happened to be ſo unhappy as to have his wiſh, he in vain made ſignals for help; but no boats dared to go off to him; and in the morning after the ſtorm nothing was to be ſeen but the bare rock, the light-houſe being gone, in which Mr. Winſtanley and all that were with him periſhed; but a very ſtately light-houſe has ſince been built in its room. The town is defended by a caſtle ſeated on an iſland named St. Nicholas, and by a citadel in the town oppoſite to the iſland. This is a ſmall but regular fortification, inacceſſible by ſea, but not exceeding ſtrong by land. It is ſurrounded with a deep trench, out of which was dug the ſtone of which the citadel was built. It is about three quarters of a mile in circumference, and has three hundred guns on its walls, which ſtand thickeſt towards the ſea. The town ſtands above the citadel upon the ſame rock, ſloping on the ſide of it towards the eaſt. The inlet of the ſea, called Catwater, forms a harbour capable of receiving any number of ſhips, and of any ſize; it waſhes the eaſtern ſhore of the town, where they have a kind of natural mole, with a quay and all other conveniences for loading and unloading of veſſels. On the other ſide of the town is another inlet of the ſea, called Hamouze; this is the mouth of the river Tamar, where is a wet dock, with yards, dry docks, launches, and conveniences of all kinds for building and repairing of ſhips. Theſe wet and dry docks exceed every thing of the kind, being hewn out of a mine of ſlate, and lined with Portland ſtone. The dry dock is large enough for a firſt-rate man of war, and the wet dock will contain five of the ſame ſize. Here are alſo ſtore-houſes for rigging, and for the naval and military ſtores of ſuch ſhips as may be appointed to be laid up there; with very handſome houſes for the commiſſioner, clerks, and officers of all kinds uſual in the king's yards. In ſhort, it is now become as complete a yard as any belonging to the government, though not ſo large. Here are two fine churches, and two or three meeting-houſes for Proteſtant Diſſenters and French refugees; alſo a free-ſchool, and an hoſpital for blue coat boys. It gives title of earl to the noble family of Hickman.

Dartmouth, a ſea-port town ſeated on the declivity of a hill at the mouth of the river Dart, where it empties itſelf into the ſea, a hundred and ninety-eight miles from London, and thirty-one from Exeter. The opening into the harbour is not broad; but the channel deep enough for the largeſt ſhips in the royal navy. The ſides of the entrance are mounded with rocks, and at the firſt narrowing of the paſſage is a good ſtrong fort, and a platform of guns which command the port. The narrow entrance extends about half a mile, and then opening forms a harbout, in which five hundred ſail of ſhips may ride with

the greateſt ſafety, and the entrance may, upon occaſion, be chained up.

Dartmouth is ſituated on the weſt ſide of this baſon, or harbour, in a kind of ſemicircle, on the aſcent of a ſteep hill; but though large and populous it is but meanly built, yet the quay is ſpacious, as is alſo the ſtreet before it. Here live ſome very flouriſhing merchants, who carry on a proſperous trade to the moſt conſiderable ports of Spain, Portugal, Italy, and the plantations; but eſpecially to Newfoundland, and from thence to Spain and Italy with fiſh; and they alſo drive a good trade in their own fiſhery of pilchards, which is carried on with the greateſt number of veſſels of any port in the weſt, except Falmouth. It has three churches, and a very large meeting-houſe; but the ſtreets are narrow and bad, though they are all paved, and is governed by a mayor, a recorder, twelve maſters, or magiſtrates, a town-clerk, and a high-ſteward.

This town was burnt by the French in the reign of Richard I. They ſome time after beſieged it again; but were bravely repulſed, particularly by the women, when the enemy being routed, general Caſtel, with three lords, and twenty-three knights, were made priſoners. This town has the title of an earldom.

About fifty miles from the north-weſt coaſt of this county is Lundy Iſland, which is five miles long, and two broad; but it is remarkable that it is ſo encompaſſed with inacceſſible rocks, that it has but one entrance into it, and that ſo narrow that two men can ſcarce go abreaſt. The ſouth part of the iſland enjoys a pretty good ſoil; but the north part is in a great meaſure barren, and has a remarkable high pyramidical rock called the Conſtable.

SECT. XVI.

Of Cornwall; its Name, Situation, Extent, Diviſion, &c. and the Members it ſends to Parliament. The Air, Soil, and Vegetables; the Mines, Minerals, and natural Curioſities; with the Cattle, Fowls, Fiſh, and Rivers of this County. The Manners of the Inhabitant, a Deſcription of the principal Towns, and a conciſe Account of the Scilly Iſlands.

THE preſent name of this county is differently accounted for; but the moſt probable derivation ſeems to be that which brings it from the promontories projecting into the ſea like horns, called in the Britiſh language Kernaw, with the Saxon addition of Waules, to denote the people who fled thither. It is ſurrounded by the ſea on all ſides, except the eaſt, where it is parted from Devonſhire by the river Tamar: the northern coaſt being waſhed by the Briſtol Channel, the weſtern by St. George's, and the ſouthern by the Britiſh ſea. Its length from eaſt to weſt is near ſeventy miles, its breadth next to Devonſhire, where it is broadeſt, is computed about forty; but in the narroweſt, at St. Ives, it does not exceed five, yet its circumference from its unequal ſhore meaſures upwards of two hundred and thirty-three miles.

Cornwall is ſituated in the dioceſe of Exeter, and contains about twenty-ſeven thouſand ſix hundred and twenty houſes, a hundred and ſixty-five thouſand inhabitants, a hundred and ſixty-one pariſhes, twenty-ſeven market-towns, and twelve hundred and thirty villages: it is ſubdivided into nine hundreds, and ſends no leſs than forty-four members to parliament; theſe are two knights of the ſhire, and as many members for each of the following towns: Camelford, Bodmin, Boſſiney, Dunevet, Launceſton, Eaſt Loe, Foy, Helſton, Grampound, St. Maws, Leſkard, Kellington, St. Ives, St. Germans, Truro, St. Michael, Tregony, Newport, Portpigham, and Saltaſh.

The air is ſharp and healthful to the natives, yet the vicinity of the ſea, on three of its ſides, prevents its being ſubject to hard froſts, and the ſnow lying long on the ground. The ſame reaſon may be aſſigned for the frequent guſts of wind which are here very boiſterous, and conſequently ſometimes pernicious; but the inhabitants are ſeldom troubled with infectious diſeaſes. The ſeaſons are ſomewhat different from thoſe in other parts, the ſummer being more temperate; and as the autumnal fruits are later, their harveſt is ſeldom ripe enough for the barn till near Michaelmas.

The ſoil as it is very ſhallow cannot be extraordinary fruitful, eſpecially on the hilly parts. The vallies yield plenty of graſs, and the lands near the ſea, by being manured with orewood, a kind of ſea-weed, and fat ſea-ſand, produce conſiderable quantities of corn. The fruits and herbs of this county are much the ſame with thoſe of others, though not ſo plentiful among the common people. It has beſides ſome plants which are either uncommon, or have never been found in other counties: among theſe is a ſort of grain ſown plentifully towards the farther end of the county, which is naked oats, called pillcorn, from its being naturally ſtripped of the huſk, with which the common oat is covered, for which reaſon it is much eſteemed. They have alſo plenty of ſea-herbs, as camphire, eringo, ros ſolis, and what is peculiar to this county the ſweet-briar grows naturally here.

From the ſurface we ſhall paſs to the bowels of the earth, where are found many ſorts of ſtones and metals. As to the former, the moor-ſtone is the chief: this is uſed both in buildings aud for large mill-ſtones. Its natural compoſition is very beautiful, it conſiſting for the greateſt part of a whitiſh granulated marble, variegated with a ſort of black and yellow matter reſembling tinſel and tin-glaſs, ſhining and glittering very agreeably in the ſun beams. This ſtone, therefore, while new, gives a glorious aſpect to buildings; but though prodigiouſly hard at firſt, it ſoon changes its colour and conſiſtence. When poliſhed it appears much more ſplendid and beautiful than any of the marble kind, and makes the richeſt furniture, as tables, chimney-pieces, &c. but being exceeding hard, the poliſhing is very expenſive.

With reſpect to the mines of Cornwall, they conſiſt of two ſorts, one of tin, the other of copper; thoſe of tin are very numerous, and are in general very large and rich in ore, theſe have rendered this county famous in all ages. There have alſo been ſometimes found a ſmall quantity of gold and ſilver, but not worthy of notice. With the metalline ores are intermixed large quantities of mundic and arſenic.

The tin works are of different ſorts, on account of the different forms in which the tin appears, for in many places the tin ore ſo nearly reſembles common ſtones, that they can only be diſtinguiſhed from them by their ſuperior weight. The ſecond form in which tin appears conſiſts of tin and earth, compounded and concreted into a ſubſtance almoſt as hard as ſtone, of a bluiſh or greyiſh colour, and often the mundic gives it a yellowiſh caſt. This ore is always found in a continued ſtratum or bed, which the tinners call the load, and thus, for the moſt part, is found running through the ſolid ſubſtance of the hardeſt rocks, beginning in ſmall veins near the ſurface, perhaps not above half an inch or an inch wide, and increaſing as they go into larger dimenſions branching out into ſeveral ſtrata, and proceeding downwards in a direction that is in general nearly eaſt and weſt. Theſe loads are ſometimes white very wide and thick; ſo that great lumps of this ore are often drawn up of more than twenty pounds value. The loads of tin ore are not always contiguous; but ſometimes break off ſo entirely, that you would think you had got to the end of it, but the ſagacious tinner knows by experience, that by digging a ſmall diſtance on one ſide he ſhall meet with a ſeparated part of the load appearing to tally with the other end as nicely as if it had been broken off by ſome ſudden ſhock of the rock.

The mines of this country follow the load in all its rich and meandering windings in the bowels of the rocky earth. Sometimes the waters are drained from theſe mines by ſubterranean paſſages, formed from the body of the mountain to the level country; theſe, which are called adits, ſometimes prove the labour of many years, but when effected they ſave the conſtant expence of large water-works and fire engines. From the ſurface of the earth they ſink a paſſage to the mine, which they call a ſhaft, and over it place a large winch; but in greater works a wheel and axle, by which means they draw up large quantities of ore at a time, in veſſels called kibbuls.

This

This ore is thrown into heaps, where great numbers of poor people are employed in breaking it to pieces and fitting it for the ſtamping mills.

The third form in which tin appears is that of cryſtals; for tin being a ſalt, will, under ſome circumſtances, readily cryſtalize; and therefore in many parts of the mineral rocks are found the moſt perfect tranſparent and beautiful cryſtals of pure tin.

The copper mines of this county next deſerve our notice, they being very numerous, and ſome of them large and rich in ore. It is remarkable, that in ſome parts of Cornwall the earth has produced ſuch an exuberance of this metal, as to afford it in large maſſy lumps of malleable copper, ſeveral pieces of which they ſhew in very curious vegetable forms. The mundic, which we have obſerved, is found in the loads of tin, was for many ages conſidered as of no other uſe but to nouriſh tin while in the mine. However, in the reign of queen Elizabeth, a laudable curioſity prompted ſome private perſons to examine into its nature; but the deſign miſcarried, and the mundic was thrown as uſeleſs into the old pits with other rubbiſh; but about eighty years ago, Sir Gilbert Clark began to work upon the mundic, and others following his example have by degrees brought the work to bear, and the copper extracted from this ore, once eſteemed uſeleſs, now brings in above one hundred and fifty thouſand pounds a year, and equals in goodneſs the beſt Swediſh copper, yielding a proportionable quantity of lapis calaminaris for making braſs. In Mount's bay, near Penzance, the ſhore is as it were paved with a rocky ſtone, of ſo fine a grain that it equals any hone in giving an edge to a razor.

In many of the cavernous parts of the rocks are found thoſe tranſparent cryſtals called Corniſh diamonds, they being extremely brilliant when well poliſhed. Their form is that of a ſix ſided priſm pointed on the top, and they are ſometimes four or five inches in length.

All the parts of Cornwall on this ſide St. Auſtle's, St. Michael's, and St. Agnes, have little or no mineral ores, but moſtly abound with rocks of blue ſlate, eſpecially towards the ſouth, where are many large quarries of that uſeful foſſil.

Among the curioſities obſervable in this county, it is worthy of notice that the Lands-end conſiſts of very ſteep rocks projecting beyond the reſt into the ſea, in which the water of the ſea runs with great rapidity, violence, and noiſe.

Among the rude relics of nature in this county, we ought not to paſs by the logan or rocking-ſtone, of which there are two ſorts, ſome artificial, others natural; we ſhall here only take notice of the latter. In the pariſh of St. Levin is a promontory called Caſtle Treryn. This cape conſiſts of three diſtinct groups of rocks, and on the top of the middle group is the moſt wonderful of theſe ſtones perhaps in the world. It is computed that its ſolid contents amount to about ninety-five tons; the two inclined ſides ſomewhat reſemble the roof of a houſe meeting in a ſort of obtuſe ridge upon the top. The lower part is a large plain baſe, near the middle of which projects a ſmall part on which it reſts, not more than eighteen or twenty inches in diameter. This prodigious ſtone is eaſily moveable upon the large ſtone below, the power of one man being ſufficient to make it vibrate up and down.

With reſpect to the cattle of this country, it has all the ſeveral kinds found in the others; but it is remarkable that the ſheep, which when it lay open and uncultivated were ſmall, and their wool ſo coarſe that it was uſually called Corniſh hair, have ſince the land has been well manured, equalled the ſheep of other counties in ſize, and in the fineneſs of the wool. The cows and oxen are ſmall, but their fleſh ſweet and juicy. They uſe oxen chiefly in ploughing. Their horſes are bred hard, and fed as coarſely; but though they are ſmall, they travel well, and are very ſerviceable in this mountainous country: mules are alſo much uſed. The parks are well ſtocked with fallow deer; but they have no red deer except what ſtray thither out of Devonſhire. Many foxes, otters, badgers, and martins harbour in the cliffs near the ſea ſide.

The fowl of this county are generally ſuch as are found in others. Wild fowl are very plenty in the parts adjoining to Devonſhire. The birds called the choughs, which are in a manner peculiar to this county, are found in great plenty, and ſomewhat reſemble the pied or grey crow; they are nearly of the ſize of the jack-daw, have red legs and beak, and have the character of being a very thieviſh bird. The moſt remarkable among the water-fowl is one about the ſize of a ſea-gull, which has a ſingular method in taking of its prey; for it riſes high in the air, and from thence falls as if dead, and by the velocity of the fall, is enabled to penetrate through the water, and ſuddenly ſeize the fiſh it ſtrikes at. Theſe are ſeen in very great numbers in Mount's bay, and other parts of the ſea-coaſt.

The rivers and ſeas afford great plenty of fiſh, but moſtly ſuch as are common to other counties; but the prodigious ſhoals of pilchards enable them to carry on a very great trade in that fiſh. On the ſouth coaſt are found large quantities of thoſe ſmall ſhell-fiſh which affords that beautiful tint called the Tyrian dye; this matter is contained in ſmall ciſtus or bag, and when taken out appears of a greeniſh yellow. If this be ſpread upon a piece of fine linen, it will in a day or two appear of a pale reddiſh colour, the linen being waſhed the firſt time it is heightened into a paleiſh purple, and every waſhing after renders the colour ſtill more ſtrong and vivid, and it is not in the leaſt ſubject to fade.

The chief rivers are the Tamar, the Camel, and the Fale. The Tamar runs a long courſe from north to ſouth, and is the boundary between the two counties of Cornwall and Devonſhire, emptying itſelf into Plymouth Sound. The Camel runs from ſouth to north, and forms Padſtowe haven in the Briſtol Channel. The Fale runs from north to ſouth, and diſcharges itſelf into St. George's Channel, forming the haven of Falmouth.

The language of the Corniſh gentry is Engliſh, which is ſaid to be as pure as that in London, except in two or three pariſhes, where a corrupt dialect of the ancient Corniſh tongue is much uſed. The natives of this country are diſtinguiſhed by their plainneſs and ſimplicity of manners; they ſeem abſolutely unacquainted with fraud, diſſimulation, and flattery, and are of a free, facetious, and generous temper; they are curious and inquiſitive, and are are alſo diſtinguiſhed for their humanity and hoſpitality to ſtrangers; they are great encouragers of the arts and ſciences, and excel in mechanics.

The principal places in this county are the following:

Leſkard is a conſiderable town, two hundred and twenty-one miles to the ſouth-weſt of London, and had anciently a good caſtle and a palace, in which the dukes of Cornwall kept their court, particularly Edward the Black prince, who reſided here as prince of Wales and duke of Cornwall. Its town hall has a turret with a fine clock. There is here an ancient large church, dedicated to St. Martin, a ſpacious meeting houſe for the diſſenters, a good free-ſchool, and a fine conduit in the market place. It has a very great trade in all manufactures of leather, as boots, ſhoes, gloves, purſes, breeches, &c.

Launceſton is ſeated on the top of a ſmall hill near the river Tamar, twenty-eight miles to the north of Plymouth, and two hundred and nine to the weſtward of London. Here the buſineſs of the county, as the aſſizes, and the election of the knights for the ſhire, are uſually tranſacted. It is a neat town, and was formerly defended by a caſtle which is now in ruins.

Falmouth, a ſea-port town, and by much the richeſt and beſt trading town in the county, is ſituated in fifty degrees, twelve minutes north latitude, and in five degrees twelve minutes weſt longitude, two hundred and eighty-two miles from London. The harbour is ſo large, that one hundred ſail may ſafely ride at anchor at a time, and thoſe of the greateſt burthen may come up to the quay. The entrance into the harbour is defended by St. Mawes and Pendennis caſtles, both of which are very ſtrong, and have governors and garriſons.

St. Mawes, alſo called St. Mary's, has a little town annexed to the caſtle; but it has neither church nor market. Falmouth is well built, and has abundance of ſhips belonging to it. It is full of merchants, and its trade has greatly increaſed ſince the eſtabliſhment of the Engliſh packets between this town, Portugal, and the Weſt

Indies, as alſo between it and the Groyne in Spain: thoſe from Portugal bringing over not only vaſt quantities of gold for the London merchants, but for thoſe of Falmouth, who trade with the Portugueſe in their own ſhips, and have a great ſhare in the profitable pilchard fiſhery. Here is the cuſtom-houſe for moſt of the towns in the county, and a head collector lives at Falmouth. This town gives title of viſcount to the noble family of Boſcawen.

Truro is one of the chief towns in the county, and is ſeated two hundred and ſeventy-four miles from London, on a branch of Falmouth haven, which is here divided into two ſtreams, and almoſt ſurrounds the town. It is a large, handſome, and well inhabited place, which takes its name from its three ſtreets, which in the Corniſh tongue are expreſſed by the word Truru. It has three churches, about ſix hundred houſes, and is governed by a mayor and aldermen.

Penryn is up the ſame branch of the haven as Falmouth, but ſtands four miles to the weſt: It is a pleaſant agreeable town, full of orchards, and looks like a town in a wood. The ſtreets are broad and paved: it has a church, and about three hundred houſes, and is governed by a mayor, four aldermen, and a town clerk, and there has been lately ſet up here a manufactory of ſerges.

Penzance, a town ſeated on Mount's bay, within about twelve miles of the promontory called the Lands-end, and two hundred and ninety to the ſouth-weſt of London, is a market-town well built and populous, and has many ſhips belonging to it; and alſo a conſiderable number of families of rank. It conſiſts of about ſix hundred houſes; the ſtreets, though bad, are paved. The church ſtands about half a mile from the town; but the inhabitants have a chapel. It is governed by a mayor, a recorder, fourteen aldermen, and twenty-four common-council men. It is remarkable that veins of lead, tin, and copper ore are ſaid to be ſeen even to the utmoſt extent of land at low-water mark, and in the very ſea.

The rocks of Scilly, called by the Greeks Caſſiterides, and by the Dutch ſeamen, Sorlings, are about one hundred and forty ſmall iſlands and rocks thirty miles from the Lands-end, of which St. Mary's is the largeſt, and moſt fruitful, though but nine miles in circumference. It has a good harbour defended by a caſtle. The iſle of Scilly was once eſteemed the moſt conſiderable; that and ſome others ſtand very high; but ſeveral of them are overflowed at high tides. Some of them bear good corn, and moſt of them paſture. They abound with rabbets, cranes, herrons, ſwans, and other water-fowl. Theſe iſlands being ſituated near the mouth of the Engliſh Channel, have proved the deſtruction of many ſhips; for, in ſpite of light houſes and the beſt ſkill of the mariners, they are very dangerous in the night, and in ſtormy weather: here Sir Cloudſley Shovel, in the admiral-ſhip, with three other men of war, unhappily ran upon theſe rocks, on the twenty-ſecond of October, 1707, and not a man was ſaved out of all the ſhips.

We have now deſcribed all the counties of England to the ſouth of the Thames and Briſtol channel, and ſhall therefore proceed further north, and begin with Monmouthſhire.

SECT. XVII.

Of Monmouthſhire; its Situation, Extent, Air, Soil, Produce, and Rivers.

MOnmouthſhire was formerly a part of Wales, and as ſuch is deſcribed by Camden, and other authors; but as all the later writers have placed it in England, we ſhall follow their example, though there ſeems to be no better reaſon for it than the Oxford circuit being extended through that county in the reign of king Charles II.

Monmouthſhire receives its name from Monmouth its county town, and is bounded on the north by Herefordſhire; on the eaſt by Glouceſterſhire; on the ſouth by the river Severn; and on the weſt by the Welſh counties of Brecknock and Glamorgan. Its extent from north to ſouth is about twenty-nine miles, from eaſt to weſt twenty, and in circumference eighty-four. It is ſubdivided into ſix hundreds, and contains ſeven market-towns, one hundred and twenty-ſeven pariſhes, about ſix thouſand four hundred and ninety-four houſes, thirty-eight thouſand nine hundred inhabitants; but ſends only three members to parliament, that is, one for Monmouth, and two for the county.

The air is temperate and healthy, and the ſoil fruitful, though mountainous and woody. The hills feed ſheep, goats, and horned cattle, and the valleys produce plenty of graſs and corn, eſpecially of the latter, of which there is as good wheat as in any county in the kingdom.

This county is extremely well watered by ſeveral fine rivers; for beſides the Wye, which parts it from Glouceſterſhire, the Mynow, which runs between it and Herefordſhire, and the Rumney, which divides it from Glamorganſhire, it has peculiar to itſelf the Uſk, which enters this county a little above Abergavenny, runs moſtly ſouthward, and falls into the Severn by the mouth of the Ebwith; which laſt river runs from north to ſouth in the weſtern ſide of the county. All theſe rivers, eſpecially the Wye and Uſk, abound with fiſh, particularly ſalmon and trout.

The gentlemen here generally ſpeak Engliſh, though the common people uſe the Welſh language. The manufacture of the county is flannels.

The principal towns in this county are the following:

Monmouth, or Mynwy, is ſeated at the mouth of the river Mynwy, or Mynow, between that river and the Wye, over each of which it has a bridge. The town is in a manner ſurrounded with water, there being another river called the Trotby, over which it has alſo a bridge. It is a populous, handſome, well built town, and has a ſtately church, the eaſt end of which is much ornamented. It has been a place of great ſtrength, and might be eaſily made ſo again. The caſtle, though now in a ruinous condition, was formerly a ſtately edifice. The market, which is very conſiderable for corn and all ſorts of proviſions, is held on Saturdays. The government is under a mayor, two bailiffs, fifteen common-council-men, a town-clerk, &c.

Chepſtow is ſeated on the ſide of a hill, fourteen miles to the ſouth of Monmouth, and a hundred and thirty-one to the weſt of London, near the mouth of the Wye, over which it has a fine bridge: it was formerly much reſorted to, and is ſtill a large, well-built, and populous town. It was antiently walled round, and defended by a caſtle; and among the other public buildings had a monaſtery, the remaining part of which is converted into a pariſh-church. This is the port for all the towns that ſtand on the rivers Wye and Lug; ſhips of good burthen come up to it, for the tide commonly riſes here ſix fathoms, or ſix and a half at the bridge, which is of timber, and no leſs than ſeventy feet high from the ſurface of the water when the tide is out. In the year 1689 was diſcovered in this town a Roman pavement, which when entire was very beautiful, repreſenting men, beaſts, birds, trees, &c.

Abergavenny has its name from the river Gavenny, which falls below it into the Uſk. It is a handſome well-built town, ſixteen miles to the weſt of Monmouth, and a hundred and forty-two of London. This town is encompaſſed by a wall, and defended by a ſtrong caſtle. It is a great thorough-fare from the weſt parts of Wales to Briſtol and Bath, and alſo from Monmouth to Glouceſter; and the inhabitants carry on a great trade in flannel. It gives title of baron to the ancient and noble family of Neville.

SECT. XVIII.

Of Glouceſterſhire; its Name, Situation, Extent, Diviſions, Repreſentatives in Parliament, Air, Soil, Produce, Rivers, and principal Towns.

THIS county takes its name from the city of Glouceſter, which was called by the Saxons Gleaucester, and is bounded on the north by Worceſterſhire, and

and a ſmall part of Warwickſhire; on the eaſt by Warwickſhire, Oxfordſhire, and Berkſhire; on the ſouth by Wiltſhire and Somerſetſhire; and on the weſt by Herefordſhire and Monmouthſhire. It is ſixty-five miles in length and thirty-two in breadth, and contains twenty-ſeven market-towns, two hundred and eighty pariſhes, one caſtle, two foreſts, nineteen parks, twenty-ſix thouſand ſeven hundred and ſixty houſes, and a hundred and ſixty-two thouſand five hundred and ſixty inhabitants: it is ſubdivided into thirteen hundreds, and ſends only eight members to parliament, that is, two for the county, two for the city of Glouceſter, and two each for Cirenceſter and Tewkſbury.

The air of this county is wholeſome throughout its whole extent; but has a different ſoil and appearance in the different parts of it: in the eaſt it is hilly, in the weſt woody, and in the middle is enriched with a fruitful vale. The eaſt part, called Coteſwould, has a ſharp air; and though the lands are not very fertile in corn, they feed a great number of ſheep: the Vale includes both ſides of the river Severn, and is very fertile, eſpecially in rich paſtures. Here is made the cheeſe which, next to that of Cheſhire, is highly eſteemed all over England; and a great deal of this cheeſe is alſo made in Wiltſhire: in this Vale the air is ſo mild, even in winter, that it ſeems to enjoy a different climate from that of Coteſwould. The Foreſt of Dean, which borders upon Herefordſhire and Monmouthſhire, is fertile both in paſture and tillage; it bears very fine oaks, and has rich mines of iron and valuable coal-pits. In general this county may be juſtly ſaid to abound with all the neceſſaries of life in the greateſt perfection, as corn, wool, iron, ſteel, timber, bacon, cyder, and ſalmon. The chief manufacture carried on by the inhabitants is clothing, which, before our wool was ſmuggled to France, has been known to return five hundred thouſand pounds per annum.

Its principal river is the Severn, which riſes in Montgomeryſhire, and entering this county a little above Tewkſbury runs near ſouth-weſt by Glouceſter, diſcharging itſelf into the Briſtol Channel. The tide flows as high as Tewkſbury, which, following the courſe of the river, is near ſeventy miles. A little below Newnham it reſembles a ſea, and the tide of flood ruſhes on with ſuch impetuoſity, that it comes in a roll often near four feet high, carrying every thing before it. This is called The Boar. But what is ſtill more remarkable is, that the tides are higheſt one year at the full moon, and the next at the change; and one year the night-tides are higheſt, and the next the day-tides. In this river are taken plenty of excellent ſalmon, lamprey, and conger eels.

The principal places in Glouceſterſhire are the following:

Glouceſter, by the Britons called Caer-Glow, which ſignifies fine city, and by the Romans Glevum, is ſeated on the eaſt ſide of the river Severn, a hundred and two miles from London. It abounds much with croſſes and ſtatues of the kings of England, and has a handſome proſpect of ſteeples, ſome without a church. Theſe and their religious foundations in every part of the city gave riſe to the old proverb, "As ſure as God is at Glou-"ceſter." The cathedral is a venerable pile with a handſome tower, and a finely vaulted choir. On the north ſide lies the unfortunate king Edward II. and before the high altar, in the middle of the church, lies the equally unfortunate prince Robert, the eldeſt ſon of William the Conqueror, who, after being impriſoned twenty-ſix years by his younger brother Rufus, died, and was interred here. In this cathedral is a whiſpering-place, which formerly paſſed among the vulgar as ſomewhat almoſt miraculous, till they were taught that there is a whiſpering-gallery in St. Paul's cathedral. This city was anciently fortified, but after the Reſtoration was diſmantled by act of parliament, on account of the reſiſtance it made againſt the forces of king Charles I. The old houſes projecting into the ſtreets, and its croſs, have been pulled down by act of parliament in 1750, and inſtead of the latter is a ſtatue of colonel Selwyn, their member, who at his own expence made a very large reſervoir about half a mile off, from which the water is conveyed into a ſquare baſon at the foot of this ſtatue, from whence it runs into four canals, which flow through the four great ſtreets that here meet in the center of the city. There are large remains of abbies and convents, both of black and white friars.

There is a large quay, wharf, and cuſtom-houſe on the river; and in the city are twelve companies, the maſters of which attend the mayor on all public occaſions in their gowns, and with ſtreamers. Great proviſion is here made for the poor, particularly Bartholomew's hoſpital for fifty-four men and women; a blue coat hoſpital for educating twenty boys, and for maintaining and annually cloathing ten men and women: there are alſo three others, with ſeveral benefactions for encouraging young tradeſmen and putting out boys apprentice, and lately an infirmary has been erected here. The city is governed by a mayor, twelve aldermen, and common-council, who are never fewer than twenty-ſix, nor above thirty-nine, a town-clerk, and ſword bearer. This city was made the ſee of a biſhop by king Henry VIII. who erected the abbey-church into a cathedral, with a dean and ſix prebendaries.

Cirenceſter, ſo called from the river Churn, on which it ſtands, and Ceſtre, a caſtle, is a populous, rich, and trading town, full of clothiers; it ſtands eighteen miles to the ſouth-eaſt of Glouceſter, and eighty five to the north-weſt of London, and carries on a great trade in wool, which is brought from the inland counties of Leiceſter, Northampton, and Lincoln, and bought up here by the clothiers of Wiltſhire and Glouceſterſhire, for the ſupply of the great clothing trade. Here is a large beautiful church, with two iſles, ſupported by ſtrong pillars. The chancel is handſomely decorated, and the tower is very neat and lofty: the windows ſhew ſome beautiful remains of painted glaſs, and there are five chapels adjoining it. In this town is a free-ſchool, and ſeveral hoſpitals and alms-houſes.

Many antiquities have been found here. In 1723 was diſcovered a fine Moſaic pavement, and afterwards Mr. Biſhop dug up in his garden a vault ſixteen feet long and twelve broad, ſupported by ſquare pillars of Roman brick three feet and half high, on which was a ſtrong floor of terrace, and near it are ſeveral other vaults. Theſe were probably the foundations of ſome Roman temple; for in the ſame place they found pedeſtals, the ſhafts and capitals of columns, and handſome entablatures. Indeed there have been found here innumerable coins and entaglios. The town is governed by two high-conſtables; and has two weekly-markets, one on Monday for corn, cattle, and proviſions; and on Friday for wool. In the neighbourhood of this town lord Bathurſt has an elegant ſeat, park, and gardens.

Fairford is a ſmall market-town ſituated on the river Coln, and is remarkable for the many medals and urns that have been dug up here, and particularly for the fine painted windows of the church. For John Tame, a merchant of London, having taken a prize-ſhip bound for Rome, in which he found a great quantity of painted glaſs, he brought both the glaſs and workmen to England. This painted glaſs was ſo beautiful, that Mr. Tame built this church in order to place it in the windows, and dedicated this ſtructure, which is a hundred and twenty-five feet long, and fifty five broad, to the Virgin Mary. It has three chancels, a good veſtry, and a noble tower. The windows, which are twenty-eight in number, are glazed with this invaluable prize, and ſtill remain entire; for in the civil wars the glaſs was taken out and concealed. The painting was from the deſign of Albert Durer, and the colouring in the drapery and ſome of the figures ſo well executed, that Vandyke affirmed they could not be exceeded. The ſubject is taken from the ſcripture hiſtories of the Old and New Teſtament. John Tame, Eſq; the founder of this ſtructure, who died in 1500, lies buried on the north ſide of the church, under a marble monument.

Tewkſbury is ſeated at the confluence of the rivers Severn and Avon, ninety-ſix miles weſt-north-weſt of London, and contains about five hundred houſes. Its church is a noble ſtructure, and one of the largeſt in England, that is not collegiate or a cathedral. It is very lofty, has two ſpacious iſles, a ſtately tower, and a large chancel. The communion-table conſiſts of one entire piece of marble, fourteen feet long, and three and a half

broad. The town is governed by two bailiffs and twenty-four burgeſſes, and its neighbourhood to Coteſwould makes the clothing trade flouriſh here. It has likewiſe a manufacture of cotton.

We have already deſcribed the city of Briſtol in treating of Somerſetſhire, though a conſiderable part of that city ſtands in this county; and have purpoſely omitted taking notice of St. Vincent's rocks, and the Hot Well, which ſtand about two miles diſtance from Briſtol, and ought to be mentioned in this county. St. Vincent's rocks are a vaſt and irregular heap of ſtones, intermixed with minerals; but the principal ſubſtance of the rocks is a very hard limeſtone. The rock, out of which iſſues the famous water called that of the Hot Well, or Briſtol water, ſtands on the north ſide of the river Avon, and affords a romantic and beautiful proſpect. To taſte this water in perfection it muſt be drank warm from the ſpring, or elſe it loſes its flavour. As it paſſes through a vaſt bed of rocks, and among a variety of different ſtones, it doubtleſs borrows its taſte and virtues from the moſt particular kinds, and when drank at the ſpring-head has a fine gentle warmth and a delicate ſoft milky taſte; it is very grateful to the ſtomach, and is allowed to be cooling, cleanſing, and balſamic; but one of its greateſt qualities is its aſtringency: this renders it uſeful in the diabetes; and in conſequence of its other qualities, it is drank with great ſucceſs in obſtructions in the urinal paſſages from gravel, as alſo in many of the chronic caſes which are leaſt to be relieved by the common courſe of medicine.

Briſtol-ſtones are found in vaſt quantities in the cracks of rocks and cavities of ſtones; but chiefly in the cavities of iron ore. They riſe in a great variety of forms in different places, and the cluſters of them are yet more various in their appearance, they generally adhere to the rock or ore at one end, and terminate in a point at the other.

SECT. XIX.

Of Herefordſhire; its Situation, Extent, Diviſions, &c. Its Air, Soil, Produce, Rivers, and principal Towns.

HEREFORDSHIRE is bounded on the north by Shropſhire; on the eaſt by Worceſterſhire and Glouceſterſhire; on the ſouth by Monmouthſhire; and on the weſt by Radnorſhire, in Wales; it extends thirty-five miles from north to ſouth, thirty from eaſt to weſt, and a hundred and eight in circumference.

This county lies in the dioceſe of Hereford, and contains eight market-towns, eighty-ſeven vicarages, a hundred and ſeventy-ſix pariſhes, and three hundred and ninety-one villages, fifteen thouſand houſes, and ninety-five thouſand ſix hundred inhabitants. It is divided into twelve hundreds, and ſends eight members to parliament, namely, two knights for the ſhire, and two for each of the following towns: Hereford, Lempſter or Leominſter, and Weobly.

The air of this county is healthy and delightful, whence the inhabitants generally live to a great age. As an inſtance of which, it is ſaid, that a morris-dance was performed before king James I. by ten men and women, whoſe ages together made a thouſand years. The ſoil is exceeding rich, producing excellent corn, wool, and fruit, as is evident from the Lempſter bread, Webber ale, and Herefordſhire cyder: the laſt of which is ſent to all parts of England. It alſo abounds with wood and fiſh.

Herefordſhire is plentifully watered with ſeveral rivers, the chief of which are the Wye, the Monow, the Zug, and the Frome, or Froom; all of which are well ſtored with fiſh. The ſalmon of this county are very remarkable, for in other parts of England they are ſo far out of ſeaſon, after ſpawning, as to be unwholeſome food, till they have been again at ſea to recover themſelves; but here they are always ſound, fat, and fit for the table. The principal places in this county are the following:

Hereford, the metropolis and only city of that county, received its name from the Saxon, it ſignifying the ford of the army, being the head-quarters of the Saxons: it is ſeated on the banks of the Wye, a hundred and thirty-one miles from London, and twenty-ſix from Glouceſter. It has a good ſtone bridge of eight arches over the Wye, and is ſurrounded with rivers on all ſides but the eaſt. This city, though large, is not populous; as it lies low the ſtreets are often overflowed, ſo that they are very dirty. It originally owed its flouriſhing ſtate to the martyrdom of Ethelbert, king of the Eaſt Angles, who was baſely murdered by king Offa, and had a church built here to his memory, which was ſoon erected into an epiſcopal ſee. This is a ſtately fabric, the choir, tho' plain, is neat, and has a good organ; and the ſpire is handſome, but not very lofty.

The city is governed by a mayor, and has diſtinct privileges for its ſeveral companies, who have their reſpective halls. In the time of the civil wars this city, being very ſtrong, and well defended, ſupported a very ſevere ſiege againſt the parliament forces, and even the Scottiſh army, four thouſand of the latter having been ſlain before it; but at length it ſurrendered. Of its ſix pariſh-churches two were demoliſhed by the ſiege; but in 1738 the Gothic chapel belonging to the biſhop's palace was pulled town, in order to erect another for the public ſervice. Without the walls of Hereford city are the ruins of Black friars monaſtery, and a pretty ſtone croſs entire, round which were the cloiſters, and now the cloiſters of the cathedral incloſe juſt ſuch another. Theſe croſſes ſerved as a kind of pulpit, whence a monk preached to the people in the open air. It has an hoſpital liberally endowed for twelve poor perſons, with two charity-ſchools, one for ſixty boys, and the other for forty girls, all taught and clothed by ſubſcription. Its weekly markets are on Wedneſday, Friday, and Saturday; and it gives title of firſt viſcount of England to a branch of the Devereaux family.

The walls may be traced all round the city, though overgrown with trees, ſhrubs, graſs, and hedges. Towards the north it is ſheltered by a high mountain of ſteep aſcent, with a vaſt camp at the top, from which is a proſpect as far as St. Michael's Mount in Monmouthſhire, and on the other ſide is a lofty bleak mountain that ſeparates Brecknockſhire from this county.

Lempſter, or Leominſter, is a large borough on the river Lug, over which are ſeveral bridges, fifteen miles from Hereford, and a hundred and thirty-ſix from London. The church, which is very large, having been in a manner rebuilt, is a very beautiful ſtructure. On the north ſide of it was a conſiderable priory, two aiſles of which now belong to the church, and two others of more lightſome work, have been added. There are ſome poor remains of the priory, particularly a little chapel which probably belonged to the prior's family, and underneath it runs a rivulet, which ſerved to grind the prior's corn, but now turns a fulling-mill; and near it are very large ponds for fiſh, which uſed to furniſh the monks on faſting days. This town is noted for its fine wool and the beſt wheat and barley, and conſequently for the fineſt bread: it has alſo a briſk trade in hat-making. Three rivulets that have a ſwift current run through the town, and there are others very near it; the inhabitants make uſe of theſe to work their mills and other machinery in the various branches of their trade.

Between Lempſter and Hereford is Hampton, the ſeat of the late lord Coningſby. There is a plentiful ſupply of water on all ſides of the houſe for fountains, baſons, and canals; and the windows of the chapel are well painted. The park, which is very fine, is eight miles in circumference, and conſiſts of lawns, groves, canals, hills, and plains.

SECT. XX.

Of Oxfordſhire; its Situation, Extent, Diviſions, Repreſentatives, Air, Soil, Produce, and Rivers; with a Deſcription of the principal Places it contains, particularly Oxford and Blenheim-houſe.

THIS county takes its name from the City of Oxford, and is bounded on the north by Warwickſhire and Northamptonſhire, between which counties it runs

runs for a few miles due north, in the form of a wedge; on the eaſt by Buckinghamſhire and Hampſhire; on the ſouth by Berkſhire; and on the weſt by Glouceſterſhire. It extends forty-one miles in length, eighteen in breadth, and a hundred and thirty-eight in circumference.

This county ſends nine members to parliament, namely, two knights for the ſhire, two repreſentatives of the univerſity, two burgeſſes for Woodſtock, and one for Banbury. It is divided into fourteen hundreds, and contains ſixty-two vicarages, two hundred and eighty pariſhes, twelve market-towns, four hundred and fifty-one villages, nineteen thouſand houſes, and a hundred and fourteen thouſand inhabitants.

The air of this county is equal in goodneſs to any of the other; for the ſoil being naturally dry, and at the ſame time plentifully watered with limpid ſtreams, the air is naturally ſweet and wholeſome.

The ſoil in general is very fruitful both in corn and graſs; but there is a great variety in it, and conſequently ſeveral degrees of fertility. The huſbandmen know well how to diſtinguiſh and manage accordingly, both as to the tillage and the different kinds of grain ſown here, there being no leſs than five ſorts of wheat adapted to as many kinds of ſoil. The meadows are covered with rich graſs, and are extremely profitable to the farmer. The chief commodities are corn, malt, cattle, fruit, free-ſtone, ſeveral ſorts of earth, uſeful in medicine, dyeing, and ſcouring. Whitney in this county is famous for its manufacture of blankets.

The principal rivers are the Thames, Iſis, Charwell, Windruſh, and Evenload, which afford plenty of fiſh, and are remarkably good. The principal places in this county are the following:

Oxford, a noble, populous, and fine city, ſeated in a delightful plain on the banks of the Iſis and Charwell, fifty-five miles from London. It is pretended by ſome authors, that it was built a thouſand years before the birth of our Saviour; but this is juſtly controverted by others; however, it is allowed by all to have been a place of note before the coming of the Saxons. The whole city, with its ſuburbs, is of a circular form, three miles in circumference. The ſtreets are ſpacious, neat, and generally ſtraight; the mayor and aldermen govern the corporation, but in ſubjection to the chancellor and vice-chancellor of the univerſity, to whom both they and the ſheriff of Oxfordſhire ſwear to maintain the rights and privileges of the univerſity. On St. Scholaſtica's-day, which is on the tenth of February, ſixty-two of the principal citizens pay an acknowledgedment of one penny each, inſtead of a heavy fine laid on the city, for an outrage committed againſt the univerſity in the reign of king Edward III. when ſixty-two ſtudents were barbarouſly murdered by the citizens.

The univerſity, conſidered as a body corporate, conſiſts of the officers of the univerſity in general, and of the ſeveral colleges. The governors of this great univerſity, which, for the number of its colleges, and the fineneſs of its buildings, has not its equal, are the following: I. The chancellor, who is choſen by the ſtudents in convocation, and whoſe office is to inſpect the government of the univerſity, to protect its privileges, and call aſſemblies. The choice generally falls on ſome nobleman of high rank, and his office is for life. II. The high ſteward, who is nominated by the chancellor, and accepted of by the univerſity: his office is for life, and his employment to aſſiſt the chancellor and proctors in the execution of their offices, and to ſit as judge in capital cauſes, when required by the chancellor III. The vice-chancellor is annually nominated by the chancellor as his deputy, and is elected in convocation. He is always the head of ſome college, and is in orders; he on all occaſions repreſents the chancellor in his abſence. IV. The proctors, who are two in number, are annually choſen out of the ſeveral colleges by turns. Their duty is to inſpect the public exerciſes, to ſee diſcipline preſerved, and all diſorders prevented or puniſhed. After theſe are the public orator, the keeper of the records, the regiſter, ſix beadles, and a verger.

The colleges are places provided with ſufficient revenues for the maintenance of a maſter, profeſſors, and ſtudents: the halls are houſes where the ſtudents live either wholly, or in part, at their own expence. Of the firſt ſort there are twenty, and of the latter but five. In each of theſe are private lectures and diſputes in the liberal ſciences, to prepare the ſtudents for the public exerciſes. They are ranked in the following order:

I. Univerſity-college is ſituated near the eaſt gate of the city, and was the beginning of the univerſity. It was founded before the year 721, but how much earlier is not certain, king Alfred not being ſo properly the founder of this univerſity, as its reſtorer after the Daniſh devaſtions. It has one maſter, twelve fellows, ſeventeen ſcholars, and two exhibitioners. Before the noble benefaction of Dr. Radcliffe, it had one large beautiful quadrangle, the ſouth ſide of which is divided into a handſome hall and chapel. In a niche before this quadrangle is a ſtatue of the late queen Anne, and in a niche on the inſide of a new quadrangle is that of Dr. Radcliffe, who left forty thouſand pounds for building a public library, which is a noble ſtructure.

II. Baliol-college ſtands in the north part in the ſuburbs, and was founded by John Baliol, whoſe ſon was king of Scotland. It maintains a maſter, twelve fellows, thirteen ſcholars, and eighteen exhibitioners. It has one large ancient quadrangle, on the north ſide of which is the chapel, and a library furniſhed with a noble collection of books.

III. Merton-college is ſituated on the ſouth ſide of the city, and takes its name from its founder Walter of Merton, biſhop of Rocheſter, and chancellor of England, about the year 1267. It has a warden, twenty-four fellows, fourteen portioniſts, and two clerks. The chapel is the pariſh-church of St. John Baptiſt. The inner large court of the college is very beautiful, and has a well furniſhed library, with a fine garden.

IV. Exeter-college is ſituated on the weſt ſide of the ſchools, in the north part of the town, and was founded in 1316, by Walter Stapleton, biſhop of Exeter, and lord-treaſurer of England. It maintains a rector, twenty-three fellows, one bible-clerk, and three exhibitioners, It has one large quadrangle, which has a very noble front, and over the gate is a ſplendid tower.

V. Oriel-college is ſituated on the ſouth ſide of the town, and was at firſt named St. Mary's and King's-college. It was founded by king Edward II. in 1324, and his ſon Edward III. adding to the revenue a rich meſſuage called Le Oriel, it thence took the name of Oriel-college. It conſiſts of one handſome regular quadrangle, and has a provoſt, eighteen fellows, and twelve exhibitioners.

VI. Queen's-college is ſeated near the pariſh-church of St. Peter's in the Eaſt, and founded in 1340 by Egleſfield, chaplain or confeſſor to Philippa, conſort to king Edward III. in honour of whom he called it Queen's-college. It maintains a provoſt, ſixteen fellows, ſixteen ſcholars, eight chaplains, nine taberders, and twenty exhibitioners. It has had ſome noble benefactors, who have erected extenſive buildings that are juſtly admired. One ſide of it is three hundred and twenty-ſeven feet long, ſupported by a piazza, and adorned with ſtatues, in which is a long and lofty library, well furniſhed with books; and on the other ſide of the college is the new chapel and hall. Her late majeſty queen Caroline's ſtatue is erected in this college under a kind of temple ſupported by pillars, ſhe having given a thouſand pounds towards completing the new building.

VII. New-college, which ſtands on the north-eaſt part of the city, was founded in 1386 by William of Wickham, biſhop of Wincheſter, and lord high chancellor, under the name of the college of the Bleſſed Virgin Mary. It has a warden, ſeventy fellows, ten chaplains, three clerks, ſixteen choriſters, &c. Great additions have been made to the beauty of the buildings, which have been alſo enlarged towards the garden with two ſtately and uniform wings. The chapel is a magnificent ſtructure, with a very lofty tower, and a fine ring of bells. The library is well furniſhed with books and manuſcripts, and the great garden laid out in form. In the front is a range of iron paliſades, and a gate of exquiſite workmanſhip.

VIII. Lincoln-college, which ſtands in the middle of the city, was founded in 1427 by Richard Fleming,

biſhop of Lincoln; but finiſhed by Thomas De Rotherham, biſhop of Lincoln, afterwards lord high chancellor and archbiſhop of York, in 1475. It has a rector, twelve fellows, nine ſcholars, twenty exhibitioners, two chaplains, &c. This college has two ſmall ancient quadrangles, with a beautiful chapel, the windows of which are curiouſly painted.

IX. All Souls college, which fronts the High ſtreet, was founded by Henry Chichely archbiſhop of Canterbury, for offering up prayers for the ſouls of all who fell in the wars of king Henry V. in France. It has a warden, forty fellows, two chaplains, nine ſcholars, three clerks, ſix choriſters, &c. Colonel Codrington bequeathed ten thouſand pounds to this college for building a library and furniſhing it with books. This library is two hundred feet long within the walls, and thirty-two feet and a half-broad: it has eleven large windows to the ſouth, with a window of ſeventeen feet in width at each end. It is a fine gothic ſtructure, and is thus built in conformity to the chapel.

X. Magdalen college ſtands without the eaſt gate, and was founded in 1458, by William Patten, otherwiſe Wainfleet, biſhop of Wincheſter, and lord high chancellor. It has a preſident, forty fellows, a ſchool-maſter, thirty ſcholars, called demies, an uſher, three public readers, four chaplains, eight clerks, ſixteen choriſters, &c. The chapel and hall are very magnificent, and the walks very delightful. The library, to which colonel Codrington alſo bequeathed ten thouſand pounds, is very well furniſhed.

XI. Brazen-Noſe college is ſituated in the middle of the city, where ſtood a hall of the ſame name, with a monſtrous noſe of braſs fixed upon the door. It was founded in 1509, by William Smith biſhop of Lincoln, and has a principal, twenty-four fellows, thirty-three ſcholars, &c. It conſiſts of two very handſome quadrangles, in the leſſer of which are the chapel and library, and under them a wide and pleaſant cloiſter, compactly and elegantly built.

XII. Corpus Chriſti college ſtands on the ſouth ſide of the city, and was founded in 1516, by Richard Fox, biſhop of Wincheſter, and lord privy ſeal to king Henry VII. and VIII. It has a preſident, twenty fellows, twenty ſcholars, two chaplains, and four exhibitioners. It contains ſome very noble buildings, and its library has a valuable collection of books and manuſcripts.

XIII. Chriſt-Church college, takes up a vaſt extent of ground, on the ſouth ſide of the city. It was begun in the year 1515, by Cardinal Wolſey, but upon his diſgrace it fell into the king's hands, who made it an epiſcopal ſee, and joined it to Canterbury college, and Peckwater Inn. It has a dean, eight canons, one hundred and one ſtudents, eight chaplains, eight ſinging men, eight choriſters, and a teacher of muſic, a ſchool-maſter, uſher, forty grammar ſcholars, &c. In the ſtately tower in the front of the gate, hangs the great bell called Tom, which was removed thither out of the ſteeple of the cathedral, and is ſeven feet one inch in diameter, weighing ſeventeen thouſand pounds weight. This bell is tolled every night one hundred and one ſtrokes, agreeable to the number of ſtudents in the college, to give warning for ſhutting up the gates in the colleges and halls in the univerſity. The buildings of this college are very large and ſplendid. The great quadrangle has a wide and handſome terrace round it, and a fountain in the middle. Peckwater quadrangle is finely built, and there are alſo two other ſquares. The cathedral is lofty, the hall and library are high and ſpacious, and the latter contains a noble collection of books. In a word, this college is a univerſity of itſelf.

XIV. Trinity college was originally a religious houſe, called Durham college; for the monks of Durham cathedral, ſeated in the north ſuburbs; but upon the diſſolution of monaſteries, Sir Thomas Pope purchaſed it of thoſe to whom it had been granted by the crown, and converted it into a college. It has a preſident, twelve fellows, twelve ſcholars, &c. It conſiſts of two quadrangles, in the firſt of which are the chapel, the hall, and the library. The chapel, which has been rebuilt, is an elegant ſtructure, and the roof is inriched with fret-work, and an admirable painting repreſenting our Saviour's aſcenſion. The gardens on the eaſt ſide of the college are large and well laid out.

XV. St. John Baptiſt's college ſtands in the north ſuburbs, and was founded in 1555, by Thomas White, lord mayor of London in the place where St. Bernard's college ſtood before the Reformation. The two quadrangles are large and uniform, particularly the inner court built by archbiſhop Laud, which is very elegant, the eaſt and weſt ſides of it being ſupported by noble piazzas. The hall is neat, and adorned with good pictures, and the gardens large and well laid out. It has a preſident, thirty-nine fellows, eleven ſcholars, &c.

XVI. Jeſus college is ſituated in St. Michael's pariſh, and was begun in 1571, by Hugh Price prebendary of Rocheſter, and appropriated to the benefit of the Welſh; it has met with ſeveral benefactions, by which it is enabled to maintain a principal, nineteen fellows, eighteen ſcholars, twenty-one exhibitioners, &c. It has two handſome quadrangles, the innermoſt of which is very regular and uniform.

XVII. Wadham college is ſeated in the north ſkirts of the city, and received its name from its founder Nicholas Wadham, of Somerſetſhire, Eſq;. It was begun in 1609, and finiſhed after his death by his lady in 1613. It conſiſts of one noble quadrangle, beſides the library and chapel, the windows of which are beautifully painted, and has a handſome garden. It maintains a warden, fifteen fellows, fifteen ſcholars, &c.

XVIII. Pembroke college ſtands on the ſouth ſide of the city, and was formerly called Broad-gate hall, but was erected into a college by the bounty of Thomas Teſdale, Eſq; and Richard Wrightwicke, B. D. in 1624, who gave it the preſent name in honour of the earl of Pembroke, then lord chancellor. It has one handſome quadrangle, the front of which is a regular neat piece of building, and has a pleaſant garden. It has a maſter, thirteen fellows, and twenty-three ſcholars, &c.

XIX. Worceſter college was lately called Glouceſter hall; but was erected into a college by Sir Thomas Cookſey, of Aſtley in Worceſterſhire, and has lately been adorned with new buildings, which make a ſtately and ſplendid appearance.

XX. Hertford college was originally called Hart hall; but was erected into a college in 1740, by his late majeſty's royal charter, by which it is to conſiſt of a principal, with four ſenior and eight junior fellows. It ſtands in the pariſh of St. Peter's in the eaſt, and conſiſts of one quadrangle.

Theſe are the twenty colleges of which this celebrated univerſity conſiſts; there are beſides five halls, which are places unendowed, though not without exhibitions; the ſtudents in theſe ſubſiſt at their own expence, are under the government of a principal, and vice-principal, and pay the former for their lodgings. Theſe five halls are Alban hall, Edmund hall, St. Marys hall, New-Inn hall, and St. Mary Magdalen hall.

Beſides the building already mentioned, is the theatre, a magnificent ſtructure raiſed by the munificence of Dr. Gilbert Sheldon archbiſhop of Canterbury, and built by Sir Chriſtopher Wren. The roof, which is ſupported without pillars, is finely painted. There is here alſo the noble Bodleian library, and the muſeum Aſhmoleanum, one of the richeſt repoſitories of natural curioſities in the world, the Clarendon printing-houſe, &c.

The city of Oxford was made an epiſcopal ſee in 1541, and beſides the colleges and halls juſt mentioned, has two charity ſchools, one erected by the univerſity for fifty-four boys, and the other by the city, for fifty boys and girls.

Woodſtock, a borough ſeven miles to the north of Oxford, is pleaſantly ſeated on a riſing ground, and was formerly celebrated for the famous labyrinth in which fair Roſamond was concealed by king Henry II. and murdered by his queen. Some years ago a ſmall part of the old palace, and of this labyrinth were remaining; but not the leaſt veſtige of them is now left. This town is now principally famous for Blenheim houſe, a magnificent pile of building erected about half a mile from the town to perpetuate the memory of the ſignal victory obtained by the allies over the French and Bavarians near the village of Blenheim on the banks of the Danube,

in

in Auguſt 1704. This noble ſeat, with the manor of Woodſtock, was ſettled by the Britiſh parliament on John Churchill, duke of Marlborough, and his heirs, as a grateful acknowledgment for his bravery and conduct on that occaſion. The roof is adorned with a ſtone baluſtrade; but there are ſeveral towers on the top of the wings, that have a very heavy aſpect. The lofty hall was painted by Sir James Thornhill, and the cieling by La Guerre; the rooms are finely inriched with marble chimney pieces, beautiful furniture, incomparable hangings, and paintings repreſenting the principal exploits of the duke of Marlborough. Among the pictures are many of Rubens's beſt and largeſt pieces, and the famous loves of the gods by Titian, which was a preſent from the king of Sardinia. The gallery is ſupported by marble columns and pilaſters, ſupporting a moſt curious entablature. Over a pediment in the front of the houſe, facing the gardens, is a fine buſt of Lewis XIV. bigger than the life, taken from the gate of Tournay The chapel is very beautiful, and the garden is a large plot of ground taken out of the park and well laid out, having fine walks, eſpaliers, &c. and the viſtas are terminated by ſome remarkable objects in the neighbouring country. In the park is a lofty bridge, conſiſting of one arch above one hundred and ninety feet wide, and a vaſt obeliſk, in which is inſcribed an excellent ſummary of the duke's actions and character.

Banbury is a large well built market-town, ſeated on the Charwell, ſeventy-ſeven miles to the north-weſt of London. It contains ſeveral good inns, and its markets are well ſupplied with proviſions. This is eſteemed the ſecond town in the county for beauty; the houſes are generally built with ſtone, and the church is a large handſome ſtructure. This town has long been famous for its cakes and ale.

SECT. XXI.

Of Buckinghamſhire; its Name, Situation, Extent, Diviſions, Repreſentatives, Air, Soil, Produce, Rivers, and principal Places.

THIS county probably derived its name from the Saxon word Buc, it formerly abounding more in deer than any other county. It is bounded on the north by Northamptonſhire; on the eaſt by Bedfordſhire, Hertfordſhire, and Middleſex; on the ſouth by Berkſhire, from which it is ſeparated by the Thames; and on the weſt by Oxfordſhire. Its length is about thirty-nine miles, its breadth where broadeſt, is about eighteen, and it is one hundred and thirty-eight miles in compaſs.

This county, which lies in the dioceſe of Lincoln, and in Norfolk circuit, is divided into eight hundreds, and contains fifteen market towns, ſeventy-three vicarages, one hundred and eighty-five pariſhes, ſix hundred and fifteen villages, eighteen thouſand three hundred and ninety houſes, and about one hundred and eleven thouſand three hundred and forty inhabitants. It ſends fourteen members to parliament, namely two for the county, two for Buckingham, two for Chipping-Wycomb, two for Aileſbury, two for Great-Marlow, two for Wendover, and two for Agmondeſham.

The air of Buckinghamſhire is generally eſteemed good, eſpecially in the higher parts; and even in the vallies it is more healthful than in many other counties. The ſoil is for the moſt part chalk, or marl, and very rich; ſo that the corn and cattle of this county are excellent, particularly their ſheep. The chief commodities are timber, beach, fine wool, and the chief manufactures are bone-lace, which is here made in great perfection, ſtraw-hats, and paper.

The rivers of this county are but ſmall, except the Thames, which waſhes its borders to the ſouth; the others are the Ouſe and the Colne.

The principal places in this county are the following:

Buckingham, which is ſeated on the Ouſe, which ſurrounds it on all ſides but the north, and is forty-ſix miles to the north-weſt of London. It ſtands on a low ground, and has three bridges over the river. A caſtle was formerly ſeated in the middle of the town, but hardly any of its ruins now remain. It has a town-hall, a church, and a chapel, erected by archbiſhop Becket, now uſed as a free-ſchool, and ſeveral meeting-houſes. The county jail and court are ſometimes kept here, and ſometimes the aſſizes are held in this town.

Near this town is Stow, a village rendered deſervedly famous by the noble gardens which belonged to the late lord viſcount Cobham, and now to earl Temple. On entering the garden on the ſouth-ſide, you are ſtruck with the grandeur and variety of the objects that preſent themſelves to view. In the middle of a large octagon piece of water is an obeliſk near ſeventy feet high, from the top of which riſes a ſtream of water. At a good diſtance are two beautiful rivers, which join, and enter the octagon in one ſtream, and over one of them is a Palladian bridge. At a diſtance on the right hand is a Gothic ſtructure ſeated on a hill, and dedicated to Liberty, and on the left, an Egyptian pyramid ſixty feet high.

From the above octagon falls a natural caſcade, in three different ſheets of water. From hence you paſs to the hermitage, which is agreeably ſituated in a wood; on paſſing through you come to a neat ſtructure called the Veneris Hortus, before which are the ſtatues of Cain and Abel. Each way from the entrance of the room is a handſome colonade leading to ſome pavilions, where are four antique buſts of Veſpaſian, Cleopatra, Nero, and Fauſtina.

On the top of a mount is the Belvidere, a building which affords a delightful proſpect. In the garden is alſo the temple of Friendſhip, a lofty ſquare building of the Doric order, with three noble porticos on the ſides. The cieling is painted, and in the room are ten pedeſtals, on which are the buſts of his lordſhip, and nine of his friends, his late royal highneſs the prince of Wales, the earl of Cheſterfield, Mr. Pitt, &c. There are alſo in the garden, St. Auguſtine's cave, which is formed of roots of trees and moſs: the temple of Bacchus; a Saxon temple, ſtanding in a ſolemn grove, and containing the ſeven Saxon deities preſiding over the ſeveral days of the week; and in the middle an altar for ſacrifice; a Corinthian column, on which is placed the ſtatue of his late majeſty king George; Dido's cave, ſeated in a wood; a rotunda, the dome of which is ſupported by ten Doric columns, and in the centre is a circular pedeſtal, on which is placed a Venus de Medicis; the ſtatue of her late majeſty queen Caroline, erected on four Ionic columns placed on a large pedeſtal; the ſleeping parlour, a ſquare ſtructure placed in a wood in the centre of ſix walks; the temple of ancient Virtue, which is a rotunda of the Doric order; and in four niches are the ſtatutes of Epaminondas, Lycurgus, Socrates, and Homer; the Elyſian fields, a moſt delightful ſpot; a grotto adorned with ſhells, pebbles and minerals; a ſhell pavilion, the the dome of which is ſupported by ſix wreathed columns; the Chineſe houſe; the monuments of Britiſh worthies, theſe are Mr. Pope, Sir Thomas Greſham, Shakeſpear, Sir Iſaac Newton, Sir Francis Bacon, king Alfred, Edward the Black Prince, queen Elizabeth, king William III. Sir Walter Raleigh, Sir Francis Drake, John Hampden, Eſq; Sir John Barnard, &c.

In ſhort, the temples, pavilions, pyramids, obeliſks, monuments, ſtatues, buſts, &c. are all highly finiſhed, and the many inſcriptions are deſigned for the information and inſtruction of the beholder; and this delightful ſpot ſeems to want nothing that can contribute to render it a terreſtrial paradiſe.

Aileſbury, the largeſt and beſt town in the county, is ſeated on a hill, 44 miles from London; but the country round it is low and dirty. It conſiſts of ſeveral large ſtreets, and has a handſome market-houſe, which ſtands in a kind of ſquare. It has alſo a town-houſe, where the aſſizes, the ſeſſions, and other meetings of the county are held, and under it the jail. Many of the poor are employed in making bone-lace. Proviſions are here plentiful and cheap, which is owing to its being encompaſſed by ſome of the richeſt land in England. This town is governed by a bailiff, ten aldermen, and twelve capital burgeſſes. It gives title of earl to the noble family of Bruce.

Eaton, or Eton, a town ſeated on the Thames, oppoſite to Windſor, is juſtly celebrated for its college, which has

has produced a great number of learned men. This building, except the great ſchool-room, are in the Gothic ſtyle, and together with the chapel were founded by Henry VI. for the ſupport of a provoſt and ſeven fellows, one of whom has the title of vice-provoſt, and for the education of ſeventy king's ſcholars, as thoſe are called, who are on the foundation. The revenue of the college is about five thouſand pounds a year. Theſe ſcholars, when properly qualified, are elected on the firſt Tueſday in Auguſt, to King's college Cambridge, but are not removed till there are vacancies in the college, and then they are called according to ſeniority; and after they have been three years at Cambridge, they claim a fellowſhip. Beſides thoſe on the foundation, there are ſeldom leſs than three hundred ſcholars, at this time there are many more, who board at the maſters houſes, or within the bounds of the college. The ſchool is divided into upper and lower, and each of theſe into three claſſes. To each ſchool there is a maſter, and four aſſiſtants. Here is a noble library. In the great court is a fine ſtatue of the founder, erected at the expence of the late provoſt Dr. Godolphin, dean of St. Paul's.

In this county are alſo Newport Pagnel, Stoney Stratford, and a number of fine ſeats.

SECT. XXII.

Of Middleſex; its Name, Situation, Extent, Diviſions, Air, Soil, and Produce; a conciſe Deſcription of the River Thames, of the City of London, the Palace of Hampton-Court, and Kenſington, with the other remarkable Places in this County.

THIS county received its name from its ſituation: it being ſurrounded by the Eaſt, Weſt, and South Saxons. It is bounded on the north by Hertfordſhire, on the eaſt by Eſſex, from which it is divided by the river Lea, on the ſouth by the Thames, which runs between it and Surry, and on the weſt by Buckinghamſhire, from which it is ſeparated by the river Coln. It extends twenty miles in length, fourteen in breadth, and is about ninety-five in circumference.

This county, which lies in the dioceſe of London, is divided into five hundreds; and, beſides the cities of London and Weſtminſter, contains four market towns, thirty-one vicarages, ſeventy-three pariſhes, five thouſand houſes, and twenty-five thouſand inhabitants: but with the addition of London, the number of all theſe is vaſtly encreaſed. It is indeed one of the leaſt counties, but is by much the richeſt, moſt populous, and pays more taxes to the government than any ten beſides; yet ſends only eight members to parliament, two for the county, four for London, and two for Weſtminſter.

The air muſt be extremely wholſome, ſince not even the great number of people in London can affect it ſo much as to render it more ſubject to epidemical diſeaſes, than other places uſually are; but, at a very ſmall diſtance from the ſmoke of this immenſely populous city, the air is not only healthful but exceeding pure; to this the ſoil, which generally conſiſts of gravel, greatly contributes. The land which chiefly conſiſts of paſture and kitchin-gardens, is extremely fertile, which indeed cannot be otherwiſe, conſidering the advantages of the dirt of London ſtreets, which in many places improves the land, and there being never any want of dung for manure, from the many thouſand horſes kept in this city and its neighbourhood.

The Thames, though running through various counties, ſeems properly to belong to Middleſex; it being here of the greateſt importance to the kingdom. It may be here proper to take notice, that the right reverend annotator on Camden obſerves, that though it is the current opinion that the Thames had its name from the conjunction of the Thame and Iſis, yet it is always called Thames before it comes near the Thame. This he proves from ſeveral ancient records, and adds, that it may be ſafely affirmed, that it does not occur under the name of Iſis in any charter and authentic hiſtory; and that the name is no where heard of, except among ſcholars; the common people all along from the ſpring-head to Oxford, calling it by no other name but that of the Thames. See Gibſon's Camden, Vol. I. page 99.

It was neceſſary to ſay thus much to reſcue truth from the poetic fictions of the marriage of Thame and Iſis, which has been farther ſtrengthened by the painters and engravers.

The Thames, ſays the author of London and its Environs, if conſidered with reſpect to its courſe and navigation, is not to be equalled by any river in the known world. It riſes from a ſmall ſpring a little to the ſouth-weſt of Cirenceſter, in Glouceſterſhire; and taking its courſe eaſt-ward, becomes navigable at Lechlade for veſſels of fifty tons, and there receives the river Colne, about one hundred and thirty-eight miles from London. From Lechlade it continues its courſe north-eaſt to Oxford, where it receives the Charwel; after which it runs ſouth-weſt to Abingdon, and from thence to Dorcheſter, where it receives the Thame, and continuing its courſe ſouth-eaſt, flows by the borders of Berkſhire, Buckinghamſhire, Surry, Middleſex, Eſſex, and Kent, and paſſing by a number of towns and fine villages, proceeds by Weſtminſter and London, to Deptford, Greenwich, Woolwich, Graveſend, and ſo on to the ſea. It is impoſſible to repreſent the beauties with which the banks of this noble river are embelliſhed from Windſor to London; the numerous villages on its banks being all along adorned with the magnificent houſes and fine gardens of the nobility. This river is navigable as far as Lechlade, in Oxfordſhire, which is two hundred and thirty miles from its mouth, and the tide flows as high as Richmond in Surry, which, following the courſe of the river, is ſeventy miles from the ſea. At London the depth is ſufficient for the navigation of large ſhips, which renders it one of the greateſt ports for trade in the univerſe. The water is juſtly eſteemed exceeding wholeſome and fit for uſe in very long voyages, during which it will work itſelf perfectly fine. It likewiſe abounds with a great variety of fiſh.

London, the metropolis of Great Britain, and one of the largeſt as well as the richeſt cities upon earth, is ſituated in the fifty-firſt degree thirty minutes north latitude, and from this city we have, through the courſe of this work, computed the longitude of all other countries in the three parts of the world of which we have treated; but it is proper here to obſerve, that placing the firſt meridian at the iſle of Ferro, its longitude eaſt from thence is ſeventeen degrees thirty-five minutes.

This city was neither built by built by Brute nor king Lud, as ſome romantic and fanciful authors pretend; but probably exiſted in the time of the ancient Britons, before the art of writing was brought into England, and when there were no other monuments of ancient facts than what were found in the ſongs of the bards which were preſerved only by memory. London, however, had no buildings either of brick or ſtone till it was inhabited by the Romans; for the dwellings of the Britons were only huts formed of twigs wattled together: however, Tacitus obſerves, that in the year 26 it was very famous for the multitude of its merchants, and the greatneſs of its traffic; but ſoon after Suetonius abandoned the city to the fury of Boadicea, it being two large to be defended by his little army of ten thouſand Romans, which is doubtleſs a proof of its being even then of conſiderable extent, that injured princeſs burnt the city, and in the cruelty excited by revenge, put the inhabitants to the ſword.

It is impoſſible in the ſmall compaſs required in a work like this, in treating of a ſingle city, to give the revolutions that have happened in this metropolis: it will be ſufficient therefore in this place to deſcribe its preſent ſtate. The two laſt great calamities this city has ſuffered were the plague in 1665, which ſwept away ſixty-five thouſand five hundred and ninety-ſix perſons, at a time when the buildings of the city and its inhabitants did not amount to half the number they do at preſent; and the fire in 1666, which burnt down thirteen thouſand two hundred dwelling-houſes, four hundred ſtreets and lanes, the cathedral of St. Paul's, eighty-ſix pariſh churches, ſix chapels, the royal exchange, with many other public ſtructures, and fifty-two of the compt nies halls. In memory of this laſt a monument is erected near the place where

Boadicea haranguing the Britons.

where it began, which is a magnificent column that rises to a prodigious height, and on the base is an allegorical representation in basso relievo of the raising of the city from this dreadful conflagration.

London is seated on the banks of the Thames, and, including the buildings which generally go under that name, extends above seven miles in length, but its breadth is in some places only three, in others two, and in others again not much above half a mile. A person unaccustomed to the sight cannot behold without surprize the vast number of barges and boats, both of pleasure and burthen, above London bridge, continually passing and repassing, for the convenience and supply of this city and the towns on the banks of the Thames; for is it possible to observe without astonishment the vast fleets which constantly appear below bridge, carrying away the manufactures of Britain, and bringing back the produce of the whole earth.

The city of London was formerly surrounded with walls, and till lately had seven gates: these were Ludgate, Aldersgate, Aldgate, Cripplegate, Newgate, Moorgate, and Bishopsgate; the three first of which were taken down in 1760, and all the rest, except Newgate, before the end of the following year. But the bounds of what is strictly called the city, including the liberties, are still every where determined by wooden bars, or rails, except on the west, where is a magnificent gate called Temple-bar.

We shall first consider the buildings belonging to the city, strictly so called. A little without the gates to the south-east it was defended by the Tower of London, a very ancient structure, in which the White Tower is said to be founded by William the Conqueror; it is surrounded by a wall and deep ditch, which inclose several streets, besides what is properly called the Tower: there are here some artillery, a magazine of small-arms for sixty thousand men, ranged in the most beautiful order, and a horse-armoury, in which are fifteen figures of kings on horse-back. Here are likewise the crown and other regalia, the mint for coining of money, and the menagerie for lions and other beasts, with several foreign birds. The circumference of the whole is about a mile. It contains one parish-church, and is under the command of a constable and lieutenant.

In Thames-street, near the Tower, is the custom-house, with the front facing the river. This is a large and stately structure, where the king's customs are received for all goods imported and exported; and opposite to it, as well as a great way down the river, is a delightful prospect of a grove of masts belonging to merchant ships. A little farther to the west is London bridge, which was formerly much admired for having houses on each side; but having been of infinite disadvantage by blocking up and narrowing the passage, they have been taken down; instead of houses a handsome stone balustrade is now fixed on each side, and the passage rendered as commodious, and at the same time as beautiful as possible, without entirely rebuilding it.

The royal exchange in Cornhill is generally allowed to be one of the best structures of the kind in the world. It was first built by Sir Thomas Gresham in 1566, and 1567; but being burnt in 1666, it was rebuilt in a grander manner, the principal part of Portland stone, and cost eight thousand pounds. In each of the principal fronts is a piazza, and in the center a grand entrance into an area, under a noble and lofty arch; on each side that of the principal front, which is in Cornhill, are Corinthian demi-columns, supporting a compass pediment; and in the intercolumnation, on each side, is a nich with the figures of king Charles I. and II. in Roman habits. On the sides of this entrance is a range of windows placed between demi-columns and pilasters of the Composite order, above which runs a balustrade. The height of the building is fifty-six feet, and from the center of this side rises a lantern and turret a hundred and seventy-eight feet high, on the top of which is a vane in the form of a grasshopper, of polished brass. The north front of the royal exchange is adorned with pilasters of the Composite order; but has neither columns nor statues; and instead of the two compass pediments has a triangular one. The inside of the area, which is a hundred and forty-four feet long and a hundred and seventeen broad, is surrounded with piazzas like those of the south and north fronts, forming ambulatories for the merchants to shelter themselves from the weather. Above the arches of these piazzas is an entablature extending round, and a compass pediment in the middle of each of the four sides. Under that on the north are the king's arms, on the south those of the city, on the east those of Sir Thomas Gresham, and on the west those of the mercers company. In these intercolumnations are twenty-four niches, twenty of which are filled with the statues of the kings and queens of England. In short, in the center of the area is another statue of king Charles II. in a Roman habit, encompassed with iron rails. In this area merchants meet every day at twelve at noon, and continue there in order to transact business till two. These merchants are disposed in separate classes, each of which has their particular station, called their walk.

The bank of England began to be erected in 1732; this is a very noble structure, to which very large additions are now making; with a grand passage to it from Cornhill.

The mansion-house is a magnificent structure; but too heavy and too large for the use for which it was designed. It is built of Portland stone, and has a portico of six lofty fluted columns of the Corinthian order in the front, the same order being continued in pilasters, both under the pediment and on each side. The basement story is very massy, and built in rustic, and on each side rises a flight of steps of very considerable height, leading up to the portico, in the middle of which is the door which leads to the apartments and offices. The columns support a large angular pediment, adorned with a very noble piece in basso relievo, representing the dignity and opulence of the city of London, executed by Taylor. In the center stands a very graceful woman crowned with turrets, representing the city, her left foot placed upon the figure of Envy, who lies on her back, and seems endeavouring to rise. Her left arm rests upon a large shield, which has the city arms, and in her right hand she holds a wand. This being the principal figure, it is done in alto relievo: she seems ready to step forwards, her head and right arm project from the back ground, and her wand extends beyond the cornice of the pediment. Near her, on her right hand, stands a Cupid, holding the cap of Liberty on the end of a short staff, and a little farther a river god, representing the Thames, lying reclined, pouring a stream of water from a large vase; and near him an anchor fastened to its cable, with shells lying on the shore. On the left hand of London is Plenty kneeling and supplicating London to accept of the fruits she is pouring from her cornucopia; and behind her are two naked boys with bales of goods, as emblems of commerce. Beneath this portico are two series of windows, which extend along the whole front; and above this is an Attic story, with square windows crowned with a balustrade. This building has an area in the middle, and the apartments are extremely noble.

Guildhall is the town-hall of the city, and is an old Gothic structure, in which the courts of justice are kept: the great hall is a hundred and fifty-three feet long, fifty broad, and fifty-eight high, embellished with two monsterous wooden giants, the pictures of several of the kings and queens of England, and of eighteen judges who distinguished themselves in determining the differences between landlords and tenants on rebuilding the city after the fire.

Blackwell-hall is famous for being the greatest mart for woolling cloth in the world. Sion-college has a library appropriated to the use of the London clergy.

In Warwick-lane is the college of physicians, where two of the fellows meet twice a week to give medicines to the poor gratis. The structure is very fine; but is in a manner entirely concealed.

Christ's hospital was formerly a house of the Grey friars, and was founded by Edward VI. for the entertainment and education of the children of citizens of both sexes. Here is a writing-school, drawing-school, grammar-school, and another for teaching the mathematics. The boys educated, maintained, and clothed gratis in this school

ſchool generally amount to near a thouſand, excluſive of the girls, who are about ſeventy in number.

The college of heralds, to which belong three kings at arms, namely, Garter, Clarencieux, and Norroy, with ſix heralds, four purſuivants, and eight proctors, is a ſpacious building, with convenient apartments, a good library relating to heraldry, and here the coats of arms are kept of all the families of note in England.

St. Paul's cathedral, which is ſeated on the higheſt ground in the city, is deſervedly eſteemed the ſecond in Europe, not for magnitude only, but for the magnificence and grandeur of the building. Its general form is that of a long croſs: the walls are wrought in ruſtic, and ſtrengthened as well as adorned by two rows of coupled pilaſters, one over the other; the lower Corinthian, and the other Compoſite. The ſpaces betwen the arches of the windows, and the architrave of the lower order, are filled with a great variety of curious enrichments, as are thoſe above. The weſt front has a moſt magnificent portico, a noble pediment, in which is repreſented the converſion of St. Paul in baſſo relievo, and two ſtately turrets. At this end is a grand flight of ſteps of black marble, that extend the whole length of the portico, which conſiſts of twelve lofty Corinthian columns below, and eight of the Compoſite order above, ſupporting the above pediment. Theſe are all coupled and fluted. The magnificent figure of St. Paul on the apex of the pediment, with St. Peter on his right, and St. James on his left, have a fine effect. The four evangeliſts, with their proper emblems on the front of the towers, are alſo well executed. The other ſides of the church are beautifully ornamented, and each has a different front. The dome, which riſes in the center of the whole, appears extremely grand: twenty feet above the roof of the church is a circular range of thirty-two columns terminated by their entablature, which ſupports a handſome ſtone gallery, adorned with a baluſtrade. Above theſe columns is a range of pilaſters, with windows between; and from the entablature of theſe the diameter encreaſes conſiderably. On the ſummit of the dome is an elegant balcony, and from its center riſes the lantern, adorned with Corinthian columns; and the whole is terminated by a ball, from which riſes a croſs, both elegantly gilt.

This vaſt and noble fabric, which is two thouſand two hundred and ninety-two feet in circumference, and three hundred and forty in height to the top of the croſs, is ſurrounded at a proper diſtance by a dwarf ſtone wall, on which is placed a baluſtrade of caſt iron. In the area of the grand weſt fronts ſtands a ſtatue of queen Anne, formed of white marble, with proper decorations. Four ſtatues ſitting at the baſe, repreſenting Britannia with the ſpear; Gallia or France with a crown in her lap; Hibernia, with her harp; and America with her bow.

At the entrance into the choir the organ gallery is ſupported by eight Corinthian columns of blue and white marble; and the choir has on each ſide thirty ſtalls, beſides the biſhop's throne on the ſouth-ſide, and lord mayor's on the north. The carving of this beautiful range of ſtalls, as well as that of the organ, is much admired. The reader's deſk, which is at ſome diſtance from the pulpit, is an incloſure of very fine braſs rails gilt, in which is a gilt braſs pillar, ſupporting an eagle of braſs gilt, which holds the book on his back, and extended wings. The altar-piece is adorned with four noble fluted pillaſters painted, and veined with gold, in imitation of lapis lazuli, and their capitals are double gilt. In the intercolumniations are twenty one pannels of figured crimſon velvet, and above them ſix windows in two ſeries. The floor of the choir, and indeed of the whole church, is paved with marble; but within the rails of the altar with porphyry. In the large croſs aile between the north and ſouth porticoes, and at a ſmall diſtance from the choir, riſes the cupola, where you have a view of the whiſpering gallery, of the paintings above it, and the concave at the top, which fills the mind with ſurpriſe and pleaſure. Under its center is fixed in the floor a braſs plate, round which the pavement is beautifully variegated; but the figures into which it is formed can no where be ſo well ſeen as from the whiſpering-gallery, to which any perſon may aſcend for a trifling expence, and there the voice of one perſon ſoftly ſpeaking againſt the wall, on the other ſide, ſeems as if he ſtood at your ear on this, though the diſtance between is not leſs than one hundred and forty feet; and the ſhutting of the door reſounds through the ſpacious vault like thunder, or as if the whole fabric was falling aſunder.

The other churches moſt worthy of notice in the city, are St. Stephen's Walbrook; which is juſtly admired for the inſide, which is covered with a ſpacious and noble dome, finely proportioned to the church, and divided with ſmall compartments decorated with great elegance, and crowned with a lantern, while the roof, which is alſo divided into compartments, is ſupported by very noble Corinthian columns, raiſed on their pedeſtals. Bow church in Cheapſide, and that of St. Bride, are rendered very famous by the extraordinary elegance and lightneſs of their ſteeples. The Temple church is one of the moſt beautiful Gothic ſtructures in England: it was founded by the Knights Templars, whoſe houſe is converted into two inns of court, called the Inner and Middle Temple, and conſiſt of handſome buildings adorned with gardens.

Among the numerous hoſpitals in this city, are St. Bartholomew's near Smithfield, a very magnificent ſtructure, of Portland ſtone, conſiſting of four ſides, which, when the old buildings and ſhops are taken away, will form the moſt ſuperb, though not the largeſt ſquare in this metropolis. This is deſigned for the relief of the ſick and lame; as is alſo the London hoſpital at Mile End. Bedlam or Bethlehem hoſpital is a magnificent building for the reception of lunatics, and St. Luke's hoſpital is a plainer, but no leſs uſeful building for the ſame purpoſe. The Magdalen hoſpital, and the ſmall-pox hoſpital, are alſo noble foundations.

The borough of Southwark is a conſiderable part of this metropolis, it is ſeated on the ſouth ſide of the Thames, and conſiſts of the pariſhes of St. Olave, St. John, St. Saviour, St. George, and St. Thomas; and for its extent, and number of inhabitants, is perhaps inferior to few cities in England. Though in the county of Surry, it is juſtly conſidered as a part of London, it being in ſome meaſure ſubject to the lord-mayor, who has under him a ſteward and bailiff, the former of whom holds a court of record every Monday at St. Margaret's hill, for all debts, damages, and treſpaſſes within his limits; and the lord-mayor proclaims Southwark fair. But tho' this is conſidered as one of the city wards, and an alderman is appointed for the government of it, yet it has its own magiſtrates, diſtinct from thoſe of the city.

The moſt remarkable ſtructures in Southwark are the two noble hoſpitals for the ſick and wounded, called St. Thomas's and Guy's. The former conſiſts of three fine ſquares encompaſſed with buildings, and adorned with the ſtatues of king Edward VI. and Sir Robert Clayton. Its annual diſburſements amount to eight thouſand pounds: there are four hundred and ſeventy-four beds, which are conſtantly kept filled; and they have always a conſiderable number of out-patients.

Guy's hoſpital is alſo a noble ſtructure, in one of the ſquares of which is a fine brazen ſtatue of Mr. Guy. This hoſpital is ſeated near the former, and contains four hundred and thirty-five beds.

The government of the city has a near reſemblance to the political conſtitution of the nation: for as England is governed by the king, lords, and commons in parliament aſſembled, ſo is the city by the lord-mayor, aldermen, and common-council. The city is divided into twenty-ſix diſtricts, called wards, each of which is governed by its reſpective alderman, who is elected by the houſe-keepers.

Out of this body the lord-mayor, or principal magiſtrate, is annually choſen on Michaelmas-day, and enters upon his office on the ninth of November. He is alſo conſervator of the river Thames, from the bridge at Stanes to the river Medway. When the lord-mayor appears abroad as a magiſtrate, it is in a coach of ſtate; he then wears a purple or a ſcarlet robe, has a gold chain, with a rich jewel to it, round his neck, and is attended by ſeveral officers walking before and on each ſide of him.

The next in power and dignity are the twenty-ſix aldermen, each of whom has under him a certain number of common-councilmen, one of whom is his deputy: theſe, as well as the aldermen, are choſen by the inhabitants of each ward. The mayor and aldermen chuſe the recorder, who is their ſpeaker, and counſellor with reſpect to the laws and cuſtoms of the city.

The two ſheriffs are conſiderable magiſtrates, who have the power to impanel juries, and in their courts cauſes are tried on actions of debt, treſpaſs, breach of covenants, &c. the execution of the laws is intruſted to to them. They are annually choſen on Midſummer-day by the liverymen.

The chamberlain of London is an officer of great truſt, he having the charge of the city caſh, and is uſually general receiver of the land-tax for the city of London and county of Middleſex. He has alſo full authority over the apprentices of the city; for in his court he decides cauſes between them and their maſters, and admits them to the freedom of the city.

The common-council are members choſen out of every ward, to the number of two hundred and thirty-ſix, by the houſe-keepers, from among themſelves. Theſe are the repreſentatives of the people.

The liverymen of the city are ſuch as have not only taken up the freedom of the city, but alſo the livery or gown of their reſpective companies. Theſe companies amount to ninety-two in number, and the lord-mayor belongs uſually to one of the principal of them; theſe are the mercers, grocers, drapers, fiſhmongers, goldſmiths, ſkinners, merchant-taylors, haberdaſhers, ſalters, ironmongers, vintners, and cloth-workers. Moſt of the ninety-two companies have halls, ſeveral of which are magnificent ſtructures; together with a maſter, a clerk, ſeveral wardens, aſſiſtants, and liverymen, who tranſact the buſineſs of the company, and provide for a number of their own poor. In theſe companies are ſeventy-nine maſters, two hundred and twenty wardens, two thouſand three hundred and eighteen aſſiſtants, eight thouſand two hundred and ſeventeen liverymen, who alone have the privilege of electing the repreſentatives of the city, with fifty-two halls; and it is computed that above twenty-ſix thouſand pounds is diſpoſed of annually by theſe companies to charitable uſes; and many of them have very noble alms-houſes in the neighbourhood of the city, where the old and decayed members of their reſpective companies are lodged, maintained, and clothed.

Beſides theſe there are ſeveral companies of merchants trading to different parts of the world, who have their reſpective halls: and a conſiderable number of companies for inſuring ſhips at ſea, and houſes from fire; theſe always keep fire-engines and a ſet of men in pay, who are ready at all hours to give their aſſiſtance in caſe of fire; and are on all occaſions extremely bold, dexterous, and diligent; but though all their labours ſhould prove unſucceſsful, the perſon who ſuffers by this devouring element has the comfort ariſing from the certainty of being paid the value of what he has inſured.

We now come to Weſtminſter, which is generally included under the name of London, and is only diſtinguiſhed from it by its not being under the government of the ſame magiſtrates. It received its name from its abbey, or minſter, being ſeated to the weſt of St. Paul's, and was once a mile diſtant from London; but its ſuburbs extending to that city, have perfectly united them.

As Weſtminſter has the honour of containing the palace of the king of Great Britain, our law-tribunals, and both houſes in which the parliament aſſemble, it is inhabited by the nobility and gentry, and thence that city and its liberties has a greater number of noble ſquares and elegant private buildings. The city of Weſtminſter at preſent conſiſts but of two pariſhes, St. Margaret's and St. John's the Evangeliſt; but the liberties contain ten pariſhes, namely, St. Martin's in the Fields, St. James's, St. Anne's, St. George's Bloomſbury, St. George's Hanover-ſquare, St. George's Queen-ſquare, St. Paul's Covent-garden, St. Mary le Strand, and St. Clement's Danes; to which may be added the precinct of the Savoy. However, each of the above pariſhes is of ſuch prodigious extent, conſidering the number of the houſes they contain, that it would be impoſſible for one-tenth part of the inhabitants to attend divine worſhip at one and the ſame time, there are therefore many chapels of eaſe for the convenience of thoſe who could not be ſo well accommodated in their pariſh-churches.

The abbey-church of St. Peter's Weſtminſter is a venerable pile of building in the Gothic taſte, where moſt of our monarchs have been crowned, and many of them interred. The preſent fabric was in part erected by Henry III. and finiſhed after his death. The extent of the building is very conſiderable; for its length is three hundred and ſixty feet within the walls, at the nave it is ſeventy-two broad, and at the croſs a hundred and ninety-five. The Gothic arches and ſide ailes are ſupported by forty-eight pillars of grey marble, each compoſed of cluſters of very ſlender ones, and covered with ornaments. This ſtructure is adorned with a prodigious number of monuments of kings, heroes, generals, and perſons diſtinguiſhed by their learning and genius: many of which are extremely beautiful, being adorned with admirable ſtatues of white marble, baſſo relievos, the moſt beautiful kind of granite, porphyry, and other rich kinds of marble, finely poliſhed, and accompanied with elegant inſcriptions.

Henry the ſeventh's chapel joins to the abbey, and is ſtiled by Leland, The Wonder of the World; it is, indeed, one of the moſt expenſive remains of the ancient Engliſh taſte and magnificence, and was founded by Henry VII. in 1502. The cieling is wrought with ſuch an aſtoniſhing variety of figures as is impoſſible to be deſcribe. The ſtalls on each ſide are of oak, with Gothic canopies moſt beautifully carved; as are alſo the ſeats; and the pavement is of black and white marble. In the middle of the eaſt end of the nave is the magnificent tomb of Henry VII. encloſed with a ſcreen of caſt braſs, moſt admirably executed and ornamented with ſtatues. In this chapel are the tombs of George Villiers, duke of Buckingham, and ſeveral other perſons of high rank.

Weſtminſter-hall is near the abbey, and is one of the largeſt rooms in Europe, whoſe roof is not ſupported with pillars. Here the courts of law are kept; and adjoining to it are the houſes of the Lords and Commons.

Weſtminſter bridge is univerſally allowed to be one of the fineſt in the world. The firſt ſtone was laid on the twenty-ninth of January, 1739, and the laſt in 1747. It is adorned and ſecured on each ſide with a lofty and noble baluſtrade, and is twelve hundred and twenty-three feet in length. The piers, which are fourteen, have thirteen large and two ſmall arches, all ſemicircular. The center arch is ſeventy-ſix feet wide, and the others decreaſe in width four feet on each ſide.

The admiralty, the treaſury, and the horſe-guards are expenſive buildings; the banqueting-houſe at White-hall is thus called from there being originally in this place an edifice in which our kings had public entertainments. This ſtructure was erected by the celebrated Inigo Jones, as a ſmall part of a ſuperb palace, of which that great architect had drawn the plan. The outſide of this ſtructure has been always eſteemed a moſt admirable work; and the cieling is painted by Rubens. This great apartment has been many years converted into a chapel.

The architecture of ſeveral churches of Weſtminſter and its liberties have been greatly admired, particularly that of St. Martin's in the Fields, and St. Paul's Covent-garden.

The Britiſh Muſeum, which may properly be ſaid to be founded by Sir Hans Sloane, bart. may be juſtly eſteemed an honour and an ornament to this nation, it conſiſting of an amazing number of natural curioſities, to which were added by his late majeſty the royal libraries of books and manuſcripts collected by the kings of England.

Amidſt the ſplendid buildings of this city we are ſorry we cannot mention the palace of our ſovereign, which is a mean ſtructure, unworthy of being the reſidence of ſo great a monarch. The meuſe, which contains the king's ſtables, is, however, a more magnificent edifice; but the ſquare in which it ſtands would admit of great improvements. The new buildings in the liberty of Weſtminſter are daily increaſing in the moſt aſtoniſhing manner. The principal ſquares are thoſe of Hanover, Groſvenor,

Groſvenor, Berkley, Cavendiſh, St. James's, Soho, Leiceſter, Golden, Red Lyon, Bloomſbury-ſquare, and Lincolns-inn Fields; with many others of leſs note.

There are in Weſtminſter, as well as in the city of London, a great number of charitable foundations, among which we may reckon the noble infirmaries at Hyde-park-corner, Middleſex hoſpital, and that called Weſtminſter infirmary, the hoſpital for expoſed and deſerted young children, the aſylum, ſeveral hoſpitals for lying-in women, and many others.

The civil and eccleſiaſtical government of this city were veſted in the dean and chapter of Weſtminſter; but ſince the Reformation the civil part has been committed to laymen. The high-ſteward, who is uſually a nobleman of the firſt rank, is choſen by the dean and chapter, and has an under-ſteward who officiates for him, and muſt therefore be verſed in the law; but his choice muſt be confirmed by the dean and chapter. The under-ſteward, with other magiſtrates, keeps the court leet, which tries all petty offences, and is commonly a chairman of the quarter-ſeſſions.

Next to the under-ſteward is the high-bailiff, who is alſo choſen by the dean and chapter. His power reſembles that of a ſheriff, for by him juries are ſummoned; all the bailiffs of Weſtminſter are ſubordinate to him, and he makes the return at the election of members of parliament. As all fines and forfeitures are his, his place is very profitable.

There is alſo a high-conſtable choſen by the court-leet, to whom all the other conſtables are ſubject. Here are likewiſe fourteen burgeſſes, or magiſtrates, ſeven for the city and ſeven for the liberties, each having an aſſiſtant. Their office is much like that of an alderman of London, each having a proper ward, out of theſe are elected two head-burgeſſes, one for the city, and one for the liberties.

Beſides the cities of London, Southwark, and Weſtminſter, there are included a great number of ſtreets which cannot properly be termed in the liberty of either, and yet are comprehended under the general name of London, they being united to it. Hence the number of ſtreets, lanes, and alleys exceed ſeven thouſand, the houſes amount to about a hundred and fifty thouſand, and that of the inhabitants cannot be leſs than a million. Beſides St. Paul's cathedral and Weſtminſter abbey, there are a hundred and two pariſh-churches, and ſixty-nine chapels of the eſtabliſhed religion; twenty-one French Proteſtant chapels, eight chapels belonging to the Germans, Dutch, Danes, &c. above a hundred meeting-houſes of the Proteſtant Diſſenters; ſeveral popiſh chapels for the uſe of foreign ambaſſadors, and three Jewiſh ſynagogues. There are alſo in and near this city one hundred alms-houſes, about twenty hoſpitals and infirmaries, twenty-two priſons, forty-two markets, twenty-ſeven public ſquares, beſides thoſe within any ſingle building, as for inſtance in the Temple; eight free-ſchools for grammar learning, and a hundred and thirty-one charity-ſchools, which conſtantly provide education for above five thouſand children.

In ſhort, this great metropolis enjoys ſeveral advantages which no other great city has in equal perfection; the plenty of water fit for drinking and all other uſes, is none of the leaſt. That of the Thames, that of the New River, conducted to Iſlington by the immortal Sir Hugh Middleton, and that of ſeveral other water-works, not only ſupply this city with that neceſſary of life, eſſential alſo to cleanlineſs, and conſequently to health, but running in ſtreams through pipes under the pavement of every ſtreet, is of the greateſt uſe in extinguiſhing fires: while the common-ſewers contribute to keep the ſtreets clean and wholeſome, and prevent our ever being greatly incommoded by that element. Add to this, that this great metropolis is much better lighted by night than Paris, or any other great city, and that, by the improvement making in the pavement, it will in this reſpect alſo be inferior to no other city.

For the entertainment of people of all ranks there are aſſemblies for dancing, muſical aſſemblies, two theatres, in which plays are acted, an opera-houſe, a houſe of theatrical amuſements called Sadler's-Wells, at Iſlington, ſeveral places where there are commodious rooms and pleaſant gardens near London, where the people meet to drink tea; beſides Marybone-gardens, and Vaux-hall-gardens already deſcribed in treating of the county of Surry, and thoſe of Ranelagh. The two laſt are not to be equalled in Europe.

Ranelagh-gardens, are ſo called from their formerly belonging to the earl of Ranelagh. Though the garden is beautiful, this place is moſt admired for its amphitheatre in the midſt of it. This is a circular building, one hundred and eighty-five feet in its external diameter. Round the whole is an arcade, and over that a gallery with a baluſtrade, to admit the company into the upper boxes, except where the entrances break the continuity; over this are the windows, and it is terminated by the roof. The internal diameter is one hundred and fifty feet, and the architecture of the inſide correſponds with that without, except that over every column between the windows, termini ſupport the roof. In the middle of the area, where the orcheſtra was at firſt deſigned, is a chimney that has four faces; this renders it warm and comfortable in cold weather. The orcheſtra fills up one of the entrances. The entertainment conſiſts of a fine band of muſic, with an organ, accompanied by the beſt voices. The regale is tea and coffee.

Chelſea, in which are the above gardens, is a large and populous village, pleaſantly ſituated on the bank of the Thames, two miles from London. Here is a phyſic-garden belonging to the company of apothecaries of London, ſeveral private buildings worthy of the curioſity of the public; Salter's coffee-houſe, well known for the great number of curioſities to be ſeen there; and Chelſea-hoſpital, a noble edifice, erected for the invalids in the land-ſervice.

Chelſea-hoſpital, which Charles II. began to erect, was carried on by James II. and completed by William III. was entirely built under the direction of Sir Chriſtopher Wren, and conſiſts of a vaſt range of buildings. The front towards the north opens into a piece of ground laid out in walks for the penſioners; and that facing the ſouth, into a garden which extends to the Thames, and is kept in good order. This ſide not only affords a view of that fine river, but of the county of Surry beyond it. In the centre of this edifice is a pediment ſupported by four columns, over which is a handſome turret, and in this part is an opening which leads through the building. On one ſide of this entrance is the chapel, the altar-piece of which is adorned with the reſurrection, painted by Ricci; and on the other the hall, where is the picture of Charles II. on horſeback, and ſeveral other pieces as big as the life, and in this room all the penſioners dine. The wings join the chapel and hall to the north, and are open towards the Thames on the ſouth: theſe are three hundred and ſixty feet in length, and about eighty in breadth; they are three ſtories high, and the rooms are ſo well diſpoſed, that nothing can be more pleaſant. On the front of this ſquare is a colonade, extending along the ſide of the hall and chapel; and in the midſt of the quadrangle is the ſtatue of king Charles II. in a Roman dreſs, ſtanding on a marble pedeſtal. There are ſeveral other buildings adjoining, that form two other large ſquares, and conſiſt of apartments for the officers and ſervants of the houſe; for old maimed officers of horſe and foot, and the infirmary for the ſick.

An air of elegance and neatneſs is obſerved in theſe buildings. They are compoſed of brick and ſtone, and there appears ſuch a diſpoſition of the parts as is beſt ſuited to the purpoſes of the charity, the reception of a great number, and the providing them with every thing that can contribute to the convenience and pleaſure of the penſioners. The expence of erecting them amounted to about one hundred and fifty thouſand pounds, and the extent of the ground is above forty acres.

In the wings are ſixteen wards, in which are accommodations for above four hundred men; and in the other buildings are a conſiderable number of apartments for officers and ſervants. Theſe penſioners conſiſt of ſuper-annuated veterans, who have been at leaſt twenty years in the army, or thoſe ſoldiers who are diſabled in the ſervice of the crown. They wear red coats lined with blue, and are provided with all other clothes, diet, waſhing, and lodging. The governor has five hundred pounds a year;

a year; the lieutenant-governor two hundred and fifty pounds, and the major one hundred and fifty pounds. Thirty-six officers are allowed six pence a day; thirty-four light horſemen, and thirty ſerjeants, have two ſhillings a week each; forty-eight corporals and drums have ten pence *per* piece; and three hundred and thirty-ſix are each allowed eight pence a week pocket-money. As the houſe is called a garriſon, all the members are obliged to do duty in turn; and they have prayers twice a day in the chapel, performed by two chaplains, who have each a ſalary of one hundred pounds a year. The phyſician, ſecretary, comptroller, deputy-treaſurer, ſteward, and ſurgeon, have alſo each a hundred pounds a year, and many other officers have conſiderable ſalaries. There are likewiſe between eight hundred and a thouſand out-penſioners, each of whom has eight pounds twelve ſhillings and ſix pence a year.

Theſe great expences are ſupported by a poundage deducted out of the pay of the army, with one day's pay once a year from each officer and common ſoldier; and when there is any deficiency, it is ſupplied by a ſum raiſed by parliament.

This hoſpital is governed by the following commiſſioners; the preſident of the council; the firſt commiſſioner of the treaſury, the principal ſecretary of ſtate, the pay-maſter-general of the forces, the ſecretary at war, the comptrollers of the army, and by the governor and lieutenant-governor of the hoſpital.

Kenſington is a large and populous village, about two miles from Hyde-Park-Corner. The palace, which was the ſeat of the lord-chancellor Finch, afterwards earl of Nottingham, was purchaſed by king William III. who greatly enlarged it; queen Mary enlarged the gardens; they were farther improved by queen Anne, and queen Caroline completed the deſign by extending them much farther. Theſe gardens, which are three miles and a half in compaſs, are extremely pleaſant, and kept in great order, and in ſummer are reſorted to by a great number of people. The palace indeed, has none of that grandeur which ought to appear in the reſidence of a Britiſh monarch, it being very irregular in point of architecture; however, the royal apartments are grand, and adorned with pictures by the greateſt maſters.

Hampton-Court is delightfully ſituated near the north bank of the Thames, twelve miles to the ſouth-weſt of London, at a ſmall diſtance from the village of Hampton. This palace was originally built by cardinal Wolſey: but king William and queen Mary were ſo greatly pleaſed with the ſituation, which rendered it capable of great improvements, and of being made one of the fineſt palaces in Europe, that while the former cauſed the old apartments to be pulled down and rebuilt in the magnificent manner in which they now appear, her majeſty, impatient to enjoy ſo agreeable a retreat, fixed upon a building near the river called the water-gallery, and ſuiting it to her convenience, adorned it with the utmoſt elegance, though its ſituation would not allow it to ſtand after the principal building was completed. Since the pulling down of the water-gallery which ſtood before the fine ſtone front that faces the river, the ground to the ſouth-weſt received conſiderable improvements. The park and gardens, with the ground on which the palace now ſtands, are about three miles in circumference. On a pediment at the front of the palace on this ſide is a baſs relief of the trials of Hercules over Envy, and facing it a large oval baſon, anſwering to the form of this part of the garden, which is a large oval divided into gravel-walks and parterres. At the entrance of the grand walk are two large marble vaſes of exquiſite workmanſhip, one ſaid to be performed by Mr. Cibber, the father of the poet-laureat; and the other by a foreigner: theſe pieces are reported to be done as a trial of ſkill; but it is difficult to determine which is the fineſt performance. They are beautifully adorned with baſſo-relievoes, that on the right hand repreſenting the triumphs of Bacchus, and the other on the left Amphitrite and the Nereiads. At the bottom of this walk, facing a canal which runs into the park, are two other large vaſes, the baſs-relief on one repreſenting the judgment of Paris, and that of the other, Meleager hunting the wild boar. In four of the parterres are four fine braſs ſtatues, all after fine originals.

The whole palace conſiſts of three quadrangles; the firſt and ſecond are Gothic; but in the latter is a moſt beautiful colonade of the Ionic order, the columns in couplets, built by Sir Chriſtopher Wren. Through this you paſs into the third court or quadrangle, in which are the royal apartments, which are magnificently built of brick and ſtone by king William III. and on the farther ſide of them are the gardens, with the ſuperb front of ſtone facing them.

On the oppoſite ſide of the quadrangle, that is adorned with a colonade, is the great ſtair-caſe, which has iron baluſters curiouſly wrought and gilt, and both the cieling and ſides were painted by Verrio. From the ſtair-caſe you paſs into the grand chamber, which is upwards of ſixty feet long, and forty wide. This room contains arms for five thouſand men, placed in various forms.

The next is the king's firſt preſence-chamber, which is hung with rich old tapeſtry. The cieling is vaulted, and from the centre hangs a fine luſtre of nineteen branches. Fronting the door are the canopy and chair of ſtate, which, as well as the ſtools, are of crimſon damaſk. On the left hand of the entrance is a fine picture, about eighteen feet by fifteen, by Sir Godfrey Kneller; in which king William III. is repreſented in armour on a ſtately grey horſe, trampling on trophies of war, and a flaming torch: Plenty, with her cornucopia, offers him an olive branch, and Flora preſents flowers. At the top in the clouds, Mercury and Peace ſupport his helmet, decorated with laurel, and a cupid holds a ſcroll. On the bottom part of the picture appear Neptune and his attendants by the ſide of a rock, welcoming the hero on ſhore; and at a diſtance is ſeen a fleet of ſhips, their ſails ſwelled with the wind.

The ſecond preſence-chamber is ſpacious, and has a vaulted ceiling, from the centre of which hangs a gilt chandelier of twelve branches. The tapeſtry is ancient, but very rich, the lights being all gold, and the ſhadows ſilk. The chair of ſtate and ſtools are of crimſon damaſk, fringed with the ſame colour. The room is alſo adorned with ſeveral paintings.

The fourth room is very lofty, in the middle hangs a beautiful chaſed ſilver chandelier of ſixteen branches. Here is a fine canopy of ſtate, with the windows, curtains, chair, and ſtools, of rich crimſon damaſk, laced and fringed with gold. The tapeſtry, which repreſents part of the ſtory of Abraham, is fine.

In the fifth room is alſo a chair of ſtate and ſtools; the window-curtains are tiſſue, with a ſilver ground, and there are ſilver ſconces faſtened to the tapeſtry. Over the chimney-piece is an admirable whole length picture of king Charles I. and over the doors are two capital pictures; the firſt is David with Goliah's head, by Fetti; the other the holy family, by Correggio.

In the king's ſtate-chamber is a bed of crimſon velvet laced with gold, with plumes of white feathers on the top. This room, which is very ſpacious, is hung with tapeſtry, and adorned with eight chaſed ſilver ſconces. The cieling, which was painted by Verrio, repreſents Endymion lying with his head in the lap of Morpheus, and Diana admiring him as he ſleeps. On another part of the cieling is a fine figure of Somnus with his attendants. In the border are four landſcapes, and four boys with baskets of flowers, intermixed with poppies.

The king's dreſſing-room has alſo the cieling painted. Mars is ſleeping in Venus's lap, while ſeveral cupids ſteal away his armour, ſword, and ſpear, and others are binding his legs and arms with fetters of roſes. The room is hung with ſtraw-coloured India damask, and the chairs, ſtools, and ſcreen, are covered with the ſame.

The king's writing-cloſet is of a triangular form. The hangings and ſtools are of a pea-green India damask. A glaſs is ſo placed as to ſhew all the rooms on that ſide of the building in one view. Over each door is a flower-piece by Baptiſt, and over the chimney a fine picture of a great variety of birds, by Bougdane.

Queen Mary's cloſet is hung with needle-work, ſaid to be wrought with her own hand; there are alſo an eaſy chair, four others, and a ſcreen, all ſaid to be the work of that excellent queen. The work is extremely neat, and ſhows great judgment in drawing.

The queen's gallery, which is about ſeventy feet long, and twenty-five feet wide, is hung with ſeven beautiful pieces

pieces of tapeſtry, repreſenting the hiſtory of Alexander the Great, done after the paintings of Le Brun.

The cieling of the queen's ſtate bed-chamber is finely painted: Aurora is repreſented riſing out of the ocean in her golden chariot, drawn by four white horſes. The bed is of crimſon damask, and, beſides other furniture, the room is adorned with a number of fine portraits, and a glaſs luſtre with ſilver ſockets.

The queen's drawing room has the cieling painted by Verrio: in the middle queen Anne is repreſented in the character of Juſtice, holding the ſword and ſcales, with Neptune and Britannia ſupporting a crown over her head. The room is hung with green damask, upon which are placed nine pictures by Andrea Montegna, three on each ſide of the room, and three at the end. Theſe were originally all in one piece of great length, as may be plainly ſeen from ſome of the figures being cut aſunder, and placed in different pieces. The whole is a triumph of Julius Cæſar, and was a long proceſſion of ſoldiers, prieſts, officers of ſtate, &c. at the end of which that emperor appears in his triumphal chariot, with Victory holding a laurel crown over his head.

The queen's ſtate audience-room has a fine canopy of ſtate, and is hung with rich tapeſtry, repreſenting the children of Iſrael carrying the twelve ſtones to the river Jordan; and has five pictures at full length of the duke, ducheſs, and marchioneſs of Brunſwic; the ducheſs of Lenox, and Margaret queen of Scots all by Holbein.

The prince of Wales's preſence-chamber is hung with tapeſtry, and has a canopy of ſtate of green damask; and both this, and the prince's drawing-room, are adorned with a number of portraits by Holbein.

In the private dining-room are four pictures of the defeat of the Spaniſh armada, by Vandeveldt, and over the chimney a very fine one, by Vandyke, of the lord Effingham Howard, lord high-admiral of England.

In the admirals gallery are the pictures of a conſiderable number of celebrated admirals; and in the room of beauties are the portraits of a number of beautiful ladies of the Engliſh court; among which is that of queen Mary.

The cartoons of Raphael Urbino, ſo called from their being painted on paper, were for a long time the moſt conſiderable ornament of this palace; but have of late been removed to the queen's palace in St. James's park.

A great number of the villages in this county are adorned with many ſeats of the nobility and gentry, and are more worthy of notice than even the market-towns: it will be ſufficient to mention one or two of thoſe ſeats.

Chiſwick, is ſeated on the Thames, on the ſouth-weſt ſide of Hammerſmith. In this village is a charity ſchool; and it is adorned with ſeveral elegant ſeats, as the earl of Grantham's, now colonel Elliot's, the earl of Shrewſbury's, the late lord Wilmington's, &c. but the moſt remarkable is that of the late earl of Burlington's, which was a plain commodious building, but a part of it being deſtroyed by fire, his lordſhip erected near it a beautiful villa, which for elegance of taſte, equals every thing of its kind in England. The court in the front is kept very neat, and has on each ſide yew-hedges in pannels, with termini placed at proper diſtances, and in the front of the hedges are two rows of cedars, the dark ſhade of which afford a pleaſing contraſt to the whiteneſs of the elegant building behind them. The aſcent to the houſe is by a noble flight of ſteps, on one ſide of which is the ſtatue of Paladio, and on the other, that of Inigo Jones. The portico is ſupported by ſix fine fluted columns of the Corintian order, with a very elegant pediment, and the cornice, frieze, and architrave, are as rich as poſſible. Though the other front towards the garden is plainer, yet it is in a bold and maſterly ſtyle, and has at the ſame time a pleaſing ſimplicity, as hath alſo the ſide-front towards the ſerpentine-river, which is different from the two others. The octagonal ſaloon in the middle of the building, which is covered at the top with a dome, through which it is enlightened, is alſo very elegant. The inſide of this ſtructure is nobly adorned, the cielings are gilt and painted, and the rooms ornamented with ſome of the beſt pictures in Europe.

The gardens are very beautiful, and laid out in the fineſt taſte: on deſcending from the back part of the houſe you enter a verdant lawn planted with clumps of evergreens, between which are two rows of large ſtone vaſes. At the end next the houſe are two wolves in ſtone, by Scheemaker: at the farther end are two large lions, and the view is terminated by three antique ſtatues, dug up in Adrian's garden at Rome, with ſtone ſeats between them, and behind a cloſe plantation of evergreens. On turning to the houſe on the right hand an open grove of foreſt-trees affords a view of the orangery; and on turning to the left is an eaſy ſlope covered with ſhort graſs, which leads down to a ſerpentine river, on the ſide of which are clumps of evergreens; and at the farther end is an opening into an encloſure, where are a Roman temple and an obeliſk, with graſs ſlopes, and in the middle a circular piece of water. From hence you are led to the wilderneſs, through which are three ſtraight avenues, terminated by three different edifices; and in the ſides are ſerpentine walks, through which you may ramble near a mile in the ſhade. On each ſide the ſerpentine river are alſo verdant walks, which accompany the river in all its turnings. On the right hand of the river is a building that is the exact model of the portico of Covent-garden church; on the left a wilderneſs laid out in regular walks, and in the middle over the river a Paladian wooden bridge. With the earth dug from the bed of this river is raiſed a terrace that affords a proſpect of the adjacent country, which when the tide is up is agreeably enlivened by a view of the boats and barges paſſing along the Thames.

Gunerſbury-houſe, near Ealing, the ſeat of the late Henry Furneſe, Eſq; is a noble and elegant ſtructure built by Inigo Jones, or, as ſome ſay, by Mr. Webb, his ſon-in-law. It is ſeated on a riſing ground, and the approach to it from the garden is remarkable fine. The loggia has a beautiful appearance at a diſtance, and commands a fine proſpect of the county of Surry, the river Thames, and of all the meadows on its banks for ſome miles; and in clear weather of even the city of London. The apartments are well contrived, and the hall, which is ſpacious, is on one ſide ſupported by rows of columns, and from thence you aſcend by a noble flight of ſtairs to a ſaloon, twenty-five feet high, and moſt elegantly furniſhed. This fine room has an entrance into the portico on the back front, which is adorned with beautiful columns. On entering the garden from the houſe you aſcend a noble terrace, which affords a delightful view of the neighbouring country, and from this terrace, which extends the whole breadth of the garden, you deſcend by a noble flight of ſteps, with a grand baluſtrade on each ſide, into the garden.

SECT. XXIII.

Of the County of Eſſex; its Situation, Extent, Diviſions, Repreſentatives, Air, Soil, and principal Places.

ESSEX, which took its name from its being the country of the Eaſt Saxons, is bounded on the north by the river Stour, which ſeparates it from Suffolk and Cambridgeſhire; on the eaſt by the German ſea; on the weſt by Hertfordſhire and Middleſex; and on the ſouth by the river Thames. It extends forty-four miles in length from eaſt to weſt, and about forty-two in breadth from north to ſouth. This county, which is in the dioceſe of London, is divided into eighteen hundreds, and contains twenty-ſeven market-towns, four hundred and fifteen pariſhes, a hundred and twenty-five vicarages, and eleven hundred villages, with about thirty-four thouſand eight hundred houſes, and two hundred and eight thouſand eight hundred inhabitants. It ſends eight members to parliament, namely, two for the county, and two for Colcheſter, Harwich, and Malden.

The air in the inland parts is healthy; but in the marſhes near the ſea it produces agues, particularly in the part called the Hundreds. However, the fertility of the unwholeſome part is very great, and even the higher grounds of this county are very fruitful. About Saffron

Walden, the earth, after bearing ſaffron three years, it is ſaid, will produce good barley for eighteen years ſucceſſively, without any manure. Its produce, which is very plentiful, conſiſts of corn, moſt excellent ſaffron, cattle, fowl, fiſh, and particularly oyſters. The chief manufactures of this county are cloth, ſtuffs, and particularly baize.

The principal rivers, beſides the Thames, are the Stour, which falls into the German ſea at Harwich; the Lea, its weſtern boundary, falls into the Thames below Stratford; the Blackwater runs through the heart of the county, and paſſing by Chelmsford is joined by the Chalmer, and from thence runs into the German ſea; the Colne runs by Halſted to Colcheſter, and ſo into the ſea. All theſe rivers abound in moſt ſorts of fiſh.

The principal places in this county are the following:

Chelmsford is thus called from the ford over the river Chelmer, and is ſeated on the road to Colcheſter, between that river and the Blackwater, over which there are bridges, twenty-eight miles eaſt-north-eaſt of London. It is a handſome well frequented town, and is governed by a chief conſtable; but has only one church, which is an ancient Gothic ſtructure, and three meeting-houſes. There is here an excellent conduit, which has ſuch a ſupply of water, that it is ſaid to run above a hogſhead and an half in a minute. Here the members for the county are choſen, and the aſſizes commonly held, as well as the four quarterly ſeſſions. As it is ſeated nearly in the center of the county, and in the great road to London, it is much frequented by travellers and the neighbouring gentry, for tranſacting all buſineſs relating to the county.

Colcheſter is a place of great antiquity, twenty-two miles to the eaſt-north-eaſt of Chelmsford, and fifty from London. It is pleaſantly and commodiouſly ſeated on the ſouth ſide of the river Coln, which runs through the town, and incloſes it on the eaſt and north-eaſt ſides: over it are three bridges. It is navigable within three miles of the town for large ſhips; a little lower it may receive the royal navy; and up to that part called the Hythe it is navigable for hoys and ſmall barks quite cloſe to the houſes, here being a long quay. The trade principally conſiſts in making baize and ſerges, the whole country being employed in ſpinning wool for this and the adjacent towns. Colcheſter, including the villages within its liberty, which is of large extent, has been ſuppoſed to contain forty thouſand people. In the civil wars, during the reign of Charles I. it ſuſtained a ſevere ſiege, which was turned into a blockade, in which the garriſon and inhabitants ſuffered the utmoſt extremity of hunger, and were at laſt obliged to ſurrender at diſcretion, when their two principal officers, Sir Charles Lucas and Sir George Liſle, were barbarouſly ſhot in cold blood under the caſtle wall, to the indelible infamy of Fairfax, the general of the parliament's forces. It was ſurrounded with a wall, which had ſix gates and three poſterns, beſides nine watch-towers; but theſe are in a great meaſure demoliſhed. It had ſixteen pariſh-churches; but now only twelve are uſed, which are not very large, and moſt of them were damaged in Cromwell's time. There are here alſo five meeting-houſes. The town conſiſts of about three thouſand dwelling-houſes, moſt of them ancient buildings; but there are among them many good houſes. The ſtreets are not very broad, but are pretty well paved: and the town, which is famous for oyſters and eringo-root, imports baize, wine, brandy, coals, deals, &c. Towards the eaſt are the ruins of an old caſtle, with a fence round it, about two miles in circumference.

Harwich, a ſea-port town, ſituated in the fifty-ſecond degree three minutes latitude, and in the firſt degree eighteen minutes eaſt longitude, ſeventy-three miles to the eaſt-north-eaſt of London, is ſurrounded on three parts by the ſea and the river Stour. It is not very large, but is well inhabited, and contains between eight and nine hundred houſes, which are generally good and lofty buildings, and the ſtreets are both pretty wide and well paved. The number of the inhabitants amount to about four thouſand. The harbour is one of the fineſt in England, for in it four hundred ſhips may ride in ſafety; and oppoſite to the town is Landguard fort, and a good battery of cannon. Here the packet-boats are ſtationed that paſs to and from Holland; and here alſo is a good dock-yard, in which many ſhips of war are built. The town is governed by a mayor, eight aldermen, a recorder, and twenty-four capital burgeſſes; but it has only a chapel of eaſe, and ſeveral meeting-houſes, the mother church being at Dover-court, at two miles diſtance. The market is kept on Tueſdays and Fridays.

Dunmow, a market-town thirty-eight miles from London, in which the manufacture of baize flouriſhes, is particularly remarkable ſince Henry III's time for the cuſtom of giving a flitch of bacon to any married couple who will ſwear, kneeling on two peaked ſtones in the church-yard, that for a year and a day after their marriage they never repented of their choice, nor quarrelled in all that time; and this appears upon record to have been ſeveral times actually claimed and delivered.

SECT. XXIV.

Of the County of Suffolk; its Situation, Extent, Diviſions, Repreſentatives, Air, Soil, Produce, and principal Towns.

SUFFOLK was thus called by the Saxons, to denote the Southern people, in oppoſition to thoſe of Norfolk, or Northfolk; and is bounded on the north by the rivers Waveney and the Leſſer Ouſe, which part it from Norfolk; on the eaſt by the German ocean; on the ſouth by the river Stour, which divides it from Eſſex, laſt deſcribed; and on the weſt by Cambridgeſhire. It extends fifty miles in length, twenty-five in breadth, and is divided into ſeventeen hundreds, in which are twenty-eight market-towns, ninety-five vicarages, five hundred and ſeventy-five pariſhes, fifteen thouſand villages, thirty-four thouſand four hundred and twenty houſes, and two hundred and ſix thouſand inhabitants. It ſends ſixteen members to parliament, namely, two knights for the ſhire, and two burgeſſes for each of the following boroughs: Ipſwich, Dunwich, Orford, Aldborough, Sudbury, Eye, and St. Edmondſbury, and lies in the dioceſe of Norwich.

The air is very clear and healthy, even near the ſea-coaſt; the beach being generally ſandy and ſhelly, which either abſorbs or ſhoots off the ſea-water, and keeps it from ſtagnating or forming a noiſome and ſtinking mud, whence phyſicians eſteem the air as good as any in England.

The ſoil is of various qualities; that near the ſhore is ſandy and full of heaths, yet abounds in rye, peas, and hemp, with numerous flocks of ſheep. High Suffolk, or the Wood-lands, which is the inland part of the county, though abounding in wood, has a rich deep clay and marle that yields good paſture-grounds, on which feed abundance of cattle. That part which lies on the confines of Eſſex and Cambridge alſo affords excellent paſture; and about Bury St. Edmund's, and ſo on to the north and north-weſt, it is fruitful in corn, except towards Newmarket. The feeding of cattle and ſheep on turnips is ſaid to have been an improvement firſt ſet on foot in this county. Its principal produce is butter and cheeſe, the latter of which is frequently in this county very much the worſe on account of the goodneſs of the former, and is ſometimes of ſo hard and horny a nature, as to require the force of the hatchet to cut it.

This county is generally divided into two parts, namely, the Franchiſe or Liberty of St. Edmund, which contains the weſt part of the county; and the Geldable, which is the eaſtern, each of theſe furniſhes a diſtinct grand-jury at the aſſizes.

The principal rivers are the Waveney, the Deben, the Orwell, by ſome called the Gipping, and the Stour. The Waveny riſes in the northern edge of the county, and running to the north-eaſtward, after it has paſſed Beccles, forms two branches, one of which runs to the eaſt almoſt to Leoſtoff, where it ſtops ſhort, without reaching the ſea; the other makes an angle to the northward, and falls into the Yare a little above Yarmouth. The Deben riſes a little to the weſtward of Debenham, and running eaſtward to Wickham, winds round that town, and runs ſouth-

ſouth-ſouth-eaſt to the German ocean. The Orwell riſes near Wulpit, and runs eaſtward to the ſame ſea. The Stour riſes in the edge of Cambridgeſhire, and running moſtly eaſtward, falls into the German ocean with the Orwell at Harwich.

The principal places in this county are the following:

Ipſwich, a place of great antiquity, is ſeated on the river Orwell, twenty miles to the north-eaſt of Colcheſter, and ſeventy-two to the north-eaſt of London, and was once ſurrounded with a wall, the traces of which are ſtill to be ſeen. The town forms a half moon upon the bank of the river, and it is remarkable that though ſhips of five hundred tons may upon a ſpring-tide come up near the town, yet the river is ſcarce navigable above the town even for the ſmalleſt boats; nor does the tide, which ſometimes riſes thirteen or fourteen feet, and gives them near the town twenty-four feet water, flow much farther up the river. This may be accounted a very neat and well-built town. It has a very ſpacious market-place, in the midſt of which is a handſome croſs. At a ſmall diſtance is the ſhambles, with the herb-market; and in a ſpacious ſtreet, at a ſmall diſtance, is a market for butter, poultry, &c. and another for fiſh, with which the town is well ſupplied. The town conſiſts of about four thouſand houſes, which are generally good buildings and very loſty, formed into ſtreets that are tolerably wide and well paved. It is divided into four wards, and contains twelve pariſh-churches, with a Preſbyterian, an Independant, and a Quaker's-meeting. Here is alſo a town-hall, with a ſpacious council-chamber, and other commodious apartments; a county-hall, two hoſpitals, a free-ſchool, a good library, a cuſtom-houſe, a good quay, and ſeveral alms-houſes. It is governed by a bailiff, twelve aldermen, and twenty-four common-councilmen; but no manufacture of conſequence is carried on here; yet being a ſea-port, and having a large and convenient quay, it has a good maritime trade, though it is not ſo conſiderable as formerly.

Bury St. Edmund's, or St. Edmundſbury, ſo called from Edmund, king of the Eaſt Angles, who was murdered in 870, and buried here, is delightfully ſituated upon an eminence on the weſt ſide of the river Lark, or Bourne, ſeventy miles to the north-eaſt of London, and having a view of a very fruitful country, has been called the Engliſh Montpelier. It is regularly built, the ſtreets croſſing each other almoſt at right angles, and is governed by a recorder, twelve aldermen, and twenty-four common-council. It was formerly famed for its abbey, which was ſaid to be the fineſt and richeſt of any in England, and ſtood between the two churches, which are both very large, and ſeated in one church-yard. In St. Mary's, one of theſe churches, lies Mary queen of France, who was married to Thomas duke of Norfolk. Beſides theſe churches, it has one Preſbyterian, one Independant, and one Quaker's-meeting. The inhabitants are ſaid to amount to about ſeven thouſand. Here is a ſpacious market-houſe, a beautiful croſs, and a grammar-ſchool. Here are held the aſſizes for the county. This town is the general rendezvous of all the nobility and gentry from the neighbouring counties.

SECT. XXV.

Of Cambridgeſhire; its Situation, Extent, Diviſions, Repreſentatives, Air, Soil, &c.

CAMBRIDGESHIRE, which receives its name from Cambridge, ſo called from its bridge over the river Cam, is bounded on the north by Lincolnſhire; on the eaſt by the counties of Norfolk and Suffolk; on the ſouth by Eſſex and Hertfordſhire; and on the weſt by Huntingdon and Bedfordſhire. It is thirty-five miles in length, about twenty in breadth, and near a hundred and thirty in circumference; it lies partly in the dioceſe of Ely, and partly in that of Norwich. It is divided into ſixteen hundreds, and contains eight market-towns, eighty-three vicarages, a hundred and ſixty-three pariſhes, two hundred and ſeventy-nine villages, with about ſeventeen thouſand houſes, and eighty-ſix thouſand ſeven hundred inhabitants. It ſends only ſix members to parliament, namely, two for the county, two for the town of Cambridge, and two for the univerſity.

The air and ſoil of this county vary extremely, ſome parts, eſpecially the ſouthern and eaſtern, are pleaſant and healthy; but the northern and fen-country are low and watery, and conſequently not very healthful. As the fen-country is in a manner the ſink of thirteen counties, it is often overflowed; for all the waters of the middle part of England, which do not run into the Thames or the Trent, fall into theſe fens, and in the latter part of the year, when they are overflowed with water, they appear covered with fogs; ſo that while the higher grounds of the adjacent country glitter with the beams of the ſun, the Iſle of Ely appears wrapt in a miſt. To clear theſe fens a number of drains has been made at a very great expence, by which a great deal of ground has been rendered fertile, and the air much improved. The people who are uſed to live in this watery country are as healthy as thoſe who enjoy a clearer air, except being ſubject to the ague, which they make light of.

In theſe fens are abundance of thoſe ingenious contrivances called decoys, and it is incredible what quantities of wild-fowl of all ſorts, as duck, mallard, teal, wigeon, &c. they take in them every week during the ſeaſon. It is ſaid that the neat profits of a decoy near Ely amount to near five hundred pounds a year; there being generally ſent to London during the ſeaſon from that decoy three thouſand couples a week.

Cambridgeſhire is almoſt wholly a corn-country, and five parts in ſix of all they ſow is barley, which is generally ſold to Ware, Royſton, and other great malting-towns in Hertfordſhire.

The principal river in this county is the Ouſe, which runs from the eaſt to the north-weſt, and receives the Cam near Thetford.

The chief places in this county are the following:

Cambridge, the capital of the county, and a celebrated univerſity, ſtands in a ſpacious, delightful, and fertile plain, fifty-five miles north of London, and ſixty north-eaſt of Oxford. The river Cam divides it into two unequal parts; but its ſituation is low, and the air is generally eſteemed not ſo good as that of Oxford. It contains about two thouſand five hundred houſes, and the inhabitants are computed at ſix thouſand: but the ſtreets are generally narrow, though pretty well paved; yet, as they lie low, they are in winter very dirty. In the midſt of the market-place is a very good conduit, continually running. The town conſiſts of fourteen pariſhes, and is governed by a mayor, a recorder, twelve aldermen, and twenty-four common-council; and the mayor, when he enters upon his office, takes an oath to maintain the privileges, liberties, and cuſtoms of the univerſity, to which he is ſubſervient.

The glory of this town is its univerſity, which is under the government of the chancellor, who is always a nobleman of high rank, and may be elected every three years, or is continued by the tacit conſent of the univerſity. The other officers of the univerſity are, II. The vice-chancellor, who is annually choſen on the fourth of November, by the body of the univerſity, out of two perſons nominated by the heads of colleges. III. A commiſſary, who holds a court of record of civil cauſes for all privileged perſons and ſcholars under the degree of maſter of arts. IV. A high-ſteward, choſen by the ſenate, and holding by patent from the Univerſity. V. Two proctors, who are annually choſen; as are alſo two taxers, who, with the proctors, have the cognizance of weights and meaſures, as clerks of the market. The univerſity has alſo a librarian, a regiſter, and other officers.

The vice-chancellor ſometimes viſits the taverns and other public-houſes in perſon; but it is more frequently done by the proctors, who have power to puniſh offending ſcholars, and to fine the public-houſes who entertain them after eight at night in the winter, or nine in ſummer.

The origin of this univerſity is concealed by the darkneſs of antiquity; it is ſaid to have been reſtored by Sebert, king of the Eaſt Angles, in the year 630, but was afterwards long neglected and overthrown by the war

war of the Danes; but at length revived under the Norman government. It has at preſent ſixteen colleges and halls, which here differ only in name, they being equally endowed, and enjoy the ſame privileges. In theſe are ſixteen maſters, four hundred and ſix fellowſhips, about ſix hundred and ſixty-two ſcholarſhips, two hundred and thirty-ſix exhibitions; and the whole number of maſters, fellows, ſcholars, exhibitioners, and other ſtudents, amount to about fifteen hundred. We ſhall now give a brief account of theſe colleges and halls, according to the date of their ſeveral foundations.

I. Peter-houſe, which perhaps took its name from St. Peter's church in its neighbourhood, was founded by Hugh Balſham, biſhop of Ely, in the year 1257. It was endowed for a maſter, fourteen fellows, &c. which number might be increaſed or diminiſhed according to the improvement or diminution of their revenues; and has at preſent twenty-two fellows, and four ſcholars.

II. Clare-hall was founded in 1340 by Richard Badew, chancellor of the univerſity, with the aſſiſtance of the lady Elizabeth Clare, counteſs of Ulſter. He had before erected a houſe called Univerſity-hall, in which the ſcholars lived for ſixteen years at their own expence, till it being accidentally burnt, the founder being ſenſible that the expence of rebuilding it would exceed his abilities, obtained the aſſiſtance of the above lady, through whoſe liberality it was not only rebuilt, but endowed. This ſtructure has been lately rebuilt with free-ſtone, and is one of the neateſt and moſt uniform houſes in the univerſity. It enjoys a moſt delightful ſituation, it being ſeated on the banks of the river, which here forms a kind of natural canal. It maintains eighteen fellows, and ſixty-three ſcholars.

III. Pembroke-hall was founded ſeven years after Clare-hall, by Mary St. Paul, counteſs of Pembroke, and maintains five fellows and thirteen ſcholars.

IV. St. Bennet's, or Corpus Chriſti-college, was founded about the ſame time by the united guilds or fraternities of Corpus Chriſti and the Bleſſed Virgin. It takes its name from the adjoining church of St. Benedict. Among its modern benefactors the moſt conſiderable is Dr. Matthew Parker, archbiſhop of Canterbury, who gave a curious library, chiefly conſiſting of ſcarce manuſcripts; he alſo founded two fellowſhips, aad five ſcholarſhips. At preſent it is able to maintain twelve fellows, and forty ſcholars.

V. Trinity-hall was founded by William Bateman, biſhop of Norwich, about the year 1348; and as he was eminent for his extenſive knowledge in the civil and canon law, two fellows and three ſcholars, placed by him there, were obliged to purſue that particular branch of learning. It has twelve fellows and fourteen ſcholars.

VI. Gonvil and Caius-college. With reſpect to this college it muſt be obſerved, that in 1348 Edmund de Gonvil, rector of Terrington in Norfolk, founded a hall, called after his name, in the place where are now the orchard and Tennis-court of Bennet's-college: but within five years after it was removed by biſhop Bateman to the place where it now ſtands. In 1607 John Caius, M. D. made ſuch large additions, both to the building and revenues, that he is deſervedly conſidered as the principal founder; and it has of late years received conſiderable embelliſhments. It now maintains twelve fellows of the firſt rank, fourteen of the ſecond, and ſeventy-four ſcholars.

VII. King's-college was founded in 1451 by king Henry VI. and afterwards enlarged by Henry VII. and his ſon Henry VIII. The model firſt laid down was never completed; only a part of the magnificent plan being executed: however, the chapel is deſervedly eſteemed one of the fineſt buildings of its kind in the world. It is three hundred and four feet in length, ſeventy-three in breadth, and ninety-one high to the battlements, and has not one pillar in it. It has twelve large windows on each ſide finely painted, and the carving and other workmanſhip of the numerous ſtalls ſurpaſs any thing of the kind. It conſtitutes one ſide of a large ſquare; for the royal founder deſigned that the college ſhould be a quadrangle, all of equal beauty; but the civil wars prevented his accompliſhing it: however, what has been lately added is not only an ornament to the college, but to the whole univerſity, and is built with great regularity and beauty. It maintains ſeventy fellows and ſcholars, beſides chaplains, &c.

VIII. Queen's-college was founded in 1448, by queen Margaret of Anjou, the wife of Henry VI. but finiſhed by Elizabeth the conſort of Edward IV. It now maintains a maſter, nineteen fellows, twelve bible-clerks, four Greek ſcholars, forty other ſcholars, beſides lecturers of Hebrew, geometry, and arithmetic.

IX. Catharine-hall owes its foundation to Richard Woodlarke, the third provoſt of King's-college. A great part of it has been lately rebuilt. It is a neat and elegant ſtructure, in which are maintained ſix fellows and thirty ſcholars.

X. Jeſus-college was begun by John Alcock, biſhop of Ely, in 1497, who having obtained of Henry VII. and pope Julius II. the revenues of a monaſtery of nuns, which had been ſuppreſſed on account of their ſcandalous incontinence, endowed and dedicated it to Jeſus, the Bleſſed Virgin, and St. Radegund, patroneſs of the nunnery. It has now ſixteen fellowſhips, and thirty-one ſcholars.

XI. Chriſt's-college was founded by the lady Margaret, counteſs of Richmond, mother of Henry VII. for a maſter and twelve fellows, which number agreeing with our Saviour and his twelve apoſtles was complained of in Edward the Sixth's reign as ſuperſtitious, on which the king added another fellowſhip and ſome ſcholarſhips. A noble building has been lately added to the old houſe, and the number of ſcholars amount to fifty-ſix.

XII. St. John's-college was begun by the ſame lady about nineteen years after Chriſt's-college, and was finiſhed by her executors. This college, which in the beginning of the reign of king James I. was greatly enlarged with new buildings, is pleaſantly ſituated near the river, and is no leſs remarkable for the number of its ſtudents and its beautiful groves and gardens, than for its ſtrict and regular diſcipline. It has a fine ſtone bridge over the river, and the library is noble and curious. The number of ſtudents amount to one hundred, and its fellows to fifty-three.

XIII. Magdalen-college was originally a hall for monks to prepare themſelves for academical exerciſes; but at the diſſolution of the monaſteries by Henry VIII. a new college was founded here by Thomas Audley, baron of Walden, and it was afterwards enlarged and endowed by Sir Chriſtopher Wray, lord chief juſtice of England. This college ſtands by itſelf on the north-weſt ſide of the river, and has been improved and adorned by handſome buildings. It maintains a maſter, thirteen fellows, and thirty ſcholars.

XIV. Trinity-college was founded by Henry VIII. who converted three ſmall houſes into one college, made a conſiderable addition to their former endowments, and dedicated this houſe to the Holy and Undivided Trinity. Queen Mary added largely to the endowment, and by ſubſequent benefactions it is enabled to maintain ſixty-five fellows, and ninety-one ſcholars. Its library, which many learned men have contributed to enrich, is very noble: the chapels, buildings, &c. juſtly place this in the firſt rank of colleges, and render it ſuperior to ſome foreign univerſities.

XV. Emanuel-college was founded by Sir Walter Mildmay, chancellor of the exchequer, in 1584, on the ſame ſpot where the Dominican friars had formerly a houſe. It has a very neat chapel, built by the bounty of Dr. William Sancroft, archbiſhop of Canterbury, and others, who likewiſe made a fine addition to the library by giving it his fine collection of books. It maintains a maſter, fourteen fellows, fifty ſcholars, and ten poor ſcholars.

XVI. Sidney Suſſex-college was founded by virtue of the will of the lady Frances Sidney, counteſs of Suſſex, who died in 1589, and for this purpoſe left five hundred pounds. Afterwards Sir Francis Clarke, and after him Sir John Brereton, not only erected a ſet of new buildings, but augmented the ſcholarſhips and fellowſhips; ſo that it is now enabled to maintain a maſter, twelve fellows, and twenty-eight ſcholars.

Among the other buildings in Cambridge is the new ſenate-houſe, which is a fine edifice, and, with the

ſchools, the univerſity-library, and other buildings, form a noble ſquare. This ſtructure is a hundred and one feet in length, forty-two in breadth, and is adorned with fluted columns, a triangular pediment, and other beautiful decorations.

The ſchools of the univerſity were at firſt in private houſes, afterwards public ſchools were erected at the expence of the univerſity, in or near the place where they now ſtand: but the preſent ſtructure, which is built of brick and ſtone, was erected partly at the expence of the univerſity, and partly by the contributions of ſeveral benefactors.

The univerſity-library was firſt built by Rotheram, archbiſhop of York, who with Tonſtal, biſhop of Durham, furniſhed it with choice books; after which his majeſty king George I. purchaſed the library of Dr. John Moore, biſhop of Ely, which coſt him ſix thouſand guineas, and beſtowed it upon this univerſity. Soon after the late lord viſcount Townſhend erected a fine marble ſtatue of his majeſty in the ſenate-hall of King's-college. The ſame prince alſo appointed two perſons, both in the univerſity of Oxford and Cambridge, well ſkilled in modern hiſtory, and in the knowledge of modern languages, to be nominated king's profeſſors of modern hiſtory, one of whom in each univerſity is obliged to read lectures in the public ſchools at particular times; each of theſe profeſſors to have a ſalary of four hundred pounds per annum, out of which each profeſſor is obliged to maintain, with ſufficient ſalaries, two perſons at leaſt, well qualified to teach and inſtruct in writing and ſpeaking thoſe languages gratis, twenty ſcholars of each univerſity, to be nominated by the king, each of which is obliged to learn at leaſt two of thoſe languages.

Stourbridge, a field near Cambridge, is known for its famous fair annually kept on the ſeventh of September, and continues a fortnight. This is eſteemed one of the greateſt fairs in England, many tradeſmen going thither from London and other parts to keep ſhops there. The trade chiefly conſiſts of woollen cloth, hops, iron, wool, leather, cheeſe, horſes, and many other things.

Ely is ſeated on an iſland of the ſame name, ſeventeen miles to the north of Cambridge, and ſixty-nine north-by-eaſt of London. It ſtands on a hill ſeated in the middle of a fenny plain, on the banks of the river, which renders it very unhealthy. The ſoil is exceeding rich, and the city is encompaſſed with gardens, which furniſh all the county for twenty miles round. Great quantities of ſtrawberries are cultivated here, particularly of the white ſort. The city conſiſts of about ſix hundred good houſes, and has but one good ſtreet well paved, the reſt being extremely dirty. The biſhop has the ſame power as in a county palatine; for he appoints a judge, holds the aſſizes, jail-delivery, and quarter-ſeſſions of the peace for the liberty. The aſſizes are held there every twelve months. The cathedral is a ſtately ſtructure, which has a lanthern of curious architecture; beſides which the city has only one church.

SECT. XXVI.

Of Hartfordſhire; its Situation, Extent, Diviſions, Repreſentatives, Rivers, Air, Soil, and principal Towns.

HARTFORDSHIRE, or Hertfordſhire, derives its name from Hartford, or Hertford, the county town, is bounded on the north by Cambridgeſhire, on the eaſt by Eſſex, on the weſt by Bedfordſhire and Buckinghamſhire, and on the ſouth by Middleſex. It is thirty-one miles in length, about twenty-eight in breadth, and about a hundred and thirty in circumference. This county, which lies partly in the dioceſe of London and partly in that of Lincoln, is divided into eight hundreds, which contain eight market-towns, fifty-four vicarages, a hundred and twenty pariſhes, and near nine hundred and fifty villages, with about ſixteen thouſand five hundred houſes, and eighty-two thouſand eight hundred inhabitants; and ſends ſix members to parliament, two knights for the ſhire, with two burgeſſes for St. Albans, and as many for Hertford.

The air is very clear and ſalutary, whence it is frequently recommended by phyſicians as highly conducive to health, and the people have a ſaying, that whoever buys a houſe or land in Hertfordſhire, pays two years purchaſe extraordinary for the goodneſs of the air. The ſoil is generally rich, and in the northern parts has a marle mixed with it, that makes it produce excellent wheat; but the meadows and paſtures are indifferent. The chief commodities are wheat, barley, malt, and wood.

This county is well watered with ſmall rivers, the chief of which are the Lea and the Coln. The principal towns in Hertfordſhire are the following:

Hertford, is ſeated on the river Lea, two miles to the weſt of Ware, and twenty-one to the north of London, and was formerly much more conſiderable than it is at preſent. It is built in the form of a Y, with a caſtle in the middle of the two horns, and contains ſeveral ſtreets and lanes. It had formerly five pariſh churches; but they are now reduced to two, with ſeveral meeting-houſes of the diſſenters.

It has a corporation, governed by a mayor, nine aldermen, a recorder, a town-clerk, a chamberlain, ten capital burgeſſes, &c. The chief commodities of its markets are wool, wheat, and malt, and it is ſaid to ſend five thouſand quarters of malt weekly to London, by the river Lea.

Here is a free-ſchool for the children belonging to the town; three charity ſchools, and alſo a ſchool belonging to Chriſt's-Hoſpital in London; this is a handſome ſtructure, erected by the governors, for ſuch children as either want health, or are too young for that hoſpital. This town gives the title of earl to the family of Conway, and near it is the ſeat of the late governor Harriſon, pleaſantly ſituated on a hill, that commands a fine proſpect, and there are ſeveral other ſeats in its neighbourhood.

Ware, is ſeated on the river Lea, twenty-one miles from London. The plenty of water about this town gave riſe to that admirable project, of cutting a channel from thence, and thus forming a new river for ſupplying London with water. This river takes its riſe from Arnwell, near this town, and was formed by the great Sir Hugh Middleton, who was obliged, in order to avoid the eminences and valleys in the way, to make it run a courſe of about thirty-nine miles, and to carry it over two valleys, in long wooden troughs lined with lead; that at Buthill being ſix hundred and ſixty feet in length, and thirty in height, under which is an arch, capacious enough to admit the largeſt waggon loaded with hay or ſtraw. In ſhort, over and under this river, which ſometimes riſes thus high, and at others is conveyed under ground, run ſeveral conſiderable currents of land waters, and both above and below it a great number of brooks, rills, and water courſes have their paſſage.

In the town of Ware is a charity-ſchool, and ſix or ſeven alms houſes. The ſchool which formerly was for the younger children of Chriſt's hoſpital, is removed to Hertford, the air being there eſteemed purer. This town has been famous for its great bed, which is much viſited by travellers, it being twelve feet ſquare, and is ſaid to hold twenty people. It was kept at the Crown, but now at the Bull.

St. Alban's, a large and ancient town, twenty-one miles from London, received its name from St. Alban, who ſuffered in the perſecution under Diocleſian, and being afterwards canonized, and interred on a hill in the neighbourhood of the town, a monaſtery was erected to him by king Offa, to atone for his guilt, in cauſing him to be murdered. King Edward I. erected here a magnificent croſs, in memory of queen Eleanor, and king Edward VI. incorporated the town by a charter, granting the inhabitants a mayor, a ſteward, a chamberlain, and ten burgeſſes; but the mayor and ſteward are here the only juſtices of peace. Here are three churches, beſides the ancient church called St. Alban's, belonging to the monaſtery, which is now a pariſh church. In this ancient ſtructure is a funeral monument, and the effigy of king Offa its founder, who is ſeated on his throne. On the eaſt ſide ſtood the ſhrine of St. Alban, and in the ſouth aile is the monument of duke Humphry, brother to king Henry V. commonly diſtinguiſhed by the title of the

the Good duke of Glouceſter. It is adorned with a ducal coronet, and the arms of France and England quartered. In niches on one ſide are ſeventeen kings, but in the niches on the other ſide there are no ſtatues remaining.

About fifty years ago, in digging a grave, a pair of ſtairs was diſcovered that led down into a vault, where a leaden coffin was found, in which the duke of Glouceſter's body was preſerved entire, by a kind of pickle in which it lay, only the fleſh was waſted from the legs, the pickle at that end being dried up. Many curious medals and coins are to be ſeen in the church, that have been dug out of the ruins of Old Verulam, which ſtood on the other ſide of the river Ver or Moore, which runs ſouth-weſt of the town.

St. Alban's is the largeſt town in the county, and, beſides its four churches, has ſeveral meeting houſes, two charity ſchools, and three fairs, and has on Saturdays one of the beſt markets for wheat in England. It gives the title of duke to the noble family of Beauclerc. The great John duke of Marlborough erected a ſeat here, called Holloway-houſe, and ſeveral neat alms-houſes have been built here by him and his ducheſs. Near St. Alban's is a fort at a place called by the common people the Oyſter-hills, which is ſuppoſed to have been the camp of Oſtorius the Roman proprætor.

SECT. XXVII.

Of Bedfordſhire; its Situation, Extent, Diviſions, Repreſentatives, Air, Soil, and principal Places.

THIS county derives its name from its chief town; it is bounded on the north by Northamptonſhire and Huntingdonſhire; on the eaſt by Cambridgeſhire; on the weſt by Buckinghamſhire; and on the ſouth by Hertfordſhire. It is twenty-two miles long, but not quite fifteen broad. This county is divided into nine hundreds, in which are ten market-towns, fifty-eight vicarages, one hundred and ſixteen pariſhes, five hundred and fifty villages, with about twelve thouſand one hundred and ſeventy houſes, and upwards of ſixty thouſand inhabitants. This county ſends only four members to parliament, two of which are for the county, and the other two for Bedford.

The air is temperate, clear, and conſequently healthy. The ſoil is a deep clay, and in the northern parts abounds in corn and paſture; but is ſandy in the middle, with a ridge of hills, covered with woods. Its commodities are chiefly fuller's earth, which is of the utmoſt conſequence to the clothing trade; it alſo affords cattle, veniſon, fowl, timber, wood, wheat, and barley in great plenty, and remarkably good. The chief manufactures here are bone-lace and ſtraw hats.

The chief river in this county is the Ouſe, the navigation of which is of great ſervice in the corn-trade. It divides the county into two unequal parts, forming the moſt beautiful meanders; for in the diſtance of twenty miles it runs over a tract of ſeventy.

The principal places in this county are the following:

Bedford, a populous and well built town, forty-four miles to the north-weſt of London, is ſeated on the banks of the river Ouſe, which divides it into two parts. Here are five pariſh churches, the principal of which is St. Paul's, and alſo ſeveral meeting-houſes of the diſſenters: a handſome ſtone bridge, with a gate at each end, to ſtop the paſſage occaſionally; and its high-ſtreet is in particular very handſome and well built, as is alſo the market-place, which is much improved with new buildings. It is the only market-town on the Ouſe, which has been made navigable to it, vaſt quantities of corn, particularly barley, being carried from hence down the river to Lynn, where it is ſhipped for Holland; and here being great plenty of proviſions, the higlers buy up conſiderable quantities for the uſe of the London markets. On which account it has many good inns, tho' it does not ſtand upon any of the great roads. Here is a well endowed free-ſchool, and a charity-ſchool for forty children. The town is governed by a mayor, twelve aldermen, a recorder, two bailiffs, a town clerk, and two ſerjeants at mace.

The ſoil in the neighbourhood of Bedford is extremely rich, and particularly produces great quantities of the beſt wheat, which is carried by waggons from hence, and the north parts of the county to Hitchin and Hertford, where it is ground, and the flour brought by land to London. This town gives the title of duke to the noble family of Ruſſel.

Dunſtable, a market-town, ſeated on a dry chalk hill, ſixteen miles from Bedford, and thirty-four from London. Here no ſprings are to be found, unleſs they dig very deep for them; but there is a large pond in the middle of the town, filled with rain water, and is never dry. It has four ſtreets, anſwering to the four cardinal points. The church is the remainder of a priory, and oppoſite to it is a farm-houſe, which was once a royal palace. The larks of this town are well known to all who ſtudy the gratification of their palates.

Woburn, a market-town, ſeated on a riſing ground, on the high road from London to Northampton. It was burnt down in 1724, but has been neatly rebuilt, and has a handſome market-place, with a free-ſchool and a charity-ſchool, founded by the duke of Bedford, who alſo erected the market-houſe. Woburn has near it plenty of fuller's earth.

This town was formerly famous for its abbey, which now belongs to the duke of Bedford, and is his ſeat; it has many noble rooms, particularly a fine library well ſtocked with books, and fitted up in an elegant taſte; and a long gallery adorned with a collection of fine paintings. Before the houſe is a large baſon of water, ſurrounded with a fine broad gravel walk. In this baſon is a beautiful yacht, of between thirty and forty tons burthen, elegantly carved and gilt, is completely rigged, and mounts ten guns, which are fired on occaſion of entertainments given on board. There are alſo a handſome pleaſure boat, a wherry, and ſkiff.

The park is nine miles round, and encompaſſed with a brick wall ten feet high. It has lofty woods, ſome of them of fir trees, and other ever-greens: particularly on the north ſide of the park is a plantation near two miles long, with a fine riding through it, where, in the depth of winter, one may ride in ſhelter through a perpetual verdure. A noble piece of water at the end of this plantation, has an iſland in the middle, upon which is a Chineſe building, where, in ſummer, his grace often dines with his company. There are alſo in this park many gravel roads through the woods, by which means a perſon may either walk or ride to every part of the park in the wetteſt ſeaſon, without meeting with the leaſt dirt.

SECT. XXVIII.

Of Huntingdonſhire; its Name, Situation, Extent, Diviſions, Repreſentatives, Air, Soil, Produce, and principal Places.

HUNTINGDONSHIRE, or Huntingtonſhire, received its name from the Saxons, who, from its being a ſporting country, called it Huntedunſcire. It is bounded on the north and weſt by Northamptonſhire; on the eaſt by Cambridgeſhire; and on the ſouth by Bedfordſhire; extending twenty-five miles in length from north to ſouth, eighteen in breadth from eaſt to weſt, and near ſixty-ſeven in circumference.

This county, which is in the dioceſe of Lincoln, is divided into three hundreds, and contains ſix market-towns, twenty-nine vicarages, ſeventy-nine pariſhes, two hundred and twenty-nine villages, about eight thouſand two hundred and twenty houſes, and upwards of forty-one thouſand inhabitants: but ſends only four members to parliament, namely, two knights of the ſhire, and two members for Huntingdon.

The air of Huntingdonſhire is good, except in the fenny parts, which are ſubject to damps and unwholeſome fogs. The ſoil is very fruitful; in the dry lands it yields good crops of corn, and in the lower grounds the meadows

meadows and paſtures are exceeding rich, producing fine horned cattle. Hence its chief commodities are corn, cattle, excellent cheeſe made at Stilton, and called the Parmeſan of England; with fowl and fiſh.

There is ſomething particular in the civil government of this county; for as Cambridgeſhire and Ely are under the ſame adminiſtration with it, the ſheriff is choſen by turns out of theſe ſeveral places.

The principal rivers are the Nen and the Ouſe. The Nen, after it has paſſed Oundle in Northamptonſhire, winds round the north-weſt and north bounds of this county. The Ouſe enters it at St. Neot's, and running to the north-eaſt paſſes Huntingdon, and then leaves the county at Erith.

In the north-eaſt part of the county, is a lake called Wittleſey-Meer, ſix miles long and three broad; the water is clear, but in the calmeſt weather is ſubject to be agitated, as if by a tempeſt. The air of this lake is thick, foggy, and too often fatal to ſtrangers, who attempt to live in its neighbourhood; but the natives receive no inconvenience from it; on the contrary, this lake abounds in fiſh, and its banks are remarkably fertile.

The chief places in this county are the following:

Huntingdon, called by the Saxons Hunter's-Down, is pleaſantly ſeated on a riſing ground, by the river Ouſe, over which it has a handſome ſtone bridge, fifty-ſeven miles north-by-weſt of London. It was once much larger than at preſent, it having fifteen pariſh churches, which are now reduced to two, with ſeveral meeting houſes. In this place the aſſizes are held, and it is a great thorough-fare on the northern road, on which account it is well furniſhed with inns. It is governed by a mayor, and confers the title of earl on the noble family of Haſtings.

Near the weſt ſide of the town is Hinchinbroke, which gives the title of viſcount to the eldeſt ſon of the earl of Sandwich, and where that nobleman has a ſeat called Hinchinbroke-houſe, the gardens of which are very fine.

St. Neot's is a well built town, fifty-ſix miles to the north-north-weſt of London, ſeated on the river Ouſe, over which there is a ſtone bridge: it has a handſome church, with a fine ſteeple, and the market is very conſiderable.

St. Ives is an ancient, large, and handſome place, fifty-ſeven miles north-weſt of London, and is ſeated on the river Ouſe, over which it has a handſome ſtone bridge. Here was a priory, which is now in ruins. It has one large church, two diſſenting meetings, and a popiſh chapel, with about five hundred dwelling-houſes. The ſtreets are pretty wide, and tolerably well paved.

SECT. XXIX.

Of Northamptonſhire; its Name, Situation, Extent, Diviſions, Repreſentatives, Air, Soil, Produce, Rivers, and principal Towns.

THIS county takes its name from the town of Northampton, which ſome ſay was ſo called from its ſituation on the north ſide of the river Anſona, or Nen, while others maintain that it was thus named from its ſituation with reſpect to Southampton. It is ſeated in the middle of England, and as it extends in a narrow tract towards the north-eaſt, borders upon more counties than any other in England; for on the north it is bounded by Lincolnſhire, Rutlandſhire, and Leiceſterſhire; on the eaſt by Cambridgeſhire, Huntingdonſhire, and Bedfordſhire; on the weſt by Warwickſhire and Oxfordſhire; and on the ſouth by Buckinghamſhire. It extends in length from the ſouth-weſt to the north-eaſt near fifty-five miles, in the broadeſt part from eaſt to weſt it is twenty-ſix, and a hundred and twenty-five in circumference. It is ſeated in the dioceſe of Peterborough, and divided into twenty hundreds, containing thirteen market-towns, eighty-five vicarages, and about five hundred and fifty villages, with about twenty-four thouſand eight hundred houſes, and a hundred and twenty-nine thouſand inhabitants. Northamptonſhire ſends nine members to parliament; two for the county, two each for Northampton, the city of Peterborough, and Brackley, and one for Higham Ferrers.

The air of this county is very healthy, and, except the little corner of Peterborough hundreds, is entirely free from bogs and fens, hence it abounds with the ſeats of the nobility and gentry. The ſoil is very fertile, both for tillage and paſturage, and is deficient in nothing but fuel, which is in moſt parts very ſcarce; nor can this ſcarcity be remedied, as they have no coal-pits, nor any navigable rivers to admit of their being ſupplied by water-carriage. It is obſervable, that here is but one barren heath, and that the reſt of the country is as fruitful in corn and graſs as any part of England. The commodities produced by this county are horned cattle, ſheep, horſes, and corn. The principal manufactures in which the people are employed are ſerges, tamies, ſhalloons, boots, and ſhoes.

The principal rivers of Northamptonſhire are the Nen and the Welland; beſides which it is partly watered by the Ouſe, the Leam, and the Charwell. Three of theſe, namely, the Nen, the Leam, and the Charwell, riſe within a ſmall diſtance of each other, near Daventry, and there form very different courſes; the Leam running weſtward, the Charwell ſouthward, and the Nen eaſtward, till it falls into the German ocean. The Welland riſes in the north-weſt ſide of the county, and divides it from Leiceſterſhire, Rutlandſhire, and Lincolnſhire, running through a part of the laſt county till it falls into the ſea. The Ouſe alſo riſes in this county, but ſoon enters Buckinghamſhire. Theſe rivers are of great ſervice in furniſhing this inland county with fiſh.

The principal towns in this county are the following:

Northampton, an ancient borough town, incorporated by king Henry II. and confirmed by king James I. is ſeated on the river Nen, ſixty-ſeven miles north-weſt-by-north of London. It had walls, which are now demoliſhed, and likewiſe a large caſtle, which is in ruins; and here ſeveral parliaments have been held. It is at preſent eſteemed the handſomeſt town in all this part of England; but its beauty is owing to a dreadful diſaſter; for it was ſo effectually burnt down on the twentieth of September, 1675, that very few houſes were left ſtanding: but it is now handſomely rebuilt with brick and ſtone, and the ſtreets are wide and ſpacious. It has two bridges over the river: the hall for the aſſizes is adorned with columns of the Corinthian order, and the market-place is ſquare and ſpacious. It had ſeven churches, which are now reduced to four, All Saints, St. Giles's, St. Sepulchre's, and St. Peter's. The firſt is a noble edifice, adorned with a cupola, and has a grand portico before it of eight lofty Ionic columns. This ſtructure ſtands in the center where four large ſpacious ſtreets terminate, and is conſequently ſeen to the utmoſt advantage. Here are alſo ſeveral meeting-houſes of Proteſtant diſſenters. The public buildings are in general extremely handſome: this town has an infirmary, a good free-ſchool, a charity-ſchool, and two alms-houſes. It is governed by a mayor, two bailiffs, a recorder, four aldermen, forty-eight common-councilmen, and a town-clerk.

Peterborough, a city of great antiquity, is ſeated on the river Nen, over which there is a bridge that leads into Huntingdonſhire, and is in the eaſtern angle of Northamptonſhire, ſeventy-ſix miles north-by-weſt of London. This is the leaſt city in England; for Wells, Ely, and Carliſle are much bigger. Here are, however, many good houſes; for the ſtreets are handſome and well built, and the market-place pretty ſpacious. It has, however, but one church beſides the cathedral, which is one of the moſt noble Gothic buildings in England: the weſt end is ſupported by three noble arches, very curiouſly embelliſhed; and the windows are finely painted with the hiſtories of the Old and New Teſtament. In ſhort, the whole ſtructure is adorned with a great deal of curious work. In this church was buried Mary queen of Scots; but her body was afterwards removed by her ſon James I. to king Henry the Seventh's chapel, in Weſtminſter abbey.

Here

Here alſo lies interred queen Catharine the divorced wife of king Henry VIII. who has a monument erected to her memory.

This town is governed by a mayor, aldermen, and a recorder, and gives the title of earl to the noble family of Mordaunt.

Wellingborough is pleaſantly ſeated on the aſcent of a hill on the weſtern banks of the river Nen, ſixty-five miles from London, and is a large, well built, and well inhabited town, with a handſome church, and a free-ſchool. A dreadful fire happened here in July, 1738, which in ſix hours time conſumed above eight hundred dwelling-houſes, moſtly in the ſouth and eaſt parts of the town; but it has ſince been rebuilt in a more handſome manner. This town enjoys a pretty good trade.

SECT. XXX.

Of Warwickſhire; its Name, Situation, Extent, Diviſions, Repreſentatives, Air, Soil, Produce, Rivers, and principal Places.

WARWICKSHIRE derives its names from the Saxons, who called it Weringſcire, which ſignifies a ſtation of ſoldiers. It is bounded on the north by Staffordſhire, on the eaſt by Leiceſterſhire and Northamptonſhire, on the ſouth-weſt by Glouceſterſhire, and on the ſouth-eaſt by Oxfordſhire; extending in length forty-ſeven miles, and twenty-ſeven in breadth. This county, which lies partly in the dioceſe of Litchfield and Coventry, and partly in that of Worceſter, is divided into four hundreds and one liberty, and contains ſeventeen market-towns, eighty-ſeven vicarages, a hundred and fifty-eight pariſhes, ſeven hundred and eighty villages, about twenty-two thouſand houſes, and two hundred thouſand inhabitants. It ſends ſix members to parliament, namely, two knights of the ſhire, two members for Warwick, and two for Coventry.

The air is allowed to be very mild, pleaſant, and healthy; and more ſo ſince the wood-lands have been thinned and laid more open than formerly, by the great conſumption of wood in the iron-works; by which means the wood-landers have been obliged to apply to tillage and paſture. The northern part of the country, called the Woodland, is divided from the ſouth, called the Feldon, by the river Avon; but the ſoil of both is rich, and produces excellent corn and cheeſe, the laſt of which is famous all over England: hence the chief commodities of this county are corn, malt, wood, wool, and cheeſe. This county alſo abounds in coals, which in ſome places lie even with the ſurface of the earth; and here are many excellent coal-pits.

The principal rivers are the Avon, which riſes in Leiceſterſhire, and enters this county a little above Rugby, running chiefly ſouth-weſt; it paſſes by Warwick, Stratford, and Bitford, below which it enters Worceſterſhire. The Tame, which riſes in Staffordſhire, and entering this county, runs eaſtward, till it has received the Blythe, and then, turning to the northward, enters Staffordſhire. The Arrow riſes in Worceſterſhire, and croſſing the weſt-ſouth-weſt borders of this county, joins the Avon a little below Bitford. The principal towns in Warwickſhire are the following:

Warwick is ſeated on a rock near the Avon, eighty-four miles to the north-weſt of London. All the paſſages to it are cut through the rock; and there is no way to go to it but over water. It was anciently fortified with a wall, which is now in ruins; but has ſtill a ſtrong and ſtately caſtle, which is the ſeat of the lord Brooke. It is a large and handſome town, in which are two pariſh-churches, with ſeveral meeting-houſes of the Diſſenters. It principally conſiſts of one regular built ſtreet, at each end of which is an ancient gate, and over the river is a ſtone bridge of twelve arches. It is governed by a bailiff and twelve burgeſſes, and has a handſome market-houſe ſupported on ſtone pillars. It has likewiſe a good free-ſchool, and an hoſpital called St. James's, for twelve decayed gentlemen, who have each twenty pounds a year, and the chaplain fifty.

This town was wholly reduced to a heap of ruins by a terrible fire on the fifth of September, 1694; but was rebuilt by act of parliament in ſo noble and beautiful a manner, that few towns in England make ſo fine an appearance. It is famous for being the reſidence of the celebrated Guy earl of Warwick, of whom ſo many fabulous and romantic accounts have been given, that it is perhaps impoſſible to diſtinguiſh his real actions from thoſe that are fabulous. He flouriſhed in the reign of Athelſtan, and decided the fate of the kingdom by ſingle combat with Colbrond, the Dane, a man of gigantic ſtature, whom he ſlew, and afterwards led an hermit's life till his death. They ſhow here his helmet and ſword.

The caſtle, already mentioned, ſtands upon the river Avon, on a ſolid rock. The terrace, like that of Windſor, overlooks a beautiful country, and you ſee the Avon running at the foot of the precipice, from above fifty feet perpendicular height. The building is old, but has often been repaired and beautified, and is now a very agreeable ſtructure, both within and without. The apartments are well contrived, and the communication between the remoteſt parts of the building is well preſerved by galleries, and the great hall, which is very magnificent. There are in the caſtle many curious original pictures, by Vandyke, and other hands, of kings, queens, and other noble perſonages.

A mile out of town on the ſide of a hill is a cell called Guy-Cliff, and in a kind of old chapel is a ſtatue of Guy eight feet high. The fence of the court is of ſolid rock, in which are cut ſtables and out-houſes. Here they ſhew the cave where Guy died an hermit.

Coventry is a city and county of itſelf, containing under its juriſdiction nineteen villages and hamlets. It is ſituated ninety-two miles to the north-weſt of London, and eleven to the north-eaſt of Warwick. It ſtands on the little river Sherburn, and is of great extent; but the houſes being moſtly very old, and chiefly built of wood and plaiſter, with ſtories projecting over each other, make but a very indifferent appearance. This is the ſiſter city to Litchfield, and is joined in the title of the ſee, which was for ſome time ſeated here. It was walled and incorporated by Edward II. afterwards its charter was confirmed by king Henry VI. and augmented with ſeveral privileges by king James I. Its walls were demoliſhed by order of king Charles II. in the year 1662, and only the gates left ſtanding, from which the beauty and ſtrength of the walls, which were three miles in compaſs, may be eaſily gueſſed at.

It is governed by a mayor, two bailiffs, ſheriffs, ten aldermen, a town-clerk, and other officers, who hold pleas for all actions, and it has a jail for felons, as well as debtors. It is divided into ten wards, and has three pariſh churches, that of the Holy Trinity, St. Michael, and St. John the Baptiſt, with ſeveral meeting-houſes; but has no cathedral. The church of St. Michael is a fine ſtructure of Gothic architecture, and has a curious piece of painting for the altar-piece. The ſpire of the great church, which is very beautiful, is three hundred feet high, and there are two churches in the ſame yard, where they ſeem to rival each other. At the ſouth end of the town alſo ſtands a tall ſpire by itſelf, this being what is left of the Grey Friar's conventual church. In the market-place ſtood the moſt ſtately croſs in England, it being ſixty-ſix feet high, and adorned with the ſtatues of ſeveral of the Engliſh kings, and a variety of curious Gothic ſculpture; but it has been lately taken down. The inhabitants have alſo lately obtained an act for paving, lighting, and cleaning the ſtreets. The town-houſe is worth ſeeing, the windows being of painted glaſs, repreſenting ſome of the old kings, earls, &c. who have been benefactors to the town.

The ſtory of the lady Godina, who rode naked thro' the high-ſtreet of the city, to purchaſe its exemption from oppreſſive taxes, is here ſo firmly believed, that they will not ſuffer the truth of it to be queſtioned, and in memory of it the inhabitants have an annual proceſſion on the Friday after Trinity Sunday, which is held as a fair, when the figure of a naked woman rides on horſe-back through the city with great pomp and ceremony, and the picture of the poor fellow who peeped out of a window

to

to ſee her, is ſtill kept up, looking out of a window in the high-ſtreet. This city has a very conſiderable manufacture of ſtuffs, particularly of tamies, and alſo of ribbons. It gives the title of earl to the noble family of Coventry.

Birmingham is a very large town, ſeventeen miles to the north-weſt of Coventry, and one hundred and nine to the north-weſt of London; it ſtands on the ſide of a hill, forming nearly a half-moon. The lower part is filled with work-ſhops and ware-houſes of the manufacturers, and conſiſts chiefly of old buildings; but the upper part contains a number of new and regular ſtreets. It has no corporation, it being governed only by two conſtables and two bailiffs, and is therefore free for any perſon to come and ſettle there, which has greatly contributed both to the increaſe of the buildings, and the trade, which is the moſt flouriſhing of any in England for all ſorts of iron-work and hard-ware. It has two churches, one in the lower part of the town, which is an ancient building with a very tall ſpire; the other is a very grand modern ſtructure, having a ſquare ſtone tower, with a dome and turret above it. In this town is a fine peel of ten bells, and a ſet of muſical chimes, which play ſeven different tunes, one for each day of the week. It has alſo two chapels and meeting-houſes for every denomination of diſſenters. The houſes, which are continually increaſing, amount to about ſeven thouſand. There is a free-grammar ſchool, founded and handſomely endowed by king Edward VI. and ſince rebuilt in a very handſome form. Here is alſo a charity ſchool, in which are maintained and taught upwards of fifty boys and girls.

SECT. XXXI.

Of Worceſterſhire; its Name, Situation, Extent, Diviſions, Repreſentatives, Air, Soil, Produce, Rivers, and principal Places.

WORCESTERSHIRE derives its name from its capital, called by the Saxons Weagorceſter, which at length became changed to Worceſter. This county is bounded on the north by Staffordſhire; on the eaſt and north-eaſt by Warwickſhire; on the weſt by Shropſhire, and Herefordſhire; and on the ſouth by Glouceſterſhire; extending about thirty-five miles in length, and twenty-ſeven in breadth.

It is divided into ſeven hundreds, and two limits, and contains twelve market-towns, fifty-five vicarages, one hundred and fifty-two pariſhes, five hundred villages, about twenty thouſand ſix hundred houſes, and one hundred and twenty-three thouſand ſeven hundred inhabitants. It is in the dioceſe of Worceſter, and ſends nine members to parliament; namely, two for the county, and two for each of the following places, Worceſter, Droitwich, and Eveſham, and one for the borough of Bewdley.

The air of Worceſterſhire is very healthy, and the ſoil in the vales and meadows very rich, producing corn and paſture, particularly the rich vale of Eveſham, which is juſtly ſtiled the granary of theſe parts. The hills have generally an eaſy aſcent, except Malvern hill, and feed large flocks of ſheep. This county had formerly two large foreſts, but the iron and ſalt works have in a manner deſtroyed them; and therefore theſe works are now chiefly carried on with coal, with which this county abounds. A number of rivers and rivulets water the fine meadows, and give them a richneſs that is eaſily perceived in the butter and cheeſe. Here is plenty of fruits of moſt ſorts, eſpecially pears, which are in many places found growing in the hedges. The chief commodities are coals, corn, cloth, cheeſe, cyder, perry, and ſalt.

The principal rivers with which this county is watered are the Severn, which enters Worceſterſhire on the north-weſt edge of the county, and running ſouthward by Worceſter, receives the Temd, when, paſſing by Upton, it enters Glouceſterſhire. The Temd enters Worceſterſhire on the weſt border, and runs to the ſouth-eaſt, till it joins the Severn. The Avon enters the eaſt-ſide of Worceſterſhire, and running through the vale of Eveſham, leaves this county at the ſouthermoſt point. All theſe rivers abound with the uſual ſorts of fiſh; but the Severn has lampreys almoſt peculiar to itſelf: they reſemble an eel in ſhape, but inſtead of gills, have nine holes on each ſide of the neck: they are in ſeaſon in the ſpring of the year, when they have a delicious taſte, which abates as the ſummer advances. The principal towns of this county are the following:

Worceſter is pleaſantly ſituated on the eaſtern bank of the river Severn, one hundred and twelve miles to the weſt-north-weſt of London. This is a large well built and populous city. It has a handſome ſtone bridge over the Severn, and from hence riſes a gentle aſcent, ſo high as to afford a pleaſant proſpect over the vale beneath. The Foregate-ſtreet is remarkably beautiful and regular, and the whole city is extraordinary well paved. The public buildings make a noble appearance, particularly the Guildhall; but the ſtatues on the out-ſide are very indifferent; the work-houſe is alſo a handſome ſtructure. The cathedral is very ancient, and makes but an indifferent appearance either within or without; the tower being low, without any ſpire, and only four very ſmall pinacles at the corners. In it lies buried king John, not where his monument now ſtands, but under a little ſtone before the altar of the eaſtermoſt wall of the church. On each ſide of him, on the ground, lie the effigies of two biſhops. On the ſouthſide of the high altar, is a large handſome chapel, the choir of which is of exquiſite workmanſhip. Here is the monument of prince Arthur, the eldeſt ſon of king Henry VII. who died at Ludlow in 1502, and among other monuments is one of the famous counteſs of Saliſbury, who, dancing before Edward III. in his great hall at Windſor, dropped her garter, which the king taking up, it is pretended gave riſe to the order of the Garter; but this is generally ſuppoſed to be a miſtake. The monument is very fine, and it is remarkable, that there are ſeveral angels of ſtone ſtrewing garters over the tomb.

Beſides the cathedral and St. Michael's church, which is without the liberty of the city, it contains nine pariſh churches; it has alſo three grammar-ſchools, ſeven hoſpitals well endowed, a water-houſe, and a well contrived quay. It is governed by a mayor, ſix aldermen, a recorder, two coroners, a ſheriff, a ſword-bearer, and five ſerjeants at mace. The inhabitants are generally eſteemed rich, being full of buſineſs, chiefly occaſioned by the clothing trade, of which the city and county carry on a great ſhare: the number of hands it employs in this town and the adjoining villages, in carding, ſpinning, weaving, fulling, &c. is almoſt incredible. One part of the city is wholly poſſeſſed by the Welſh, who ſpeak their own language, and are employed in this manufacture. There is here alſo a manufacture of porcelain, which is carried to a very great perfection; ſo as to equal that brought from China.

Droitwich, is ſeated on the river Salwarp, ſix miles from Worceſter, and ninety-five from London; it is a corporate and borough town, remarkable for its excellent ſalt ſpings, of which is here made fine white ſalt: the inhabitants have alſo a manufacture of linen cloth and hats.

Kidderminſter, a town ſeated under a hill, by the river Stour, one hundred and twenty-eight miles to the north-weſt of London, is particularly famous for its woollen manufacture, called Kidderminſter ſtuffs; but at preſent here is an extraordinary manufactory of blankets and carpets, equal to thoſe of Turkey, and the inhabitants are ſaid to have no leſs than one thouſand looms conſtantly employed. Here is a handſome church, a very good free-ſchool, and an alms-houſe. It is governed by a bailiff, twelve capital burgeſſes, and twenty-five common council men.

Stourbridge, or Sturbridge, is ſeated on the river Stour, over which it has a bridge, from whence it has its name, is one hundred and ſeventeen miles to the noth-weſt of London. The inhabitants have a conſiderable manufacture of glaſs of all ſorts, and alſo iron works. Here are alſo made fine ſtone pots for glaſs-makers to melt their metal in, and likewiſe crucibles, the clay of which theſe are made being almoſt peculiar to this place. Here is a good free-ſchool, in which is a library.

Near this town is Hagley-park, the ſeat of Lord Lyttelton, which is a beautiful ſpot of ground, intermixed with a pleaſing variety of hills, valleys, and woods. The houſe is eſteemed one of the fineſt ſeats in the county.

SECT. XXXII.

Of Shropſhire; its Name, Situation, Extent, Diviſions, Repreſentatives, Air, Soil, and Produce. Of the Phænomena of this County; its Rivers, and principal Towns.

SHROPSHIRE obtained its name from that given by the Saxons to Shrewſbury, which they called Scrobbeſberig, which ſignifies a town built on a woody hill. It is bounded on the north by Flintſhire, in Wales, and Cheſhire; on the eaſt by Staffordſhire and Worceſterſhire; on the ſouth by Worceſterſhire, Hereford ſhire, and Radnorſhire, in Wales; and on the weſt by the Welch counties of Radnorſhire, Montgomeryſhire, and Denbighſhire. It extends about thirty-eight miles in length from north to ſouth, thirty in breadth, and a hundred and forty in circumference.

This county lies partly in the dioceſe of Litchfield and Coventry, and partly in that of Hereford; and is divided into fourteen hundreds, in which are contained ſixteen market-towns, fifty-two vicarages, a hundred and ſeventy pariſhes, ſix hundred and fifteen villages, with about twenty-two thouſand three hundred and eighty houſes, and a hundred thirteen thouſand ſix hundred and eighty inhabitants. It ſends twelve members to parliament, that is, two for the county, and two for each of the following towns, Shrewſbury, Ludlow, Bridgenorth, Wenlock, and Biſhop's-caſtle.

The air of Shropſhire is ſalubrious, and not very ſharp, except on the hills. The ſoil is generally fruitful, eſpecially in the northern and eaſtern parts, which produce plenty of wheat and barley; but the ſouthern and weſtern, being mountainous, are leſs fertile, yet yield ſufficient paſture for ſheep and cattle. Under the ſurface are mines of lead, copper, iron, ſtone, and inexhauſtible coal-pits. Over moſt of the coal-pits lies a ſtratum of a blackiſh, hard, porous ſubſtance, containing great quantities of bitumen, which being ground to powder in horſe-mills, and boiled in coppers of water, there ſwims on the ſurface a bituminous matter, which, by evaporation, is brought to the conſiſtence of pitch; or, by the help of an oil diſtilled from the ſame ſtone, and mixed with it, may be thinned to a ſort of tar: both theſe ſubſtances ſerve particularly for caulking of ſhips, as well, if not better than pitch or tar, it being leſs liable to crack.

Many authors mention a remarkable phænomenon at Broſely, about ſix miles north of Bridgenorth. This is a well that exhales a ſulphureous vapour, which when contracted to one vent, by means of an iron cover with a ſemicircular hole, and fired by applying a lighted candle to it, will continue burning with great violence, ſo as to boil a large piece of beef in two hours; but what is ſtill more extraordinary, a piece of meat broiled in this flame has not the leaſt ill taſte from the ſulphur. This, however, is not the only phænomenon of the kind, there being another burning well of much the ſame nature in Lancaſhire.

The chief rivers of this county are the Severn and the Temd. Both theſe rivers receive ſeveral ſmaller ones, and all of them are well ſtocked with a variety of fiſh, as ſalmon, trouts, pike, carp, lampreys, eels, &c. As the Severn, which riſes in Montgomeryſhire, is navigable before it leaves it, that river is of infinite advantage to this county, not only for the communication it affords, but for the commerce it maintains with Worceſterſhire, Glouceſterſhire, and Briſtol.

The principal places in Shropſhire are the following:

Shrewſbury, a beautiful, large, pleaſant, populous, and rich town, a hundred and fifty-ſeven miles to the north-weſt of London, is ſuppoſed to have been built out of the ruins of the ancient Uriconium. In the reign of William the Conqueror, Roger earl of Montgomery built a caſtle on the north ſide, and a ſtately abbey called St. Giles's, or the Holy Croſs, at the eaſt end, famous for being the repoſitory of St. Winifred's body; but only ſome ruins of it are now to be ſeen.

Shrewſbury is ſeated on the Severn, which in part ſurrounds the town, in the form of a horſe-ſhoe, and over it are two ſtone bridges, upon one of which is built a very noble gate that has over the arch the ſtatue of the great Llewellin, whoſe memory is dear to the Welſh, he being their laſt prince of Wales. The town is near two miles long, and the ſtreets moſtly broad and paved. Here are five churches, and two of them have lofty ſpires: St. Chad's and St. Mary's are ſaid to have been anciently collegiate; and all the churches, except the laſt, which is a royal peculiar, are in the dioceſe of Litchfield and Coventry. There are here a great number of gentry, and this is a place of mirth and gallantry, ſomething like Bury in Suffolk, or Durham in the north; but is much bigger than either of them.

Here is the largeſt market, the greateſt plenty of good proviſions, and the cheapeſt that is to be met with in all the weſtern part of England. Over the market-place is kept a kind of hall for their manufactures, which are chiefly of flannel and white broad-cloth, great quantities of which are weekly ſold here. All the inhabitants ſpeak Engliſh; but on a market-day you would imagine yourſelf in Wales.

Here is the moſt conſiderable free-ſchool in this part of England, founded by king Edward VI. and endowed by queen Elizabeth, with a ſufficient maintenance for a head-maſter and three under-maſters. The buildings, which are of ſtone, are very ſpacious, particularly the library, which contains a great many books. The ſchool-maſters have alſo very handſome dwelling-houſes; ſo that the whole has the appearance of a college. The town was incorporated by king Henry I. and is under the government of a mayor, a recorder, a ſteward, twenty-four aldermen, and forty-eight common-councilmen.

Near this place was fought the bloody battle between Henry Hotſpur and Henry IV. king of England, in which the former was killed, and his army entirely defeated; and the place is ſtill called Battle-field. This town is alſo famous for the reception it gave to Charles I. but the fate of the war afterwards turning againſt the king, the town was almoſt ruined; but it has now fully recovered from this diſaſter, and is one of the moſt flouriſhing places in England: the wall and gates are ſtill ſtanding, but uſeleſs, and the old caſtle is gone to ruins. This town gives title of earl to the noble family of Talbot.

Ludlow is ſeated twenty-nine miles to the ſouth of Shrewſbury, and one hundred thirty-ſix to the north-weſt of London, and was formerly defended by a caſtle, which, now in its decay, gives ſome idea of its beauty in its flouriſhing ſtate. This was the palace of the prince of Wales in right of his principality. It enjoys a fine ſituation, there being a ſpacious plain in its front, which formerly extended near two miles; but much of it now is encloſed. The country round it is exceeding pleaſant and fertile, and nothing can be added by nature to render it a fit place for a royal palace. It is built upon a rock, in the north-weſt angle of the town, and on the weſt is ſhaded by a lofty hill, and waſhed by the river. The battlements are of great height and thickneſs, with towers at convenient diſtances. That half which is within the walls of the town is ſecured with a deep ditch; the other is founded on the ſolid rock; but all the fine courts, the royal apartments, halls, and rooms of ſtate lie open, abandoned, and ſome of them falling down.

The town of Ludlow is likewiſe fortified with walls, which have ſeven gates. It is well built, and is a place of good trade. On the ſouth ſide of the town runs the Temd, over which is a good bridge. The river has ſeveral dams acroſs it, on which are placed abundance of mills. Ludlow has a very good church, the windows of which are full of painted glaſs, pretty entire; the tower is handſome, and has a pleaſant ring of ſix bells. The church is dedicated to St. Laurence, and in the market-place is a conduit, on the top of which is a long ſtone croſs bearing a niche, in which is the image of that ſaint. The town is governed by two bailiffs, twelve aldermen, a recorder, twenty-five common-councilmen, and other inferior officers. It has the privilege of trying

and executing criminals, and has an alms-houſe for thirty poor people.

Bridgenorth is pleaſantly ſituated, twenty-one miles to the ſouth-eaſt of Shrewſbury, and a hundred and thirty-ſix to the north-weſt of London. The air is healthy, the proſpect delightful, and it has a pretty good trade. It conſiſts of two towns, the High and the Low, which are ſeparated by the Severn; but united by a ſtone bridge of ſeven arches, which has a gate and gate-houſe. It has been fortified with walls, and a caſtle now in ruins; and the area in the laſt is converted into a fine bowling-green. The ſtreets are broad and paved. In Cowgate-ſtreet a rock riſes perpendicularly, where are ſeveral tenements that have an agreeable, though a groteſque appearance. There is a hollow way cut through the rock, leading from the High town to the bridge, in ſome parts of the depth of twenty feet, and likewiſe many vaults and dwellings hewn out of the rock. The town is governed by two bailiffs, twenty-four aldermen, and other inferior officers. It is famous for gunſmiths, and the manufacture of ſtockings. Here are two churches, St. Mary Magdalen's, which was made a free chapel, and exempted from epiſcopal juriſdiction by king John; and St. Leonard's, which was burnt in the civil commotions in the reign of Charles I. and lately rebuilt by the inhabitants; but though the pariſhes are large, and the town very populous, the churches are very indifferently endowed; and this is alſo the caſe with the free-ſchool.

Whitchurch is ſeated on the confines of the county, near Cheſhire, about a hundred and ſixty-two miles to the north-weſt of London. It is a pleaſant and populous town, and in the Old church, which was lately taken down, was a monument of the great Talbot, firſt earl of Shrewſbury, called in his time the Engliſh Achilles. The New church is a large and handſome ſtructure. The town has a good market, and many gentry near it.

SECT. XXXIII.

Of Staffordſhire; its Situation, Extent, Diviſions, Repreſentatives, Air, Soil, Produce, Rivers, Lakes, and principal Towns.

STAFFORDSHIRE, which is ſo named from Stafford, the county town, is bounded on the eaſt and ſouth-eaſt by Derbyſhire; on the ſouth by Warwickſhire; on the ſouth-weſt by Shropſhire; and on the north-weſt, north, and north-eaſt by Cheſhire and Derbyſhire. It extends forty-five miles in length, twenty-eight in breadth, and a hundred and forty-two in circumference. This county, which lies in the dioceſe of Litchfield and Coventry, is divided into five hundreds, and contains nineteen market-towns, thirty-nine vicarages, a hundred and fifty pariſhes, and ſix hundred and ſeventy villages; with about twenty-three thouſand ſeven hundred and forty houſes, and a hundred and forty-two thouſand four hundred and forty inhabitants. It ſends ten members to parliament, two for the county, and two for each of the following towns, Litchfield, Stafford, Newcaſtle Under Lyne, and Tamworth.

The air of this county is generally very good, though ſharp, eſpecially on the hilly part, which lies between Trentham and Beach. The moor-lands, which are mountainous, and therefore reckoned the moſt barren, produce a ſhort, but ſweet graſs, and feed as large cattle as thoſe of Lancaſhire. The banks of the Dove in particular maintain the great dairies which ſupply Uttoxeter market with ſuch ſtore of butter and cheeſe. Great numbers of ſheep are fed both in the northern and ſouthern parts; but they are ſmall, and their wool coarſer than that of ſeveral other counties; but a great deal of it is manufactured in the clothing and felting buſineſs. The arable ground is no leſs fruitful than the paſtures, and even the moor-lands, when manured with marl and lime, mixed with turf-aſhes, produce good oats and barley. The ſouthern parts, and ſome of the northern, yield wheat, rye, barley, pulſe, flax, and hemp.

With regard to the ſubterraneous productions, the moor and wood-lands yield copper, lead, iron, marble, alabaſter, mill-ſtones, excellent coal, ſalt, &c. In the more fruitful parts are ſeveral marls which are uſed with great ſucceſs on the lands. Here is likewiſe brick-earth for red bricks, and others that burn blue; fuller's-earth, potter's-clay, particularly a ſort uſed in the glaſs-houſes; ſlip, a reddiſh earth with which veſſels are painted yellow, red ochre, and tobacco-pipe clay. It likewiſe yields fire-ſtone, rocks of lime-ſtone, a kind of iron-ſtone called muſh, as big as the crown of a hat, and containing about a pint of a cold, ſharp, pleaſant liquor, which the workmen are fond of; the beſt ſort of iron-wares are made of this ſtone; alſo hæmatites, or blood-ſtone.

The principal rivers in this county are the Trent, the third river in England, which riſes among the moor-lands in the north-weſt ſide of the county, and has its waters increaſed by ſeveral rivulets, with the Sow, Eccleſhall-water, and other ſtreams, then runs to the eaſtward into Derbyſhire. The Dove riſes in the moſt northern point of Staffordſhire, forming the boundary between it and Derbyſhire, and joins the Trent a little below Burton. The Sow riſes a few miles to the weſt of Newcaſtle Under Lyne, and running to the ſouth-eaſt falls into the Trent. They are all well ſtocked with fiſh, eſpecially the Trent.

Beſides theſe Staffordſhire has plenty of water from its ſmall lakes, as Ladford-pool, Cock-meer, Eccleſhal-caſtle-pool, New and Mare-pools, &c. moſt of which have rivulets paſſing through them, or are fed with ſprings, and abound in fiſh.

The principal places in this county are the following:

Litchfield, a neat well built city, and county of itſelf, is ſeated in a pleaſant champain country, a hundred and eighteen miles to the north-weſt of London. A brook, which glides ſlowly through it, divides the city into two parts, one of which is called the Town, and the other the Cloſe. In the firſt is a fine ſchool, a very handſome hoſpital dedicated to St. John, and well endowed: this part is the largeſt and moſt populous; but the other has the beſt buildings, and among the reſt the cathedral, with the houſes of the reſidentiary clergy, and many other good buildings. The cathedral is eſteemed one of the moſt elegant Gothic ſtructures in England, it is built of a reddiſh ſtone, and the weſt end is adorned with the ſtatues of all the kings who reigned in Jeruſalem, from David to the captivity: but the two towers are much too low for their breadth; yet the ſpires above them are carried up in a beautiful taſte, and a tower and ſpires which riſe from the middle of the church are much higher than thoſe at the weſt end, and equally beautiful. The great window over the middle door is very large, and beautifully adorned. The ſee is very ancient, it having been once archiepiſcopal, with juriſdiction over the kingdoms of the Mercians and Eaſt Angles. Beſides the cathedral, here are three pariſh-churches, a free-ſchool, and two hoſpitals. The juriſdiction of the city extends in a circle near ten miles in compaſs, and is annually rode round by the ſheriff on the eighth of September. The corporation conſiſts of a recorder, who is a nobleman of high rank, two bailiffs, a ſheriff, twenty-four burgeſſes, &c. The market is well ſupplied with all ſorts of proviſions on Tueſdays and Fridays. This town gives title of earl to the noble family of Lee.

Stafford, the county town, is ſeated on the river Sow, which waſhes it on the ſouth and weſt, over which is a ſtone bridge. It ſtands ſixteen miles to the north-weſt of Litchfield, and a hundred and thirty-five to the north-weſt of London. It is a neat and well built town, ſurrounded with meadows: the ſtreets are large, and many of the houſes handſomely built. It has a fine ſquare market-place, in which is the county hall, which is a very handſome ſtructure, and under it is the market-houſe. This town has two pariſh-churches, and a free-ſchool. It is governed by a mayor and other inferior officers, and here the aſſizes and ſeſſions are kept. Stafford is much increaſed and grown rich by the cloathing trade, and it is remarkable that it ſtill retains the ancient cuſtom of Borough Engliſh, which is, that the youngeſt ſons inherit the lands of their fathers within the town.

Newcaſtle Under Lyne is ſeated on a branch of the Trent, fifteen miles to the north of Stafford, and a hundred

hundred forty-nine to the north-north-weſt of London. It is a large place, with broad paved ſtreets; but the caſtle, from whence it receives its name, is quite demoliſhed. It is governed by a mayor, two juſtices, two bailiffs, and common council; and had formerly four churches, which are now reduced to one. The principal manufacture of the town is hat-making, there being here an incorporated company by the name of felt-makers. The cloathing trade alſo flouriſhes here; and about three miles from the town is a manufacture of earthen-ware, which imitates brown china: they alſo make black tea-pots and other veſſels, ſome of which are neatly figured and gilt, and likewiſe a prodigious quantity of white earthen-ware.

The adjacent parts yield pit-coal, which ſhining with a variety of colours, is therefore called peacock-coal.

About three miles ſouth-eaſt of Newcaſtle is the little town of Trentham, ſo called from the river Trent, which riſes there, where is the noble ſeat of earl Gower, eſteemed the fineſt in the county: the houſe is modern, and built on the plan of the queen's palace in St. James's-park; but its ſituation, with the front towards the church-yard, renders the entrance inconvenient. The park is very beautiful; it has two large pieces of water, and the hills which riſe from them are finely covered with wood. The park is walled round, and from the high ground in it you have an extenſive view of the country on every ſide.

Wolverhampton, or Woolverhampton, a very ancient, large, and flouriſhing town, a hundred and twenty miles to the north-weſt of London, is pleaſantly ſeated on a hill. The houſes are pretty well built, and the ſtreets are for the moſt part broad and well paved. It has an ancient collegiate church annexed to the deanry of Windſor, in which are ſeveral ancient monuments, and a very handſome chapel; with a Preſbyterian, a Roman catholic, and a Quakers meeting-houſe. Here the trade of lock-making is carried on to great perfection, as alſo are the making of moſt other utenſils in braſs and iron, which are ſent from hence and exported all over Europe. A market for iron-work is held weekly, ſome of which is made in the town; but the principal part is brought to the market by the farmers for ſeveral miles round, where every farm has one forge or more; ſo that the farmers work at their forges as ſmiths, when they are not employed in the fields, and what they bring to market is bought up by the great tradeſmen who ſend it to London.

SECT. XXXIV.

Of Leiceſterſhire; its Name, Situation, Extent, Diviſions, Repreſentatives in Parliament, Air, Produce, Rivers, and principal Towns.

THIS county takes its name from Leiceſter, its capital, which it obtained from its ſituation on the river Leire, now called the Soar, and is bounded on the north by Derbyſhire and Nottinghamſhire, on the eaſt by Lincolnſhire and Rutlandſhire, on the ſouth by Northamptonſhire, and on the weſt by Warwickſhire. It extends about thirty miles from eaſt to weſt, near twenty-five from north to ſouth, and about ninety-ſix in circumference.

Leiceſterſhire, which lies in the dioceſe of Lincoln, is divided into ſix hundreds, and contains thirteen market-towns, eighty-one vicarages, a hundred and ninety-two pariſhes, ten parks, five hundred and fifty villages, and about a hundred and twelve thouſand two hundred inhabitants; but ſends only four members to parliament, namely, two for the county, and the like number for the town of Leiceſter.

The air of this county is very healthful; but the ſoil is different in different parts: in the ſouth-weſt it is rich and plentiful, both for corn and paſture; but ſo deſtitute of fuel, that the inhabitants are forced to burn dried cow-dung. In this part there are, however, fine meadows on the banks of the Avon. The north-eaſt part, eſpecially about the river Wreke, is moſtly barren, mountainous, and rocky; but affords plenty of wood and pit-coal, feeding vaſt numbers of ſheep, which here and in Lincolnſhire are the largeſt mutton with which the London markets are ſupplied, and have the greateſt fleeces of wool of any in England; nor is the wool leſs fine on account of its quantity, and, ſome few places excepted, is the longeſt ſtaple in the whole iſland. The ſheep-breeding country here reaches from the river Anker, on the confines of Warwickſhire, to the Humber, at the fartheſt end of Lincolnſhire, which is near a hundred miles in length; and from the banks of the Trent, in Lincolnſhire and Leiceſterſhire, to thoſe of the Ouſe, which is above ſixty miles in breadth.

The horſes fed here are alſo the largeſt in England, they being generally the great black coach and dray-horſes, of which ſuch numbers are continually ſent up to London. Indeed moſt of the gentlemen are graziers, and in ſome places it is not uncommon for theſe to rent from five hundred to two thouſand pounds a year.

In ſhort, this county produces wheat, barley, peas, and oats; but its moſt natural and plentiful crops are of beans.

Its principal rivers, the Avon, the Soar, anciently called the Leire, the Anker, and the Welland, which riſe in the weſt part of this county, form four different courſes; for the Avon ſoon leaves this county, and runs to Warwick. The Soar, the principal river, firſt runs north-eaſt by Leiceſter, till having received the Wreke, it turns to the north-weſt, and falls into the Trent, where the three counties, Leiceſterſhire, Derbyſhire, and Nottinghamſhire, meet. The Anker runs north-weſt to Atherſton, on the edge of Warwickſhire. The Welland runs north-eaſt by Harborough to Stamford. The Wreke riſes in a part of the county called the Would, and runs weſtward till it falls into the Soar.

We ſhall now deſcribe the principal places of this county.

Leiceſter, the county town, is ſeated on the river Soar, by which it is half ſurrounded, ninety-eight miles from London. It is a very ancient place, was once the ſee of a biſhop, and is ſaid to have had thirty-two pariſh-churches, which are now reduced to five, with ſeveral meeting-houſes. At preſent it is the largeſt and moſt populous town in the county. In the High-ſtreet is an exquiſite piece of workmanſhip in the form of our Saviour's croſs, and the hoſpital built by Henry Plantagenet, duke of Lancaſter, ſtill continues in a tolerable condition, it being ſupported by ſome revenues from the duchy of Lancaſter, and can decently maintain one hundred aged people; but the moſt ſtately edifice of this kind at preſent is the New Bede-houſe, or hoſpital, built in the reign of Henry VIII. and endowed by Sir William Wigiſton, a merchant of the ſtaple in this town, for twelve poor lazers, which has a chapel and library for the uſe of the miniſters and ſcholars belonging to the town; there is another for ſix widows, and a charity-ſchool for thirty boys and ten girls. Leiceſter has a very ſpacious market-place, and the ſtreets are paved; but have many old buildings. It is governed by a mayor, &c. and the freemen of Leiceſter have by their charter the privilege of being exempted from paying toll in all the fairs and markets in England.

Before the caſtle was diſmantled it was a vaſt building, in which the great Henry, duke of Lancaſter, kept his court; the hall and kitchen ſtill remain entire, the former of which is ſo lofty and ſpacious, that the courts of juſtice, which are held here at the aſſizes, are at ſuch a diſtance as not to incommode one another. The principal buſineſs of the town is ſtocking-weaving.

Many curious relics have been found in this town, particularly Roman coins; and in the bottom of a cellar was diſcovered a piece of Moſaic pavement repreſenting the ſtory of Acteon torn to pieces by his own hounds. This is an admirable piece of workmanſhip, the ſtones being only white and brown, and very ſmall. This piece of antiquity is ſtill preſerved.

The firſt law for burning hereticks, by which lord Cobham and others ſuffered death, was made in a parliament held here, in the reign of king Henry V. declaring the favourers of Wickliff's doctrine heretics and traitors. In the civil wars Leiceſter was beſieged by king Charles I. and taken by ſtorm, on the thirty-firſt of May, 1645, when his army gave the garriſon no quarter, hanged ſome of the committee, and plundered the inhabitants.

inhabitants. But Sir Thomas Fairfax ſoon after advancing with the parliament's forces, beſieged it again, and obliged the new garriſon to ſurrender upon terms.

Loughborough, is pleaſantly ſeated among fertile meadows, near the foreſt of Charwood, one hundred and ſeven miles from London. It ſtands on the river Soar, over which it has a bridge, and is a handſome town, with one ſpacious church.

Aſhby de la Zouche, is a very conſiderable market-town, which took its name from the Zouches, its lords; it is ſeated between Preſton-park, and the great park on the ſkirts of Derbyſhire, about a hundred miles from London. It has a large handſome church, near which ſtand the ruins of the earl of Huntingdon's caſtle, deſtroyed in 1648. There is a free-ſchool here, endowed by the earl of Huntingdon, to whom the manor belongs. The town is noted for its large manufacture of hats, in which ſome hundreds are employed.

SECT. XXXV.

Of Rutlandſhire; its Situation, Extent, Diviſions, Repreſentatives in Parliament, Air, Soil, and principal Towns.

RUTLANDSHIRE, the leaſt of all the counties in England, is almoſt of a circular form, and is bounded on the north and north-eaſt by Lincolnſhire; on the ſouth and ſouth-eaſt by Northamptonſhire; and on the ſouth-weſt and north-weſt by Leiceſterſhire; extending from north to ſouth about fifteen miles, from eaſt to weſt ten, and about forty in circumference. This county is divided into five hundreds, in which are ten vicarages, forty-eight pariſhes, one hundred and eleven villages, about three thouſand two hundred and ſixty houſes, and ſixteen thouſand three hundred inhabitants. It lies in the dioceſe of Peterborough, and ſends only two members to parliament, which are the two knights for the ſhire.

The air is ſweet and ſalubrious, it being quite clear from fogs and miſts. Rutlandſhire is extremely well watered, for, beſides the Welland, which waſhes the ſouth and ſouth-eaſt borders, and the Guaſh or Waſh, which interſects the county from eaſt to weſt, quite through the middle of it; there are abundance of ſmall rivers and brooks, which fall into them on all ſides. They all afford plenty of excellent fiſh, which makes ſome amends for the want of ſea-fiſh, from which the inhabitants are in a great meaſure debarred, by their inland ſituation.

The ſoil is very fruitful, in corn and paſture, which feeds great numbers of cattle, eſpecially ſheep, the wool of which is redder than in other counties, from the peculiar redneſs of the ſoil. The vale of Catmos, in which Okeham ſtands, is not inferior in point of fertility to the vales of White-horſe and Belvoir. This county gives title of duke to the noble family of Manners. The principal towns it contains, are Okeham, and Uppingham.

Okeham, the county town, ſtands in the rich valley of Catmos, ninety four miles from London. It is pretty well built, has a good church, a free-ſchool, and an hoſpital. It has likewiſe an ancient caſtle, in which the aſſizes are held. It is ſaid to be a cuſtom in this town, that when a nobleman comes within its precincts, he is obliged to pay homage, by giving a ſhoe from one of his horſes, or to compound for it in money; when the forfeited ſhoe, or that made in its ſtead, is fixed with the nobleman's name on the caſtle-gate. Sometimes they are made very large, and gilt in proportion to the ſum of money given inſtead of the ſhoe. The caſtle was built ſoon after the conqueſt, by Walkelin de Ferrariis, who bearing horſe-ſhoes in his arms, gave riſe to the above cuſtom.

Uppingham, a town of Rutlandſhire, is ſeated on an eminence, and is a pretty compact well built place, with a very good free-ſchool, and an hoſpital.

Though this county is very ſmall, it contains a conſiderable number of noblemen's ſeats.

SECT. XXXVI.

Of Lincolnſhire; its Situation, Extent, Diviſions, Repreſentatives in Parliament, Air, Soil, Produce, and principal Towns.

LINCOLNSHIRE, takes its name from the city of Lincoln, which by the ancient Britons was called Lindcoit, and by the Saxons Lincollſcire; it is bounded on the north by Yorkſhire, from which it is divided by the Humber, on the eaſt by the German ocean, and a ſmall part of Norfolk, on the ſouth by Cambridgeſhire and Northamptonſhire; and on the weſt is bounded by Rutlandſhire, Leiceſterſhire, Nottinghamſhire, and a ſmall part of Yorkſhire.

It is generally reckoned almoſt ſixty miles from north to ſouth, and in the middle, where wideſt, thirty-five; but according to Templeman, it is ſixty-ſeven miles in length, and forty-three in breadth. It is generally divided into three parts, namely, Holland on the ſouth-eaſt ſide, Keſteven on the ſouth-weſt, and Lindſay on the north; which laſt diviſion is the largeſt, for it includes all that lies north of Lincoln city, and the Foſſe-dyke, which king Henry I. cut between the Witham and the Trent. This county is ſub-divided into three hundreds, and twenty-five wapentakes, and contains one city, five parliamentary boroughs, thirty-four other market-towns, two hundred and fifty-ſix vicarages, one thouſand five hundred and fifty-ſix villages, near forty thouſand ſix hundred houſes, and about two hundred two thouſand nine hundred inhabitants. It is in the dioceſe of Lincoln, and ſends twelve members to parliament, two for the county, and two for each of the following places, Lincoln, Stamford, Grantham, Boſton, and Grimſby.

This county is well watered with rivers, the principal of which are the Trent, which waſhes the weſtern edge of the county, and falls into the Humber, the northern boundary. The Witham, which riſing in the ſouth-weſt of the county, runs northward, till it receives the Foſſe-dyke at Lincoln, where it turns to the ſouth-eaſt, and at length falls into the German ocean below Boſton; and the Welland, which parts this county from Northamptonſhire, running through Holland diviſion alſo into the German ocean.

With reſpect to the air of this county, it muſt be obſerved, according to its three grand diviſions, that of Holland, as it is partly under water, and the reſt of it moiſt and fenny, muſt be bad. Keſteven is more ſalubrious, it being leſs affected with the fogs from the fen country, and its ſoil more fruitful. Lindſay is generally eſteemed healthy, eſpecially on the weſtern ſide. The ſoil is in moſt places very rich, the inland part producing corn in great plenty, and the fens cole-ſeed, and very rich paſtures; whence their breed of cattle is larger than that of any other county in England, except Somerſetſhire; their horſes are alſo excellent and very large: The hunting hounds and hares are particularly noted for their extreme ſwiftneſs. Here are all the common fruits, and they are ſaid to have better pippins than thoſe of Kent, eſpecially ſuch as grow in the diviſion of Holland, and about Kirton, both of which ſorts are very wholeſome and delicious; yet, being grafted on their own ſtock, are much improved, and are then called rennets.

The churches of this county are ſaid to be its chief ornaments, it being commonly obſerved, that no county has better churches and worſe houſes. The poorer ſort of people here waſh their cloaths with hog's-dung, and burn dry cow-dung.

The principal places in Lincolnſhire are the following.

Lincoln, a city ſeated one hundred and twenty-eight miles from London, was anciently a Roman colony, called Lindum Colonia. It is pleaſantly ſeated on the top, ſide, and foot of a hill, on the river Witham, which divides into ſeveral ſtreams, and waters the lower part of the city, over which are ſeveral bridges. It had formerly fifty churches, which are now reduced to fourteen, beſides the cathedral or minſter, and meeting houſes of every denomination of diſſenters. The cathedral is one of the moſt ſuperb ſtructures of the kind in England, and from its ſituation on the top of a hill, may be ſeen

from five or ſix counties. It has a double croſs or tranſept, with two ſpires or towers, and many bells, particularly in the north tower, which has the fineſt great bell in England, called Tom of Lincoln: it weighs four tons eighteen hundred and ninety-four pounds, and is twenty-two feet eight inches in circumference. The middle or Round-tower is the higheſt in the kingdom, and when the ſpire was ſtanding it muſt, in proportion to the height of the tower, have exceeded that of Old St. Paul's, which was five hundred and twenty feet. The monks were ſo proud of this ſtructure, that they would have it the devil looked upon it with an envious eye, whence the proverb "He looks as the devil does over "Lincoln." Now there are only four very ordinary pinacles, one at each corner. It has two large gates on the weſt: the cloiſters and library are fine, and the latter well furniſhed with printed books and manuſcripts. Two catharine-wheel windows at the ends of the larger tranſept are remarkably beautiful, and adorned with painted glaſs.

To the ſouth of the cathedral, upon the very brow of the hill, is the biſhop's palace. Though this is the largeſt dioceſe in England, the revenue of the biſhopric is laid now to amount only to fifteen hundred pounds per annum; but was formerly immenſely great. In this dioceſe are contained the counties of Lincoln, Leiceſter, Huntingdon, Bedford, Bucks, and part of Hertfordſhire; and in them twelve hundred and fifty-five pariſhes, of which five hundred and ſeventy-ſeven are impropriations.

In the upper town are good buildings, and ſeveral gentlemen have their houſes there, beſides thoſe of the prebendaries and other clergy. The communication between the upper and lower town is very troubleſome; but in the ſteepeſt part is the briſkeſt trade, and here the ſhops are well furniſhed with commodities; but the buildings are generally old, eſpecially in the lower part. This is a city and county of itſelf: it is governed by a mayor, twelve aldermen, two ſheriffs, &c. whoſe juriſdiction extends twenty miles in circumference. It has given the title of earl to the noble family of Clinton ever ſince the reign of queen Elizabeth. Here are four charity-ſchools, in each of which thirty poor children are taught by clergymen's widows.

Stamford is ſeated on the Welland, eighty-three miles from London, and is a large and populous borough in the ſub-diviſion of Keſteven. It ſtands on the ſlope of a hill, and has a ſtone bridge of five arches over the river, on the confines of Northamptonſhire and the county of Rutland. The river is navigable by barges up to the town. Here is a handſome town-hall and ſix pariſh-churches, with ſeveral good ſtreets and fine ſtructures. It is an ancient town, it being known in the time of the Romans, and had long ago a college whoſe ſtudents removed to Brazen-Noſe-college, in Oxford; but though its trade is not very conſiderable, the inhabitants are numerous and rich; and it being ſeated upon the York road, is particularly famous for its large and commodious inns. Among the privileges of which the inhabitants boaſt, is, that the mayor is immediately under the king, and commands the militia, returns writs, &c. and that they have the cuſtom of Borough Engliſh, by which the younger ſons inherit upon their fathers dying inteſtate. In this town is a charity-ſchool, in which eighty poor children are taught and employed.

Boſton, a large, populous, and well built ſea-port town, in the ſub-diviſion called Holland, twenty-ſix miles ſouth-eaſt of Lincoln, and ninety north of London, is built on both ſides of the river Witham, at its mouth, and ſtands part in Lincolſhire and part in Northamptonſhire, which are joined by a wooden bridge. It has a commodious harbour on the German ocean, is full of merchants, and enjoys a good trade. The town is ſupplied with water by pipes from a reſervoir made by act of parliament, in a common called the Weſt Fen. The church is without croſs ailes, and is ſaid to be the largeſt pariſh church in the world; and its tower, which is two hundred and eighty feet from the ground, ſerves as a land-mark to mariners, not only into this port, but even into the mouth of the Ouſe, being ſeen out at ſea to the entrance of the channels, called Lynn-deeps and Boſton-deeps, very difficult places. The living is a vicarage, in the gift of the mayor and burgeſſes.

Grantham, a neat populous borough of the ſub-diviſion called Keſteven, is a place of great reſort, and has abundance of good inns, it lying on the north road, a hundred and four miles from London. It has a fine large church, with a ſtone ſpire two hundred and eighty feet high, which, by a mere deception of the ſight, ſeems to ſtand awry. It has alſo a good free-ſchool, built and endowed by Dr. Richard Fox, biſhop of Wincheſter, who was a native of this town; and here the celebrated Sir Iſaac Newton received his firſt education. In this town there are alſo two charity-ſchools, and upon the neighbouring courſe are frequently horſe-races. It gives title of baron to the noble family of Robinſon.

Gainſborough, a large and well built town of Lindſay ſub-diviſion, is ſeated on the Trent, a hundred and thirty-ſeven miles from London; it has a fine large market held weekly on Tueſdays, and gives title of earl to the noble family of Noel. Its church was rebuilt by act of parliament in 1735; and here are ſeveral meeting-houſes of Diſſenters. The Danes landed here when they came up the Trent, which brings up ſhips of burthen with the tide, though it is forty miles diſtance by water from the Humber.

SECT. XXXVII.

Of the County of Norfolk; its Situation, Extent, Diviſions, Repreſentatives in Parliament, Air, Soil, Produce, Rivers, and principal Places.

THIS county received its name from its northern ſituation with reſpect to Suffolk; it is bounded on the north and eaſt ſides by the German ocean, on the weſt by Cambridgeſhire and Lincolnſhire, and on the ſouth by Suffolk. It extends about fifty miles from eaſt to weſt, thirty-five from north to ſouth, and about a hundred and forty-five in circumference.

It is divided into thirty-one hundreds, and contains a hundred and ſixty-four vicarages, thirty-three market-towns, ſix hundred and ſixty pariſhes, near fifteen hundred villages, about forty-ſeven thouſand one hundred and eighty houſes, and two hundred and eighty-three thouſand inhabitants. This county is in the dioceſe of Norwich, and ſends twelve members to parliament, namely, two for the county, and two for each of the following boroughs, Norwich, Lynn-Regis, Yarmouth, Thetford, and Caſtle-Riſing.

The air of this county is ſharp and piercing, which throws the ſeaſons backwarder than is uſual in the ſame latitude in England. The inland country is thought very healthy; but the ſoil is obſerved to have a greater variety in it than is found perhaps in any other county, and from thence has been conſidered as an epitome of England, it having all the kinds of ſoil found throughout the kingdom, namely, arable, paſture, wood-lands, meadows, heaths, fens, light ſandy ground, and deep clay; but even the worſt of theſe are far from being unprofitable, the ſandy heaths feeding ſheep and breeding rabbets, and the fens affording rich paſture for cattle. The chief commodities are corn, cattle, wool, rabbets, honey, ſaffron, herrings in great abundance, with jet and amber thrown upon the ſea-coaſt. The manufactures are worſted, woollens, and ſilks, in which all the inland part is employed. This county gives title of duke to the noble family of Howard.

The principal rivers of Norfolk are the Ouſe, which divides it on the weſt from Suffolk and Cambridgeſhire. The Waveney, which is the boundary between Norfolk on the ſouth-eaſt and Suffolk. The two different courſes of theſe rivers are the more remarkable, as both riſe within a very ſmall diſtance of each other in the ſouthern edge of the county. The Yare, which is peculiar to Norfolk, riſes near the center of the county, and runs eaſtward through Norwich to Yarmouth, where it falls into the German ocean. A little above this laſt mentioned town the Yare is joined by the Waveney. Theſe three rivers abound with fiſh, and are

particularly famous for excellent perch; but the Yare has alſo a fiſh, called a ruff, peculiar to itſelf, that exceeds the perch in the delicacy of its taſte: it is much about the ſame ſize, and the body is all over rough with ſharp prickles, from whence it has its name. The back is of a browniſh colour, the belly of a pale yellow, and about the jaws it has double ſemi-circular marks.

The principal towns in this county are the following:

Norwich, a very ancient, large, handſome, populous, and well frequented city, is ſeated on the banks of the river Yare, which runs through a part of it, a hundred and nine miles north-eaſt-by-north of London. It is encompaſſed by walls, which have twelve gates, and has a fine old caſtle, at preſent uſed as a priſon, and from whence a perſon may have a view of the whole city. Here alſo are the ruins of a caſtle, called by the name of Kett, who lived in the reign of Edward VI. and did much damage to the city, which is very ancient, and has undergone great calamities. It has ſeveral bridges over the river, and has thirty-ſix churches, beſides the cathedral, which is a handſome ſtructure, and has a lofty ſpire ſteeple: there are here alſo meeting-houſes of Diſſenters of all denominations. As the walls are three miles in compaſs, the whole ſpace within them is not inhabited, they incloſing many gardens and orchards. There are here, however, about eight thouſand houſes; the ſtreets are pretty wide, and there is a very ſpacious market-place. It has alſo a new play-houſe, a place of entertainment called Vauxhall, and ſeveral other curious gardens to which the gentry reſort; with an hoſpital for a hundred poor men and women.

It has a large and flouriſhing manufactory of camblets, crapes, &c. for which it has a great trade, both at home and abroad. It is a city and county of itſelf: the biſhop has a palace here, as hath alſo the duke of Norfolk. It is governed by a mayor, a recorder, twelve aldermen, two ſheriffs, and twenty-one common-council.

It has been obſerved of this city, that if a ſtranger was only to ride through it, or view it on ordinary days, he would be induced to think it a town without inhabitants; but, on the contrary, if he was to view this city either on a Sunday, or on any public occaſion, he would wonder where the people could dwell, the multitude is ſo great: but the caſe is this, the inhabitants being all buſy at the manufactures, are in their combing-ſhops, as they call them, at their twiſting-mills, in their garrets at their looms, and the like; almoſt all the works they are employed in being done within doors.

Yarmouth, a ſea-port town, a hundred and twenty-two miles to the north-eaſt of London, is ſeated on the river Yare, where it falls into the ſea, and is a place of great ſtrength, both by art and nature, it being almoſt ſurrounded with water, and defended by a very ſtrong fort. It is an ancient town much older than Norwich, and is well built and very populous. It has the fineſt quay in England, if not in Europe, and is ſaid to equal at leaſt that of Marſeilles; for the ſhips ride here ſo cloſe, that for half a mile together they go acroſs the ſtream with their bowſprits over the land, their bows or heads touching the very wharf; ſo that one may walk from ſhip to ſhip as on a floating bridge all along by the ſhore ſide. The quay, which reaches from the draw-bridge almoſt to the ſouth gate, is ſo ſpacious and wide, that in ſome places it is near a hundred yards from the houſes to the wharf. In this pleaſant and agreeable range of buildings are ſome very magnificent ſtructures, and among the reſt the cuſtom-houſe, the town-hall, and ſome merchants houſes which reſemble little palaces rather than the dwelling-houſes of private men.

The greateſt defect of this town ſeems to be, that tho' it is very rich and increaſing in wealth and trade, and conſequently in people, there is not room to enlarge it by new buildings. It conſiſts of about fifteen hundred houſes, and though there are ſeveral pretty wide ſtreets, they are chiefly very narrow, and juſt wide enough for their little carriages to paſs through. It is eſteemed the key of this coaſt; but though the harbour is a very fine one, it is very dangerous for ſtrangers in windy weather. Yarmouth is governed by a mayor, eighteen aldermen, and thirty-ſix common-council. This town, though ſo conſiderable, has only one large church, which is dedicated to St. Nicholas, and a neat chapel, with a conſiderable number of meeting-houſes. The ſteeple of St. Nicholas's church is ſo high, that it ſerves for a land-mark to thoſe at ſea; and it is remarkable, that which way ſoever this ſteeple be viewed it appears crooked.

Yarmouth is noted for its red herrings, which are jocoſely called Yarmouth capons, and alſo for its coaches, which are nothing more than ſledges drawn with one horſe. During the fiſhing ſeaſon the land is covered with people, and the river with barks and boats, buſy day and night in landing and carrying off the herrings, which are caught here in almoſt incredible quantities. Our author ſays, he happened to be there during their fiſhing fair, as they call it, when he counted in one tide a hundred and ten barks and fiſhing veſſels coming up the river, all loaden with herrings taken the night before. After the herrings are cured, they export them to Genoa, Leghorn, Naples, Meſſina, Venice, Spain, and Portugal; and at the ſame time carry to thoſe places great quantities of woollen goods. They have alſo a conſiderable trade in woollen manufactures to Holland, Norway, and the Baltic, from whence they import timber and naval ſtores; and have a very great ſhare in the coal-trade between Newcaſtle and the port of London.

Lynn-Regis, or King's-Lynn, was firſt called Lynn-Epiſcopi, as being the property of the biſhop of Norwich, till the diſſolution of monaſteries by king Henry VIII. when that prince becoming its poſſeſſor, conferred on it the title of Lynn-Regis. It is a handſome, large, and well built town, ninety-eight miles north-eaſt of London, in the fifty-ſecond degree fifty-five minutes north latitude, and in thirty-two minutes eaſt longitude. It is ſeated at the mouth of the Ouſe, which, by means of the ſeveral ſtreams it receives before it falls into the ſea, forms a navigation, by which the merchants of Lynn entirely ſupply Cambridgeſhire, Huntingdonſhire, the north part of Buckinghamſhire, Bedfordſhire, and Northamptonſhire, with the inland parts of Norfolk and Suffolk; more particularly with coals and wine: and they carry on a conſiderable foreign trade, eſpecially to Holland, Norway, the Baltic, Spain, and Portugal. The harbour is ſafe when ſhips have once entered it; but there are flats and ſhoals at the entrance, at which buoys are placed; and there are always good pilots ready for ſteering ſtrangers in.

The town contains about two thouſand four hundred houſes; and is ſtrong by ſea, as it was alſo formerly by land, where there are the ruins of the works in part demoliſhed in the civil wars, yet not ſo much but they may be eaſily repaired; theſe conſiſt of nine regular baſtions, and a ditch nearly in the form of a ſemi-circle, which make the place about half a mile in breadth; and St. Anne's fort and platform at the north-eaſt end commands all ſhips that enter the harbour.

It has a ſpacious and fine market-place, in which is a handſome ſtatue of king James II. with a fine croſs, which has a dome, and a gallery round it, ſupported by ſixteen columns; and the market-houſe is a modern free-ſtone building ſeventy feet high, neatly adorned with ſtatues and other embelliſhments. Four rivulets, over which are fifteen bridges, run through the town; and the tide in the Ouſe, which for a mile here is about as broad as the Thames at London bridge, riſes twenty feet perpendicular. The town is ſupplied with freſh water by conduits and pipes from the neighbourhood.

The king's ſtaith-yard is a very handſome ſquare, adorned with a ſtatue of king James II. here the greateſt part of the wines imported are landed. The town-houſe, called Trinity-hall, is an ancient and noble building. The exchange in the middle of the town is an elegant ſtructure of free-ſtone, adorned with two orders of columns, and within it is the cuſtom-houſe.

It has two churches, a very large chapel, and two diſſenting meeting-houſes. St. Margaret's church, which is very large, formerly belonged to an abbey, and has a high lantern, covered with lead: at the weſt end is a ſtone tower, with a moon-dial, ſhewing the increaſe and decreaſe

decreaſe of that planet; and above the tower is a ſpire, in which is a ring of bells. St. Nicholas's chapel is very ancient, and has a tower and octangular ſpire.

In this chapel is a library, to which lord Townſend, the late earl of Orford, Sir Charles Turner, &c. were conſiderable benefactors.

The town is governed by a mayor, a recorder, a high ſteward, twelve aldermen, and eighteen common-council; and there is here a very laudable cuſtom, which is is, that every firſt Monday of the month, the mayor, aldermen, preachers, &c. meet to hear and determine all diſputes in an amicable manner, in order to prevent law-ſuits. There are here alſo a free-ſchool, which is a ſtrong and beautiful building, two hoſpitals, and a charity-ſchool.

SECT. XXXVIII.

Of Nottinghamſhire; its Situation, Extent, Diviſions, Repreſentatives, Air, Soil, Produce, Rivers, and principal towns.

NOTTINGHAMSHIRE takes its name from Nottingham, the county town, called by the Saxons Snottengaham, or a houſe of Dens, ſo called from the ſpacious vaults dug in the rocks, in which the ancient Britons perhaps reſided. This county is remarkable for its being bounded on the four cardinal points of the compaſs, by four ſingle counties, a circumſtance which is not found in the ſituation of any other county in England: on the north it borders upon Yorkſhire, on the eaſt on Lincolnſhire, on the ſouth on Leiceſterſhire, and on the weſt on Derbyſhire. It extends forty-ſeven miles in length, and twenty-ſeven in breadth.

This county, which lies in the dioceſe of York, is divided into ſix wapentakes, and contains nine market-towns, one hundred and ſixty-eight pariſhes, ninety-four vicarages, four hundred and fifty villages, about ſeventeen thouſand four hundred and ſixty houſes, and ninety-five thouſand inhabitants. It ſends eight members to parliament, namely, two for the county, and two for each of the following boroughs, Nottingham, Eaſt-Retford, and Newark upon Trent.

The air of this county is eſteemed exceeding healthful, but the ſoil is various: the eaſtern ſide is very fruitful, and yields great plenty of corn and graſs; but the weſtern parts are leſs fertile, being generally very woody, and in ſome places barren, and only yielding coal. The chief commodities are pit-coal, a kind of ſtone ſomewhat like alabaſter, but not ſo hard, which when burnt, makes a plaiſter harder than that of Paris, with which the inhabitants generally plaiſter the floors of their upper rooms, inſtead of boarding them. Their other commodities are malt, wool, liquorice, wood, fiſh, and fowl. Their manufactures chiefly conſiſt of frame-work knitting, glaſs, and earthen-ware.

The principal rivers of this county are, the Trent and the Idle. The Trent is one of the capital rivers in England, it running a courſe of near two hundred miles before it reaches the Humber. Its ſpring-head is in the highlands of Staffordſhire, as hath been already obſerved, in treating of that county, and from thence it runs through Derbyſhire, Nottinghamſhire, and Lincolnſhire. The name is derived by ſome from the thirty ſmaller rivers it receives, and by others from thirty different kinds of fiſh found in it. It enters this county at the ſouth-weſt point, where it is joined by the Erwaſh, and runs to the eaſtward till it reaches Newark, where it forms an iſland, and turning to the northward, runs into Lincolnſhire. The Idle riſes in Sherwood foreſt, and running through the northern parts of the county to the edge of Yorkſhire and Lincolnſhire, there joins the Trent. The principal towns in this county are the following:

Nottingham, which is delightfully ſeated on a rock, one hundred and twenty-two miles north weſt of London, at the foot of which runs the river Leane, which, at a mile's diſtance, falls into the Trent, over which there is a handſome ſtone bridge, and another over the Leane. The town is large and well built; moſt of the houſes in the market-place and principal ſtreets, have their front ſupported by lofty ſtone colums, of the Tuſcan order, which not only make a very handſome appearance, but afford ſhelter in bad weather. The ſtreets are well paved, and from their ſituation on a rock, are always clean. The market-place, which is large and ſpacious, has a beautiful croſs, in which a kind of dome, is ſupported by very lofty ſtone columns, under which is kept the corn-market. In a ſtreet at ſome diſtance from this market, are ſeveral ſtone ſteps diminiſhing as they riſe, and on the top ſtands a very noble column crowned with a ball. This is called the Hen-croſs, and here is a market for all ſorts of poultry.

It is proper to obſerve, once for all, that, though what are called market-croſſes, take their name from crucifixes being antiently erected in thoſe places, no modern ſtructure of this kind, ever bears any mark of popiſh ſuperſtition.

The rock on which the town ſtands, is pretty ſoft, and renders the town remarkable for its cellars, two or three being ſometimes under each other, with the ſteps hewn out of the rock, in ſome places to the number of ſixty or ſeventy in depth. Theſe conveniencies, together with the goodneſs of the malt, enable the inhabitants to drink the beſt malt liquors, and to make a conſiderable advantage in ſending them to moſt parts of England; for which purpoſe moſt of the low lands of this county are ſowed with barley. As the meadows, which lie between the town and the Trent, are liable to be overflowed, a good boarded cauſeway for foot-paſſengers, extends about a mile long.

The town has three churches; that of St. Mary's is a large and noble gothic ſtructure, with a ſquare tower; and that of St. Peter's is a very handſome building, with a modern painting of the Laſt Supper, on the altar-piece. It has a lofty ſpire, and each has a good ring of bells and chimes. St. Nicholas's church is however a mean building. There are alſo four meeting-houſes.

Heavy goods are brought hither from London by ſea up the river Trent, and many coal-pits within three or four miles of the town, afford plenty of fuel at a ſmall expence. It is governed by a mayor, a recorder, ſix aldermen, two ſheriffs, two chamberlains, two coroners, and eighteen common-council.

At the ſouth-weſt end of the town is a ſteep hill, which has on the ſouth a high precipice fronting the meadows. On this hill ſtood a caſtle of ſuch antiquity, that the time of its firſt erection cannot be traced. It was rebuilt by William Peverel, baſtard ſon to the Conqueror, and afterwards improved by Edward IV. and Richard III. This ſtructure was granted to the earl of Rutland, and afterwards came into the poſſeſſion of William Cavendiſh, marquis of Newcaſtle, who, in 1674, cleared away the old building, and a moſt magnificent ſtructure was at length erected, which ſeems to have been modelled after ſome of the draughts of Inigo Jones. The preſent duke of Newcaſtle, in 1760, made a preſent of this noble edifice to the earl of Lincoln, his grace's nephew. It is built entirely of ſtone, and has a delightful proſpect over the meadows, which extend two or three hundred feet below it, about twelve miles in length, like a level bowling-green, interſperſed with villages, and the river Trent winding through it; on the eaſt-end, over the town and the diſtant country; and on the north, over the park, which is beautifully variegated with hills and valleys.

In this park are the remains of a church or pagan temple, hewn out of the rock, the roof vaulted and ſupported by a kind of maſſy pillars, in a very rude taſte: the floor, the roof, the pillars, and ſides, being all of a piece. In the ſame ledge of perpendicular rocks, are the remains of ſeveral houſes, chambers, dove-houſes, &c. which might poſſibly be the reſidence of ſome of the ancient Druids.

Newark, is a very handſome well built town, ſeated on the Trent, ſeventeen miles to the eaſt of Nottingham, and one hundred and four from London. The market-place is a noble ſquare, and the church is large and ſpacious, with a handſome lofty ſpire. The town is under the government of a mayor, and twelve aldermen. Here was once a handſome caſtle, which is now

in ruins. The Trent here divides itſelf, and forms an iſland, to which there is a bridge leading from the town.

Mansfield, a large well built market-town, ſeated in the foreſt of Sherwood, thirteen miles to the north of Nottingham, and one hundred and thirty-ſix to the north-weſt of London, and carries on a conſiderable trade in malt.

Retford, is divided into Eaſt and Weſt Retford, by the river Idle, which runs through it. This town enjoys many conſiderable privileges, and is governed by a ſteward, who is generally a perſon of quality. In Weſt Retford is a very fine hoſpital, founded in 1666, by Dr. Dorrel, and ſince incorporated: it has a maſter, ten brethren, a ſteward, and a nurſe, who have a garden and orchard divided into ten ſhares.

SECT. XXXIX.

Of Derbyſhire; its Situation, Extent, Diviſions, and Repreſentatives in Parliament; its Air, Soil, and Rivers; with a Deſcription of the Wonders of the Peak, and the principal Towns of the County.

DERBYSHIRE is bounded on the north by Yorkſhire, on the eaſt by Nottinghamſhire, on the ſouth by Leiceſterſhire and Warwickſhire, and on the weſt by Staffordſhire and Cheſhire. It extends near forty miles in length, in the northern parts it is about thirty miles broad, but in the ſouthern not above ſix; and it is computed to be near one hundred and thirty miles in circumference.

This county is divided into five hundreds, in which are contained eleven market-towns, fifty-three vicarages, one hundred and ſix pariſhes, near five hundred villages, twenty-one thouſand one hundred and fifty houſes, and one hundred twenty-ſix thouſand nine hundred inhabitants. It is ſeated in the dioceſe of Litchfield and Coventry, and ſends four members to parliament, two for the county, and two for the town of Derby.

The air, eſpecially on the eaſt-ſide, is wholeſome and agreeable; but in the mountains of the Peak it is ſharp and cold. The north and weſt parts are hilly and ſtony; but the ſouthern and eaſtern have rich lands, that are pleaſant and fertile, producing moſt kinds of grain, particularly barley. Even the north-weſt part, called the Peak, is not deſtitute of riches, for the bleak mountains, produce great quantities of the beſt lead, marble, alabaſter, mill-ſtones, iron, coal, a coarſe ſort of cryſtal, and in the intermediate valleys is great plenty of graſs.

The principal rivers are the Derwent, the Dove, the Erwaſh, and the Trent. The two firſt riſe in the Peak; the Derwent running from north-weſt to ſouth-eaſt, through the middle of the county, and at length becoming a conſiderable river, diſcharges itſelf into the Trent, about eight miles below Derby. The Dove parts this county from Staffordſhire, and falls into the Trent, about five miles to the north of Burton upon Trent. The Trent, of which we have given a particular account in treating of Nottinghamſhire, only viſits a ſmall ſpace of the ſouthern parts of this county.

It will now be proper to take notice of what are called the Seven Wonders of the Peak, one of the moſt extraordinary of which is Poole's-hole, a ſtupendous cavern, at the foot of a great mountain. The entrance is ſo low and narrow, that you muſt ſtoop to get in; but it ſoon opens into a wide and lofty concavity, that has ſome reſemblance to a gothic cathedral, which reaches above a quarter of a mile in length. Water drops every where from the roof and ſides, and being of a petrifying quality, it cruſts all the ſtones with long cryſtals, in various forms, which, by the help of a ſtrong imagination, are ſhewn you as lions, lantherns, organs, a flitch of bacon, &c. At length you come to the queen of Scots pillar, which is the boundary of moſt people's curioſity, and was ſo named by that unhappy princeſs, when ſhe viſited this place. It is compoſed of a clear bright ſtone, like alabaſter, or rather like that kind of ſpar which is found about lead. A ſtream of water runs along the middle of this cavern among the fallen rocks, with an hideous noiſe. On the left hand is a ſort of chamber, where they ſay Poole, a famous robber, lived, and whoſe kitchen and bedchamber they ſhew you, after you have crept ten yards on your hands and knees. What appears moſt extraordinary is, the ſurpriſing height of the arch, which Dr. Leigh compares to fret-work, organ, and choir-work, beſpangled with ſtars, which dazzle the eyes, and looks extremely beautiful from the reflection of the lights.

Another of theſe wonders is Mam-Tor, which ſignifies the Mother-Rock. From the top of a prodigious precipice, the ſoft earth being continually crumbling and falling down, raiſes a mountain below, which viſibly increaſing without an apparent diminution of the top, the ignorant people imagine, that, though the earth is continually falling, the mountain loſes nothing of its bulk.

Another wonder is called by the groſs name of the Devil's Arſe. Here, or on the ſteep ſide of a mountain, is a large opening, almoſt in the form of an old Gothic arch, above thirty feet perpendicular, and above twice that breadth at the bottom. Several ſmall cottages are built on each ſide the entrance, whoſe inhabitants in a great meaſure ſubſiſt by guiding ſtrangers into the cavern. Its width, however, ſoon diminiſhes; for, after croſſing one ſtream of water, the roof gradually deſcends till it is ſo low, that a man cannot ſtand upright under it; but, ſtooping for a little way, and paſſing over another ſtream, you find it more lofty. Then proceeding on, you come to a third rivulet, where the rock deſcends almoſt to the ſurface of the water, and prevents all farther ſearch. The vault in ſeveral places makes a noble appearance, and being chequered with various coloured ſtones, its beauty is admired by every ſpectator.

Another wonder, is called Tides-Well, or Weeden-Well, a ſpring, which according to ſome writers, ebbs and flows regularly like the ſea. That it does ebb and flow is certain; but it is at very unequal periods, ſometimes not in a day or two, and ſometimes twice in an hour. The baſon of the ſpring is about a yard deep, and the ſame in length and breadth. When it flows the water riſes with a bubling noiſe, as if the air, which was pent up within the cavities of the rock, was forcing itſelf a paſſage, it driving the water before it.

The next wonder, as it is called, is Buxton-Wells, which, beſides their medicinal uſe, have this ſingularity, that within five feet of one of the hot ſprings, there ariſes a cold one; but this is not very extraordinary, ſince hot and cold ſprings riſe near each other, in ſeveral places in England, and in other countries. The water of Buxton-Wells is ſulphurous, with a ſmall quantity of ſaline particles; but is not in the leaſt impregnated with vitriol. Hence they are very palatable, in compariſon with other medicinal waters. Theſe wells are often recommended by phyſicians, both for drinking and bathing, eſpecially for ſcorbutic, rheumatic, or nervous complaints.

The late duke of Devonſhire built a large and convenient houſe for the reception of ſtrangers. The bath-room is arched over, and the whole made handſome, convenient, and delightful. The bath will receive twenty perſons at a time to walk and ſwim in, and the water is of a warmth equal to that of new-milk. Theſe waters were well known in the time of the Romans. Beſides the principal ſprings, which are at the village of Buxton, there are many others that riſe unregarded in the neighbouring incloſures, and on the ſides of the hill, ſo that their number can ſcarce be known.

We ſhall now proceed to the next wonder. In the midſt of a plain open field is a frightful chaſm in the earth, or rather rock, called Elden-hole, the mouth of which is about twenty feet over one way, and fifty or ſixty another, deſcending down perpendicularly to a depth that is ſaid never yet to have been diſcovered, tho' ſeveral attempts have been made to find its bottom. Mr. Cotton ſays he let down eight hundred fathoms of line, which is ſixteen hundred yards, or near a mile perpendicular.

The laſt wonder is that of Chatſworth-houſe and gardens, belonging to the duke of Devonſhire. On the top of a mountain, where mill-ſtones are dug, is a vaſt extended moor, which for fifteen or ſixteen miles together

has neither hedge, houſe, nor tree; but appears like a waſte and barren wilderneſs, over which when ſtrangers travel, it is impoſſible to find their way without a guide. If contraries illuſtrate each other, here they are ſeen in the ſtrongeſt oppoſition, for nothing can be more ſurpriſing to a traveller who comes from the north, when, after a tedious progreſs through a diſmal deſart, on a ſudden the guide brings him to a precipice where he looks down from a comfortleſs and barren waſte into the moſt delightful valley, and beholds a noble palace and one of the fineſt gardens that can be imagined. Before the weſt front of the houſe, which is very fine, runs the river Derwent, which, though not many miles from its ſource, ſometimes appears like a large and rapid river, when after a ſudden rain the torrents ruſh down from the mountains. Over this river is a ſtately ſtone bridge, with an ancient tower upon it, and in an iſland in the river is a tower, in the form of a caſtle. The front to the garden is a regular piece of architecture. The ſaſhes of the ſecond ſtory are ſeventeen feet high, of poliſhed looking-glaſs, each ſquare two feet wide, and the wood-work double gilt. The windows, doors, and rooms are adorned with beautiful marble, and the inſide with paintings. The chapel is extremely beautiful, the altar-end and the floor are of marble, the ſeats and gallery of cedar, and the reſt of the wall and cieling finely painted. The gardens abound with green-houſes, ſummer-houſes, walks, wilderneſſes, and orangeries, intermixed with ſtatues, urns, canals, baſons, and a great variety of water-works; among which are many curious fountains, an artificial willow-tree, which drops water from every leaf, and a wonderful caſcade, where from a neat houſe of ſtone, like a temple, a whole river deſcends the ſlope of a hill a quarter of a mile in length, over ſteps, with a roaring noiſe, till it is at laſt loſt under ground.

The principal towns in Derbyſhire are the following:

Derby is ſituated on the weſt banks of the Derwent, over which it has a handſome ſtone bridge, a hundred and twenty-two miles to the north-weſt of London. It is a pleaſant, agreeable, and well built town, inhabited by a great number of gentlemen. The river is navigable up to the bridge, and juſt above it, is a beautiful artificial iſland raiſed out of the water and formed into a garden. This iſland ſtands before the celebrated engine-houſe for making organzine, or thrown ſilk; by which invention one hand will twiſt as much ſilk as could be done by fifty, and that in a truer and much better manner. This engine contains twenty-ſix thouſand five hundred and eighty-ſix wheels, and ninety-ſeven thouſand ſeven hundred and forty-ſix movements, which work ſeventy three thouſand ſeven hundred and twenty-ſix yards of ſilk thread every time the water-wheel goes round, which is three times in one minute, and three hundred and eighteen millions five hundred and four thouſand nine hundred and ſixty yards in one day and night. One water-wheel gives motion to all the reſt of the wheels and movements, of which any one may be ſtopt ſeparately. One fire-engine likewiſe conveys warm air to every part of the machine, and the whole work is governed by one regulator. The town is very populous, and contains five pariſhes and ſeveral meering-houſes.

Derby has a large market-place, a beautiful town-houſe of free ſtone, and very handſome ſtreets. The principal church is that of All Saints, which has a beautiful Gothic tower a hundred and ſeventy-eight feet high, and for the elegance of its ornaments, is not to be equalled by any in this or the adjacent counties. According to an inſcription in this church the ſteeple was erected about queen Mary's reign, at the expence of the bachelors and maidens of the town, on which account whenever a maiden, a native of the town, was married, the bells uſed formerly to be rung by bachelors. The government of this town is under a mayor, an high-ſteward, nine aldermen, a recorder, fourteen brothers, fourteen capital burgeſſes, and a town-clerk. The principal trade of the town conſiſts in malt and ale.

Wirkſworth is ſeated in a valley near the ſpring-head of the river Eccleſborn, and is a pretty large populous place, a hundred and eighteen miles from London, and has a handſome church, a free-ſchool, and an alms-houſe. The town is remarkable for having the greateſt lead market in England, and for having what is called a barmoot-court, to judge controverſies among the miners, and to adjuſt ſubterranean quarrels and diſputes.

Cheſterfield is a handſome populous town, ſituated on a hill between two ſmall rivers, a hundred and twenty-ſeven miles to the northward of London. It has a handſome large church, which has a ſpire of timber covered with lead, but warped all a wry; and alſo ſeveral meeting-houſes. It is governed by a mayor. Its market is conſiderable for corn, lead, and country commodities. The houſes are for the moſt part built of rough ſtone, and covered with ſlate. The inhabitants carry on a conſiderable trade to and with all the neighbouring counties in lead, grocery, the malting of barley, tanning, ſtockings, blankets, bedding, &c. Cheſterfield has a large free-ſchool, reckoned the moſt conſiderable of any in the north of England, and likewiſe ſeveral alms-houſes. This town gives title of earl to the noble family of Stanhope.

SECT. XL.

Of Yorkſhire; its Situation, Extent, Diviſions, Repreſentatives in Parliament, Air, Soil, and Rivers; with a Deſcription of the principal Towns.

YORKSHIRE, which in extent is equal to ſome ſovereignties, and is bigger than any two of the largeſt counties in England, is bounded on the north by Weſtmoreland and the biſhopric of Durham; on the eaſt by the German ocean; on the ſouth by Lancaſhire, Nottinghamſhire, and Derbyſhire; and on the weſt by a ſmall part of Cheſhire, Lancaſhire, and Weſtmoreland. It extends ninety miles in length from eaſt to weſt, ſeventy-five in breadth from north to ſouth, and above three hundred and ſixty in circumference. This county is divided into three ridings, called the North, Eaſt, and Weſt; beſides which there is a fourth diviſion, called Richmondſhire; and is ſub-divided into twenty-three wapentakes, which contain fifty-ſeven market-towns, two hundred and forty-two vicarages, five hundred and ſixty-three pariſhes, two thouſand three hundred and thirty villages, about a hundred and ſix thouſand one hundred and fifty houſes, and ſix hundred and thirty-ſix thouſand nine hundred inhabitants. It lies in the dioceſe of York, except Richmondſhire, in the North Riding, which belongs to the dioceſe of Cheſter, and ſends thirty members to parliament, namely, two for the county, and two for each of the following boroughs, York, Kingſton upon Hull, Knareſborough, Scarborough, Rippon, Richmond, Heydon, Boroughbridge, Malton, Thirſk, Aldborough, Beverley, Northallerton, and Pontefract.

The air and ſoil of this extenſive country vary extremely; the Eaſt Riding, on account of its neighbourhood to the German ocean, is leſs healthy than the other Ridings; but this inconvenience decreaſes in proportion as the country recedes from the ſea. However, where the air is moſt indifferent, the ſoil is moſt fruitful; for on the hilly parts of this Riding, eſpecially in what is called the York Woulds, the ſoil is generally barren, dry, and ſandy. Great numbers of lean ſheep are therefore ſold from hence, and ſent into other counties to be fattened for the market.

The Weſt Riding enjoys a ſharp but healthy air, and the ſoil on the weſtern ſide is hilly, ſtony, and not very fruitful; but the intermediate valleys afford plenty of good meadow ground, and alſo paſture for the largeſt cattle. On the ſide next the river Ouſe, the ſoil is rich, producing wheat and barley; and in its worſt parts the beſt oats. Its commodities, beſides what have been mentioned, are iron, pit-coal, jet, allum, horſes, and goats.

The North Riding in general exceeds the other two in the ſalubrity and coldneſs of the air. The worſt parts breed lean cattle; but on the ſides of the hills, in the valleys, and plains, it produces good corn, and rich paſtures for large cattle; nor is it wanting in ſubterraneous

riches, as marble, pit-coal, copperas, alum, and between the clefts of the rocks on the ſea-coaſt is found the beſt ſort of jet.

The principal rivers are the Ouſe, and thoſe which fall into it, as the Dun, or Don, the Calder, the Aire, the Wharfe, and the Swale, which joining their ſtreams form the Humber, which falls into the German ocean, between Yorkſhire and Lincolnſhire. The Ouſe riſes in the weſt-north-weſt ſide of the county, and chiefly running to the ſouth-eaſt, at length falls into the Humber. The Dun riſes in the hills near the ſouth-weſt end of Yorkſhire, and running to the ſouthward till it has reached Sheffield, turns to the north-eaſt, and having received the Aire, falls into the Ouſe. The Calder, has its ſource in the edge of Lancaſhire, and entering the ſouth-weſt ſide of this county, runs eaſtward, and joins the river Aire. The Aire has its ſpring at the foot of a high hill, called Pennigent, and running ſlow, chiefly to the eaſtward, diſcharges itſelf into the Dun. The Wharfe, or Wherfe, riſes among the hills in the weſt of Yorkſhire, and runs with a ſwift and impetuous current, moſtly to the ſouth-eaſt, till it falls into the Ouſe. The Swale riſes among the north-weſt hills of Yorkſhire, and running chiefly from the north-weſt to the ſouth-eaſt, joins the Ure, about four miles below Boroughbridge. Beſides theſe, the Tees riſes in the biſhopric of Durham, and becoming the boundary between theſe two counties, runs eaſtward till it falls into the German ocean. The Darwent, which divides the north and eaſt ridings, riſes in the north-eaſt of Yorkſhire, near the ſea coaſt, and firſt runs to the ſouth, but ſoon winding to the ſouth-weſt, falls into the Ouſe. The Hull has its ſource in the Woulds, from whence it runs moſtly to the ſouthward, paſſing near Beverley, and falls into the Humber. Into theſe principal rivers a great number of rivulets diſcharge themſelves, and they afford great plenty of fiſh, particularly ſalmon, trout, and craw-fiſh.

We ſhall now deſcribe the principal places in this extenſive county.

York, is ſeated on the river Ouſe, one hundred and ninety-eight miles to the north of London, and is generally eſteemed the ſecond city in England, though Briſtol now claims that honour, on account of its extenſive trade. It is very ancient, and has undergone various revolutions; but is ſtill adorned with many fine buildings, both public and private; it being very populous, and inhabited by gentlemen and wealthy tradeſmen. It is ſurrounded with a good wall, through which are four gates and five poſterns, and has a caſtle, built by William the Conqueror, which was formerly a place of great ſtrength, but is now a priſon, in which debtors and felons are confined, in a manner more agreeable to the dictates of religion and humanity, than perhaps in any other priſon in the kingdom.

The bridge over the Ouſe conſiſts of five arches, of which that in the center is fifty-one feet in height, and eighty-one in diameter.

There are now in this city but ſeventeen churches in uſe, with ſome meeting-houſes; though, in the reign of king Henry V. there were forty-one pariſhes, beſides ſeventeen chapels, and nine abbeys. The cathedral, or minſter, is a noble Gothic ſtructure, in which the rules of proportion are better obſerved than is uſually found in other churches of that kind of architecture. The weſt-end meaſures a hundred and twenty-four feet in breadth: it is adorned with two regular towers, which diminiſh by degrees, and have a good effect. Between them is the principal entrance, over which is a magnificent window that cannot be equalled, except by that in the eaſt front, which can never be ſufficiently admired. The great arch, under which is the entrance into the church, is ſaid to be the largeſt of the kind in Europe. The moſt remarkable deficiency in the building is in the lantern-ſteeple, which terminates very indifferently: it is however finely ornamented, and has eight ſtately windows, meaſuring forty feet from top to bottom. The nave of the church exceeds that of St. Paul's at London, ſeveral feet both in height and breadth, but is not quite ſo high as that of Weſtminſter-abbey, though it exceeds it by upwards of ſixteen feet in breadth. The ſtone ſcreens at each end of the choir are beautifully wrought: the firſt ſeparates the choir from the middle of the church, the other terminates it behind the altar, which by a gradual aſcent of ſixteen ſteps is raiſed to a graceful height above the level of the body of the church. From the middle of the church is ſeen the noble window at the eaſt-end, which is upwards of thirty feet in breadth, and ſeventy-five in height. The maſonry of the upper part is beautifully executed, below which, in one hundred and ſeventeen partitions, is expreſſed the hiſtory of the Bible, on painted glaſs. The ſouth end of the cathedral is beautified with a circular window, called from the colour of the ſtained glaſs, the Marygold-window. The north end is taken up with five lights, which reaching almoſt from the top to the bottom, may be conſidered as one ſtately window, repreſenting a rich embroidery of moſaic needle work. The chapter-houſe is an octagon Gothic building, ſixty-three feet in diameter, with windows of painted glaſs on each ſide; the roof, which is ſixty-eight feet high, is ſupported without any pillar, and over the building is a timber ſpire, covered with lead.

With reſpect to the modern buildings of this city, the aſſembly-houſe is a noble ſtructure, deſigned by the earl of Burlington, conſiſting of a ſtately Egyptian-hall, one hundred and twenty-three feet in length, and about forty in breadth and height, and alſo a common ball-room, ſixty-ſix feet long, with about two thirds of that dimenſion in height and breadth; with other ſmaller rooms for cards and tea. The corporation have lately built a manſion-houſe for the lord-mayor, for ſo he is ſtiled here as well as in London: The corporation alſo conſiſts of twelve aldermen, a recorder, two ſheriffs, twenty-four prime common-council-men, eight chamberlains, ſeventy-two other common-council, &c. The city is a county of itſelf, whoſe juriſdiction extends over thirty-ſix villages and hamlets. This city gives title of duke to his majeſty's eldeſt brother, Edward Auguſtus.

Hull, or Kingſton upon Hull, ſtands on the weſt-ſide of the river Hull, where it diſcharges itſelf into the Humber, one hundred and ſeventy miles north of London. It is very populous; but as its ſituation will not admit of any additional buildings, the ſtreets are very cloſe, and much crouded. One of the ſtreets reſembles Thames-ſtreet in London, where pitch, tar, cordage, and ſails are to be ſold, and where ſhips come to load and unload their merchandize. The town is very well fortified, and is one of the principal places in England for trade; for here centers the cloth trade from Leeds, Wakefield, and Halliſax; the lead from Derbyſhire, butter from moſt parts of Yorkſhire, cheeſe from Cheſhire, Warwickſhire, and Staffordſhire, and corn from many counties. In return for theſe, are imported all kinds of goods, not only from other parts of England, but from foreign countries, where the merchants of Hull have great credit. The town contains two pariſh churches, and ſeveral meeting-houſes of the diſſenters. Among the other public buildings are the Trinity-houſe, for the relief of ſeamen, their wives or widows; an exchange for tranſacting of buſineſs among the merchants, and a town-hall. The bridge over the river Hull is of ſtone, it conſiſts of fourteen arches, and makes a noble appearance. The town, with ſome contiguous lands, forms a county of itſelf, governed by a mayor, ſheriff, twelve aldermen, &c. They have a ſword of ſtate, a cap of maintenance, as marks of their power on land, and an oar of lignum vitæ, to denote their juriſdiction of admiralty, which they enjoy upon the river Humber.

Leeds is ſeated in the Weſt-Riding of Yorkſhire, one hundred and eighty-two miles from London, and ſtands on the banks of the river Aire, over which it has a handſome ſtone bridge, which was formerly capacious enough for holding on it the cloth-market; but the trade being much increaſed, the cloth is now ſold in the High-ſtreet, beginning at the Bridge-foot. The method in which this branch of trade is tranſacted, is ſo extraordinary, as to deſerve particular notice. Early on Tueſdays and Saturdays, a great number of treſſels are ranged, and covered with boards in the ſtreet, at ſix in

ſummer,

ſummer, and ſeven in winter: The market-bell gives the ſignal to the clothiers in the ſeveral inns, to bring out their cloth, which is done with ſuch expedition, and ſo little diſturbance, that ſtrangers are amazed, to ſee in a few minutes all the counters covered with pieces of cloth, and the owner ſtanding behind within the treſſels. When the bell ceaſes ringing, the chapmen enter the market, and ſuit their patterns; the price is aſked and bid in a very low voice, and a very few words determine a bargain. Thus, twenty thouſand pounds worth of cloth is often ſold in about an hour's time. At half an hour after eight the bell rings again, upon which the buyers, ſellers, cloth and treſſels all diſappear, and by nine the market is left clear to the linen-drapers, hardware-men, ſhoemakers, &c. Here is alſo a great demand for white cloths, which are ſold in a magnificent hall. The Guild-hall is alſo a noble building, adorned with a fine ſtatue of queen Anne. Here are three churches, only one of which is parochial; this is St. Peter's, which has the ceiling finely painted in freſco, by Parmantier: the ſubject is, giving the law to Moſes. The town is governed by a mayor, twelve aldermen, and twenty-four aſſiſtants. The great trade of Leeds occaſioned the river Aire to be made navigable, by which means a communication is opened by water with Wakefield, York, and Hull, to which places, beſides its woollen manufactures and other goods exported to Holland, Hamburg, &c. Leeds has the advantage of furniſhing York with coals. This town gives title of duke to the noble family of Oſborne.

Hallifax, a very conſiderable town in the Weſt-Riding of Yorkſhire, one hundred and ninety-nine miles from London. This is an inſtance of the immenſe advantage of our woollen manufactures, it being formerly an inconſiderable village, and has ſtill but one pariſh; but it is near twelve miles in diameter, and has more pariſhioners than any other pariſh in England; for it contains twelve chapels of eaſe, a number of meeting-houſes, and upwards of twelve thouſand inhabitants. The houſes are built of ſtone, and formed into good ſtreets. When a perſon leaves the town, the reſt of the pariſh reſembles a continued village, every houſe having its tenter-ground, with a piece of cloth, ſhaloon, or kerſey, upon it. The women card, ſpin, and wind: the men weave, and work at dreſſing or dying the cloth, and throughout the whole pariſh, there appears ſuch chearful induſtry, and the good effects of it are ſo viſible, that it affords a very ſenſible pleaſure to all who have any benevolence for mankind in general, or concern for their country in particular. It has been computed, that in the articles of ſhaloons alone, not leſs than one hundred thouſand pieces are annually made in this one pariſh only. This town gives title of earl to the family of Montague Dunk.

Scarborough, a town in the North-Riding of Yorkſhire, two hundred and four miles to the north of London. Its ſituation is perfectly romantic, it being built on the top of a ſteep rock, bending in the form of a creſcent to the main ocean, of which you have almoſt an unbounded proſpect from all parts. The ſummit of this mountain contains no leſs than eighteen or twenty acres of meadow ground, and on the upper part ſtood a caſtle. The town which is populous, is almoſt encompaſſed by the ſea, and walled where it does not join to the caſtle, or is not more ſtrongly defended by the ſea; and it has one of the beſt harbours in the kingdom. This town is juſtly celebrated for its ſpaw waters, on which account it is much reſorted to by the nobility and gentry, who have occaſioned many new buildings to be erected. There are now good accommodations for great numbers, even of the higheſt quality, and there are here aſſemblies and public balls, in rooms built for that purpoſe. The ſpring was under the cliff, part of which fell down in December 1737, and the water was loſt; but in clearing away the ruins to rebuild the wharff, it was, to the great joy of the town, recovered. The inhabitants catch prodigious quantities of fiſh of all ſorts, and have ſome foreign trade. This town gives the title of earl to the noble family of Saunderſon.

SECT. XLI.

Of the Biſhopric of Durham; its Name, the Manner in which it became a County Palatine, its Situation, Extent, Diviſions, Repreſentatives, Air, Soil, Rivers, and principal Towns.

THE biſhopric of Durham received its name from its chief town, called by the Saxons Deorham, or Dunholm, to expreſs its ſituation on a hill ſurrounded by a river. On the converſion of the kingdom of the Northumbrians, of which this was a part, this county was beſtowed on St. Cuthbert, biſhop of Lindisfarn, and his ſucceſſors for ever. This grant was ratified both by the Danes and Normans, with the addition of ſeveral privileges, particularly that of being a county palatine, enjoying the ſame prerogatives within, as the king did without its bounds, with reſpect to forfeitures, &c. Thus it was a kind of royalty ſubordinate to the crown.

It is bounded on the north by the river Tyne, which parts it from Northumberland; on the eaſt by the German ocean; on the ſouth by the Tees, which divides it from Yorkſhire; and on the weſt by Weſtmoreland and Cumberland. It extends thirty-five miles in length, and thirty-four in breadth. It is in the dioceſe of its own name, and contains nine market-towns, fifty-nine vicarages, one hundred and thirteen pariſhes, near two hundred and thirty villages, about fifteen thouſand nine hundred and eighty houſes, and ninety-ſix thouſand nine hundred inhabitants; but ſends only four members to parliament, namely, two for the county, and two for the city of Durham.

The air of this county is wholeſome, and though very ſharp in the weſtern parts, is milder towards the ſea, whoſe warm vapours mitigate the ſeverity of the winter ſeaſons. The ſoil is very different, the weſtern ſide being mountainous and barren, while the eaſtern and ſouthern parts nearly reſemble the ſouth of England, and conſiſt of beautiful meadows, rich paſtures, woods, and corn-fields. The inhabitants have their induſtry rewarded by the immenſe quantities of coals, lead, and iron, found in the bowels of the earth.

The principal rivers are the Weare, which riſes in the weſtern part, and after ſeveral turnings falls into the ſea at Sunderland. The Tees, which riſes within three miles of the head of the Weare, and forms the boundary between this county and Yorkſhire. The Tyne, of which we ſhall give a deſcription in treating of Northumberland.

The principal places in this county are the following:

Durham is pleaſantly and commodiouſly ſituated on an eaſy aſcent, and almoſt ſurrounded by the river Weare, over which are two large ſtone bridges, two hundred and ſixty-two miles from London. It is encompaſſed by a wall, and has a caſtle, ſeated on the higheſt part of the hill, now uſed for the biſhop's palace. It contains ſix pariſh-churches, beſides the cathedral, and is governed by a mayor, twelve aldermen, twelve common-councilmen, a recorder, a town-clerk, &c. Its pleaſant and healthful ſituation makes it much frequented by the neighbouring gentry, who, with the prebendaries of the cathedral, make the city look extremely chearful, and money circulate better than could otherwiſe be expected where there is little or no trade. The cathedral ſomewhat reſembles Weſtminſter abbey, and adjoining to it are the houſes of the dean and prebendaries. The biſhop, as count palatine, appoints all officers of juſtice; and, before his prerogatives were abridged by Henry VIII. had a court of chancery and common-pleas; iſſued out writs in his own name, and coined money. He is ſtill ſheriff paramount, and his deputy is not obliged, like other ſheriffs, to account with the exchequer, but only with the biſhop. The earldom of Sedberg is ſtill annexed to the biſhopric, which is eſteemed one of the beſt in England; and as the country about Rome is called St. Peter's patrimony, ſo that about Durham is called St. Cuthbert's.

Sunderland, a ſea-port town, two hundred and ſixty-four miles from London, ſtands in a peninſula almoſt ſurrounded by the ſea. It is a well built, thriving, and

populous

populous town, inhabited by many rich merchants and tradeſmen. Its port is capable of containing many hundred ſail of ſhips at one time, and from thence are loaded and ſent great numbers of ſhips with coals, ſalt, glaſs, and other merchandize, as well to different places in this kingdom, as to foreign parts. It has a very fine church, with a dome at the eaſt end, under which is the altar, placed beneath a canopy of inlaid work, ſupported in front by two fluted columns of the Corinthian order. There is here a bathing-houſe, and a taſte for politeneſs and elegance has been introduced into the town.

Darlington is a pretty large town, two hundred and forty-three miles from London. It is ſeated in a flat, on the river Skern, which falls into the Tees, and is remarkable for its dirty ſituation, and its beautiful church, which has a high ſpire, riſing up in the midſt of it. It has a good ſtone bridge of conſiderable length, over little or no water. However, it is a place of good reſort, the market is large and convenient, and is particularly celebrated for its huckabacks, which are made no where elſe in England, and of which, as well as other linen cloth, it ſends up large quantities to London. The water of the Skern is eſteemed ſo good for bleaching, that linen has been ſent hither from Scotland to bleach.

At Oxenhall near this town are three deep pits called Hell Ketties, full of water, and which have occaſioned many fabulous ſtories among the country people, who imagine they have no bottom. The moſt probable opinion is, that they are old coal-pits, rendered uſeleſs by the water riſing in them.

SECT. XLII.

Of Northumberland; its Name, Situation, Extent, Diviſions, Repreſentatives in Parliament, Air, Soil, Produce, Rivers, and principal Towns.

THIS county received its name from its being ſituated to the north of the Humber. In the Saxon heptarchy it was a part of the kingdom of the Northumbrians, which contained not only the county now called Northumberland, but alſo Yorkſhire, Lancaſhire, Durham, Cumberland, and Weſtmoreland. It is ſeated in the extremity of England next to Scotland, and is bounded on the eaſt by the German ocean; on the ſouth by the biſhopric of Durham and Cumberland; on the weſt by Cumberland; and on the north-weſt by Scotland, from which it is ſeparated by the river Tweed. It extends ſeventy-four miles in length from north to ſouth, and forty-five in breadth from eaſt to weſt.

Northumberland contains twelve market-towns, nine vicarages, four hundred and ſixty pariſhes, about twenty-two thouſand ſeven hundred and forty houſes, and a hundred and twenty-ſix thouſand four hundred inhabitants. It is in the dioceſe of Durham, and ſends eight members to parliament; namely, two for the county, and two for each of the following boroughs, Newcaſtle upon Tyne, Morpeth, and Berwick upon Tweed.

The air of this county is not ſo cold as might be imagined from the latitude in which it lies; for its ſituation between two ſeas in the narroweſt part of England gives it the advantage of having the cold moderated by the vapours of each, and for this reaſon the ſnow ſeldom lies long in Northumberland, except on the tops of high hills. The air is extremely healthful, and the people, who generally live to a great age, are ſeldom afflicted with ſickneſs. The ſoil is various, the eaſtern part, which is fruitful, having very good wheat and moſt ſorts of corn, and has rich meadows on the banks of the rivers; but the weſtern part is generally barren, it being moſtly heathy and mountainous. The ſouth-eaſt part abounds with pit coal, of which ſix hundred thouſand chaldrons are computed to be annually ſhipped from thence for London. There are alſo large quantities of lead and timber. This county gives title of earl to the noble and ancient family of Piercy.

The rivers cauſe the country to be well watered, and afford great plenty of ſalmon and trout. The principal of theſe are the Tyne, the Tweed, and the Cocket; the former has two arms riſing at a great diſtance from each other, but are united a little above Hexham. South Tyne riſes in the north-eaſt edge of Cumberland, but ſoon entering Northumberland runs northward, and at length bends towards the eaſt. North Tyne has its ſource in the weſtern part of Northumberland, called Tyne-Dale, then running to the ſouth-eaſt it joins South Tyne near Hexham, from whence it runs eaſtward by Newcaſtle into the German ocean. The Tweed is the boundary between this county and Scotland, in which it riſes, and having entered Northumberland, purſues its courſe to the north-eaſt, till it reaches the German ocean at Berwick.

We ſhall now deſcribe the principal places in this county.

Newcaſtle upon Tyne, the largeſt town of Northumberland, ſtands two hundred and ſeventy-ſix miles from London: it is a large and populous town ſituated between the Picts wall and the Tyne, which is here a fine and deep river, ſo that ſhips of a middling burthen may ſafely come up to the town, though the large colliers are ſtationed at Shields; and it is ſo ſecure an haven, that veſſels, when they have paſſed Tynemouth-bar, are in no danger either from ſtorms or ſhallows. It is defended by Clifford's fort, which effectually commands all veſſels that enter the river. The town may be conſidered as divided into two parts, of which Gateſhead, on Durham ſide, is one, and both are joined by a bridge of ſeven arches, on which is a ſtreet of houſes. The ſituation of the town is very uneven; it riſes on the north bank of the river, where the ſtreets upon the aſcent are exceeding ſteep. Moſt of the houſes are built with ſtone; but ſome of them are of timber, and the reſt of brick. Through this town went part of that wall which extended from ſea to ſea, and was built by the Romans to defend the Britons, after they had drawn off all their choſen youth to fill their armies, againſt the incurſions of the Picts. The liberty of the town and the power of the corporation extend no farther than the gate upon the bridge, which ſome years ago put a ſtop to a terrible fire, which would otherwiſe, perhaps have burnt the whole ſtreet of houſes on that ſide of the bridge, as it did thoſe beyond it. On the eaſt ſide of this gate are carved the arms of the biſhop of Durham, and on the weſt ſide thoſe of the town of Newcaſtle. The town is defended by an exceeding ſtrong wall, in which are ſeven gates, and as many turrets, with ſeveral cazemates bomb-proof. The caſtle, which is old and ruinous, over-looks the whole town.

The greateſt inconveniencies of Newcaſtle are its ſituation on the declivity of two hills, and the buildings being very cloſe and old, which render it improper for thoſe who ſeek a reſidence of pleaſure; but then, as the river which runs between the two hills renders it a place of great trade, theſe inconveniencies are abundantly recompenſed.

There is here a very noble exchange, and the wall of the town, running from it parallel with the river, leaves a ſpacious piece of ground before it, between the water and the wall, which being well wharfed and faced with free-ſtone, forms the longeſt and largeſt quay for landing goods, that is to be ſeen in England, except that at Yarmouth in Norfolk. Here are four pariſh churches, beſides one at Gateshead, and likewiſe ſeveral meeting-houſes. St. Nicholas's church ſtands on the top of a high hill, and has a lofty ſteeple of curious architecture. There is a great deſcent from it, and a ſtream of water in time of drought runs down from a noble conduit, that ſtands far up in the town, and is of great uſe to the inhabitants near it. Among the other public buildings is a manſion houſe for the mayor, who dwells in it during his mayoralty, with his officers and attendants, at the town's expence, who allow him, in order to keep up his ſtate, ſix hundred pounds for the year. Here is alſo a hall for the ſurgeons to meet in, and a large hoſpital, built by the contribution of the keel-men, for the maintenance of the poor of their fraternity, and ſeveral charitable foundations. The town is almoſt ſurrounded with coal-pits, which furniſh ſuch immenſe quantities of coals, that ſeveral thouſand ſhips are annually loaded with

with them, and they have ſome manufactures, owing to the plenty of this valuable kind of fuel, particularly the making of hard ware, and ſalt, which laſt is indeed performed at Shields, ſeven miles below the town; but the coals are brought chiefly from thence, and the quantity conſumed in theſe ſalt works is ſo great, that a prodigious cloud of ſmoke riſes over the hills, and is ſo thick, that it is ſaid it may be ſeen at ſixteen miles diſtance. Ships are alſo built here to perfection, as to ſtrength and firmneſs; and there are here a conſiderable number of merchants, who trade to Holland, Hamburg, Norway, and the Baltic. This town gives title of duke to the noble family of Holles.

Berwick, is pleaſantly ſituated on the ſouth ſide of an eaſy declivity, on the Scots coaſt of the river Tweed, about half a mile diſtant from its conflux with the ſea, and three hundred and thirty-nine miles from London. It is regularly fortified with baſtions, flanks, and a ditch, on the north and eaſt; and on the ſouth and weſt with high walls well built, and planted with cannon, to which the river ſerves as a moat. The houſes make a good appearance, and the town-houſe is a handſome ſtructure, with a lofty turret, in which is a ring of eight bells. Here is a very ſtately bridge of ſixteen arches over the Tweed. The church, built by the protector Cromwell, is a neat building; but has neither ſpire nor bells. The barracks form a regular ſquare, and will conveniently contain two regiments of foot. The town is governed by a mayor, a recorder, a town-clerk, and four bailiffs.

Corn and eggs are ſhipped from this place for London and other ports; but the principal trade conſiſts of the ſalmon which is taken in the Tweed, and eſteemed the beſt in the kingdom, great quantities of which, being pickled, are put up in veſſels called kits, and ſhipped off for London, where they are called Newcaſtle ſalmon. During the months of June and July the beſt ſalmon may be bought at Berwick for one penny per pound. Conſiderable quantities of the ſmaller fiſh are ſent alive to London in veſſels called ſmacks, built for that purpoſe, they having a well in the middle, bored full of holes for the free paſſage of the ſea water, and in which the fiſh live without injury.

This town is particularly mentioned in all laws, proclamations, &c. that comprehend both England and Scotland, as if it was in neither of theſe countries.

Alnwick is a populous and well built town, ſeated on the north ſide of a hill near the river Aln, over which is a ſtone bridge, at the diſtance of three hundred and ten miles from London. It has a large town-houſe, where the quarter-ſeſſions and county courts are held, and the members of parliament elected. It has three gates which are almoſt entire, and ſhew that it was formerly ſurrounded by a wall, and is defended by an old ſtately Gothic caſtle, the ſeat of the earls of Northumberland.

About ſeven miles to the ſouth-eaſt of Alnwick ſtands Warkworth, a pleaſant village which gives title to the eldeſt ſon of the earl of Northumberland; and near it is a remarkable cave, called the Hermitage, cut out of the ſolid rock. The roof is arched, and the ſides adorned with pillars in the Gothic taſte. It is divided into two apartments of the ſame dimenſions, one of which ſeems to have been a lodging-room, and the other a chapel. At the eaſt end of the chapel is an altar, with a croſs cut in the rock above it; and in the window the figure of a woman in a recumbent poſture at full length. At one end of this figure is another, which ſeems to be weeping over it, and at the other a bull's head.

The higheſt mountain in this county, or perhaps in all England, is that of Cheviot, made famous by the old ballad of Chevy Chace. The top, to thoſe who are below, ſeems to terminate in a point; but has a level plain about a mile and a half in circumference, with a large pool of water in the midſt of it. From hence, in clear weather, is an extenſive proſpect of near fifty miles on every ſide.

SECT. XLIII.

Of Cumberland; its Name, Situation, Extent, Diviſions, Repreſentatives, Air, Soil, Produce, Rivers, and principal Places.

ACCORDING to ſome authors, this county was originally called Cumbria, which name was at length changed to Cumberland. It is bounded on the north by Scotland; on the eaſt by Northumberland, part of the biſhopric of Durham, and Weſtmoreland; on the ſouth by Lancaſhire; and on the weſt by the Iriſh ſea. It extends ſeventy-five miles in length, and twenty-ſeven in breadth. Cumberland is divided into five wards, and contains one city, fourteen market-towns, ninety pariſhes, thirty-ſeven vicarages, near four hundred and forty-ſeven villages, about fourteen thouſand eight hundred and twenty houſes, and eighty-eight thouſand nine hundred inhabitants. It lies partly in the dioceſe of Cheſter, and partly in that of Carliſle, and ſends ſix members to parliament, two for the county, two for Carliſle, and two for Cockermouth.

The air is cold and piercing, yet leſs than might be expected from its being ſituated ſo far to the north. The mountains feed large flocks of ſheep, whoſe fleſh is particularly ſweet and good, and the valleys produce corn, &c. This country is generally admired for the pleaſant proſpects it affords; but theſe would be more beautiful could trees be brought to thrive here better than they generally do. The principal commodities produced by this county are coal, lead, copper, lapis calaminaris, black-lead, a mineral almoſt peculiar to this county, which contains more than is ſufficient to ſupply all Europe; wild-fowl, ſalmon, pearls, &c. The laſt are found in muſcles at the mouth of a brook, called the Irt, which diſcharges itſelf into the ſea a little to the north of Ravenglaſs.

This county abounds with rivers and lakes, called by the inhabitants meers; of the former the Eden takes its riſe from Ulles Water, and after a courſe of about thirty miles to the northward turns to the weſt, and falls into Solway frith. This river is remarkable for a ſmall delicious fiſh called char. The Derwent runs through the middle of the county, and diſcharges itſelf into the Iriſh ſea. This river abounds with ſalmon.

The chief towns in this county are the following:

Carliſle, a city of great antiquity, is ſeated at the confluence of ſeveral ſmall rivers, which almoſt encompaſs it: the river Peterill running on the eaſt, Cauda on the weſt, and Eden on the north, which ſoon after falls into the ſea. It ſtands three hundred and one miles from London, and is ſurrounded with walls, and defended by a caſtle, which ſtands on the weſt ſide. The houſes are well built, and the cathedral is a venerable Gothic pile; beſides which there is another church called St. Cuthbert's. The city has three gates, called Scots-gate, Iriſh-gate, and Engliſh-gate; and the walls are ſo thick, that three men may walk a-breaſt on them, within the parapet. Over the Eden is a bridge that leads towards Scotland, which is not above ſix miles off. The city is very ſmall, but has a good trade in fuſtians. It has ſuffered the fate of moſt frontier towns, and has been taken, retaken, burnt, and deſtroyed ſeveral times by the Scots, Danes, and Norwegians; and lay once in ruins for near two hundred years, till it was rebuilt by William Rufus. In 1745 this city was taken by the rebels, and ſoon after retaken by his late royal highneſs William duke of Cumberland. It is under the government of a mayor, twelve aldermen, &c. and here begins the remains of the famous wall which the emperor Severus built inſtead of Hadrian's dyke, or rampart, and which croſſed the north end of this county and extended through the ſouthern part of Northumberland, ending at the German ocean, near the mouth of the river Tyne, in order to prevent the Picts invading England. This city gives title of earl to the noble family of Howard.

Whitehaven is ſeated on a creek of the ſea, on the north end of a great hill, where is a quarry of a hard

white ſtone, which gives name to the place; and which, with the help of a great ſtone wall, ſecures the harbour into which ſmall barks may enter. It ſtands forty miles to the ſouth-weſt of Carliſle, and two hundred and eighty-nine north-weſt of London; and, by the encouragement of the Lowther family, has riſen from being a ſmall place to be a very conſiderable one, it being about one-third bigger than the city of Carliſle, and contains three times the number of inhabitantss, who are all well lodged, and embarked in profitable employments; ſo that there is here a continual ſcene of induſtry, and buſineſs is carried on with great diſpatch, without hurry or confuſion. They have a plentiful and commodious market, and the adjacent country is well cultivated and ſtrewed with neat and pleaſant houſes. There is here a cuſtom-houſe, and the port is well ſecured by numerous and coſtly works. The coal-trade is ſo increaſed of late, that it is the moſt eminent port in England for it, next to Newcaſtle, for the city of Dublin, and all the towns of Ireland on that coaſt, with ſome parts of Scotland and the Iſle of Man, are principally ſupplied from hence; and the late Sir James Lowther was ſaid to have ſent from hence to Ireland annually as many coals as brought him in near twenty thouſand pounds per annum.

The coal in the mines near this place has ſeveral times been ſet on fire by the ſulminating damps, and has continued burning for many months till large ſtreams of water were conducted into the mines, and ſuffered to fill thoſe parts where the coal was on fire. But more mines have been ruined by inundations from ſprings burſting into them.

In order to deſcribe theſe wonders of nature and art, the reader may ſuppoſe, ſays our author, that he has entered the mines at an opening at the bottom of a hill, and has already paſſed through a long adit hewn in the rock, and arched over with brick, which is the principal road into them for men and horſes; and which, by a ſteep deſcent, leads down to the loweſt vein of coal. Being arrived at the coal he ſtill deſcends by ways leſs ſteep till, after a journey of a mile and a half, he arrives at the profoundeſt part of the mine. The greateſt part of this deſcent is through ſpacious galleries, which continually interſect other galleries, all the coal being cut away, except large pillars, which in deep parts of the mine are three yards high, and about twelve yards ſquare at the baſe; ſuch great ſtrength being required to ſupport the ponderous roof. Thoſe who deſcend into theſe mines find them moſt cloſe and ſultry in the middle parts that are moſt remote from the pits and adits, and perceive them to grow cooler the nearer they approach to thoſe pits and adits that are ſunk to the deepeſt parts of the mines; down which pits large ſtreams of freſh air are made to deſcend, and up which the water is drawn by means of fire-engines. Theſe mines are ſunk to the depth of a hundred and thirty fathoms, and are extended under the ſea to places where there is above them ſufficient depths of water for ſhips of large burthen. Theſe are the deepeſt coal-mines that have been hitherto wrought, and perhaps the miners have not in any other part of the globe penetrated to ſo great a depth below the ſurface of the ſea; the very mines in Hungary, Peru, &c. being ſituated in mountainous countries, where the ſurface of the earth is elevated to a great height above the level of the ocean.

Penrith, or Perith, is a pretty large well built place, ſeated under a hill called Perith Fell, two hundred and eighty-two miles from London; it has a very good market for all ſorts of commodities and cattle; the market-houſe is convenient and ſpacious, and the church is a large and very handſome ſtructure. The town is built of red ſtone, whence it received its name Penrith, which in Britiſh ſignifies a red hill.

This having been a frontier county, the ancient ſeats of the nobility and gentry are, for the moſt part, built in the form of caſtles. We ſhall here deſcribe Corby-caſtle, which did lately, if it does not ſtill, belong to Mr. Howard, a deſcendant of the family of the dukes of Norfolk, and which we chuſe, as it will give us an opportunity of deſcribing the natural beauties of this county, as they are here improved by art.

Corby-caſtle is ſeated four or five miles to the ſouth-eaſt of Carliſle, and is a neat but plain ſtone building. The entrance to the houſe is by a large ſquare court, on the right hand of which are the gardens, and on the left offices for the ſervants and ſtabling for horſes. It is plentifully watered by ſprings in ſeveral large reſervoirs made about the houſe, which ſtands near the precipice of a rock, which on the back part is about a hundred feet high. In this rock is cut a regular pair of ſtairs about ſix feet wide, with all their ornaments down to the bottom. As you deſcend theſe ſtairs, you paſs by ſeveral rooms hewn out of the rock, of about ſixteen feet ſquare, which have no other furniture than tables and ſeats made out of the ſtone. At the bottom of theſe ſtairs you aſcend another pair about ten feet high, which leads to a terrace made in the form of a ſemi-circle, by the ſide of which runs the river Eden. The terrace preſents a fine view of another part of the rock of equal height with the former; from the top of which falls a moſt beautiful cataract. It is at leaſt a hundred feet high, and the water is broken by the pointed ridges of the rock into ſo many forms, and flies about in ſo delightfully rude a manner, as affords a ſurpriſing inſtance of the power of art in embelliſhing nature. From this terrace you have a view of half a mile long of the river on the right hand, and a hanging grove of trees, juſt as nature has placed them, on the left; and at the end of the walk is a ſmall banquetting-room, with a portico in the front, facing the walk. On the other ſide of the river, oppoſite the houſe, are the remains of an old caſtle, under which is an hermit's cave.

SECT. XLIV.

Of Weſtmoreland; its Name, Situation, Extent, Diviſions, Repreſentatives, Air, Soil, Produce, Rivers, and principal Towns.

THIS county probably received its name from its weſtern ſituation, and the meers or lakes it contains. It is bounded on the north and north-weſt by Cumberland, on the north-eaſt and eaſt by the biſhopric of Durham and Yorkſhire, on the ſouth-eaſt by Yorkſhire, and on the ſouth and ſouth-weſt by Lancaſhire. Its extent from north to ſouth is about forty miles, and its breadth from eaſt to weſt twenty-one. It is generally divided into the baronies of Kendal and Weſtmoreland: the former is very mountainous, but the latter is a large champaign country. Theſe are the only principal diviſions of this county, which contains eight market-towns, twenty-ſix pariſhes, two hundred and twenty villages, above ſix thouſand five hundred houſes, and thirty-nine thouſand inhabitants. It lies partly in the dioceſe of Cheſter, and partly in that of Carliſle. The earl of Thanet is hereditary ſheriff of the county, which ſends only four members to parliament, namely, two for the county, and two for the borough of Appleby. Weſtmoreland gives the title of earl to the noble family of Fane.

The air is clear, ſharp, and ſalubrious, the natives being ſeldom troubled with diſeaſes; but generally live to a good old age. The ſoil is various, that on the mountains is very barren, while that in the valleys is fertile, producing good corn and graſs, eſpecially in the meadows near the rivers. In the hilly parts on the weſtern borders it is generally believed there are vaſt quantities of copper ore, and veins of gold; ſome mines of copper are worked, but moſt of the ore lies ſo deep, that it will not anſwer the expence.

The principal rivers are the Eden, the Lone, and the Kan. The Eden, which riſes in the eaſtern borders, runs moſtly northward, and having received eight ſmall rivers, enters Cumberland. The Lone riſes within a few miles of the Eden, and after running a little way to the eaſtward, turns toward the ſouth, and enters Lancaſhire. The Kan, or Can, flows from a lake called Kan, or Kent-meer, and running moſtly ſouthward, after it has paſſed Kendal, which takes its name from this river, falls into the Iriſh ſea at the ſouth-weſt point of the county.

county. These rivers run in rocky channels, and are generally swift limpid streams, well stored with excellent trouts.

Among the mountains in the south part of the county, on the borders of Cumberland lies, Winander-meer, said to be the greatest lake in England, and to be so called by the Saxons from its winding banks. It is about ten miles in length, and paved as it were at bottom with one continued rock. In some parts it is of a vast depth, and is well stored with chare-fish, which is rarely found, except among the Alps. The Ulles-water is a lake also well stocked with fish, and has likewise some chares; but not in such plenty as the former. Both Cumberland and this county lay claim to this lake.

The chief towns in this county are the following:

Appleby is seated on the river Eden, by which it is almost surrounded, two hundred and eighty miles from London. It is a very ancient place but is much decayed, and chiefly consists of only one broad street of mean houses. This is esteemed the county town, and here the assizes are held in the town-hall. At the upper end of the Broad-street is a castle, which was formerly the goal for malefactors, and is surrounded with the river and with a ditch. At the lower end of the town are the church and a school. It is governed by a mayor, a recorder, twelve aldermen, a common council, and serjeants at mace.

Kendal is seated in a valley among hills, on the west side of the river Kan or Kent, two hundred and fifty-six miles from London, and is a rich and populous town which has two bridges of stone, and another of wood, over the river, and at a small distance are the ruins of a castle. The church is a handsome structure, supported by five rows of handsome pillars, and has two chapels of ease. A free school stands on the side of the church-yard and is well endowed, having exhibitions to Queen's college in Oxford. The town consists of several streets neatly paved, one of which is very long, and has a bridge in the middle. The market is plentifully supplied with all kinds of provisions, and with woollen yarn, and the town is famous for its manufacture of cottons, druggets, hats, and stockings.

Lonsdale, or Kirby Lonsdale, is a large well built town, seated on the river Lone, two hundred and thirty-one miles to the north-north-west of London, and has a handsome stone bridge with a stately church, and a fine church-yard, from which and from the banks of the river is a fine prospect of the mountains at a great distance, and of the beautiful course of the river Lone, in a valley far beneath. This town has a good trade in cloth.

SECT. XLV.

Of Lancashire; its Situation, Extent, Divisions, Representatives in Parliament, and Rivers. A concise Account of the curious Canals forming by the Duke of Bridgewater, for extending the Navigation within Land through this and the neighbouring Counties. Of the principal Towns of Lancashire, a remarkable Cave, and other Objects of Curiosity.

THIS county receives its name from Lancaster its county town. It is bounded on the north by Westmoreland and Cumberland; on the east by Yorkshire, on the south by Cheshire; and on the west by the Irish sea. It extends seventy miles in length, and thirty-five in breadth; it is divided into five hundreds, and contains twelve vicarages, twenty-seven market towns, sixty-one parishes, eight hundred and ninety-four villages, about forty-three thousand houses, and two hundred and sixty thousand inhabitants. It lies in the diocese of Chester, and sends fourteen members to parliament, namely, two for the county, and two for each of the following boroughs, Lancaster, Liverpool, Preston, Wigan, Clithero, and Newton.

The air here is in general very healthful, the inhabitants often living to a great age. The soil may be considered under three different classes; the hilly parts are stony and barren; the level grounds bear crops of wheat and barley, and there are here also moss ground, which affords little else but turf and fir-trees, that are frequently found lying under the surface. The chief commodities of this county are great plenty of all sorts of provisions; pit coal, of which they have a species called cannel-coal, which far exceeds all other, not only in making a clear fire, but by in its being capable of being manufactured into candlesticks, cups, standishes, snuff-boxes, &c. and of being polished so as to represent a beautiful black marble. The manufactures of this county are woollen and cotton cloths of various kinds, tickings, and cotton velvets, for which Manchester is particularly famous.

The principal rivers are the Mersey, which parts Cheshire and this county, and the Ribble which rises in Yorkshire, and enters this county at Clitheto, running south-west by Preston into the Irish sea. Besides these there are many lesser streams.

The navigation made by his grace the duke of Bridgewater in this county, is highly worthy of notice. This was begun so lately as about six years ago, and bears vessels of sixty tons burthen, and is carried over two rivers the Muxy and the Irwell. The sough, or adit, which was necessary to be made, in order to drain the water from the coal mines, is rendered navigable for boats of six or seven tons burden, and forms a kind of subterraneous lake, which runs about a mile and a half under ground, and communicates with the canal. This lake which leads to the head of the mines, is arched over with brick, and is just wide enough for the passage of the boats: at the mouth of it are two folding doors, which are closed so soon as you enter, and you then proceed by candle-light, which casts a livid gloom, serving only to make darkness visible.

But this dismal gloom is rendered still more awful by the solemn echo of this subterraneous lake, which returns various and discordant sounds. One while you are struck with the grating noise of engines, which by a curious contrivance let down the coals into the boats: Then again you hear the shock of an explosion, occasioned by the blowing up the hard rock, which will not yield to any other force than that of gun-powder. The next minute your ears are saluted by the songs of merriment from either sex, who thus beguile their labours in the mine.

You have no sooner reached the head of the works, than a new scene opens to your view. There you behold men and women almost in the primitive state of nature, toiling in different capacities, by the glimmering of a dim taper: some digging coal out of the bowels of the earth; some again loading it in little waggons made for the purpose; others drawing those waggons to the boats.

When we behold, says the ingenious gentleman from whose letter we have borrowed this account, a part of our species deprived of sun-shine, the common inheritance of mankind, and buried in a dismal and confined cavern, our feelings prompt us to pity their condition; but when we observe the lively ray of chearfulness break forth in this scene of darkness and distress; when we behold the glow of health in the midst of damp and suffocation; we then cease to pity them, and begin to examine ourselves: we then discover that our enjoyments above ground serve only to multiply our wants; and are convinced of the truth of that maxim, which assures us, that happiness is every where, or no where.

This navigation has already been of great benefit to the town and neighbourhood of Manchester, by reducing the price of coals to one half less than was usually paid; the poor, in particular, reap vast benefit from it, as coals are retailed to them in such small quantities as one hundred weight, at the rate of three pence half-penny. It has likewise afforded great improvement to the lands through which it have been cut, by means of the subterraneous drains which has been made to convey the waters under the canal. When the navigation shall be extended to Liverpool, whither it is expected to be carried in about four or five years, the towns and neighbourhood of Liverpool and Manchester will have the bene-

fit

fit of boats paſſing every day between the two places, and of ſaving half the expence of the water-carriage they now pay.

The principal places in this county are the following.

Lancaſter, the county town, is ſeated near the mouth of the river Lone, two hundred and thirty-three miles from London, and is an ancient, neat, and handſome town; but its port is decayed, and incapable of receiving ſhips of any conſiderable burthen. The bridge has five arches and is ſtrong and handſome. The caſtle is now the county goal, in which the aſſizes are held, and upon its top at one corner, is a ſquare tower called John of Gaunt's chair, from whence you have a delightful proſpect of the adjacent country, and of the courſe of the river Lone; but more eſpecially towards the ſea, where you have an extenſive view over it to the Iſle of Man. There is a handſome ſquare of neat buildings near the caſtle; but the town has little trade, and is but thinly inhabited. It has only one church, and is governed by a mayor, &c.

About five miles from Lancaſter is a remarkable cave called Dunald Mill-hole. In the middle of a large common a brook, near as big as the New-River, after turning a corn-mill juſt at the entrance of the cave, runs into its mouth by ſeveral beautiful caſcades, continuing its courſe two miles under a large mountain, and at laſt makes its appearance again near Carnford, a village in the road to Kendal. The entrance of this ſubterraneous channel has ſomething pleaſingly terrible: from the mill at the top you deſcend about ten yards perpendicular by means of chinks in the rock, and clumps of trees: the paſſage is then almoſt parallel to the horizon leading to the right, a little winding, till you have ſome hundreds of yards thick of rocks and minerals above your head. "In this manner, ſays our author, we proceeded, ſome-"times through vaults, ſo capacious that we could "neither ſee the roof or ſides, and ſometimes on all-"four, ſtill following the brook, which entertained us "with a ſort of harmony well ſuiting the place; for the "different height of its falls were as ſo many keys of "muſic, which being all conveyed to us by an amazing "eccho, greatly added to the majeſtic horror which ſur-"rounded us. In our return we were more particular in "our obſervations. The falls from one rock to another "broke the rays of our candles, ſo as to form the moſt "romantic vibrations and appearances upon the varie-"gated roof. The ſides too are not leſs remarkable for "their fine colouring; the damps, the creeping vege-"tables, and the ſeams in the marble and limeſtone parts "of the rocks, form as many tints as are ſeen in the rain-"bow, and are covered with a perpetual varniſh from "the juſt weeping ſprings that trickle from the roof. "When we arrived at the mouth, and once more be-"held the chearing day-light, I could not but admire "the uncouth manner in which nature has thrown to-"gether the huge rocks which compoſe the arch over "the entrance; but, as if conſcious of its rudeneſs, "ſhe has clothed it with trees and ſhrubs of the moſt "various and beautiful verdure, which bend downwards, "and with their leaves cover all the rugged parts of the "rock."

Mancheſter, a very large and populous town, is ſeated between the rivers Irk and Irwell, upon a rocky hill, a hundred and ſixty-ſix miles to the north-north-weſt of London, and is a place of great antiquity. It carries on a very extenſive trade in cottons, tickings, velvets, and a number of other manufactures diſtinguiſhed by the name of Mancheſter goods; and has increaſed ſo much of late years, that though it is neither a city, borough, nor corporation, is ſuppoſed to contain upwards of fifty thouſand inhabitants. It has a collegiate church, which has a choir of excellent workmanſhip, and two modern churches, one finiſhed in 1723, and an act paſſed for building another in 1753. Theſe are very handſome ſtructures. This town alſo boaſts its college, hoſpital, free-ſchool, and library. The college was founded by Thomas, Weſt, lord Delawar, in 1421; It is incorporated by the name of the warden and fellows of Chriſt's church, in Mancheſter, and conſiſts of a warden, four fellows, two chaplains, four ſinging-men, and four choriſters. The hoſpital was founded for forty boys; but its revenue is ſo much improved, that it at preſent maintains ſixty. The library is well ſupplied with books, and has a revenue for buying others, and a competent maintenance for the librarian. The free-ſchool has been alſo much improved. Mancheſter has likewiſe many meeting-houſes of Diſſenters, and a handſome town-houſe; ſome new ſtreets have been lately built with great elegance. The chief magiſtrate is a conſtable, or headborough. This town gives title of duke to the ancient and noble family of Montagu.

Liverpool, or Leverpoole, is commodiouſly ſeated on the river Merſey, a hundred and eighty-five miles from London, in the fifty-third degree twenty-two minutes north latitude, and in the ſecond degree thirty minutes weſt Longitude, where it has an excellent harbour, ſhips being admitted into a noble wet dock, ſecured by large flood-gates. It is much increaſed and beautified within theſe few years, and, next to London and Briſtol, has the greateſt trade of any town in England; and will probably ſoon, if it has not already exceeded the latter. Here is a handſome town-houſe, ſupported by twelve ſtone pillars and arches, and under it is the exchange for merchants. The houſes are generally new and built with brick. It has alſo three or four churches, which are very noble ſtructures, and one of them has the fronts of the galleries, the pulpit and the altar entirely of mahogany. There are here alſo ſeveral meeting-houſes for Diſſenters, one of which is built in a circular form, and thoſe who meet there have printed forms of prayer different from thoſe of the church of England, a peculiarity that is in no other diſſenting meeting-houſe in this kingdom; but will probably be imitated by other congregations. The town is governed by a mayor and aldermen. It has a good free-ſchool, a very noble charity-ſchool, ſupported by the generous contributions of the inhabitants, for fifty boys and twelve girls, who are maintained with cloaths, meat, and lodging. Here are alſo ſeveral alms-houſes for the ſupport of ſailors widows and indigent perſons.

Warrington is a large market-town ſeated on the river Merſey, a hundred and eighty-two miles from London. It contains two churches, ſeveral meeting-houſes, and a Romiſh chapel; and is a large handſome place, whoſe market is well ſupplied with corn, cattle, and fiſh. In this town has been lately founded an academy upon a noble and extenſive plan, for the education of youth for the learned profeſſions. Here is a ſtone bridge over the river, which leads into Cheſhire. In this town and the neighbouring villages ſail-cloth is made for the royal navy. Here are alſo copper-works, ſugar-houſes, and glaſs-houſes, which furniſh the induſtrious with the means of obtaining a comfortable ſubſiſtence; and on the banks of the Merſey, which, by means of wears and locks, is made navigable to Mancheſter, are paper-mills, gunpowder-mills, oil-mills, iron forges, and ſlitting-mills.

Preſton, a large fine town ſeated on the river Ribble, two hundred and eleven miles from London. Though it has no manufacture, yet as it has a court of chancery, and other officers of juſtice for the county palatine of Lancaſter, it is full of gentlemen, attorneys, proctors, and notaries. It is a clean, neat, and gay place, to which the gentry many miles round reſort in winter, and have aſſemblies, balls, &c. hence it is vulgarly called Proud Preſton. It has a large market-place, and the ſtreets are open, wide, and well paved. On the neighbouring common are frequent horſe-races. Near it the duke of Hamilton, who came to reſcue Charles I. from impriſonment, was defeated in 1648; as were alſo the Engliſh rebels under general Foſter, on the twelfth of November, 1715.

Wiggan, a large well built town, ſeated on the river Douglas, a hundred and ninety-five miles from London, is inhabited by ſhop-keepers of almoſt all kinds, and has been noted for its manufacture of coverlets, rugs, and blankets.

Within a mile and a half of this town, ſays Dr. Gibſon, biſhop of London, is a well, which at firſt ſight does not appear to be a ſpring, but rather rain-water. There

There is nothing about it that ſeems extraordinary; but, upon emptying it, there preſently breaks out a ſulphureous vapour, which makes the water bubble up as if it boiled; a candle being put to it, it preſently takes fire, and burns like brandy; the flame in a calm ſeaſon will continue a whole day; by the heat of which you may boil eggs, meat, &c. though the water itſelf be cold: but by the bubbling the water does not increaſe; it being only kept in motion by the ſudden halitus of the vapours breaking out. The ſame water taken out of the well will not burn.

SECT. XLVI.

Of Cheſhire; its Situation, Extent, Diviſions, Repreſentatives, Air, Soil, Produce, Rivers, and principal Towns.

CHESHIRE is ſeparated on the north from Lancaſhire by the river Merſey, but juſt at the north-eaſt point it borders on Yorkſhire; on the eaſt it is bounded by Derbyſhire; on the ſouth-eaſt by Staffordſhire; on the ſouth by Shropſhire; on the weſt by Denbighſhire and Flintſhire, from which it is ſeparated by the Dee; and on the north-weſt it is waſhed by the Iriſh ſea, into which projects a peninſula about ſixteen miles in length, and ſeven in breadth, formed by the mouths of the Merſey and the Dee.

The whole county extends fifty miles in length and thirty-three in breadth, and is divided into ſeven hundreds, in which are contained thirteen market-towns, twenty vicarages, eighty-ſix pariſhes, ſix hundred and ſeventy villages, about twenty-four thouſand one hundred houſes, and a hundred and ſixty-four thouſand three hundred inhabitants. It lies in the dioceſe of Cheſter, and ſends only four members to parliament, namely, two for the county, and two for the city of Cheſter.

As this, as well as Lancaſhire, is a county palatine, it has a diſtinct government, which is adminiſtered by a chamberlain, a judge ſpecial, called chief-juſtice of Cheſhire, a puiſny judge, &c.

The air is temperately cold and very healthy; for the generality of the inhabitants live to a good old age. It is very rich in paſture and corn-land; but there are ſeveral heaths upon which horſes and ſheep feed. The country is generally level, and the extenſive paſtures with which it abounds feed a great number of cows, whoſe milk is peculiarly rich, and of which is made the excellent cheeſe well known by the name of Cheſhire; and ſuch quantities are made of it, that London alone is ſaid to take annually fourteen thouſand tons of it: vaſt quantities are alſo ſent to Briſtol, York, Scotland, Ireland, &c. However, a conſiderable quantity of what commonly goes by the name of Cheſhire cheeſe is made in Shropſhire, Staffordſhire, and Lancaſhire. This county alſo produces excellent ſalt, mill-ſtones little inferior to thoſe of France, fowl, fiſh, and metals.

The principal rivers of Cheſhire are the Merſey, which runs from the north-eaſt, and is the boundary between this county and Lancaſhire; the Wevel, which riſes in Shropſhire, and, after running about eighteen miles from ſouth to north, turns to the weſtward, and diſcharges itſelf into the mouth of the Merſey: the Dee, which riſes from two fountains in Wales, enters this county at Grafton, and running almoſt due north to Cheſter diſcharges itſelf by a very wide and extended mouth into the Iriſh ſea. It abounds with fine ſalmon and trout. The principal towns in Cheſhire are the following:

Cheſter is a very ancient city, a hundred and eighty-two miles north-weſt of London. It is of a quadrangular form, and the walls which ſurround it are two miles in circumference, affording a pleaſant walk, with very agreeable proſpects. The city is ſquare, and the ſtreets which croſs each other at right angles are bounded by four gates, which anſwer the four cardinal points, of which the eaſt gate in particular is very ſtately. It is remarkable that all the principal ſtreets have a kind of piazza over the ground-floor, in which are the tradeſmen's ſhops: theſe afford ſhelter from the rain, and at the end of every ſtreet is a flight of ſteps to aſcend to the piazza. Here is a ſtrong caſtle on the ſouth ſide of the city, in which is the county-hall, where all cauſes belonging to the county palatine are determined. The exchange is a neat building, ſupported by columns thirteen feet high, each of one ſtone, and over it is the city-hall. Here is a ſtrong ſtone bridge over the Dee, which extends into Wales, and by it is a handſome water-houſe. Cheſter has ten pariſh-churches, beſides the cathedral, which is a pile venerable for its antiquity; but is in no extraordinary condition. It is governed by a mayor, two ſheriffs, and twenty-four aldermen. It was formerly a harbour for ſhips; but ſuch vaſt quantities of ſand have been thrown up by the ſea, that the river would hardly float a ſmall bark up to the city. Great pains have, however, been taken to remedy this inconvenience, and the inhabitants have cut a canal of near ten miles in length at a very great expence, through which ſhips of conſiderable burthen may come to Cheſter. This city gives title of earl to his royal highneſs the prince of Wales.

Nantwich, or Namptwich, is ſeated on the banks of the river Wever, which runs through the middle of it, and is a large town, a hundred and ſixty-two miles from London. The pariſh church is a ſpacious and beautiful ſtructure, with a ſteeple in the middle of it. The town is well built, and the ſtreets make a handſome appearance. The inhabitants are rich, and carry on a good trade, particularly in ſalt and cheeſe; the latter exceeding all that is made in the county from the excellency of the ſoil. Here are ſalt ſprings which lie on the banks of a freſh water ſtream, of which they make great quantities of white ſalt. The water brought from the ſalt ſprings to the wich-houſes, as they are called, by troughs, are received into large caſks ſet in the ground; from hence it is put into the leads, and a fire made for keeping it warm, during which women with wooden rakes gather it as it ſettles to the bottom. After this it is put into ſalt-barrows, a kind of wicker-baſkets, in the ſhape of a ſugar-loaf reverſed, that the water may drop from it and leave the ſalt dry.

Middlewich, which ſtands between Nantwich and Northwich, likewiſe takes its name from its wich-houſes, and is alſo a large market-town, with a ſpacious church: it is ſeated on the river Croke, a hundred and fifty-ſix miles from London; has two excellent ſalt ſprings, and is chiefly noted for making ſalt.

Northwich is likewiſe famous for the ſame ſprings, and is ſeated a hundred and fifty-nine miles from London. About the end of the laſt century was diſcovered on the ſouth ſide of the town rock-ſalt, which they ſtill continue to dig up and ſend in great lumps to the maritime ports, where it is diſſolved and made into common ſalt. The ſalt mines here are very curious; they deſcend into them by a bucket a hundred and fifty feet below the ſurface of the earth, where the mine looks like a cathedral, ſupported by rows of pillars, and the roof that reſembles cryſtal all of the ſame rock, tranſparent and glittering from the numerous candles of the workmen labouring with their pick-axes, in digging it away. This rock-work extends ſeveral acres. The church of Northwich is a handſome building, with a fine roof and a ſemi-circular choir.

Macclesfield is a large handſome town, ſeated at the edge of a foreſt of the ſame name, near the river Bollin, a hundred and fifty-one miles from London: it has a good church, with a high ſpire, and a college adjoining to it, and alſo a good free-ſchool. It has manufactures of hat-bands, twiſt, and mohair-buttons; and ſome years ago ſeveral ſmall ſilk-mills have been erected here after the model of that of Derby. This town gives title of earl to the noble family of Parker.

We have now gone through our deſcription of England; but, before we proceed to Wales, ſhall give an account of the Iſle of Man, which lies oppoſite to the coaſt of Weſtmoreland and Lancaſhire.

SECT. XLVII.

The Isle of Man.

Its Situation, Extent, Climate, and Produce. The Manners, Language, and Government of the Inhabitants; their Religion and Trade; with a concise Description of the little Islands situated on its Coast.

THE Isle of Man, which Cæsar calls Mona, is situated between England and Ireland, at almost an equal distance from each, and lies between the fifty-third degree fifty-three minutes and the fifty-fourth degree twenty-five minutes north latitude, and in the fourth degree thirty minutes west longitude. It is about thirty miles in length from north to south; in the widest part not above fifteen broad nor less than eight in the narrowest. It is entirely surrounded with rocks, and consequently has a very dangerous coast.

The soil is very different; the limestone ground to the south is as good as any in England; but the mountains are cold and less fruitful. These mountains extend in a ridge almost the whole length of the island, and supply the inhabitants quite round with exceeding good water and excellent peat for fuel. Snafield, the highest of these mountains, rises at least five hundred and eighty yards above the level of the sea, and from thence is a fine prospect of England, Ireland, Scotland, and Wales.

The air is cold and sharp in winter; but where they have shelter it is as mild as in Lancashire, the frosts being short, and the snow never lying long on the ground, especially near the sea. They have no coal-pits; but good quarries of black marble, and other stones for building. They have likewise mines of lead, copper, and iron. The orchards and gardens produce as good fruit, roots, and vegetables, as any in the neighbouring countries.

The horned cattle are generally less than those of England, and the gentlemen have good draught and saddle horses; but there is a very small sort bred in the mountains three feet some inches high, which are very handsome, and run with great swiftness. Here is also a breed of small swine, which run wild in the mountains; these and the wild sheep are esteemed excellent meat. They have no badgers, foxes, otters, moles, hedgehogs, snakes, or any other noxious animals.

The number of inhabitants, besides strangers, amount to about twenty thousand. They are an orderly civilized people, very charitable to the poor, and hospitable to strangers. Their language, which is called the Manks, is a dialect of that spoken in the western isles of Scotland, with a mixture of some Greek, Latin, and Welsh words.

In their habit and manner of living they imitate the English, only the poorer sort wear a kind of sandals made of untanned leather, they being cross-laced from the toe to the instep. Oat-cakes are their common bread. They have mills both for grinding of corn or fulling of cloth. Their staple commodities are wool, hides, and tallow; and they are extremely well situated for a foreign trade.

The island is, in civil concerns, divided into six sheadings, and every sheading has its proper coroner, who is in the nature of a sheriff, and is intrusted with the peace of his district, secures criminals, and brings them to justice. The legislative power is lodged in twenty-four keys, so called from their unlocking, as it were, or solving the difficulties of the law. These represent the commons, and join with the lords court in making all new laws, and with the deemsters or judges in settling and determining the meaning of the ancient laws and customs in all difficult cases. The deemsters are two in number, these are judges in cases of common law, and of life and death; but such controversies as are too trivial to be brought before a court, are dispatched at their houses.

The bishop of Man is suffragan to the archbishop of York, and stiled bishop of Sodor and Man; the former being a bishopric in the western island of Jona, or St. Columbus, commonly called Columb-kyle; but the bishop is a baron of the isle, and has his own courts for his temporalities, in which one of the deemsters sits as judge; but he has no seat in the house of lords. The religion and worship is exactly the same with that of the church of England. The clergy meet in convocation at least once a year, on Thursday in Whitsun-week, and they are dignified with the title of Sir before their Christian names. There are here seventeen parish-churches, and four chapels; with four market-towns.

Douglas is the richest and most populous town of the island. The harbour for ships of tolerable burthen is extremely safe, and has a fine mole which runs out into the sea, which renders this one of the best harbours in any part of the three kingdoms.

The island has been successively inhabited by the Britons, Scotch, and Norwegians; but at last became subject to England, about the close of the reign of king Edward I. or the beginning of that of Edward II. King Henry IV. granted the island, together with the patronage of the bishopric, to Sir John Stanley, and his heirs, in which family it continued, till by marriage it came from the earl of Derby to the duke of Athol, in Scotland, who was stiled king in Man.

Its trade was very great before the year 1726; but the late lord Derby farming out his customs to foreigners, the insolence of those farmers drew on the island the resentment of the government of England, who by an act of parliament deprived the inhabitants of a fair trade with this kingdom. This naturally introduced a clandestine commerce, which they carried on with England and Ireland with prodigious success, and an immense quantity of foreign goods was annually run into both kingdoms, till the government, in 1765, thought proper to put an entire stop to it, by purchasing of the duke of Athol the customs of the island, and permitting a free trade with England.

On the little isle of Peele, on the west side of Man, is a town of the same name, with a fortified castle.

Before the south promontory of Man, is a little island called the Calf of Man: it is about three miles in circuit, and separated from Man by a channel about two furlongs broad. At one time of the year it abounds with puffins, and also with a species of ducks and drakes, by the English called barnacles, and by the Scots clakes and soland geese. The puffins 'tis said, breed in the holes of the rabbits, which for that time leave them to these strangers. The old ones, says our author, leave the young ones all day, and fly to the sea, and returning late at night with their prey, disgorge it into the stomachs of their young; by which means they become almost an entire lump of fat. In August, they are hunted as it is called, and no less than five thousand of these young ones are generally taken every year; these are mostly eaten on the island, but many of them are pickled, and sent abroad as presents. About the rocks of this island also breed an incredible number of all sorts of sea fowl.

SECT. XLVIII.

Of Wales.

Of this Country in general; with an Account of Flintshire; its Situation, Extent, Air, Soil, Produce, Rivers, and principal Towns.

WE are now come to Wales, an extensive and mountainous country, separated from England by a range of almost inaccessible mountains, which to the ancient inhabitants of Britain seemed formed by nature as bulwarks for the defence of liberty. Thither therefore those Britains retired, who, finding resistance ineffectual, disdained to submit to the Romans, and thither they were followed by their countrymen, who were afterwards unable to oppose the victorious arms of the Saxons. Thus these barren mountains became the asylum of liberty, and were inhabited by the brave, who for the sake of that invaluable blessing, liberty, preferred them to their native possessions in the fertile plains of England.

By this means they have preserved their race, who still speak the same language, have the same tempers and

diſpoſitions, and laugh at a pedigree that can be traced no higher than William the Conqueror.

The Saxons gave the country the name of Wallia, and the people that of Welſh, terms by which they uſed to denote nations and countries, that appeared to them ſtrange and unknown. Hence the people themſelves, who are unacquainted with the Engliſh, know not that their country is called Wales; or themſelves or their language termed Welſh; but inſtead of Wales uſe the word Cycary, or the antient country, and call the language Cymeraeg. However, people in affluent circumſtances, and thoſe who keep inns on the public roads, generally ſpeak Engliſh.

It was anciently bounded on all ſides by the Severn and Dee, till the Saxons made themſelves maſters of all the plain country over theſe rivers, and Offa, king of Mercia, made a great ditch, as the boundary between his kingdom and Wales. The kings of England alſo, after the conqueſt, obliged the inhabitants to retire farther weſtward, and to ſecure themſelves among the mountains. They enjoyed their own laws, lived under their own princes, and maintained their liberties againſt all the attempts of the Engliſh, till in 1282, Llewellin ap Griffith, prince of Wales, loſt his life, in a battle obtained by Edward I. and afterwards ſending his queen, who was pregnant, to Caernarvon, where ſhe was ſafely delivered, ſummoned a meeting of the Welſh lords, and proffered them the young child, a native of their own country, for their lord and governor, they readily ſwore obedience to him, and ſince that time the king's eldeſt ſon has been created prince of Wales.

This country is at preſent divideſt into twelve counties, which, beginning at the north-eaſt are Flintſhire, Denbighſhire, Caernarvon, Angleſey, Merionethſhire, and Montgomeryſhire, called North-Wales; Radnorſhire, Cardiganſhire, Pembrokeſhire, Caermarthenſhire, Brecknockſhire, and Glamorganſhire, termed South-Wales.

Flintſhire, is bounded on the North by an arm of the ſea, which is properly the mouth of the river Dee; on the eaſt by Cheſhire, on the ſouth by Shropſhire, and on the ſouth-weſt and weſt by Denbighſhire. It is twenty-nine miles in length, and eighteen in breadth, and is divided into five hundreds, in which are one market-town, twenty-eight pariſhes, about five thouſand four hundred houſes, and thirty-two thouſand four hundred inhabitants. The greateſt part of this county lies in the dioceſe of St. Aſaph, and the reſt belongs to that of Cheſter. It ſends two members to parliament, one for the county, and one for Flint.

The air is cold but healthful, it is full of hills, intermixed with a few valleys, which are very fruitful, producing ſome wheat, and great plenty of rye. The cows, though ſmall, yield a great quantity of milk, in proportion to their ſize, and are excellent beef. The mountains are well ſtored with lead, coal, and mill-ſtones. This county alſo produces good butter, cheeſe, and honey, of which laſt the natives make metheglin, a wholeſome liquor, much uſed in theſe parts.

The principal rivers are the Clwyd, the Wheeler, the Dee, the Sevion, the Elwy, and the Alen, which furniſh Flintſhire with great quantities of fiſh.

The principal towns in this county are the following.

St. Aſaph, an epiſcopal city, called by the Welſh Lhan Elwy, as being ſituated at the confluence of the river Elwy with the Clwyd, obtained its Engliſh name from Aſaph, a devout man, who was biſhop of this place. The town though ſeated in a pleaſant vale, and the ſee of a biſhop, is a poor ill built place, even without a weekly market; and the cathedral is far from being an elegant ſtructure: the town has a bridge over each of the rivers above mentioned.

Flint is ſituated near the river Dee, where is a ſmall harbour, one hundred and ninety-four miles from London; but notwithſtanding its advantageous ſituation for trade, it is a mean place, without any market. The aſſizes are generally held here, and the town is governed by a mayor, who is ſtiled governor of the caſtle, which now lies in ruins.

Holywell, a town ſeated twelve miles to the eaſt of St. Aſaph, and two hundred and twelve to the north-weſt of London, is famous for St. Winifred's-well, which is one of the fineſt ſprings in the world. It pours out ſuch a quantity of a water, that running in the middle of the town down the ſide of a hill, it is made uſe of by every houſe as it paſſes, after which it turns ſeveral mills. Over the ſpring, where there is a handſome bath, is a neat chapel, which ſtands upon pillars, and on the windows are painted the hiſtory of St. Winifred's life. About the well grow ſome moſs, which people fooliſhly imagine to be St. Winifred's hair. And as ſhe is reputed a virgin martyr, who they tell you being raviſhed and murdered, was interred here, on which this water ſprung out of her body when buried, the well is much frequented by popiſh pilgrims out of devotion, as well as by thoſe who come to bathe in it, for medicinal purpoſes. Almoſt all the houſes of the town are either let into lodgings, or public houſes, and the Romiſh prieſts who attend here are very numerous, and appear in diſguiſe.

Caerwis, the only market-town in the county, is ſeated five miles to the eaſt of St. Aſaph, on an aſcent, but is a ſmall place not worthy of a particular deſcription.

SECT. XLIX.

Of Denbighſhire; its Situation, Extent, Diviſions, Air, Soil, Produce, Rivers, and principal Towns.

DENBIGHSHIRE, is bounded on the eaſt by Flintſhire and Shropſhire, on the ſouth by Merionethſhire, on the weſt by Caernarvonſhire, and on the north by the Iriſh ſea. It extends thirty-nine miles in length, and fifteen in breadth. This county is divided into twelve hundreds, which contain four market-towns, fifty-ſeven pariſhes, about ſix thouſand four hundred houſes, and thirty-eight thouſand four hundred inhabitants. It is partly in the dioceſe of St. Aſaph; but the greateſt part of the vale of Clwyd is in the dioceſe of Bangor. It ſends two members to parliament, one for the county, and one for the borough of Denbigh.

The air of this county is very wholeſome, but ſharp, it being continually agitated by the winds which blow over the ſnowy tops of the mountains. The ſoil is various; for the famous vale of Clwyd is a fruitful, pleaſant, and delightful ſpot, ſaid to be equalled by few places in Europe, and takes up ſo great a part of the county, that it extends near ſeventeen miles from north to ſouth, and from eaſt to weſt about five. The eaſt ſide of the county is not very fertile, and the weſt is in a manner entirely barren. The inhabitants generally live to a great age, and thoſe who dwell in the above vale are remarkable for retaining great vivacity to the longeſt period of life. The chief commodities this county affords are lead, horned cattle, ſheep, goats, fiſh, and fowl.

The valleys are well watered by rivers; the Clwyd riſes in the middle of the county, and taking a compaſs to the ſouth-eaſt, then turns to the northward, and having entered Flintſhire falls into the Iriſh ſea. The Elwy riſes in the ſouth-weſt edge of the county, and runs chiefly to the north and north-eaſt, till it enters Flintſhire, immediately after which it falls into the Clwyd. The Dee enters this county from Merionethſhire, and becomes the boundary between this county and Cheſhire. The Conway is the boundary between Denbighſhire and Caernarvonſhire.

The principal places in this county are the following:

Denbigh, the county town, is ſeated on the ſide of a rocky hill on a branch of the river Clwyd, twenty-ſeven miles to the weſt of Cheſter, and two hundred and nine to the north-weſt of London. It was formerly walled round, and ſecured by a caſtle, thought to be impregnable from its advantageous ſituation. It gives title of earl to the noble family of Fielding; it is governed by an alderman, two bailiffs, twenty-five capital burgeſſes, &c. Its market on Wedneſdays is plentifully ſupplied with corn, cattle, and other proviſions. The town is pretty large and populous, and a conſiderable trade is carried on by the tanners and glovers.

Wrexham, which is eſteemed the largeſt town in North Wales, is ſeated on a river that falls into the Dee, and has

has been much extolled on account of its church, the ſteeple of which has been much admired. It is indeed adorned with imagery; but the work is mean, and the ſtatues without fancy or ſpirit; and as the ſtone is of a red and crumbling kind, it is greatly diſfigured by time. The church is large; but they are much miſtaken who pretend that it is one of the fineſt in England. The town is well built and populous; and, beſides the church, there are two large meeting-houſes, in one of which, it is ſaid, they preach in Welſh one part of the day, and in Engliſh the other. There is here a conſiderable manufacture of flannel, which is ſent in large quantities from hence to London.

Ruthen is ſeated in the vale of Clwyd, ten miles to the ſouth-eaſt of Denbigh, and a hundred and ninety-nine north-weſt of London, and had once a large caſtle, which is now in ruins; it is a pretty large corporation town, well inhabited, and has an hoſpital and a free-ſchool.

SECT. L.

Of Caernarvonſhire; its Situation, Extent, Diviſions, Air, Soil, Produce, Mountains, Rivers, and principal Towns.

CAERNARVONSHIRE, or Carnarvonſhire, called by the Welſh Sir Gaernarvon, is bounded on the north by the Iriſh ſea, on the eaſt by Denbighſhire, on the ſouth-eaſt by Merionethſhire, and on the weſt and ſouth-weſt by Angleſey and the Iriſh ſea; extending fifteen miles in length, and thirteen in breadth. This county is divided into ten hundreds, in which are ſix market-towns, ſixty-eight pariſhes, about two thouſand ſeven hundred and ſeventy houſes, and upwards of ſixteen thouſand inhabitants. It is ſeated in the dioceſe of Bangor, and ſends only two members to parliament, one for the county, and one for Caernarvon.

The air is cold and piercing, which may be attributed to the ſnow, which, on many of the mountains, lie for nine or ten months in the year. The ſoil is particularly ſtony, and riſes in vaſt mountains one above another, from whence this county has not been improperly called the Engliſh Alps. The higheſt mountain, which is called Snowdon-hill, is boggy on the top, and has two lakes that abound with fiſh. The ſheep which feed on the ſides of this mountain yield the ſweeteſt mutton in Wales. The moſt remarkable mountain, next to that of Snowdon-hill, is Penman Mawr, which hangs perpendicularly over the ſea at ſo vaſt a height, that few ſpectators would be able to look down the dreadful ſteep. On the ſide next the ſea is a road cut out of the ſide of the rock, about ſix or ſeven feet wide, which winds up a ſteep aſcent, defended on one ſide by a ſlight wall, in ſome parts about a yard high, and in others by only a bank, that ſcarce riſes a foot above the road. The ſea is ſeen daſhing its waves forty fathoms below, and the mountain riſes as much above the traveller's head. This, dangerous and tremendous as it muſt appear, is the high road to Holy-head, over which the lord lieutenant of Ireland paſſes in his way to that port. Indeed the author of The Tour through Great Britain, ſays, there is no danger, it being every where defended by a wall; and another author ſays, it is breaſt high, but they are both miſtaken. This county is alſo remarkable for the great number of its lakes; and the continuator of Camden ſays, that there are here no leſs than fifty or ſixty of them. Between the hills are fruitful and pleaſant valleys, whoſe beauties are much heightened by the rude proſpects and dreary waſtes, with which they are encompaſſed. The principal commodities are the cattle, including ſheep and goats, wood, and plenty of fiſh both from the lakes and rivers, and lead, which is found in the mountains.

The principal river is the Conway, which parts Caernarvonſhire from Denbighſhire. It riſes from a lake where the three counties of Caernarvonſhire, Denbighſhire, and Merionethſhire join, and running northward falls into the Iriſh ſea at Aberconway. Here are many other ſmaller rivers, diſperſed in various parts of the country. The chief towns are the following:

Bangor is ſeated thirty-ſix miles to the weſt of St. Aſaph, and two hundred and thirty-ſix to the north-weſt of London: though the ſee of a biſhop, it is an old mean looking place; yet was ſo conſiderable in ancient times, that it was called Bangor the Great, and was defended by a ſtrong caſtle. It has a market on Wedneſdays, and its principal buildings are the cathedral and the biſhop's palace. The cathedral is by ſome thought to be the moſt ancient in Britain; but it now makes a very mean appearance: there is here alſo a free-ſchool. The town is governed by the biſhop's ſteward, who holds the courts.

Caernarvon borders on the ſea, by which, and two rivers, it is ſurrounded on all ſides, except the eaſt: it ſtands ſeven miles to the ſouth-weſt of Bangor, and two hundred and fifty-one to the north-weſt of London. It had a ſtrong caſtle, which is now in ruins, and has one pariſh-church; the houſes and ſtreets are tolerably handſome. The conſtable of the caſtle is always mayor of the town by his patent; beſides whom there is always an alderman, two bailiffs, a town-clerk, &c. It was built by king Edward I. to ſecure a paſſage into the iſle of Angleſey, and here was born king Edward II. the firſt Engliſh prince of Wales; here was likewiſe eſtabliſhed the chancery and exchequer for North Wales.

Abercon way, or Conway, is ſeated at the mouth of the river Conway, fifteen miles to the north-weſt of Denbigh, and two hundred and nine from London. It is a large walled town, with a caſtle, and the houſes are tolerably well built. Near the town corn, timber, and oak-bark, are in great plenty; and they clear out at the cuſtom-houſe from eleven to twelve thouſand buſhels of grain every year. A vaſt body of marcaſite is found up the river, of which copperas is made; and it is thought that there are veins of copper ore near it. This town was formerly famous for a pearl-fiſhery; but though there are ſtill plenty of pearl-muſcles, they are neglected. Here is one church, in which they preach one Sunday in Engliſh, and the other in Welſh; it has a remarkable epitaph to the following purpoſe: "Here lieth the body of Ni-"cholas Hookes, of Conway, gent. who was the one "and fortieth child of his father, William Hookes, "Eſq; by Alice his mother, and the father of twenty-"ſeven children. He died the twentieth day of March, "1637."

SECT. LI.

Of the Iſle of Angleſey; its Situation, Extent, Diviſions, Air, Soil, Produce, Rivers, and principal Towns.

THE iſle of Angleſey, or Angleſea, the moſt weſtern county of North Wales, was called by the ancients Mona, and was the ſeat of the Druids; but being reduced by the Engliſh in the reign of Edward I. it received the name of Angleſey, or the Engliſh Iſland. It is ſurrounded on all ſides by the Iriſh ſea, except on the ſouth-eaſt, where it is divided from Britain by a narrow ſtreight called Meneu, which in ſome places may be paſſed on foot at low water. Its extent from Beaumaris on the eaſt to Holyhead on the weſt is twenty-four miles, and from Abermana's ferry on the ſouth to Lhanbaderig on the north, where broadeſt, is about ſeventeen.

It is divided into ſix hundreds, in which are two market-towns, two chaces, ſeventy-four pariſhes, eighteen hundred and forty houſes, and upwards of twelve thouſand perſons. According to Camden it formerly contained three hundred and ſixty-three villages. It lies in the dioceſe of Bangor, and ſends two members to parliament, one for the county, and one for Beaumaris.

It in general enjoys a pretty good air, except when it happens to be covered with the fogs and exhalations that ariſe from the ſea, which are apt to occaſion agues, eſpecially in autumn. The ſoil of Angleſey is much more fertile than one would imagine from its ſtony, rocky, and mountainous bottom. It particularly abounds in wheat, which is ſaid to be the beſt in all Wales, and likewiſe in cattle, fowl, and fiſh. From the mountains are dug mill-ſtones, and grindſtones. Near Kemlyn

harbour is a quarry of a beautiful marble, among which is found the aſbeſtos, called here ſalamanders wool; it is a ſubſtance like flax, and will bear a common fire without being conſumed. Not far from this is a yellow ſulphureous copper ore, and about three miles to the eaſtward is a vein of ſtony ochre of various colours, as red, yellow, and blue.

The principal rivers are the Brant, the Alow, and the Keveny. The firſt has its ſource on the eaſt ſide of the iſland, and runs moſtly ſouthward, till it falls into the Meneu. The Alow alſo riſes in this county, and, after ſeveral windings, falls into the Iriſh ſea. The Keveny iſſues from the high hills to the north of Coydana, and falls into the ſea, on the ſouth-weſt ſide of the iſland.

Among the antiquities of this iſland are two circles of ſtones, like thoſe of Stone-henge on Saliſbury-plain. This iſland gives the title of earl to the family of Anneſley.

Among the other popiſh cuſtoms ſtill retained in North Wales, it is here uſual, after morning ſervice on Sunday, for the people of a whole pariſh to go to foot-ball; and when the afternoon ſervice is done they go to the ale-houſe, which is frequently kept by the parſon of the pariſh, and there they play at all ſorts of games.

The principal place in this iſland is

Beaumaris, the county town, where all the public affairs of the iſland are tranſacted. It is ſeated on the eaſt ſide of Angleſey, nine miles to the north of Bangor, and two hundred and forty-one north-weſt of London. It was built by king Edward III. to ſecure his conqueſts here, who for that purpoſe began a caſtle; but it does not appear that it ever was finiſhed. The town receives its name from its ſtanding in a fine mooriſh plain. It is at preſent a populous place, in which the ſeſſions and county goal are kept. It has a good harbour for ſhipping; and as it lies in the direct road to Holyhead, this contributes to its trade, by the paſſengers who go through it in order to ſet ſail for Ireland; but, notwithſtanding its harbour, it has little or no foreign trade. It principally conſiſts of two handſome ſtreets, and has a church, in which are ſome fine monuments. The market, which is on Wedneſdays and Saturdays, is well furniſhed with proviſions. The corporation conſiſts of a mayor, a recorder, two bailiffs, who are alſo juſtices of the peace, and twenty-one burgeſſes.

Holyhead is ſeated twenty-four miles to the weſt of Beaumaris, and lies oppoſite to Dublin: from hence is the ſhorteſt and ſafeſt paſſage over St. George's channel, it being the moſt weſterly point of Angleſey. It is a little iſland of itſelf, joined to Angleſey by a ſtone bridge. It has a village called in the Welſh Kaer Gybi, which conſiſts of a few ſtraggling thatched houſes, built on the rock; yet ſeveral of them have good accommodations for travellers. The packet boats from Dublin arrive here three times a week, if the wind permits.

On the rocks grow the herb of which is made kelp, a fixed ſalt uſed in making glaſs and in alum-works. In the neighbourhood is a large vein of white fuller's-earth, and another of yellow, which might be of uſe to fullers. Large flocks of puffins are often ſeen here; they all come in one night, and depart in the ſame manner.

SECT. LII.

Of Merionethſhire; its Situation, Extent, Diviſions, Air, Soil, Produce, Rivers, and principal Towns.

MERIONETHSHIRE is bounded on the north by Caernarvonſhire and Denbighſhire; on the eaſt by Montgomeryſhire; on the weſt by St. George's Channel, or the Iriſh ſea; and on the ſouth by the river Dyffi, which parts it from Cardaganſhire; it extending forty-ſeven miles in length, and twenty-five in breadth.

This county is divided into ſix hundreds, in which are five market-towns, thirty-ſeven pariſhes, about two thouſand five hundred and ninety houſes, and ſeventeen thouſand one hundred inhabitants. It lies in the dioceſe of Bangor, and ſends one member to parliament, namely, a knight for the ſhire.

The air of Merionethſhire is very ſharp in winter, on account of its many high barren mountains. The ſoil is as bad as any in Wales, it being very rocky and mountainous. However, this county feeds large flocks of ſheep, many goats, and large herds of horned cattle, which find pretty good paſture in the valleys. Beſides theſe, among their other commodities may be reckoned Welſh cotton, deer, fowl, fiſh, and eſpecially herrings, which are taken on this coaſt in great plenty.

Some learned authors mention a ſurpriſing phænomenon, which they tell us this part of the country has ſometimes fatally experienced; this is a livid vapour ariſing from the ſea, which ſpreading itſelf on the land ſets fire to all combuſtibles in its way, as barns, ſtacks of hay and corn; after which the graſs and herbage being all blaſted by this peſtilential exhalation, a great mortality of cattle, ſheep, horſes, &c. generally enſued; but on firing a gun, upon ſeeing it approach, it is eaſily diſperſed. See the Philoſophical Tranſactions, and a deſcription of it in Camden's Addenda.

This county is watered by ſeveral rivers, the principal of which are the Dee, the Avon, and the Drurydh. The Dee has two ſpring-heads in the eaſtern part of the county, which being united, is ſuppoſed to run through the lake called Pimble-meer, without mixing its waters with thoſe of the lake; at leaſt the fiſh ſeem not to mingle; for it is ſaid, that though the Dee abounds with ſalmon, none are ever taken in the lake out of the ſtream of the river; nor does the Dee carry off any gwiniads, a fiſh peculiar to the lake, which reſembles the whiting, but taſtes like a trout. This river, after leaving the lake, runs by a north-eaſt courſe into Denbighſhire. The Avon riſes in Beroſe-wood, on the eaſt ſide of the county, and running moſtly ſouth-weſt, falls into St. George's Channel. The Drurydh iſſues from a lake in the north of Merionethſhire, and running to the ſouth-weſt, alſo falls into the Iriſh ſea.

Harlech, the principal town in this county, is ſeated on a ſteep rock on the ſea-ſhore, and is but a poor place, though it is the county town. It had formerly a ſtrong handſome caſtle, which had a garriſon for king Charles I. in the civil wars, on which account it was afterwards demoliſhed by the parliament. The town is governed by a mayor, and has a weekly market on Saturdays.

Dolgelly is ſeated at the foot of a great rock called Cader Idris, which is extremely high, a hundred and eighty-ſeven miles to the north-weſt of London, and is waſhed by the river Avon. It is but an ordinary town, and yet has not only a market on Tueſdays, but a conſiderable manufacture of Welſh cottons.

SECT. LIII.

Of Montgomeryſhire; its Situation, Extent, Diviſions, Air, Soil, Rivers, and principal Places.

MONTGOMERYSHIRE, the laſt county in North Wales, is called by the Welſh Sir Trevalwyn, and is bounded on the north by Merionethſhire and Denbighſhire; on the north-eaſt and eaſt by Shropſhire; on the ſouth by Radnorſhire and Cardiganſhire; and on the weſt by the laſt-mentioned county and part of Merionethſhire. It extends thirty-five miles in length, and thirty-four in breadth. This county is divided into ſeven hundreds, and contains ſix market-towns, ſixty-eight pariſhes, about five thouſand ſix hundred and ſixty houſes, and thirty-three thouſand nine hundred and ſixty inhabitants. It lies in the three ſeveral dioceſes of St. Aſaph, Bangor, and Hereford; but ſends only two members to parliament, one for the county, and one for the town of Montgomery.

The air is pleaſant and ſalubrious: but this county being extremely mountainous, is not very fertile, except in the vallies, which afford ſome corn, and plenty of paſture; however, the ſouth, ſouth-eaſt, and north eaſt parts being much more level, are extremely fruitful, eſpecially a pleaſant vale through which the Severn glides in beautiful meanders. This county has long been famous for an excellent breed of horſes, which are larger

here than in any other part of Wales. The county likewiſe abounds in horned cattle, fowl, fiſh, and corn.

It is watered by ſeveral ſmall ſtreams which fall into the Severn, a river that is the principal beauty of this county: its ſource is a ſmall lake on the vaſt mountain of Plinlymmon, and in its courſe receives ſo many ſmall ſtreams, that it becomes navigable before it leaves the county. The rivers Rhydel and Wye have their ſources on the ſame mountain: but theſe laſt ſoon leave Montgomeryſhire. The Tenat riſes towards the north-weſt ſide of the county, and running eaſtward, forms part of the northern boundary between Montgomeryſhire and Denbighſhire; falling into the Severn at the north-eaſt point of the county. The Turgh riſes on the weſt ſide of Montgomeryſhire, and running eaſtward till it reaches the foot of Mount Golway, turns to the north, and, after receiving the Wurway, falls into the Tanat.

Montgomery, the county town, is pleaſantly ſeated in a fertile ſoil, and a healthful air, on the aſcent of a hill, twenty-four miles to the ſouth of Shrewſbury, and about a hundred and ſixty-eight to the north-weſt of London; it had once a caſtle, which was demoliſhed in the civil wars; but it at preſent contains only about a hundred houſes, and has a market on Tueſdays.

Welſhpool is ſeated in a rich vale on the bank of the Severn, ſeven miles to the north of Montgomery, and a hundred ſeventy-ſix to the north-weſt of London. It is the largeſt and beſt town of the county, and has a very good trade. The market is conſiderable for cattle, proviſions and flannels. The caſtle, now called Powis-court, is built of a reddiſh ſtone, and is a large ſtately ſtructure.

SECT. LIV.

Of Radnorſhire; its Situation, Extent, Diviſions, Air, Soil, Produce, Rivers, and principal Towns.

WE now come to South Wales, and ſhall begin with Radnorſhire, called by the Welſh Sir Vaes y Ved. It is bounded on the north by Montgomeryſhire, on the eaſt by Shropſhire and Herefordſhire, on the ſouth and ſouth-weſt by Brecknockſhire, and on the weſt by Cardiganſhire; extending thirty miles in length, and twenty-five in breadth.

This county is divided into ſix hundreds, in which are contained four market-towns, fifty-two pariſhes, about three thouſand one hundred and ſixty houſes, and eighteen thouſand nine hundred and ſixty inhabitants. It is ſeated in the dioceſe of Hereford, and ſends two members to parliament, one for the county, and one for the town of Radnor.

The air of this county is in winter cold and piercing. The ſoil in general is but indifferent; yet ſome places produce corn, particularly the eaſtern and ſouthern parts; but in the northern and weſtern, which are mountainous, the land is chiefly ſtocked with horned cattle, ſheep, and goats.

With reſpect to the rivers of Radnorſhire; beſides the Tame, or Temd, which, on the north-eaſt, divides this county from Shropſhire, and the Wye, which waters the weſt ſide, it has the Ithon, which riſes in the northern borders of the county, forming its winding courſe to the ſouthward, and, after having received ſeveral rivulets, falls into the Wye. Several other ſmall rivers riſe in the middle of the county, and run into Shropſhire and Herefordſhire; by which means this county is ſupplied with plenty of fiſh.

The principal towns in this county are the following:

Radnor, the county town, is ſeated near the ſpring-head of the little river Somergil, a hundred and forty-nine miles to the weſt-north-weſt of London. It ſtands in a pleaſant valley at the foot of a hill, where a caſtle formerly ſtood, which was deſtroyed by Owen Glendour, when, upon the depoſition of Richard II. he aſſumed the title of prince of Wales. The town is governed by a bailiff and twenty-five burgeſſes, and has a court of pleas for all actions, without being limited to any particular ſum; yet the aſſizes are not held here, nor has the town a market.

Preſteign is ſeated in a rich and pleaſant valley, a hundred and forty-nine miles from London, and is a handſome town, with regular well built ſtreets. It has ſeveral convenient inns, and its market is remarkable for barley, of which a great deal of malt is made. Here the aſſizes are held, and the county jail is kept.

SECT. LV.

Of Cardiganſhire; its Situation, Extent, Diviſions, Air, Soil, and principal Towns.

CARDIGANSHIRE, called by the Welſh Sir Aberteivy, is bounded on the north by a ſmall part of Merionethſhire and Montgomeryſhire, on the eaſt by Radnorſhire and Brecknockſhire, on the ſouth by Caermarthenſhire and a ſmall part of Pembrokeſhire, and on the weſt by Cardigan bay in St. George's Channel. It extends forty-two miles in length and twenty in breadth, and is divided into five hundreds, which contain four market-towns, ſixty-four pariſhes, about three thouſand one hundred and ſixty houſes, and thirty-five thouſand three hundred inhabitants. It lies in the dioceſe of St. David's, and ſends two members to parliament, one for the county, and one for the town of Cardigan.

The air is milder here than in moſt part of Wales. To the ſouth and weſt are plains fruitful in corn; but the northern and eaſtern parts are a continued ridge of mountains, which, compared with the reſt, are bleak and barren: yet in the worſt parts of this county there are paſtures in which are bred flocks of ſheep, and large herds of cattle. Here is alſo plenty of tame and wild fowl: alſo near the rivers are found great numbers of otters. In the valleys are ſeveral lakes, and this country is well ſupplied with ſea and river fiſh. However, coals and other fuel are ſcarce; but the mountains abound with veins of lead and ſilver ore; a ton of which laſt will yield ſeventy or eighty ounces of ſilver. The mines have been worked ſeveral times to great advantage; and particularly Sir Hugh Middleton is ſaid to have cleared two thouſand pounds a month, for ſeveral years together, which enabled him to bring the New River water to London: however, ſome private adventurers have attempted to work them, but have failed for want of a ſufficient capital.

The principal rivers are the Teivy, which riſes from a lake of the ſame name, at the foot of the mountains on the eaſtern edge of Cardiganſhire: at firſt it wanders, loſt, as it were, among the rocks and ſtones with which this part of the country abounds, till beginning to have a regular channel, it runs to the ſouth-weſt, and falls into St. George's channel below Cardigan. This river is famous for its great plenty of excellent ſalmon, and for its abounding with otters. The Rydal has its ſpring on the ſouth-weſt ſide of Plinlymmon mountain, and runs ſouth and ſouth-weſt, till it falls into St. George's channel, jointly with the Iſtwyth, which riſes beyond the lead mines on the north-eaſt ſide of Cardiganſhire.

Cardigan, the principal town, is called by the Welch, Abertievy, from its being ſituated at the mouth of the Tievy, it is ſeated one hundred and ninety eight miles to the weſt-north-weſt of London, and is a large, ancient, and populous borough, with a good ſtone bridge over the river leading into Pembrokeſhire. The tide flows up to the town, and the chief trade of the inhabitants is to Ireland, to which, and other parts, they export lead. Cardigan was once defended by walls and a caſtle, but they are in ruins. It gives title of earl to a branch of the noble family of Montagu. The town is governed by a mayor and aldermen; here the county buſineſs is tranſacted, and the aſſizes held. The church is a handſome ſtructure, as is alſo the town-hall

Aberiſtwyth, a populous town ſeated on the river Rydal, near the place where it falls into the mouth of the river Iſtwyth, thirty miles to the north-eaſt of Cardigan, and one hundred and ninety-nine to the weſt-north weſt of London. It is but a poor town, conſiſting

conſiſting of about a hundred houſes; yet has a conſiderable maket on Mondays. It had formerly a caſtle and walls; but they have long ſince been decayed.

SECT. LVI.

Of Pembrokeſhire, its Situation, Extent, Diviſions, Air, Soil, Produce, Rivers, and principal Towns.

PEMBROKESHIRE, called by the Welch Penbroſhire, is bounded on the north-eaſt by Cardiganſhire; on the eaſt by Caermarthenſhire; on the ſouth by the mouth of Briſtol channel; and on the weſt and north by St. George's channel; extending thirty-ſeven miles in length and eighteen in breadth.

This county is divided into ſeven hundreds, which contains one city, nine market towns, one hundred and forty three pariſhes; about four thouſand three hundred houſes, and twenty-five thouſand nine hundred inhabitants. It lies in the dioceſe of St. David's, and ſends three members to parliament, one for the county, one for Haverford-weſt, and another for Pembroke.

The air is better than is generally experienced in countries ſo much expoſed to the ſea. The ſoil is fertile: its few mountains, which are chiefly in the north-eaſt part, yield pretty good paſture for cattle, and the parts near the ſea afford plenty of good corn, and rich meadows. It likewiſe abounds in goats, and fowl, particularly in excellent faulcons, in fiſh, and in pit-coal.

It is well watered with rivers; for beſides the Teivy, which parts it from Caermarthenſhire, are the Clethy, which riſes at the foot of Wrenywaur hill, and running ſouthward, joins the Dougledye. This laſt has its ſource near the middle of the county, and running towards the ſouth-weſt, joins the Cledhewen, after which, turning towards the ſouth-weſt, and paſſing by Haverford-weſt, it at length receives the Clethy, and at laſt falls into Milford-haven.

The principal places in this county are, St. David's, a city which ſtands on the moſt weſtern promontory of all Wales, two hundred and ſeventy miles from London. It was not at firſt an epiſcopal ſee; but afterwards in the reign of king Arthur, became the metropolitan of all the churches in Wales, and thus continued till the reign of Henry I. when it became ſuffragan to the ſee of Canterbury. It was once a conſiderable city defended by walls; but theſe are demoliſhed, and it is at preſent a ſmall town thinly inhabited, without ſo much as a market. The cathedral is the remains of a venerable building; the weſt end which contains the choir, is ſtill in good repair; but the eaſt end has ſuffered ſo much from time and neglect, that the roof has fallen in.

From the point of land on which St. David's ſtands, may be diſtinguiſhed in a clear day, the coaſt of Ireland, though it is near forty miles diſtant. Before this point lie ſeveral dangerous rocks called the Biſhop and his Clerks, on which many ſhips have been loſt. Near theſe is a little iſland named Ramſey, two miles in length, and a mile and a half in breadth.

Haverford-weſt is commodiouſly ſeated on the river Dougledye, over which is a ſtone bridge, fifteen miles ſouth-by-eaſt of St. David's, and two hundred and ſixty-nine miles to the weſtward of London: is a large handſome place, with ſeveral good houſes, and contains three pariſh churches, among which St. Mary's is a neat building, with a high ſpire. There is alſo a fourth church in the out parts. Haverford has a conſiderable trade and ſeveral ſhips belonging to it. It had formerly a wall and a caſtle, which are now demoliſhed. The aſſizes and county jail are kept here, and it is governed by a mayor, alderman, and twenty-four common council; it has alſo a ſheriff, a town clerk. two bailiffs, ſerjeants at mace, and other officers. The town and neighbourhood abound with gentry, who in politeneſs emulate Caermarthen, as that now does Haverford-weſt for trade and merchandize. There is here a free-ſchool, a charity-ſchool for boys and girls, and an alms-houſe.

Milford-haven, on which this town ſtands, is a large, ſafe, and moſt commodious harbour, capable of containing a thouſand ſhips at one time, without any danger of their running foul of each other. It has thirteen roads, ſixteen creeks, and five bays, all of which have their particular names; and it has ſeveral years been improving and fortifying by order of the government, conſiderable ſums having been granted by parliament for that purpoſe. The entrance into it may be known by three ſmall iſlands on the north-weſt, all in ſight, and the iſle of Lundy on the ſouth-eaſt.

Pembroke, the county town, is commodiouſly, ſeated on the innermoſt creek of Milford-haven, over two branches of which there are two handſome bridges. It ſtands two hundred and fourteen miles to the weſtward of London, and is ſurrounded with a wall which has three gates, and is alſo defended by a ſtrong caſtle ſeated on a rock. It is well built and has two churches, as it is happily ſituated for commerce, the inhabitants carry on an extenſive trade, and employ near two hundred ſhips on their own account; and beſides merchants, ſeveral other conſiderable families reſide there. It gives the title of earl to the noble family of Herbert, and is governed by a mayor and aldermen.

SECT. LVII.

Of Caermarthenſhire; its Situation, Extent, Diviſions, Air, Soil, Produce, Rivers, and a Deſcription of Caermarthen.

CAERMARTHENSHIRE or Carmarthenſhire is bounded on the north by Cardiganſhire; on the eaſt by Brecknockſhire, and Glamorganſhire; on the ſouth by St. George's channel; and on the weſt by Pembrokeſhire; extending forty-eight miles in length and twenty-five in breadth. It is divided into ſix hundreds, in which are contained eight market towns, one hundred and forty-five pariſhes, about five thouſand three hundered and fifty houſes, and ſeventeen thouſand inhabitants. It lies in the dioceſe of St. David's, and ſends two members to parliament, one for the county, and the other for the town of Caermarthen.

The air is generally eſteemed ſalutary, and more mild in winter than in moſt of the neighbouring counties. As the land is leſs incumbered with rocks and mountains than the other parts of Wales, it is more fertile; it produces great plenty of corn and graſs, and the rich meadows feed very fine cattle. This county alſo abounds in wood, pit coal, fowl, and fiſh, eſpecially ſalmon, which is remarkably good here.

The principal rivers are the Toway, which riſes in Cardiganſhire, and entering the north-eaſt ſide of this county, runs ſouth and ſouth-weſt, and at length falls into Briſtol-channel. The Cotley riſes near the north borders of Caermarthenſhire, and running moſtly ſouthward joins the Toway. The Tave, or Teivy, riſes in Cardiganſhire, but ſoon becomes the boundary between that county and Caermarthenſhire, till being joined by the little river Keach, it parts Cardiganſhire and Pembrokeſhire.

Caermarthen, or Carmarthen, the county town, is pleaſantly ſeated, on the banks of the Toway, two hundred and fifty-one miles to the north weſt of London. The town is well built, populous, and daily encreaſing. Hither the gentry of South Wales chiefly reſort, invited by its pleaſing ſituation, handſome buildings, and the plays and aſſemblies held here. It has a convenient quay for the lading and unlading of goods, and a handſome ſtone bridge over the river; but the inhabitants ſuffer from the ſands thrown up by the ſea in the mouth of the harbour. The town is governed by a mayor, two ſheriffs, choſen out of the ſixteen aldermen, a recorder, &c. who on ſolemn days appear in their ſcarlet gowns, with the ſword, cap of maintenance, and two maces. It was once fortified with a wall and a ſtrong caſtle, and at preſent gives title of marquis to the duke of Leeds, of the name of Oſborne.

This was the birth-place of Merlin, the ancient Britiſh prophet, who flouriſhed in 480, and about a mile from the town, by the road ſide, almoſt oppoſite to the biſhop of St. David's palace, is Merlin's grove. The

people in and about this town are reckoned the wealthieſt and politeſt in all Wales.

SECT. LVIII.

Of Brecknockſhire; its Name, Situation, Extent, Diviſions, Air, Soil, Produce, Rivers, and principal Towns.

THIS county is called by the Welſh Breckiniauc, which the Engliſh have changed to Brecknock. The Welch name has been derived by ſome authors from Brechimus, a Britiſh prince famous for his twenty-four daughters, who, from the ſanctity of their lives, were after their death eſteemed ſaints. It is bounded on the north by Radnorſhire, on the eaſt by Herefordſhire, on the ſouth by Glamorganſhire, and on the weſt by Caermarthenſhire and Cardiganſhire, extending thirty-nine miles in length, and twenty-ſeven in breadth.

This county is divided into ſix hundreds, and contains four market-towns, ſixty-one pariſhes, and about thirty-five thouſand three hundred inhabitants. It lies in the dioceſe of St. David's, and ſends two members to parliament, one for the county, and one for Brecknock.

The air of this county, except on the mountains, is remarkably mild. It is indeed extremely mountainous, which renders travelling through it ſo diſagreeable and dangerous, that the Engliſh who ride through it, ludicrouſly, but not very improperly, call it Break-neck-ſhire; however, towards Radnorſhire it is ſomewhat more low and level. The air on the mountains is, during the winter, extremely ſharp, but ſalubrious. The valleys produce plenty of corn, and from the mountains great herds of cows and oxen are brought to England; this county alſo produces goats, ſome veniſon, and plenty of fowl.

The principal rivers in Brecknockſhire are, the Uſk, which riſes from a ſpring on the ſide of the Black-mountain, on the ſouth-weſt borders of the county, and running firſt to the north, and then to the eaſt, paſſes into Monmouthſhire. The Wye is the north-eaſt boundary between this county and Radnorſhire, after which it enters Herefordſhire. The Irvon riſes among the mountains on the north-weſt, and running firſt to the ſouthward, and then to the north-eaſt, falls into the Wye. Both theſe and the ſmaller rivers, are well ſtored with fiſh, particularly the Uſk and the Wye, which abound with ſalmon and trout.

We ought not here to omit Brecknock-meer, a lake in the middle of the county, between two and three miles over, ſo full of fiſh, that the inhabitants commonly ſay, that there are only two thirds of water to one of fiſh.

We ſhall now give a conciſe deſcription of the chief towns of this county.

Brecon, or Brecknock, the capital of the county, is called by the Welch Aber-Hodney, it being ſeated at the confluence of the Hodney and the Uſk, one hundred and ſixty-one miles to the weſtward of London. It is an ancient and large town, containing three churches, one of which is collegiate, and ſtands at the weſt end. The houſes are well built, it has a good ſtone bridge, and it had formerly a wall with three gates, and a ſtately caſtle. The aſſizes are kept here, and it has a pretty good trade in woollen manufactures. It has a market on Saturdays, which is well ſupplied with corn, cattle, and proviſions.

It is governed by two bailiffs, fifteen aldermen, two chamberlains, two conſtables, and a town-clerk.

Bealt, Bealth, or Builth, is pleaſantly ſeated in a woody country, on the banks of the river Wye, ſixteen miles to the north of Brecknock, and has a wooden bridge over the river, leading into Radnorſhire. The inhabitants are chiefly employed in the ſtocking manufacture. The market is well ſupplied with cattle on Mondays, and on Saturdays with corn, and all ſorts of proviſions.

Hay, called by the Welch, Treghelly, is ſeated on the Wye, near the borders of Herefordſhire, one hundred and thirty-four miles to the weſtward of London, and is a pretty good town, with a market on Mondays, well ſupplied with proviſions.

SECT. LIX.

Of Glamorganſhire; its Situation, Extent, Diviſions, Air, Soil, Produce, Rivers, and principal Towns.

GLAMORGANSHIRE, the laſt county in Wales we have now to deſcribe, is bounded on the north by Brecknockſhire, on the eaſt by Monmouthſhire, on the ſouth by Briſtol-channel, and on the weſt by that channel and Caermarthenſhire, extending twenty-ſeven miles in length, and twenty-five in breadth.

It is divided into ten hundreds, in which are contained nine market-towns, one hundred and eighteen pariſhes, twenty-five caſtles, about ten thouſand houſes, and fifty-eight thouſand inhabitants. It lies in the dioceſe of Landaff, and ſends two members to parliament, one for the county, and one for the town of Cardiff.

On the north ſide of this county, where it is mountainous, the long continuance of the ſnow renders the air ſharp; but the country being more level on the ſouth ſide, it is milder, more populous, and bears very large crops of corn, with very ſweet graſs; whence it is called the Garden of Wales. Cattle abound in all parts, there being fruitful valleys among the mountains, that yield very good paſture. Its other commodities are lead, coals, butter, and fiſh.

The principal rivers of this county are the Avon, which riſes among the mountains in the north of Glamorganſhire, and falls into Briſtol-channel. The Rumney, which riſes in Brecknockſhire, but ſoon entering this county, is the boundary between it and Monmouthſhire, and falls into the mouth of the Severn. The Taff, Taffe, or Tave, which alſo riſes in Brecknockſhire, and runs near the eaſtern ſide of Glamorganſhire, to the mouth of the Severn. The Ogmore riſes from a ſpring in the northern borders of this county, and running to the ſouthward, through the middle of Glamorganſhire, falls into Briſtol-channel. The Tavye riſes at the foot of the Black-mountain in Brecknockſhire, and entering this county at the north-weſt, runs moſtly ſouthward, till it enters Briſtol-channel at Swanſey. Theſe, with the many rivulets running into them, render this county ſo fertile, and at the ſame time ſupply the inhabitants with great variety of fiſh.

The principal places in this county are the following:

Landaff, is ſeated on an aſcent, by the river Tave, near Cardiff, one hundred and ſixty-three miles to the weſt of London: but though it is the ſee of a biſhop, and is therefore ſtiled a city, it has not ſo much as a market. The cathedral is however, a neat ancient building.

Cardiff, or Caerdiff, is ſeated on the river Tave, two miles to the ſouth of Landaff, and is a handſome, populous trading town. It has a caſtle, a wall, and four gates, with a bridge over the river. The neighbouring country is fruitful, and four miles below the town is a commodious haven in Briſtol-channel, from which ſmall veſſels may come up to the bridge. It contains two pariſhes, and about three hundred houſes, formed into broad paved ſtreets. The conſtable of the caſtle is chief magiſtrate, and called mayor, beſides whom there are a recorder, twelve aldermen, twelve common-council, two ſerjeants at mace, and eight conſtables. Here the aſſizes and ſeſſions for the county are held. The town carries on a conſiderable trade with Briſtol.

Caerfilly, or Caerphilly, is ſeated between the rivers Tave and Rumney, five miles to the north of Landaff. It ſtands in a mooriſh ground among the hills; and the many Roman coins dug up here, render it probable that the walls were built by the Romans. The caſtle is one of the nobleſt pieces of ruins in the whole iſland. It was larger than any caſtle in England, that of Windſor excepted; and from what remains of it, was extremely beautiful. One half of a round tower has fallen quite down, but the other over-hangs its baſis more than nine feet, and is as great a curioſity as the leaning tower of Piſa in Italy.

Neath, is ſeated on a river of the ſame name, over which there is a bridge, one hundred and ninety-five

miles to the weſtward of London. It is an ancient and pretty large town, governed by a portreve, who is ſworn in by the deputy conſtable of the caſtle of Neath. Small veſſels come to this town to load coals, which are here in great plenty. On the other ſide of the river are the ruins of a fine monaſtery; but a large ſtructure belonging to it is kept in good repair.

Swanſey is a ſea-port town, commodiouſly ſeated on the ſea-ſhore, near the mouth of the river Tavye, in the fifty-firſt degree forty minutes north latitude, and in the fourth degree five minutes weſt longitude. It is a large, clean, and well built town, governed by a portreve, a chief, twelve aldermen, two chamberlains, and ſixty or ſeventy common-council-men. The ſtreets are broad and paved, and it has two churches, and an old caſtle. It has the beſt trade of any town in the county, eſpecially for coals, which are ſent by ſea to Somerſetſhire, Devonſhire, Cornwall, and even to Ireland; a hundred ſail of ſhips being often ſeen here at a time loading of coals. Mineral waters were ſome years ago diſcovered at Swanſey, which are ſaid to be of great efficacy in fluxes, hæmorrhages, diabetes, palſies, rheumatiſms, and other diſtempers.

Among the many antiquities of Glamorganſhire, one of the moſt ſingular is in the weſtern part of the county called Gower, where, on a mountain named Kevyn-Bryn, is a ſtone of an immenſe ſize, computed to weigh near twenty ton, laid upon ſeveral others by way of ſupporters. They are all of the mill-ſtone ſort, and though the upper one is of ſuch a prodigious ſize, ſeveral tons have been broke off for mill-ſtones. It is commonly known by the name of Arthur's ſtone.

CHAP. XXX.

Of NORTH BRITAIN, or SCOTLAND, with its Iſlands.

SECT. I.

Its Situation, Extent, Face of the Country, Air, Soil, Produce, Lakes, and Rivers.

SCOTLAND, which ſince the Union has been called North-Britain, is the northern part of this Iſland, which in the fifth of queen Anne, in 1707, was by the conſent of the parliaments of both kingdoms united to England; and they being thus joined, the whole iſland is ſtiled Great-Britain.

Thus all the northern part of this iſland beyond the counties of Cumberland and Northumberland, belongs to Scotland, together with a multitude of iſlands, which amount to about three hundred; but ſome of them are very inconſiderable. This country is bounded on all ſides by the ocean, except on the ſouth, where it is ſeparated from England, beginning at the eaſt, by the river Tweed, Cheviot-hills, the river Erſk, and Solway Frith. It is generally reckoned to extend three hundred and eighty miles in length, from Aldermouth-head, near the iſle of Mull, to Buchaneſs, and one hundred and ninety in breadth, where broadeſt. The coaſt is much indented, and the land in ſeveral places nearly cut through by bays, gulphs, and rivers, the firſt of which form excellent harbours, and the latter abound with freſh water fiſh.

North-Britain, excluſive of its iſlands, lies between the fifty-fourth degree forty minutes, and the fifty-eighth degree thirty minutes north latitude, and between the firſt degree thirty minutes, and the ſixth degree weſt longitude. The longeſt day is upwards of eighteen hours, and the ſhorteſt five hours forty-five minutes: but the brightneſs of the northern lights in a great meaſure remedy the inconvenience of the ſhort days of winter.

The air is very temperate, and not half ſo cold as might be imagined from its being ſeated ſo far to the north. This, as in England, is owing to the warm vapours and moderate breezes that continually come from the ſea; which alſo ſerve to purify the air, and put it in ſuch a conſtant agitation, as preſerves the inhabitants from any remarkable epidemic diſeaſes.

Great part of the country, particularly towards the north and weſt, is mountainous, and covered with heath; this is called the Highlands, but theſe in ſeveral places yield good paſture: between the higher grounds are many rich valleys, which produce corn and cattle. Indeed the ſouth parts of Scotland are far preferable to the north parts of England, and there are every where all things neceſſary for human life; and not only ſufficient for the inhabitants, but alſo to export. They do not want wheat, but the grain moſtly cultivated is oats, as it will grow in the mountainous parts. The productions in Scotland are in general much the ſame as in England. In the Lowlands there is little timber, but in the more northern parts there are foreſts of fir-trees, that might afford maſts for the largeſt men of war; but it is difficult to bring them to the ſea-ſide. There are alſo many large woods of oaks, aſhes, and elms, fit for building, and abundance of fruit-trees in their gardens and orchards. The ſoil likewiſe in many places produces great plenty of hemp and flax. They have coal-pits, which afford excellent coal, great quantities of which are brought to London, where it is known by the name of Scotch-coal. This is their fuel in ſeveral parts; but in the Highlands they burn wood, and in other places turf, peat, heath, broom, and furze. They have likewiſe mines of lead, with quarries of free-ſtone, and the latter in ſuch plenty, that moſt of the principal towns are built with nothing elſe.

The country abounds in flocks of ſheep, many of which are ſent into England, as is the greateſt part of their wool. It has alſo great herds of cattle, which are generally black, except in corn ſoils, and theſe are much larger than thoſe bred in other parts: but in general, their ſheep and horned cattle are much ſmaller than thoſe of England, and their fleſh is very ſweet. The Highlanders annually bring great numbers of them into the Lowlands, where ſome are fatted; but the bulk of them, with many of thoſe bred in the Lowlands, are ſent into ſeveral parts of England, eſpecially to St. Faith's, near Norwich, where they turn to good account.

They have alſo many hogs, and an incredible number of goats, particularly in the north and the Highlands; the latter they eat themſelves, but the hogs they for the moſt part pickle and export, as they likewiſe do great quantities of ſalt beef. In the ſouthern parts there are no deer, except in gentlemen's parks; but every where elſe they are in great plenty.

They breed great numbers of horſes, eſpecially in Galloway and the Highlands. Theſe, tho' ſmall, are hardy and capable of great fatigue, and are therefore extremely proper for a mountainous country, which in many places will not admit of carriages and teams: theſe will thrive upon what would ſtarve other horſes. However, in many places of the Lowlands, they breed horſes fit for coaches and other carriages, and for war.

Scotland has not only plenty of the domeſtic fowl common in other countries, but many other kinds, eſpecially in the iſlands, where they are ſo numerous, that the inhabitants can neither conſume nor vend half of them. Their fowl and eggs afford a conſiderable trade for food, and their feathers for bedding, and other uſes. Their fat is likewiſe uſed by the inhabitants, not only in many caſes where it is neceſſary, but likewiſe for phyſic.

Beſides the freſh-water fiſh found in the lakes and rivers, ſeveral of the iſlands are frequented by whales; and cod, ling, haddoc, ſturgeon, turbut, mackrel, ſcate, ſea-urchins, cat-fiſh, &c. are caught in great plenty on all their coaſts. Lobſters, crabs, and oyſters, are found in vaſt quantities on the Weſtern Iſlands; and cockles, muſſels, limpets, wilks, ſcallops, and ſpouts, are caſt by the tide in ſuch numbers on the iſles, that the people cannot conſume them.

In this country ſprings of clear and wholeſome water are every where in plenty, not only on the ſides, but on the tops of many of the mountains. Theſe in their deſcent ſwell into pleaſant rills, and augmenting their ſtreams beeome rivers. Many of theſe meeting with hollow places in their paſſage, expand themſelves into lakes, till finding a proper channel they reſume their form of rivers, and, as the nature of the ſoil directs, ſometimes expand themſelves again and again, or continue their progreſs in the ſame form to the ſea.

The moſt remarkable lochs or lakes in Scotland are Lochtay, Lochneſs, and Lochlevin, which ſend forth rivers of the ſame name with themſelves; Lochlomond, which ſends forth the river Lomond; and Lochiern, from which flows the river Iern. There is a lake in Straitherrach, which never freezes, however ſevere the froſt, till February, and then in one night it freezes all over, and if it continues two nights, the ice grows very thick. Another lake at a place called Glencanich, is ſeated on a high ground between the tops of two mountains, and it is remarkable that the middle of this lake is always frozen throughout the ſummer, notwithſtanding the ſtrong reflection of the ſun-beams from the mountains, which melts the ice at the ſides of the lake. Round the lake the ground has a conſtant verdure, as if it enjoyed a perpetual ſpring; and by feeding on that graſs, cattle grow ſooner fat than any where elſe.

In Linlithgowſhire is a lake called Lochoat, from whence a ſtream runs under a neighbouring mountain, and after it has purſued its courſe about two hundred paces, iſſues with great force from a ſpring about three feet broad, when it forms a ſtream that turns a mill.

The capital rivers, particularly the Forth, Clyde, Tay, and Neſs, &c. divide the country into peninſulas; theſe running ſo far within land as to be intercepted only by a ſmall iſthmus, or neck of land. Theſe and the other rivers, which are very numerous, will be particularly treated of in our deſcription of the countries through which they paſs.

SECT. II.

Of the Government, Religion, Fiſheries, and Trade of North Britain.

THE parliament of Scotland being now mingled with that of Great-Britain, there are ſixteen peers choſen out of the nobility who repreſent that body, and forty-five members who repreſent the following ſhires and diſtricts.

The ſhires which ſince the Union ſend one member each to parliament, are, 1. Aberdeen, 2. Aire, 3. Argyle, 4. Bamff, 5. Berwick, 6. Bute and Caithneſs, by turns, 7. Clackmannam, 8. Dumbarton, 9. Dumfries, 10. Edinburgh, 11. Elgin, 12. Fife, 13. Forfar, 14. Haddington, 15. Inverneſs, 16. Kincardine, 17. Kircudbright, 18. Lanerk, 19. Linlithgow, 20. Nairn, 21. Orkney and Zetland, 22. Peebles, 23. Perth, 24. Renfrew, 25. Roſs, 26. Roxburgh, 27. Selkirk, 28. Stirling, 29. Sutherland, and 30. Wigton.

Beſides theſe there are the following fifteen diſtricts of royal burghs, which alternately ſend one member to parliament. 1. Aire, Irwin, Rothſay, Inverary, and Campbell-town. 2. Bamff, Elgin, Cullen, Kintore, and Inverury. 3. The city of Edinburgh. 4. Forreſs, Nairn, Inverneſs, and Fortroſe. 5. Pittenweem, Eaſt-Anſtruther, Weſt-Anſtruther, Craile, and Kilrennie. 6. Inverkeithing, Stirling, Dumferling, Culroſs, and Queensferry. 7. Brunt-iſland, Dyſert, Kirkaldy, and Kinghorn. 8. Dundee, Perth, St. Andrew's, Cowpar, and Forfar. 9. Montroſe, Aberdeen, Brechin, Aberbrothock, and Inverbervey. 10. Kircudbright, Dumfries, Lochmaban, Annan, and Sanquhar. 11. Lanerk, Linlithgow, Selkirk, and Peebles. 12. Renfrew, Glaſgow, Ruglen, and Dumbarton. 13. Dingwall, Tayne, Dornock, Weik, and Kirkwall. 14. Jedburgh, Haddington, Dunbar, North-Berwick, and Lauder. 15. Wigton, Whithorn, New-Galloway, and Stranroer.

The courts of civil judicature in Scotland are,

The college of juſtice, commonly called the ſeſſion, which conſiſts of a preſident, and fourteen fixed ſenators or judges, called ordinary lords of ſeſſion, with two extraordinary lords. Under theſe are ſeven clerks of ſeſſion, and ſix inferior officers. Before this court are tried at ſtated times, all civil cauſes, which they determine by acts of parliament, and the cuſtom of the nation; and where theſe are defective, they decide according to the civil law, and the rules of equity. There lies no appeal from this court but to the parliament; and the preſence of nine judges is required to make their decrees valid.

The juſticiary, uſually called the juſtice or criminal court, conſiſts of five lords of the ſeſſion, the juſtice-general, and juſtice-clerk. Theſe are joined by a pannel of fifteen out of forty-five, cited like juries in England, by whom all cauſes of a criminal nature are tried. They hold aſſizes all over the kingdom twice every year, and from thence are called lords of the circuit.

The court of exchequer, which is like that of England, and conſiſts of a chief and four other barons, &c.

The court of chancery. The officers of ſtate are, the keeper of the ſeal, the lord privy-ſeal, the lord clerk-regiſter, and the lord advocate.

Beſides the above national judges, every county or ſhire has a chief magiſtrate or his deputy, who is ordinary judge in all civil and criminal cauſes; but, in moſt caſes, an appeal lies from this magiſtrate to the ſeſſion and court of juſticiary. The ſheriff is in effect the ſupreme juſtice of peace, to whom the law principally intruſts the ſecuring the quiet and tranquility of that part of the kingdom of which he is ſheriff. Bailiffs, ſtewards, and conſtables, in their reſpective diſtricts, have the ſame liberty as ſheriffs in their ſhires.

There are two ſorts of burghs, namely royal burghs, and burghs of barony, each of which is a corporation, and holds courts, though none but the royal burghs ſend members to parliament. The royal burghs are one intire body, governed by one general court, called, The Convention of Burrows, which is generally held every year at Edinburgh, and has cognizance of every thing relating to the trade and intereſt of all the burghs in general. As to the burghs of barony, every one that holds a barony of the crown, has a court, in which leſſer cauſes, both civil and criminal, are tried.

The court of admiralty is a ſupreme court, in which all maritime cauſes, crimes, treſpaſſes, quarrels, &c. may be tried before the lord high admiral's judge, for he himſelf never judges; he forms his deciſions on the civil law, and the cuſtoms of Scotland.

There are alſo in Scotland what are called commiſſariot courts, which are a kind of eccleſiaſtical courts, in which cauſes are tried by commiſſaries. The principal of theſe is at Edinburgh. The four commiſſaries of that metropolis particularly try cauſes of matrimony and adultery, in order to a plenary divorce, ſo that the innocent perſon may marry, as if the offending party were naturally dead.

The eſtabliſhed religion is called the Preſbyterian; it being a church government by paſtors, teachers, elders, and deacons. The eccleſiaſtical courts are the four following:

I. The General Aſſembly, which is the higheſt eccleſiaſtical court in the kingdom, meets annually in May, and ſits about ten days. A lord commiſſioner, who is always a nobleman of the firſt quality, preſides here, as a repreſentative of the king's perſon. All the members are annually elected, and the moderator of the laſt year's aſſembly opens the new ſeſſions with a ſermon.

II. The Provincial Synod, which is compoſed of the members of ſeveral adjacent preſbyteries, meets twice a year, at a principal place within the bounds, and is opened by a ſermon. Their buſineſs is to receive cor-

reſpondents from the neighbouring ſynods, who are a check upon one another; to determine appeals from the preſbyteries within their diſtrict; and to enquire into and cenſure the behaviour of the preſbyteries themſelves. They have likewiſe power to remove a miniſter from one place to another: but appeals lie from this ſynod to the general aſſembly.

The Preſbytery, which conſiſts of a miniſter and one elder from five to ten or more neighbouring pariſhes, who, being aſſembled, chuſe one of the miniſters to be præſes, or moderator. Here are tried appeals from the Kirk-ſeſſion; and here they inſpect into the behaviour of the miniſters and elders within their reſpective bounds. They ſupply vacant pariſhes, ordain paſtors, examine and licenſe ſchool-maſters and young ſtudents for probationary preachers; and judge when or on whom to inflict the greater excommunication.

IV. The Kirk-Seſſion conſiſts of the miniſter, elders, and deacons in each pariſh, who conſider the affairs of the pariſh as a religious ſociety. They judge in all leſſer matters eſteemed ſcandalous, can ſuſpend from the communion, and regulate every thing relating to public worſhip and the poor.

The number of kirks or churches in Scotland amounts to about nine hundred and fifty, beſides a few chapels, which make up ſixty-eight preſbyteries, included in thirteen provincial ſynods.

The law of Scotland has provided againſt pluralities, and throughout the whole country there are no benefices worth leſs than fifty pound ſterling per annum; which in that country is a good maintenance, nor any that exceed a hundred and fifty pounds a year.

There are here however ſeveral ſects of diſſenters from the eſtabliſhed worſhip, the principal of which are the Epiſcopalians, who uſe the form of prayer of the church of England: but the nonjurers among theſe are not permitted to have public meeting-houſes, but are only ſuffered to preach and read the divine ſervice to very ſmall congregations; while thoſe who take the oaths, and pray for his majeſty in expreſs terms, have meeting-houſes. There are alſo the Erſkinites and Gibbonites, ſo called from the miniſters of thoſe names, who have broke off from the church of Scotland, and upon that account they are alſo called Seceders. There are likewiſe Mountaineers, thus named from their preaching in the open fields, and on the mountains; theſe are alſo called Covenanters.

From the government and religion of North-Britain, we ſhall proceed to its trade. The Scots plaids are a manufacture in which they exceed all other nations, both as to colour and fineneſs; they have likewiſe manufactures of various other woollen ſtuffs; but the principal articles are linen cloth, which is greatly encouraged and improved; cambricks, muſlins, ſtriped, flowered, and plain. The ſalt of Scotland, which is principally made in what they call pans or caldrons, is ſaid to be better and ſtronger than that of Shields and Newcaſtle, and cures fiſh to greater advantage; whence it is ſo valued abroad, that great quantities of it are annually exported to Norway, Germany, and the Baltic.

The fiſheries of Scotland are very conſiderable, and of great advantage to the people, particularly that of ſalmon, cod, and herrings, all of which employ a vaſt number of hands, and are barrelled and exported in great quantities to the continent. Indeed Scotland has the advantage of catching herrings ſooner, and curing them at a leſs expence than England: their ſituation for exporting them is likewiſe extremely commodious, ſo that they can be ſooner at market than the Dutch; thoſe belonging to the Glaſgow merchants ſooner arriving on the coaſts of Spain, Portugal, and up the Streights, as the merchants of Dundee, Aberdeen, &c. can ſooner reach the Baltic.

As it was agreed at the Union that the ſubjects of the united kingdom ſhall have free trade belonging to either, to be regulated as in England, the Scots merchants not only trade to all parts of Europe, but to our plantations in America; from whence they bring great quantities of tobacco, ſugar, drugs, &c. and what they do not ſell at home, export to the different countries of Europe.

In ſhort, Scotland is ſaid to have this advantage to boaſt, which neither England nor any nation in Europe has, namely, that in every branch of its trade with other countries, the balance is on its ſide, that is, the Scots ſend out to every country more commodities than they receive back, and conſequently the difference or overplus muſt be made good in ſpecie.

We ſhall now refer our readers for a farther account of Scotland, to the beginning of the account we have given of Great Britain in general, and conclude this ſection with obſerving, that Scotland is divided into thirty-three ſhires, or counties; theſe are the ſhires of Berwick, Haddington, Edinburgh, Roxborough, Selkirk, Peebles, Lanerk, Dumfries, Wigtown, Aire, Dumbarton, Bute, Caithneſs, Renfrew, Sterling, Linlithgow, Perth, Kincardin, Aberdeen, Inverneſs, Nairne, Cromartie, Argyle, Fife, Forfar, Bamff, Kirkcudbright, Sutherland, Clacmanan, Kinroſs, Roſs, Elgin, and Orkney.

SECT. III.

Of Berwickſhire; its Situation, Extent, Diviſions, Soil, Produce, and principal Towns.

THIS county received its name from Berwick upon Tweed, which once belonged to it; but it was originally termed the Mers, or March, from its being the boundary between England and Scotland. It lies to the ſouth-eaſt of all Scotland, and is bounded on the eaſt by the North ſea; on the ſouth by the Tweed and Tiviot-dale; on the weſt by Tweedale, in Peebleſhire; and on the north by Eaſt Lothian, in Haddingtonſhire; extending about thirty miles in length, and containing two preſbyteries, and thirty-five pariſh-churches.

This county is divided into three parts, namely, Mers, Lammermoor, and Lauderdale. The Mers is a pleaſant low ground, open to the influence of the ſun, and guarded from ſtorms by Lammermoor; hence the ſoil is fruitful, abounding with corn and pulſe, but eſpecially hay.

Lammermoor is a tract of hills on the north ſide of the ſhire, above ſixteen miles long, and at leaſt ſix in breadth, which, though to appearance barren, feed multitudes of ſheep and black cattle. In the ſummer ſeaſon it is particularly noted for paſturage, and for affording plenty of moor-fowl, partridges, plover, dotterels, and other game.

Lauderdale is a tract lying on each ſide the water of Lauder, abounding in hills, woods, and pleaſant valleys. It belongs to the crown, and is governed by a bailiff; which office is annexed to the noble family of Lauderdale.

In ſhort, the ſhire of Berwick is in general very fertile in corn and graſs. It abounds with black cattle, ſheep, and horſes. The moſt fruitful and populous parts are thoſe that lie on the Tweed, and the leſſer rivers Whitewater, Black-water, and the Eye. The fuel of the common people is turf and peat, but the gentry have coals from Northumberland.

As the duke of Richmond derives his title of earl of March from the marches or borders of Wales, ſo this county of the Mers, or March, the borders of Scotland, gives title of earl to the noble family of Douglas.

It is obſervable, that on entering the borders of Scotland, the firſt town you reach is almoſt as perfectly Scots, as if you were a hundred miles north of Edinburgh; and there is very little appearance of any thing Engliſh, either in the cuſtoms or habits of the people, or their way of living, eating, or behaviour: nor are there many Engliſh families to be found among them. On the contrary, in the towns of Northumberland and Cumberland, next to Scotland, there are abundance of Scotſmen, Scots cuſtoms, words, and habits.

We ſhall now deſcribe the principal towns in this ſhire.

Duns, a burgh famous for giving birth to that celebrated ſchoolman John Duns Scotus, who was born in 1274, became the greateſt ſcholar of that age, and was ſtiled The ſubtile doctor. It is ſeated twelve miles to the weſt of Berwick upon Tweed, and is a pretty large populous town, which has the beſt trade of any in the county.

county. It ſtands on a riſing ground in the center of the ſhire, and is the ſeat of a preſbytery, to which belong eleven pariſhes. Its market is ſaid to be the beſt in all Scotland for horſes, cows, and ſheep.

Coldingham ſtands near the coaſt, and is famous for an ancient abbey, built about the year 1100, the remains of which are uſed for a pariſh church. Ebba, its lady abbeſs, on there being a Daniſh invaſion, ſlit her noſe, cut off her upper lip, and perſuaded all her nuns to do the ſame, that their deformity might prevent their being raviſhed by the Danes; upon which thoſe barbarians were ſo exaſperated, that they fired the nunnery, and burnt them all alive. This abbeſs was afterwards ſainted, and a neighbouring promontory is from her called St. Ebba's-head, and by the ſailors St. Tabbe's. In the adjacent moor there is not a hedge or tree to be ſeen for the ſpace of eight miles.

Greenlaw, the chief burgh of the ſhire belonging to the earl of Marchmont, ſtands about five miles from Duns; and in its neighbourhood that nobleman has a fine ſeat.

Lauder, an ancient royal burgh, the capital of Lauderdale, is pleaſantly ſeated on a river of the ſame name, which runs through it, twenty-two miles to the ſouth of Edinburgh. It has a bridge over the river, is the ſeat of the commiſſariot, and has a good market.

From the long valley of this name on both ſides the river Lauder, the family of Maitland takes the title of earl; and there is a ſtately ſeat on the river, in the neighbourhood of the town, called Lauderforth, which belongs to the earl of Lauderdale.

SECT. IV.

Of Haddington, or Eaſt Lothian; its Situation, Extent, Produce, and principal Places.

THIS ſhire is bounded on the north and eaſt by the Firth; on the ſouth by the hills of Lammermoor, in Berwickſhire; and on the weſt by Mid Lothian, or Edinburghſhire. According to ſome authors it is only thirteen, and according to others twenty-two miles in length, and twelve in breadth.

Eaſt Lothian produces corn of all ſorts, and has plenty of graſs, coal, and limeſtone, with ſome conſiderable woods. It feeds a great number of ſheep, eſpecially about the hills of Lammermoor and by Weſt Lammerlow; and from the weſt part to the ſea it abounds with rabbits. A great deal of ſalt is made here, and there was a conſiderable manufacture of broad-cloth made by Engliſh workmen, and with Engliſh wool; but after the Union the Engliſh clothiers poured in ſuch quantities of cloth, that they underſold the Scots, and thus the manufacture was dropt; yet the people employ themſelves in ſpinning, dying, weaving, &c. Here are ſeveral convenient harbours, with the advantage of ſome fiſhing-towns; and particularly there is every year a herring fiſhery after Lammas at Dunbar, where they take enough both for home conſumption and exportation.

The principal towns in this ſhire are Haddington and Dunbar.

Haddington, or Hadina, the ſhire town, is a royal burgh, pleaſantly ſeated on the Tyne, over which it has a handſome bridge with three large arches. It ſtands eighteen miles to the weſt of Edinburgh, and is pretty large, well built, with ſome very good houſes; the ſtreets are well paved; it has a good market, and is the ſeat of a preſbytery, conſiſting of ſixteen pariſhes. Here are the remains of an ancient nunnery, and of a good church built of hewn ſtone, to which adjoins the chapel of the family of Lauderdale, with theirs and other very noble tombs, but the choir of the church is pulled down. This town gives title of earl to a branch of the noble family of Hamilton, which has large poſſeſſions and fine ſeats in the neighbourhood. No place in Scotland is ſurrounded with more little towns and houſes of the nobility and gentry than this; among which Yeſter, the manſion-houſe of the earl of Tweedale, deſerves particular notice.

There is here a noble plantation of fir-trees, which is ſaid to take up ſix thouſand acres. The park itſelf is about ſix miles round, and encompaſſed by a very handſome wall. This noble palace ſtands about half a mile from the park-gate, to which you go by a paved coach-way through a thicket. The building is of free-ſtone, a hundred and twenty feet in front, and ſixty feet deep, with a pavilion or wing. The offices under ground are very noble and vaulted, with paved galleries of communication. There is an aſcent to the houſe of ſix or eight ſteps, which lead to a large hall thirty-ſix feet high; behind it is a ſaloon from the garden of the ſame height, and at the top is a gallery for muſic, which opens into both, exactly as at Blenheim-houſe, near Woodſtock. The rooms of ſtate, which run on each ſide of this ſaloon fronting the garden, are very noble and of an exact ſymmetry. A mathematical ſtone ſtaircaſe, with an iron baluſtrade, leads up to the apartments above.

The garden behind the houſe is very ſpacious, riſing up by an eaſy aſcent to the park. In the middle of the parterre is a handſome baſon with a jet d'eau, and four good ſtatues, one at each corner. There are abundance of ever-greens, and green ſlopes; and to the weſt of the garden, on an artificial mount, is a pleaſant ſummer-houſe. The green-houſe joins the pavilion to the weſt, as does the laundery to the eaſt. A pretty large ſtream runs by the houſe, and from its murmuring as it paſſes through the thick groves in the park, gives the whole a very rural appearance. By the river ſide is a pretty bowling-green. The coach-houſes, ſtables, and hen-houſe are at a diſtance in the park, as is the cuſtom at the ſeats of the nobility in Scotland: for every nobleman's houſe has what is called the Mains, where their labourers, grooms, and every body belonging to the ſtables and poultry reſide.

Dunbar, a royal burgh, is ſeated on the ſouth ſide of the mouth of the river Firth, where is a good harbour, twenty-five miles to the eaſt of Edinburgh. The town is handſome and well built; the houſes, as in moſt of the principal towns, being all of ſtone covered with ſlate. It has been defended by a ſtrong wall, which is now decayed; and on the oppoſite ſide of the haven are the ruins of a caſtle, almoſt covered with the ſea at high tide: it was once remarkably ſtrong, and was the ſeat of the earls of March, afterwards ſtiled earls of Dunbar. This fortreſs was often won by the Engliſh, and as often recovered by the Scots; but was demoliſhed in 1656 by order of the commonwealth, to prevent its affording a retreat for the royaliſts. The port is very conſiderable, and of great advantage to all ſhips in the river, in caſe of ſtreſs of weather. The inhabitants have here a very conſiderable herring-fiſhery, and alſo one for whales.

Between the town and the great road ſtands a pleaſant and agreeable ſeat of the duke of Roxborough, called Broxmouth. It is ſeated in the middle of a fine park, planted with large groves of trees between the building and the ſea, and conſiſts of a body and two wings, between which is a fine paved court; before the building is a good avenue, and behind is a ſpacious parterre adorned with ſtatues.

From the town of Dunbar to Edinburgh the country may be reckoned as fruitful, rich, and pleaſant, as any in Scotland, or indeed as moſt in England. The ſea is on the eaſt at a moderate diſtance, and the hills on the weſt are ſtill farther off; theſe feed large flocks of ſheep, and have many open roads over them leading towards England.

SECT. V.

Of Mid-Lothian, or Edinburghſhire; its Situation, Extent, and Produce; with a Deſcription of Edinburgh, and of the other Places worthy of Notice; with an Account of the Iſland of Baſs, and of the Solan Geeſe which reſort thither.

THIS is the principal county in North Britain, both on account of its fertility and its containing the capital. It is bounded on the eaſt by Eaſt Lothian for thirteen miles together; on the ſouth-eaſt by Berwick-

ſhire

ſhire for about four miles; on the ſouth by the ſhire of Selkirk and Tweedale, in Peebleſhire, for thirteen miles; on the ſouth-weſt by Lanerkſhire for ſix or ſeven miles, and by the ſame on the weſt for two miles; on the north-weſt by Linlithgowſhire for fourteen miles; and on the north by the Frith, or Forth, for eight miles: extending about twenty-one miles in length, and in ſome places ſixteen or ſeventeen in breadth; but in others not above five or ſix.

Mid-Lothian is ſo fertile that it yields a great deal of corn of all ſorts, with good paſture for cattle, and is provided with all neceſſaries in abundance, particularly coals, limeſtone, and a kind of ſoft black marble; and near the water of Leith, ſome miles diſtance from Edinburgh, is a copper mine.

Edinburgh, the metropolis of North Britain, is ſituated in the fifty-fifth degree fifty-ſeven minutes north latitude, and in the ſecond degree fifty-five minutes weſt longitude; fifty-four miles weſt-north-weſt of Berwick upon Tweed, ſeventy-two north of Carliſle, two hundred and one north-north-weſt of York, and three hundred and ninety-three miles north-north-weſt of London. It is a city and county of itſelf, and was formerly the royal ſeat of the kings of Scotland. In this city alſo the parliaments were held, as are ſtill the ſupreme courts of judicature. It ſtands two miles to the ſouth of the port of Leith, and is ſeated upon the ſide of a high hill, or rather a narrow ridge. At the extremity of the eaſt end of the city is the palace of Holy-Rood-houſe; leaving which a little to the left, you come through a populous ſuburb to the entrance, called the Water-port, and from hence proceeding to the weſt, the ſtreet goes on in a ſtraight line, through the whole city, to the caſtle, extending above a mile in length; and is, perhaps, the largeſt, longeſt, and fineſt ſtreet for buildings and the number of its inhabitants in the world. From the gate of the palace, which ſtands on a level with the plain country, the ſtreet begins gradually to aſcend; but is no where ſteep; yet the aſcent being continued ſo far, the upper part muſt neceſſarily be very high; for the caſtle, which ſtands at the extremity weſt, as the palace does eaſt, has on every ſide, except on that which joins it to the city, very ſteep and frightful precipices. The ſtreet is extremely well paved; but the ridge or top of the aſcent is ſo narrow, that the ſtreet and the row of houſes on each ſide take up the whole breadth; ſo that which way ſoever you turn, you immediately go down a ſteep deſcent; and theſe ſide lanes are called wynds. The houſes are very large, and ſome of them ſo lofty, eſpecially in the High-ſtreet, that five or ſix ſtories are but an ordinary height. Moſt of the houſes being parted into tenements, they have as many landlords as ſtories. The fronting of houſes with timber is now prohibited, on account of the many fires that have happened; and about eighty years ago the inhabitants were at the expence of bringing one of the beſt ſprings in Scotland into the city, by leaden pipes laid from a hill at three miles diſtance.

We ſhall now conſider more particularly the buildings of the city. The royal palace, called Holy-Rood-houſe, from its being originally an abbey of that name, was firſt converted into a palace by king James V. and rebuilt by king Charles II. all but two towers on the north ſide of the entrance. It is a magnificent ſtone building in the form of a ſquare, adorned with the ſeveral orders of architecture, and divided into four courts. The entrance is very grand, and over the gate is a large apartment, which the duke of Hamilton claims as hereditary keeper of the palace. Within this entrance is a large irregular court, where are coach-houſes and ſtables. The entrance from the great outer court is adorned with columns, which ſupport a cupola in the form of an imperial crown, baluſtraded on each ſide at the top. The inner court is very magnificent, and has piazzas all round, which lead into very noble apartments, richly furniſhed; among which is a gallery ſaid to be adorned with the pictures of all the kings of Scotland, from Fergus their firſt king, three hundred and twenty years before the birth of Chriſt, to the Revolution. This palace is encompaſſed by beautiful gardens.

From the palace-gate weſtward the ſtreet is called Canongate, from the canons of the abbey formerly reſiding there. This is a kind of ſuburb, in which are ſeveral magnificent houſes of the nobility, with ſpacious gardens behind them. The city is parted from this ſuburb by the Nether-bow-port, or gate, which was rebuilt in 1716, and adorned on both ſides with towers, and a ſpire at the top. The city is encloſed on all ſides, except towards the north, with a wall, where it is ſecured by a lake; and has ſix gates beſides that juſt mentioned.

The great church, which was the cathedral, is a large and ſtately ſtructure, in the form of a croſs, now divided into four churches; here alſo the magiſtrates aſſemble, and the judges in their habits in time of ſeſſion. In a large chapel in the ſouth-weſt part of this church the general aſſembly hold their ſeſſions, as does alſo the commiſſion of the aſſembly, in the interval between the general meetings. This ſtructure is adorned with a very high ſteeple, the ſummit of which reſembles an imperial crown. Here they have a ſet of bells which are not rung as in England, for that is a manner of ringing unknown in this country; but all manner of tunes are played very muſically upon them, and the city gives a man a yearly ſalary for playing upon them, from twelve to one every day, Sundays and holidays excepted. The four churches in this ſtructure, with the reſt, and the chapel in the cathedral, make twelve in all. There are alſo about twenty meeting-houſes of the epiſcopal party.

On the ſouth ſide of the great church is a ſquare of very fine buildings, called the Parliament-cloſe; the weſt and ſouth ſides of which are moſtly taken up with the parliament-houſe, the ſeveral courts of juſtice, the council-chamber, the exchequer, the public regiſters, the court for the royal burghs, the lawyer's library, the poſt-office, &c. The eaſt and part of the ſouth ſide is built into private dwellings, which are magnificent and lofty, they being ſeven ſtories high to the front of the ſquare; and the hill they ſtand on having a very ſteep deſcent, ſome of them are backwards no leſs than fourteen ſtories high. In the middle of this ſquare is an equeſtrian ſtatue of king Charles II.

The caſtle, which, as hath been already ſaid, is ſeated at the weſt end of the city, is inacceſſible on the north, weſt, and ſouth; and the entrance from the city is defended by a round battery, and an out-work at the foot of it. In this ſtructure is a royal palace, magnificently built with hewn-ſtone, in which are kept the regalia and the records of ſtate. Here alſo is the magazine for the arms and ammunition of the public; and there are deep vaults in the rock, which are ſaid to be bomb-proof. It is furniſhed with water by two wells in the rock; and has a chapel for the uſe of the garriſon. The governor is always a perſon of the firſt quality, and general of the forces; and both he, the lieutenant-governor, foot-major, and other officers, have very handſome apartments. From the caſtle is a delightful proſpect over the city and neighbouring country.

Near the Potter-row-port ſtands the college, or univerſity, which conſiſts of three courts, two lower and one higher, equal to the other two. Theſe courts are encompaſſed with neat buildings, for the uſe of thoſe ſtudents who chooſe to lodge in them; for they do not reſide together nor live in common, but only attend their claſſes at certain hours. The public ſchools are large and commodious, with accommodations for the ſtudents, handſome dwellings for the profeſſors, and fine gardens for their recreation. This univerſity was founded in 1580 by king James VI. who eſtabliſhed there a primate, or principal, a profeſſor of divinity, four regents, or maſters of philoſophy, a profeſſor of philology, and a regent of humanity. In 1640 the town added a profeſſor of mathematics; to which have been lately added profeſſors of eccleſiaſtical hiſtory, civil law, theoretical and practical medicine, chemiſtry, &c. They have a good library, which is kept in great order, the books given by its benefactors are kept by themſelves, and over them is the donor's name in letters of gold; and above the books hang the pictures of ſeveral princes, with the moſt eminent reformers at home and abroad. Here is alſo a noble muſeum, in which is contained a prodigious number of curioſities both of art and nature. Under the library is a royal printing houſe, where they are chiefly employed in printing Bibles.

The phyſicians, who were incorporated in 1682 by king Charles II. have their college in Fountain-cloſe, near the Netherbow. They are deſervedly eſteemed for their learning and abilities, in which they are at leaſt equal to the phyſicians of any other country. They have a noble muſeum, called from its founder, Sir Andrew Balfour, M. D. Muſeum Balfourianum; and on the north ſide of the city they have a neat phyſic garden, containing ſome thouſand exotic plants.

On the ſouth ſide of the city is a large building belonging to the ſurgeons and apothecaries, in which is a ſpacious hall hung round with the pictures of all the eminent ſurgeons of Edinburgh that have flouriſhed ſince this building was founded. They have a theatre for diſſections, and a muſeum, in which are the ſkeletons of uncommon animals, a mummy, and other curioſities.

In this city are ſeveral hoſpitals, the chief of which is Heriot's, a large and beautiful building, ſaid to be the moſt magnificent of the kind in the world. It is an exact ſquare, with piazzas all round the inſide. At the corners are ſquare towers, adorned with little turrets. This is a nurſery for an indefinite number of the ſons of freemen, who are maintained, cloathed, and educated in uſeful learning, till they are fit to be put out apprentice, or to go to the univerſity, where they are allowed handſome ſalaries. The gardens, which conſiſt of a flower-garden, kitchen-garden, and orchard, are kept in great order, and, with the houſe, contain between nine and ten acres.

There are here alſo St. Thomas's hoſpital, in which old decayed citizens and their widows are maintained, and have their own chaplain; and a maiden hoſpital, a neat building cloſe to the college, founded and endowed for the relief and education of the female orphans of decayed freemen. Another hoſpital of the ſame kind has been lately founded by the tradeſmen and artificers of Edinburgh.

A royal infirmary has likewiſe been erected here, after the example of thoſe of London, Bath, &c. by the liberal contribution of many well diſpoſed perſons; to this work the proprietors of quarries contributed ſtone and lime, the merchants timber, the farmers engaged to carry materials gratis, and even the journeymen maſons and labourers contributed a certain portion of their labour.

The city is governed by a provoſt, whoſe office is much the ſame with that of the lord mayor of London; four bailiffs, who, beſides the power of aldermen in the government of the city, have that of ſheriffs; there is alſo a common-council, which uſually conſiſts of twenty-five perſons, but on extraordinary occaſions of thirty-eight. All theſe are choſen annually; and the provoſt, dean of guild, and treaſurer, are to be merchants; or if any inferior tradeſman be choſen, he muſt quit his trade, and not return to it without leave of the magiſtrates and town-council.

There are fourteen incorporated trades, each of which has its deacon, or maſter of the company; theſe are the ſurgeons, goldſmiths, ſkinners, farriers, hammermen, wrights, maſons, taylors, bakers, butchers, cordwainers, weavers, wakers, or fullers, and bonnet-makers. But none of the merchants or traders are to make any by-laws, without the conſent of the magiſtrates and town-council, except to chooſe their own deacons at the appointed time, to make perſons free of their trade, or to try their work.

The trained-bands of the city conſiſt of ſixteen companies; beſides which they have a ſtanding company of town-guards.

There is in Edinburgh a very uſeful kind of blackguard boys, who attend at taverns, coffee-houſes, and other places to go on errands, and know every body of any note in the town. Though they are in rags, and lie every night in the ſtreets, or upon the ſtairs of the houſes, yet they are conſiderably truſted, and ſeldom prove unfaithful. They are ſubject to a kind of magiſtrate, called the conſtable of the cawdies, who generally puniſhes them for any neglect or miſdemeanor by a fine of ale or brandy; but ſometimes corporally. Moſt of them are very acute, and execute whatever employment is aſſigned them with great ſpeed and addreſs.

Now leaving Edinburgh, we ſhall take a view of the other places in this county moſt worthy of notice.

Leith, which is the port of Edinburgh, is a large flouriſhing town in the fifty-fifth degree fifty-eight minutes north latitude, and in the ſecond degree fifty-nine minutes weſt longitude, two miles to the north of Edinburgh. It lies on the firth of Forth, upon a river called the Water of Leith, which falls into the firth on the weſt ſide of the town. The river runs through the middle of the town, and over it is a ſtately ſtone bridge of one large arch, to which ſhips of burthen may come, and at high-water lay their ſides cloſe to the ſhore. Here is a very fine quay, well wharfed with ſtone, and fenced with piles. At the mouth of the harbour is a very long and well built pier, which runs out a great way beyond the land, and prevents the entrance of the harbour being filled with ſand. It is alſo ſecured by ſtrong ranges of piles, or counter-piers; and a beacon or maſt is ſet up at low-water mark, for the convenience of navigation. The buildings on the ſouth ſide oppoſite to the water are very lofty and handſome, they being generally about ſix ſtories high, with large ſaſh windows. Here are commodious cellars and ware-houſes for laying up goods, the merchants of Edinburgh having the bulk of all their commodities here in order to be ready for carriage either by land or ſea: ſo that Leith is very properly called the ware-houſe, as well as the port of the city. Here are likewiſe glaſs-houſes and ſaw-mills.

North Leith, which lies on the other ſide of the harbour, has docks for building and repairing of ſhips; with the ruins of a citadel built by Oliver Cromwell, and in part demoliſhed by Charles II. The citizens of Edinburgh often come to Leith in coaches, or a-foot, for a walk on the mole, or other recreations; and at the numerous inns are good accommodations, at a reaſonable rate.

Dalkeith is a pretty large and pleaſant town, defended by a caſtle; it ſtands at the confluence of the two rivers Eſk, ſix miles to the ſouth-eaſt of Edinburgh, and is the ſeat of a preſbytery that contains ten pariſhes. Here is a noble palace built by the late ducheſs of Buccleugh; this is ſaid to be the model of that which belonged to king William at Loo, in Guelderland, only this is of ſtone and that of brick. It ſtands on a riſing ground by the North Eſk, and commands the view of a large park, beautified with a canal and water-works. The front is adorned with columns of the Corinthian order, and it has a double wing at each end. Between the palace and park is a ſpacious court, ſurrounded with iron baluſtrades between pillars of free-ſtone. The grand ſtaircaſe of the houſe is ſupported by marble columns, and every ſtair curiouſly inlaid with walnut-tree. This ſtaircaſe leads into a noble room adorned with the pictures of all the beauties of the age, at whole length, in pannels. The offices of the palace join to the town.

We ſhall conclude this ſection with a deſcription of the iſland of Baſs, which ſtands within the Forth, about a mile from the ſouth ſhore, forty-five miles to the eaſt of Edinburgh. It is about a mile round, and is on every ſide a ſteep rock, itbeing only acceſſible by one at a time. It riſes high above the ſea in the form of a cone. At the top was a fort mounted with cannon; but ſince the Revolution it has been neglected. In the lower part the force of the tide has worn a hole almoſt through.

This rock is reſorted to in May and June by incredible flocks of fowls, and then the ſurface of it is almoſt covered with their neſts, eggs, and young birds. The beſt taſted of theſe different ſorts of wild-fowl is the Solan geeſe. Before theſe birds come it is ſaid they ſend ſome before to fix their manſions, for which reaſon they are called ſcouts. The inhabitants take care not to diſturb them till they have built their neſts, after which no noiſe will fright them. They lay but one egg in a year, and fix it ſo dexterouſly to the rock by one end, that if it be removed it is impoſſible to fix it again. They are ſaid to hatch it with their foot, and ſcarce leave it till that be done. They are of an aſh colour, but the old ones are all white. Their neck reſembles that of the crane, and they have a ſtrong ſharp bill, between three and four inches long, which they ſtrike through their prey with ſuch

ſuch violence, that it often ſticks ſo faſt in a board baited with a herring, that being unable to pull it out again, they are taken. They leave this place in September, but whither they retire in winter is unknown. People make great profit of the young ones, which are taken from their neſts by a man let down the rock with a rope. When they come to be as big as ordinary geeſe they are very good meat, and yield a conſiderable profit by their fleſh and feathers, which are uſed for beds.

SECT. V.

Of the Shire of Roxburgh, Roſsburgh, or Teviotdale; its Situation, Extent, Diviſions, Face of the Country, Produce, and principal Places.

THIS is a ſheriffdom hereditary in the family of Douglas, by the title of ſheriff of Teviotdale, it being thus called from the river Teviot running through it. It is bounded on the eaſt by Northumberland, on the ſouth-eaſt by part of Cumberland, on the ſouth and ſouth-weſt by Anandale, and on the weſt by Tweedale; extending thirty miles in length from eaſt to weſt, and fifteen in breadth. It is divided into Teviotdale, Liddeſdale, and Euſdale, or Eſkdale, and has three preſbyteries, to which belong twenty-five pariſhes; and, with the Mers, makes up a provincial ſynod of ſix preſbyteries and ſeventy-one pariſhes.

This diſtrict has many mountains, of which the moſt famous is Cockraw, from whence runs a chain of hills weſtward, dividing Scotland from England, and in many places impaſſable; ſome of them are very high, but furniſhed with excellent graſs, and have plenty of lime and free-ſtone. In ſhort, this country produces good corn, particularly oats, great quantities of which are ſent from hence to England: it has alſo excellent paſturage, and abounds with large black cattle, ſheep, and horſes.

The principal towns in this ſhire are Kelſo and Jedburgh.

Kelſo, which is a burgh of barony, is a large and very handſome town, pleaſantly ſeated by the river Tweed on the borders of England, two hundred and fifty-ſix miles to the north-north-weſt of London. It is the ſeat of a preſbytery, and a great thorough-fare from Edinburgh to Newcaſtle. It has the beſt trade of any town in this part of the country, and has a very good market kept in a large ſquare of handſome houſes: it has alſo ſome good ſtreets, and a pariſh-church, that is the remains of an abbey of Ciſtercian monks. The duke of Roxburgh, who is ſtiled lord of the town, has a houſe in it, and a noble ſeat called Fleurs, with pleaſant gardens, near the influx of the Teviot into the Tweed.

Jedburgh is a royal burgh, ſeated near the confluence of the Tefy and the Jed, from whence it takes its name, thirty miles from Edinburgh. It is a pretty large town, well inhabited, and the ſeat of a preſbytery. It has a handſome church and town-hall, where the ſheriff keeps his courts; with a good market for corn and cattle. It gives title of lord to the eldeſt ſon of the marquis of Lothian; and many perſons of quality have ſeats in its neighbourhood.

The town of Roxburgh, which gives title of duke to the chief of the noble family of Ker, was antiently a royal burgh; but in the wars between England and Scotland its caſtle was razed, the town ruined, and its royalty tranſmitted to Jedburgh.

Melroſs, or Mailroſs, ſtands on the Tweed about nine miles from Jedburgh, and is the ſeat of a preſbytery and a royalty belonging to the earl of Haddington. An abbey was founded here in 1136, and poſſeſſed by the Bernardine monks, and appears by its ruins to have been one of the nobleſt abbeys in Europe: the window over the great gate of the abbey, which is ſtill intire, is larger that that of York minſter, and round the top are the ſtatues of our Saviour and the twelve apoſtles. The choir of the church, which is ſtill viſible, is a hundred and forty feet long.

SECT. VI.

Of the Shire of Selkirk; its Situation, Extent, Produce, and a conciſe Deſcription of the Town of Selkirk.

THIS county is bounded on the north by Tweedale, in Peebleſhire, and Mid-Lothian; on the eaſt and ſouth by Teviotdale, in Roxburghſhire; on the weſt by Teviotdale, and part of Anandale, in the ſhire of Dumfries. According to Cambden its diameter is ſixteen miles every way; but, according to others, it extends twenty-two miles in length, and only ten where broadeſt.

This county is alſo called the ſheriffdom of Ettric foreſt, from the river Ettrick, which runs through it, and is one of the principal rivers in the country; its other rivers moſt worthy of notice are the Yarrow and the Gallo-water.

The hills in Selkirkſhire feed great herds of black cattle and flocks of ſheep, with which the inhabitants carry on a good trade to England, and the meadows on the banks of the rivers produce corn and hay. It is ſaid that in Glangebar-water in this county, and in other places, pieces of gold have been found in the ſhape of birds eyes and eggs. Here are ſeveral gentlemen's ſeats, and the chief families are the Pringles, Scots, and Kers.

Selkirk, which gives name to the ſhire, is a royal burgh on the banks of the river Ettrick, thirty-three miles to the ſouth of Edinburgh, and gives title of earl to a branch of the noble family of Hamilton. It is the ſeat of a preſbytery, which has eleven pariſhes under its juriſdiction, and here the ſheriff keeps his court. The town has a handſome pariſh-church, a weekly market, and ſeveral fairs. The chief employment of the inhabitants is the making of boots and ſhoes.

In this ſhire are likewiſe Philiphaugh and Gallaſhields, each of which has a weekly market.

SECT. VII.

Of Peebleſhire, or Tweedale; its Situation, Extent, Air, Mountains, Lakes, and Rivers; with a Deſcription of the Town of Peebles.

THE ſhire of Peebles is called alſo Tweedale, from the river Tweed, which riſes at a place called Tweed's-croſs, and runs from weſt to eaſt through this country. Peebleſhire is bounded on the eaſt by the ſhire of Selkirk; on the ſouth by Anandale, in the ſhire of Dumfries; on the weſt by Clydſdale; and on the north by Mid-Lothian; extending about twenty-eight miles in length, and eighteen where broadeſt. It contains ſeventeen pariſh-churches, which are all included in the preſbytery of Peebles.

It enjoys a temperate and clear air. It is generally ſwelled with hills, many of which are as verdant as the downs of Suſſex, and intermixed with pleaſant vallies, fruitful in corn and graſs. The chief mountain here is Braidalb, from whence may be ſeen the ſeas on both ſides of the iſland. This ſhire has plenty of limeſtone; the grain is chiefly oats and barley: the inhabitants have black cattle, milk, cheeſe, and butter. The ſheep feed in vaſt flocks on the hills, and are much prized both for their fleſh and wool.

Several rivers which fall into the Tweed ſupply the country with plenty of ſalmon; and a lake, called the Weſt Water-loch, ſo abounds with eels, and other fiſh, in the month of Auguſt, that, during the weſt wind, they are ſaid to enter the river Yarrow, which runs from the lake, in ſuch ſhoals, that they are ready to overturn the people who go in to catch them. There is another lake called Lochgenen, from its being ſeated on a hill named Genen, and from it a river runs that falls from a precipice into Anandale, the height of two hundred and fifty paces, ſo that fiſh are frequently killed by the fall of the water.

The only town of note here is Peebles, a royal burgh and market-town, ſeated in a very pleaſant plain on the

banks of the Tweed, over which it has a ſtone bridge of five arches, and near a river of its own name, upon which it has two bridges. It ſtands twenty-two miles to the ſouth of Edinburgh, and was formerly remarkable for its three churches, three gates, three ſtreets, and three bridges; but the town is at preſent ſmall, not very well built or inhabited, though it has ſome good houſes, as well as a handſome pariſh-church, and is the ſeat of a preſbytery.

SECT. VIII.

Of the Shire of Lanerk, or Clydſdale; its Name, Situation, Extent, Diviſions, Rivers, and Produce; with a particular Deſcription of the City of Glaſgow, and the other Places worthy of Notice.

THIS ſhire, which is called Lanerk from its ſhire town, and Clydſdale from the river Clyde, is bounded on the eaſt by the ſhire of Linlithgow; on the ſouth-eaſt by Anandale; on the ſouth by Dumfrieſshire; on the ſouth-weſt by that of Aire; on the north-weſt by that of Renfrew; on the north by that of Dumbarton; and on the north-eaſt by Sterlingſhire. It is generally reckoned forty miles in length, about twenty-four where broadeſt, and ſixteen in the narroweſt part. It is divided into two wards, the Upper and Nether ward; the one called the ſhire of Lanerk, and the other the barony of Glaſgow: the one hilly, heathy, and fit for paſture; and the other level, and proper for corn.

The river Clyde, which runs through this ſhire into its own firth, ariſes in Errick-hill, in the Upper ward; and from the ſame hill riſe the river Anan, which runs into the Iriſh ſea, and the Tweed, which near the mouth of the firth falls into the German ocean.

This is a pleaſant fruitful country, and, though in ſome places mountainous and in others woody, is well inhabited, eſpecially near the Clyde. It abounds with coal and limeſtone, and has ſome profitable lead mines; gold has alſo been found in great quantities, though it does not appear that any of that valuable metal is ever found at preſent; and abundance of lapis-lazuli is dug up there, particularly in Crawford-moor.

The principal places in this ſhire are the following:

Glaſgow, the ſecond city in Scotland, is pleaſantly ſeated on the ſide of a hill ſloping to the river Clyde, in the fifty-fifth degree thirty two minutes north lat. and in the fourth degree five minutes weſt longitude, thirty-five miles to the weſt of Edinburgh. It has a noble and beautiful ſtone bridge over the river, which ſometimes overflows its banks; and as one third of the city lies in a flat next the river, it is then overflowed. In the centre of Glaſgow is the Tolbooth or town-houſe, a very magnificent ſtructure of hewn ſtone, lately rebuilt, with noble apartments for the magiſtrates, and a very lofty tower, with bells which chime every hour. From this town houſe and the adjacent market place run the four principal ſtreets of the city in the form of a croſs, dividing the city into four equal parts, each adorned with ſeveral public buildings, and each ſaid to be larger and finer than any one ſtreet in London; the houſes being uniformly built of free ſtone, ſix ſtories high, and ſome more: they are for the moſt part adorned with columns of the Doric order, have beautiful piazzas, and are well ſaſhed. From the centre the whole city may be ſeen; and the ſtreets are ſpacious, ſtraight, and well paved.

In the higher part of the city, and at the end of one of the ſtreets, ſtands the cathedral, a vaſt pile dedicated to St. Mungo, who was biſhop here about the year 560. It is divided into two churches, one over the other, called the upper and lower; and its ſeveral rows of pillars and exceeding high towers, with the tall ſpire, the higheſt in Scotland, riſing from one of the towers, ſhew the extraordinary ſkill of the architect. Here are five other very good churches, all of them neatly built, with handſome ſteeples. Beſides theſe places of worſhip there are convenient apartments for the meeting of the preſbytery, which conſiſts of nineteen pariſhes, and for the provincial ſynod, which conſiſts of 127.

Near the cathedral is a ruinous caſtle, which in the time of Epiſcopacy was the palace of the archbiſhop, who was lord of the city, and gave it its firſt charter. It is fenced in with a very high wall of hewn ſtone, and has a fine proſpect of the whole city.

The glory of the city is its univerſity, which indeed conſiſts of only one college; but it is by far the beſt, the moſt ſpacious, and the fineſt built in Scotland. It conſiſts of two large ſquares of noble and lofty ſtone buildings, adorned with a high tower, and many fine turrets, and is ſeparated from the reſt of the town by a very high wall. The front towards the city is a noble piece of architecture. This univerſity was founded by king James I. in 1453. By the firſt foundation it was under the government of a rector, a dean of the faculty, a principal or warden, who was to teach theology, three profeſſors of philoſophy, and afterwards ſome of the clergy taught the civil and canon law. King James VI. granted it a new charter, and in 1617 eſtabliſhed a principal, three profeſſors of philoſophy called regents, four purſers, a ſteward or ſurveyor to furniſh the table, &c. and ſeveral of the ſucceeding kings ratified its privileges, and were benefactors to the univerſity. The library is furniſhed with many curious printed books and valuable manuſcripts. The precincts of the college are enlarged by ſome acres of ground, purchaſed by the king and parliament; theſe are converted into well planted walks and gardens, one of which is for medicinal plants. The univerſity makes uſe of the ſame arms as the city, which are a ſalmon with a gold ring in its mouth; an oak, with a red bird upon it, and a bell. The ſcholars wear ſcarlet gowns, and here lodge in the college, which at Edinburgh they do not. The principal, regents, and maſters, have all handſome apartments, and good ſalaries.

Though the river is navigable for ſmall veſſels up to the town; yet New-Glaſgow at the mouth of the Clyde, is the harbour for all thoſe that are of conſiderable burthen, it having a good quay and a cuſtom houſe for all the coaſt; ſhips are alſo laid up here and refitted, and the goods are brought from thence to the city in lighters. The merchants of Glaſgow annually ſend about fifty ſhips to Virginia, New England, and other Engliſh colonies in America. They have alſo a very conſiderable trade in herrings, which they export to Spain and Portugal. The city has likewiſe a manufacture of plaids and muſlins. It gives title of earl to the honourable family of Boyle; and in this city has been lately erected a noble foundation under the name of the Glaſgow charitable marine ſociety, in order to provide for ſuch ſeamen as ſhall become old and diſabled in the merchants ſervice, and to afford relief to their widows and children.

Hamilton is ſeated near the confluence of the Avon and Clyde, eleven miles to the ſouth-weſt of Glaſgow, and is a well built town, with a bridge over the Avon, and a handſome pariſh church. It is larger than moſt of the royal burghs, and the houſes, which are built with free ſtone, are ſupported on pillars: but its principal ornament is the noble ſeat of the duke of Hamilton, which has a magnificent front intirely of free ſtone, adorned with different orders of architecture, and very deep wings. The apartments are truly noble, and the pictures, furniture, and other decorations, are exquiſitely fine. The offices of this ſtructure join the town; it has a very beautiful garden, conſiſting of ſeven terrace walks down to the river ſide; with a wood on the oppoſite ſide. In ſome of the walks are grottos and banquetting houſes. The great park is about ſeven miles in compaſs, and well planted with lofty oaks, firs, pines, &c. It is walled round with ſtone, and ſtocked with deer. The leſſer park is alſo well planted with trees.

Lanerk is a royal burgh in the diviſion called the Upper ward; it is ſituated on the Clyde, nine miles to the ſouth-weſt of Hamilton, and is the ſeat of a preſbytery which conſiſts of thirteen pariſhes.

It has a remarkable bridge, built by the inhabitants at a great expence; but was ſubject to ſuch frequent repairs on account of the rapid current of the water, that they have been obliged to obtain an act for making all who paſs over it pay a ſmall toll.

A little below the town the river Douglas falls into the Clyde, and gives the name of Douglaſdale to the lands near it. In a vale near this river ſtood a very old caſtle, which had been the paternal ſeat of the family of Douglas for above a thouſand years: but though the apartments were very fine, the frequent additions to the building rendered the whole ſuch an irregular maſs, that at a diſtance it rather reſembled a little town than a ſingle ſtructure; but in December 1758 this ancient caſtle was conſumed by a fire which began in a room where nobody ſlept, and was got to ſuch a height before it was diſcovered, that it was impoſſible to prevent its progreſs; whence the family, who were waked out of their ſleep, with difficulty ſaved their lives, but moſt of the fine paintings and valuable furniture were deſtroyed.

SECT. X.

Of Dumfries-ſhire, including Annandale and Nithſdale; its Situation, Extent, Rivers, Produce, and principal Towns.

DUMFRIES is bounded on the north by part of Clydſdale, Tweedale, and Teviotdale; on the weſt by Teviotdale, and Eſkdale; on the ſouth by Solway firth; and on the weſt by Galloway and Kyle; extending about thirty-five miles in length, and thirty-four in breadth.

Annandale, which ſignifies the dale or valley on the river Annan, lies in the eaſt part of the ſhire between Nithſdale on the weſt, and Eſkdale on the eaſt; extending twenty-four miles in length, and fourteen in breadth. The river Annan runs through the middle of the ſhire, and falls into Solway firth, after a courſe of twenty-ſeven miles, in which it has received ſeveral ſmall rivers, that run on both ſides through pleaſant woods and fruitful fields abounding with paſture. This diviſion is a ſtewartry, that gives title of marquis to the family of Johnſton.

Nithſdale, or Nidisdale, on the weſt ſide of Annandale, is ſo called from the Nith or Nid, which runs through it; it has both paſture and arable lands; for though it is encompaſſed on all ſides with a ridge of rocks, the bottoms produce abundance of corn.

The river Nith or Nid iſſues out of a lake called Lochcure, and runs into Solway firth.

Nithſdale is divided into the Overward, which contains the pariſhes in the preſbytery of Pent-pont; and the Netherward, containing thoſe of Dumfries preſbytery. Here were formerly woods and foreſts, which are now much exhauſted; and pieces of gold have after great rains been found in ſome of the brooks.

Annand, the chief town of Anandale, was an ancient royal burgh and ſea-port at the mouth of the Annan, where it falls into Solway-firth, ſeventy miles to the ſouth of Edinburgh. It had once a caſtle and a pretty good trade; but being often taken by the Engliſh, and burnt to the ground in the reign of Edward VI. moſt of the merchants removed to Dumfries, and it has never ſince recovered itſelf. It has however a weekly market, with a handſome bridge over the river.

Dumfries, the chief town of Nithſdale, and the capital of the ſouth-weſt part of the kingdom, is a pleaſant and thriving place, whence it has been called the Liverpool of Scotland: it ſtands eight miles from the mouth of the Nith, in the fifty-fourth degree fifty minutes north lat. but the tide flowing up brings ſmall ſhips quite up to the quay, and about four miles lower, the largeſt ſhips may ride in ſafety. It has ſpacious ſtreets, with a ſtately church, and a caſtle, which, though old, is pretty ſtrong. It has alſo four gates and a noble bridge of free ſtone over the river, leading to Galloway: this bridge has thirteen arches, and is eſteemed the fineſt in Britain next to thoſe of Weſtminſter, London, and Rocheſter. In the middle of it is a gate which bounds the ſhire of Dumfries and the ſtewartry of Galloway. A ſtreet leads from it by an eaſy aſcent to the caſtle, which is on the eaſt ſide of the town, and commands a proſpect of the town and the adjacent country; and from the caſtle a ſpacious high ſtreet runs by an eaſy deſcent to the church, which is half a mile diſtant. On each ſide of the high ſtreet are good ſtone buildings, thoſe on the north ſide having gardens next the river; and about the middle of it are the exchange and the town-houſe. It has likewiſe a large market place, with a noble croſs. The town gives title of earl to the ancient family of Crichton. It is the ſeat of a preſbytery, to which belong eighteen pariſhes, and is the place where the provincial ſynod meets, which conſiſts of four preſbyteries, that have under them fifty-four pariſhes.

The country round the town is very pleaſant, and adorned with many ſeats of gentlemen, all finely planted with trees.

Drumlanric lies ſeventeen miles to the north of Dumfries; it has a weekly market, and gave title of earl to the duke of Queenſberry, who has here a noble palace, adorned with twenty-eight turrets, grand avenues, gardens, and terrace walks, beſides a ſtately ſtone bridge over the river Nith. Like Chatſworth in Derbyſhire, it ſtands in a wild rocky country, and is environed with mountains. It is a ſquare free-ſtone building, and has hanging gardens cut out of the rock down to the river, adorned with water-works and grottos, with a plantation of oaks ſix miles in length.

SECT. XI.

Of the Stewartry of Kircudbright, or Lower Galloway; its Situation, Extent, Produce, and principal Towns.

THIS and the Stewartry of Orkney and Shetland differ only from the ſhires in the title of the chief officer, who is here called the ſtewart, and in the other the ſheriff. Galloway is divided into two parts; this ſtewartry, which is towards the eaſt, being called Lower Galloway; and the weſtermoſt Upper Galloway, or Wigtown. Lower Galloway begins at the middle of the bridge of Dumfries, and lies between Nithſdale on the eaſt, and the water of Cree on the weſt; and is bounded on the north by a part of Kyle in the ſhire of Aire; and by the Iriſh ſea on the ſouth. According to Templeman, it extends forty-three miles in length, and thirty-two in breadth.

The country ſeems one continued heath, except here and there a grove of trees; yet vaſt herds of ſmall black cattle, and flocks of ſheep, are grazed here, and ſent in great numbers to England.

Kircudbright, which gives its name to this ſhire, ſtands in a bay at the mouth of the river Dee, eighty-three miles to the ſouth-weſt of Edinburgh, and is an ancient royal burgh, the ſeat of a preſbytery, to which belong ſixteen pariſhes, and the place where the ſtewart holds his courts. It has a weekly market, and a good ſalmon fiſhery on the river Dee, which riſes in the mountains near Carrick; and it is ſo full of turnings and windings, that though it is not above ſeventy miles in a line, it runs near two hundred. It has a commodious harbour ſufficient to hold all the Britiſh navy, and the largeſt firſt rates may caſt anchor by the church-yard. It is alſo land-locked from all winds, which, together with the waves, are broke by Roſs iſland at its mouth. The town ſtands in a perfect amphitheatre, like Trent on the confines of Italy: not ſurrounded with high mountains, but with a rocky and ſtony cruſt, which in this country is called crags; a diſtinction being here made between mountains, hills, and crags: the firſt are very high, rocky, and covered with heath; the hills are high, but not rocky, and covered with graſs, which affords good paſture, and the crags are ſtony rocks, not high, and very thinly covered with graſs. In the midſt of this craggy country is ſeated this little town, which conſiſts of tolerable good ſtreets, and all the houſes are built with ſtone: but neither its buildings, nor the manners, dreſs, or the countenance of the people reſemble the Engliſh: the common ſort wear bonnets inſtead of hats, and it is ſaid, that though ſome of the townſmen have hats, they wear them only upon Sundays and extraordinary occaſions. There is nothing of Engliſh gaiety, but a ſedate gravity, which is viſible in every face; and notwithſtanding the excellence of their harbour, they have no notion of trade.

New Galloway is a royal burgh on the river Ken, fourteen miles from Kircudbright, with a good weekly market, well frequented for corn and other proviſions; and it has a good ſalmon-fiſhery in a lake called Loch-ken, which abounds not only with ſalmon, but other fiſh: this lake is about five miles long, and in ſome places about a mile broad, containing ſeveral iſlands.

SECT. XII.

Of Upper Galloway, or the Shire of Wigton; its Situation, Extent, and principal Towns.

UPPER Galloway extends from the water of Cree, which divides it on the eaſt from Lower Galloway, to the point called the Mull of Galloway and the Iriſh ſea. According to Templeman, it is thirty-ſeven miles in length, and twenty-ſix in breadth; but is much indented by Loch-rian on the north, and the bay of Glenluce on the ſouth.

This is a hilly country, more fit for breeding cattle than bearing corn. The inhabitants follow fiſhing, not only in the ſea, but in the rivers and lakes that lie every where under the hills; in which, about the middle of September, they catch an infinite number of eels. Though the people have been cenſured for not applying to commerce, they having ſeveral good harbours on the coaſt, yet they are not idle, for they are great huſbandmen and graziers; and, including horſes, they annually ſend about fifty thouſand head of cattle every year to England. Galloway had anciently its own princes, but it now gives title of earl to a branch of the family of Stuarts.

The principal towns of this ſhire are the following:

Wigton, a royal burgh, a market town, and the capital of the country, is ſeated near the mouth of a river, on a bay of its own name, ninety-five miles to the ſouth-weſt of Edinburgh. This bay is eleven miles in length and breadth: it is a good port, which has a very narrow entrance. At this town the ſheriff holds his courts, and it is the ſeat of a preſbytery that conſiſts of ten pariſhes. It gives title of earl to the chief of the ancient and noble family of Fleming.

Port-Patrick is a market town beyond the river Loſſie, a hundred and ten miles to the ſouth-weſt of Edinburgh, and has a ſafe harbour called the Rine or Beak of Galloway. It lies oppoſite to Donaghadee, in Ireland, and is a dirty poor place, where the packet-boats go for Belfaſt, and other ports of that kingdom, to which coaſt it is but a ſhort paſſage, and of which there is a full view all the way: but little uſe is made of the harbour, except for the packet-boats and a few fiſhing veſſels. A neighbouring hill affords a plain view of Ireland to the ſouth-weſt; of the coaſt of Cumberland and the Iſle of Man to the ſouth-eaſt; with the Iſle of Ilay and the Mull of Kintyre to the north-weſt.

SECT. XIII.

Of the Shire of Aire; its Situation, Extent, Diviſions, Produce, and principal Towns.

THE ſhire of Aire is bounded on the north by that of Renfrew; on the ſouth by Galloway; on the eaſt by Clydſdale; and on the weſt by the frith of Clyde. It is divided into Carrick, Kyle, and Cunningham, which are eſteemed the three great baileries, and are thus called from their being governed by bailiffs. According to Templeman, there are ſeven hundred and ninety-five ſquare miles in the baileries of Kyle and Carrick, and two hundred and twenty-nine in the diviſion called Cunningham.

In this county is a conſiderable lake called Dun, ſix miles long, and two broad, with an iſland in it, upon which is an old houſe called Caſtle-Dun. Upon the water Dun, or Dawn, iſſuing from this lake, is a bridge of one arch ninety feet wide, which is much wider than the Rialto at Venice, or the middle arch of the great bridge at York.

We ſhall begin with Carrick, which is bounded on the north by Kyle, on the eaſt by Kyle and Galloway, on the ſouth by the latter alone, and on the weſt by the Frith of Clyde; extending thirty-two miles along the frontiers of Galloway, where it is longeſt, from eaſt to weſt, and twenty-five, where broadeſt, from north to ſouth.

The land is here more fruitful and better cultivated than that of Galloway, and is leſs mountainous; but has not ſo many cattle, eſpecially ſheep and horſes. It gives one of the titles of honour to the prince of Wales.

The chief rivers of this diſtrict are the Stincher and the Girven, which abound with ſalmon and other fiſh. Here are alſo many lakes and woods. Though there is no conſiderable port in this part of the country, the people towards the coaſt are great fiſhermen, and are employed by the merchants of Glaſgow and other places to catch herrings for them.

The principal town in the earldom of Carrick is Bargeny, which has a market, and gives title of lord to a branch of the family of Hamilton.

Kyle is ſeparated from Carrick by the river Dun, and from Cunningham by the Irwin; it has Cunningham on the north; part of Clydſdale on the eaſt; Nithſdale, Carrick, and part of Galloway on the ſouth; and the frith of Clyde on the weſt; extending thirty-four miles from eaſt to weſt, and twenty-ſix from north to ſouth. It is divided by the river Aire into two ſtewartries: that on the ſouth ſide as far as the river Dun is called King's Kyle, and is under the juriſdiction of a ſheriff; and Kyle Stuart, which is under the prince of Wales.

The river Aire has the longeſt courſe of any in the county; its banks are adorned with woods, caſtles, and gentlemen's ſeats; and the river, after running (beſides its many turnings and windings) twenty-four miles from eaſt to weſt, falls into the ſea.

Aire, the chief town of this diviſion, and the capital of the whole country, is ſeated at the mouth of the river of its own name, ſixty-five miles to the ſouth-weſt of Edinburgh. It has a good harbour near the firth of Clyde, and is well ſituated for trade. It is an ancient town diſtinguiſhed by its privileges, its juriſdiction extending ſixty-four miles from the mouth of the Clyde to the borders of Galloway. The river turns ſeveral mills in the middle of the New Town; this is joined to the Old Town, which ſtands on the ſouth ſide of the river, by a ſtone bridge of four arches. The Old Town is ſeated in a ſandy plain, amidſt pleaſant fertile fields, with delightful greens, that afford a good proſpect winter and ſummer. It was formerly reckoned next to Glaſgow, the principal market town in the weſt of Scotland, and has a ſtately church. It is the ſeat of a preſbytery, to which belong twenty-eight pariſhes, and, with Glaſgow, conſtitutes a provincial ſynod: but its trade is ſaid to be much decayed.

Cunningham, the laſt diviſion of this county, is bounded on the eaſt by Renfrew and Clydſdale, on the ſouth by Kyle, and on the weſt and north by the firth of Clyde. Its greateſt length from the ſouth-eaſt to the north-weſt is about twenty-nine miles, and its greateſt breadth from eaſt to weſt about twelve. It is divided from Kyle by the river Irwin, and is a much finer country and leſs mountainous than that.

Irwin is the beſt town of this diſtrict; it ſtands at the mouth of the river of the ſame name, ſixty-three miles to the ſouth-weſt of Edinburgh; but its port is ſo ſhallow, and ſo choaked up with ſand, that it is only capable of receiving ſmall veſſels: yet it has much more buſineſs than Aire, and conſiſts of two pretty good ſtreets, with well built houſes, and a quay from whence the inhabitants carry on a coal trade to Dublin. There is a handſome ſtone bridge over the river; and in 1736 an act was paſſed for reſtoring the harbour, and repairing the town-houſe, church, jail, &c. This town gives title of viſcount to the family of Ingram. On the twenty-ſixth of November, 1740, there was here ſuch a ſtorm of thunder and lightning, that the people who were not ſtruck down by the lightning fell to the ground, apprehending that the day of general judgment was come.

SECT.

SECT. XIV.

Of the Shire of Renfrew, or Reinfraw; its Situation, Extent, Produce, and principal Towns.

THIS county is called the barony by way of eminence; it having given the title of baron to the prince of Scotland before the Union, as it does now, together with Snowden, to his royal highneſs the prince of Wales. It is bounded on the ſouth by Cunningham, on the eaſt by Lanerkſhire, on the north by Lenox, and on the ſouth by the ſhire of Dumbarton; it extending, according to Templeman, thirty miles from north to ſouth, and thirteen where broadeſt from eaſt to weſt.

That part of the county next to the Clyde is fruitful and pleaſant, with only a few ſmall eminences; but that to the ſouth, ſouth-weſt, and weſt, is more barren and mountainous: it abounds with all neceſſaries, enjoys a healthful air, and at the ſame time the convenience of the frith of the Clyde, in which there is very ſafe riding upon all the coaſt, has much improved theſe parts, which are populous, and adorned with many gentlemen's ſeats. It is watered by ſeveral ſmall rivers, the chief of which are the White-cart and the Black-cart, which unite their ſtreams before they fall into the Clyde.

The principal towns of this county are the following:

Renfrew, the ſhire town, and a royal burgh, is ſeated on a branch of the Clyde, called the Cathcart, forty-ſix miles to the weſt of Edinburgh. It is a ſmall but ancient town, where the ſheriff holds his courts.

Paſley, or Paſlay, is ſeated on the river White-cart, ſix miles to the weſt of Glaſgow, where is a pearl-fiſhery; and though no royal burgh, is much bigger than Renfrew, and is the ſeat of a preſbytery compoſed of ſixteen pariſhes. Here is a bridge over the Cart, and there are ſtill to be ſeen the remains of an abbey founded in the year 1160: the remains of which, together with its church, gardens, orchard, and a little deer-park, are encloſed by a ſtone wall, about a mile in compaſs.

On a high ground in the lands ſtiled New-yards, at a ſmall diſtance from Paſley, is a ſpring famous for its ebbing and flowing with the tide.

Greenock, a handſome well built town on the firth of the Clyde, twenty-ſix miles to the weſt of the Clyde, has a good road for ſhips that come into and go out of Glaſgow. It is the chief place in the weſt of Scotland for the herring-fiſhery; and the merchants of Glaſgow, who are concerned in it, employ the veſſels of the inhabitants for catching and curing the fiſh, and for carrying them abroad to market afterwards. Here are many rich trading families, and the town is noted for good ſeamen and excellent pilots.

SECT. XV.

Of Dumbartonſhire, or Lenox; its Situation, Extent, Produce, and principal Towns.

THIS county, which lies on the other ſide of the Clyde above Glaſgow, runs far north among a cluſter of hills, and is bounded on the ſouth by the firth and river of Clyde; on the eaſt by Menteith and Sterlingſhire, it being ſeparated from the latter by the water of Blane; on the north by the Grampian-hills; on the north-weſt by Argyleſhire; and on the weſt by the lake called Loch-long, and a water of the ſame name that falls into it. According to the editor of Camden, it extends only twenty-four miles in length, and twenty in breadth; but Mr. Templeman makes it forty-one miles long, and twenty-ſeven broad. Its bounds were formerly larger than they are at preſent, eſpecially on the eaſt ſide; and it has now only twelve pariſhes.

The lower part of Dumbartonſhire, which lies to the eaſt, is very fruitful in corn, eſpecially towards the rivers; and the upper, which is hilly, is fit for paſture, eſpecially at the beginning of the Grampian-hills, and feeds numerous flocks of ſheep. It has alſo a noble herring-fiſhery in two bays, named Loch-long and Loch-fyn, that break into it from the mouth of the Clyde.

Levinia, the Latin name for Lenox, is derived from the river Levin, which runs from Loch-lomond into the Clyde. This loch, or lake, ſpreads between the mountains, twenty-four miles in length, and eight in breadth, though at the narroweſt part it is but two. It abounds with fiſh, particularly with a delicious ſort of the eel kind, called pollac, that is ſaid to be peculiar to this lake, whence its banks are lined with the cottages of fiſhermen. It contains thirty iſlands, three of which have churches, and many of the reſt are inhabited, particularly Inchmurin, which is fruitful in corn and graſs, and abounds with deer. Several of them are called floating iſlands: theſe are ſaid to be artificial, and formed of beams faſtened together and covered with earth and turf; upon ſome of theſe are forts, into which the natives uſed to retire in time of war. The ſhire of Lenox, together with the town of Richmond in Yorkſhire, give the title of duke to the family of Lenox, deſcended from king Charles II.

Dumbarton, the principal town of this ſhire, from which it takes its name, is ſeated at the confluence of the Leven and the Clyde, fifteen miles to the north-weſt of Glaſgow, and was once conſiderable for its trade, which is now much decayed; but is ſtill remarkable for its caſtle, which is thought to be one of the ſtrongeſt in Europe; it being ſeated on the top of a craggy rock, very ſteep on all ſides, except to the Clyde. It has only one narrow ſteep aſcent, where ſteps are cut out of the rock, paſſable by only one man at a time. The river Leven on the weſt, and the Clyde on the ſouth, ſerve it for ditches; and to the weſtward lies a moraſs, which is overflowed by every tide. As this is at one of the great ſtrong paſſes between the low country and the highlands, a governor and a garriſon are conſtantly kept in it.

SECT. XVI.

Of the Shire of Bute and Caithneſs; their Situation, Extent, Produce, and principal Places.

THE ſhire of Bute contains Bute and Arran, two of the Weſtern iſlands, and is now joined with Caithneſs in ſending one member to the parliament of Great Britain alternately.

Theſe iſlands are tolerably fertile, and their produce much the ſame as that of the other Weſtern iſlands. They lie in the firth of Clyde, and have Argyleſhire on the north; Cantyre on the weſt; and Renfrew, Cunningham, and Kyle on the eaſt. The iſland of Bute, which is about twelve miles in length, and five in breadth, with an area of twenty-ſeven miles, is ſeparated on the north by two narrow ſtreights from Argyleſhire, and on the weſt from the iſle of Arran; it lies ſix miles to the weſt of the coaſt of Cunningham, and but half a mile from Argyleſhire.

The northern parts of this iſland are mountainous, but afford good paſtures and ſome wood. The others produce oats, barley, and peas. The iſland has a quarry of red ſtone. It enjoys a healthful air, and its inhabitants live to a great age. There is a conſiderable herring and cod-fiſhery on the coaſt. The earl of Mont-Stuart is its chief proprietor and heretable coroner.

The chief town of the ſhire is Rothſay, which ſtands near the middle of the iſland, on the eaſt ſide, ſeventy miles to the weſt of Edinburgh; the inhabitants ſubſiſt chiefly by fiſhing and agriculture. It is a royal burgh, and has two forts, one called the caſtle of Rothſay, the other the caſtle of Kermes.

The iſle of Arran lies about four miles from the ſouth part of the iſle of Bute, and ſix to the eaſt of Cantyre, extending, according to the General Atlas, twenty-four miles from north to ſouth, and nine, where broadeſt, from eaſt to weſt; but Mr. Mackay, a native of the iſland, in his journey through it, ſays it is but twelve in circuit. The air is cold and moiſt, but cleared by frequent breezes from the mountains. The iſland is fruitful in grain, and has good paſtures. The middle of the iſland is mountainous, and the higheſt part, called Capra, abounds with deer. Here are many horſes and black cattle, both of a middling ſize, with abundance of ſmall ſheep and goats;

land and ſea fowl. Here are alſo found fullers-earth, and cryſtal. On the coaſt are ſeveral caves, one of which is large enough to hold a hundred men; and at the farther end of it is a pillar cut out of the rock, with a deer and a double hilted ſword carved upon it; and the natives pretend that Fune Machkowle, a giant, who diſtinguiſhed himſelf by his great exploits, lodged in theſe caves with his attendants. A miniſter ſometimes preaches in one of them to ſuch as live at a diſtance from the church. Here are many large ſtones, from ſix to fifteen feet high, ſet up on end, ſome ſingly, and others in a circular form, ſuppoſed to have been the remains of pagan temples, or of places for adminiſtering juſtice.

This iſland has ſeveral rivers which abound with ſalmon, as the ſea all round does with cod, herrings, ling, whitings, and ſhell-fiſh. But the adjacent ſea is tempeſtuous and dangerous, eſpecially when a ſtrong ſouth or ſouth-weſt wind blows.

The inhabitants are generally of a brown complexion, healthy, vigorous, and ingenious. In the iſland are five churches, with ſeveral caſtles; among which the moſt noted is Brodich, a pleaſant ſummer ſeat at the north-eaſt corner of the iſland. Theſe, and almoſt the whole iſland, belong to a branch of the noble family of Hamilton.

The ſhire of Weik, or Caithneſs, though united in ſome meaſure to Bute, by ſending a member alternately to parliament, is as far diſtant from the iſlands juſt deſcribed as poſſible, it being ſeated in the north-eaſt extremity of Scotland: it has therefore the Northern ocean on the eaſt, Strathnaver and Sutherland on the ſouth and ſouth-weſt, and on the north is divided from the Orkney iſlands by Pentland frith. It comprehends all the country beyond the river Neſſe and the lake into which it flows, and extends thirty-five miles from north to ſouth.

The land is much indented by the many windings and breakings of the ſhore, and the whole coaſt, except the bays, conſiſts of high rocks and many promontories. The ſea is here very dangerous, eſpecially in calm weather, except at ſtated times, on account of the many vortexes, owing to the repulſe of the tides from the ſhore, and their paſſage between the Orkney iſlands. The inland country is mountainous; but towards the coaſt it is low, and produces corn enough both for the natives and for exportation; but the ſoil being moiſt and clayey, their harveſt is late, and the corn not ſo good as that of Roſs and Sutherland. There is plenty of paſture in the fields and valleys, with good fowling and hunting on the mountains, and fiſhing in the lakes and rivers, as well as the ſea. In the foreſts of Moravins and Berridale is great plenty of red deer and roebucks, and many cows, goats, and ſheep. In ſeveral parts are copper, iron, and lead ore; but the inhabitants chiefly ſubſiſt by grazing and fiſhing.

This county is populous, and has many little towns and villages, with a preſbytery of twelve pariſhes, and gives title of earl to a branch of the ancient and noble family of Sinclair; but the earl of Braidalbin, who has a great eſtate in the county, is hereditary ſheriff.

Proviſions, eſpecially corn, cattle, and fiſh, are ſo plentiful here, that this is ſaid to be the cheapeſt market in the world, and that a man can live better here for fifty pound a year, than he can in the ſouth of Scotland for two hundred: but the firing is turf, for want of coals. The rocks on the coaſt are much frequented by eagles, hawks, maws, herons, and other fowl of various kinds, like thoſe of the Orkney and Shetland iſlands; and the people take the young fowls from their neſts by a hook and line. There is a particular ſort called ſnowfleets, which reſort to this country in February by thouſands in a flight, and go away in April. They are of about the ſize of a ſparrow, but exceeding fat and delicious eating. They have alſo great plenty of moor fowls and plovers.

The inhabitants are ſo induſtrious, that in ſome places, where there is no harbour or bay, but a continued hard rugged rock, they have procured harbours by art and dint of labour, and made paſſages in many places by forming ſteps or ſtairs from the top of the rock to the bottom, where their fiſhing boats lie; and at the top of the rock have their houſes, to which they carry up their fiſh, and there ſalt and dry them for the market.

The principal towns in this county are Wick, or Weik, and Thurſo.

Weik, from whence this is called the ſhire of Weik, is a royal burgh, and market town, where the courts are kept. It ſtands on the eaſt ſide of the county at the mouth of Murray frith, where it falls into the north ſea; but it is not much frequented.

Thurſo lies oppoſite to it on the weſt ſide of the county, about twelve or fourteen miles from Weik, and is ſo defended by the promontory called Holborn-head, that it is a ſecure place for ſhips to ride in. It is more populous, and better built than Weik, and has the beſt church in the ſhire. A ſmall river called the water of Thurſo, runs by the eaſt ſide of the town, in which is a good fiſhery for ſalmon, which keep in this river all the year; ſo that they are to be had in winter by breaking the ice.

SECT. XVII.

Of Sterlingſhire, or Striveling; its Situation, Extent, and Produce; with a Deſcription of the Towns of Sterling and Falkirk.

THIS country is bounded on the weſt by part of Lenox and Clydſdale; on the north by Menteith; on the ſouth and ſouth-eaſt by Lothian; extending twenty miles in length and twelve in breadth.

The ſouth part is mountainous; but that which lies upon the Forth is very fertile, and alſo abounds with coal. The produce of this ſhire conſiſts of corn, graſs, black cattle, ſheep, and horſes; beſides ſalmon and other fiſh, with which it is ſupplied by the rivers. The Forth, which is the moſt famous, though not the largeſt river in Scotland, riſes near the foot of the mount Lomond, and runs from weſt to eaſt into the Firth of Edinburgh.

Sterling, the capital of the county, to which it alſo gives name, ſtands thirty miles to the north-weſt of Edinburgh, upon the deſcent of a deep rock, at the foot of which runs the Forth; and takes its name from the Saxon word *ſter*, which ſignifies a hill, and *lin*, a water.

The ſituation of Sterling is much like that of Edinburgh, with a caſtle on an eminence, and the town extending up the aſcent, with a principal ſtreet that is large and handſome. It is incloſed with a wall, except towards the north, where it is waſhed by the river Forth, over which is a bridge of hewn ſtone, with an iron gate, and four ſtately arches, to which ſhips come up at full tide, and a little below it is the haven. The caſtle is ſtrengthened on every ſide with batteries and ramparts, and has a conſiderable number of great guns for defending the paſſage of the bridge: for in times of trouble the chief magazine of the nation is uſually conveyed hither, it lying upon a conſiderable paſs between the north and ſouth parts of Scotland, and almoſt in the centre of the kingdom. It is indeed the only place to which people can come from all parts of the nation, except from the iſlands, without croſſing ſome bay or frith of the ſea, which has rendered it of ſuch importance, that it is always kept in a good condition, and the garriſon generally conſiſts of two hundred men, beſides officers. It has ſix rooms of ſtate, which are extremely noble, from their extraordinary height, length, and breadth, adorned with fine carved work on the wainſcot and ceiling. At the top of it the late earl of Mar made a very convenient apartment of twelve rooms on one floor, for the governor's lodgings. It has a large park walled round; but it has little or no wood in it. This caſtle has been the reſidence of the kings of Scotland, at which time parliaments were frequently held in it.

Sterling has a ſpacious church in the upper part of the town, which has a very high tower. It has alſo a ſpacious market place and a handſome town-houſe. Oppoſite to it is the late earl of Mar's fine palace, on the top of the hill: the duke of Argyle has alſo a fine ſeat near the caſtle, from whence to the bottom of the town, it is above half a mile, all upon the deſcent, with good houſes. As Sterling ſtands in a commodious ſituation for commerce, ſo it has one way a fine proſpect of Edinburgh frith and caſtle, and of the mountains of Argyle-

ſhire and Dumbartonſhire another, as well as of the various windings of the Forth. It is the ſeat of a preſbytery, which conſiſts of twelve churches, and has a conſiderable manufacture of ſerges. Joining to the church is a neat hoſpital for decayed merchants. It was founded by James Cowen, merchant, and richly endowed. His ſtatue as big as life is at the top of the gate, and in the garden of the hoſpital is a pleaſant bowling-green.

Falkirk is a handſome ancient town, ſeated on the ſouth ſide of the Forth, eight miles to the ſouth of Sterling, and is a clean market town, noted for being the place where the rebels defeated the king's forces on the 17th of January, 1746.

SECT. XVIII.

Of Linlithgow, or Weſt-Lothian; its Situation, Extent, Produce, and principal Towns; with a conciſe Account of the Roman Wall built acroſs this Part of Scotland.

WEST-Lothian is bounded on the north by the Forth; on the eaſt and ſouth by Mid-Lothian; on the weſt by part of Clydſdale; and on the north-weſt by Stirlingſhire; extending about fourteen miles in length, and thirteen in breadth.

It is in general a pleaſant country, and abounds with corn and paſtures, coal, limeſtone, and ſalt; with great plenty of fiſh, with which it is ſupplied by the ſea and rivers. In the reign of king James VI. a mine was diſcovered here which yielded a great deal of ſilver.

The principal places in this county are the following:

Linlithgow, from which the ſhire takes its name, is ſituated on the ſide of a lake, ſixteen miles to the weſt of Edinburgh, and is remarkable for its ancient palace, ſeated on an iſland in the midſt of the lake, which has an aſcent of ſeveral ſteps in the form of an amphitheatre. The palace was magnificently built of hewn ſtone by ſeveral kings, and completed by James VI. The porch bears the name and arms of King James V. incircled with the orders of the Garter, St. Andrew, St. Michael, and the Golden Fleece, of all which James V. was a companion. In the inner court, which is larger than that of Hampton Court, is a fountain adorned with ſeveral ſtatues, and at each of the four corners a tower, with fine apartments. Adjoining the palace is St. Michael's church, a noble ſtructure with a lofty ſteeple.

In the town is alſo a quadrangular court adorned with a curious fountain: on the ſouth ſide is the Tolbooth or town-houſe, neatly built of hewn ſtone, with a very high ſteeple, in which are bells and a very fine clock. In this ſtructure the ſheriff and magiſtrates of the town keep their courts. This place is the ſeat of a preſbytery conſiſting of nineteen pariſhes. There is a large ſtreet half a mile in length, from the one end of the town to the other, adorned with handſome buildings, from each ſide of which ſeveral lanes open a paſſage to pleaſant gardens.

The lake itſelf is a mile in length and a quarter of a mile over, and abounds with perch and other ſort of fiſh; and on the north ſide is a park belonging to the palace.

The town has the appearance of great trade, with a harbour for ſhips near the caſtle of Blackneſs, where is a large cuſtom-houſe, with other houſes for the uſe of merchants. Here is a manufacture of linen, which the water of this lake is reckoned ſo extraordinary for bleaching, that a great deal of it is brought from other parts hither to be bleached.

Blackneſs is a ſtrong caſtle in a peninſula on the coaſt. It belongs to the crown, and has been often uſed for a priſon of ſtate; but is at preſent neglected, and is ſaid to reſemble at a diſtance a great ſhip unrigged.

Queen's Ferry is a royal burgh on the ſouth ſide of the river Forth, ten miles to the weſt of Edinburgh, where the queens of Scotland generally embarked when they went to their palaces on the other ſide of the Forth; and it is now a common paſſage at all times of tide from Lothian to Fife.

Severus's or Adrian's wall, which extended acroſs this part of Scotland, began at the Forth near Queen's Ferry, and extended thirty-ſix Scots miles to Dumbarton at the firth of Clyde, for covering the provincial Britons againſt the incurſions of the Picts. It was built with ſtone ten feet thick, and had watch-towers within call of one another, where centinels kept watch day and night; it had alſo a court of guard to lodge a ſufficient number of ſoldiers againſt any ſudden alarms, and ſtrong forts able to receive a whole army; with a good ditch of twelve feet wide before it.

SECT. XIX.

Of the Shire of Perth; its Situation, Extent, Produce, Rivers, Diviſions, and principal Towns.

THIS is a large, plentiful, and rich country, bounded on the eaſt by Angus; on the ſouth-eaſt by Kinroſs-ſhire and Fife; on the ſouth by Clacmannan-ſhire, Stirlingſhire, and the river and firth of Forth; on the weſt and ſouth-weſt by Argyleſhire, Lenox, and Dumbartonſhire; on the north-weſt and north by Lochaber and Badenoch; and on the north-eaſt by Marr. According to Camden, it extends fifty-two miles in length from eaſt to weſt, and about forty-eight in breadth from north to ſouth. It contains Perth Proper, part of Gowry, Strathern, Athol, Braidalbin, and Menteith, in which are five preſbyteries, and eighty-eight pariſh churches.

This county, whoſe hereditary ſheriff is the duke of Athol, is fruitful both in corn and paſture, the former in the low lands and the latter on the high grounds; and is interſperſed with fruit-trees, groves, lakes, and rivers.

The principal rivers of this county are the Tay, which is the longeſt in all Scotland, and riſes in the mountains of Braidalbin; and after ſpreading itſelf into a lake of the ſame name, fifteen miles in length, and near ſix in breadth, it runs near forty miles, excluſive of its turnings and windings, into the firth of Tay. The Keith, which is famous for its ſalmon fiſhery, and has a cataract near the Blair of Dromond, the noiſe of which is ſo loud as to ſtun thoſe who come near it. The river Ern riſes from the lake called Lochern, which is about ſeven miles in length, and one broad, in the mountainous country of Strathern, and falls into the Tay, after a courſe of thirty-four miles from eaſt to weſt, and being joined by ſeveral rivers in its paſſage.

Perth Proper, the firſt diviſion of this ſhire, has the Carſe of Gowry on the north-eaſt; Angus on the eaſt; Strathern on the weſt; Athol on the north; and the Firth of Tay on the ſouth. It is about twenty miles from the north-weſt to the ſouth-eaſt, and fifteen where broadeſt. The principal places in this diviſion are the following.

Dunkeld ſtands on the north ſide of the Tay, after it has received the Almund, twelve miles to the north of Perth, and about forty from Edinburgh. It is ſeated at the foot of the Grampian hills and is ſurrounded with woods. This is the chief market-town of the Highlands, and has been much adorned with ſtately buildings by the duke of Athol. It is the ſeat of a preſbytery containing twenty pariſhes.

Perth is a royal burgh, and the county-town where the ſheriff keeps his courts. It is frequently called St. John's town, from a church built there dedicated to St. John, and ſtands thirty miles to the north of Edinburgh, agreeably ſeated between two meadows on the ſouth bank of the Tay, and at a full tide veſſels of burthen may come up to it. Parliaments have often been held there, and it is at preſent the ſeat of a preſbytery containing twenty-one pariſhes. Here is a fine town-houſe. St. John's church, which ſtands in the middle of the town, is divided into two. The inhabitants carry on the linnen manufacture, and the merchants have a conſiderable trade to the Baltic. About a mile from Perth is Scone or Scoon, which is ſeated on the north bank of the Tay, and is thought to be in the centre of the kingdom. It was anciently famous for its abbey, founded by king David I. for the monks of the order of St. Auguſtine, where the kings of Scotland were crowned. There is

alſo a fine palace, belonging to the crown, the front of which towards the chapel is two hundred feet long, the dining-room forty feet in length, and all the apartments ſpacious and magnificent, but built after the ancient manner. The gallery of this palace is one hundred and ſeventy-five feet long, and the ceiling painted above two hundred years ago. It was in the chapel belonging to this palace that king Charles II. took the covenant.

The Carſe of Gowry, the next diviſion, is eſteemed the beautifulleſt ſpot in Scotland: it extends fourteen miles in length, and from two to four in breadth, on the north ſide of the Tay, from Dundee to Perth, which is all a perfect garden.

Strathern, the third diviſion, has Menteith and part of Fife on the ſouth; Braidalbin and Athol on the north; part of Menteith on the weſt; and Perth Proper on the eaſt; extending above forty miles from eaſt to weſt, and twenty from north to ſouth. It takes its name from the river Ern running through it. The Ochil hills, which extend along the ſouth part, abound with metals and minerals, particularly copper, lapis calaminaris, and lead; there is here alſo excellent peat, and abundance of wood. What is properly called Strathern, is a fine valley, about four miles broad, between the mountains, extremely fruitful, and ſtrewed with gentlemen's ſeats, which ſtand on the ſide of the hills, and with their plantations of trees render the valley more agreeable.

Abernethy ſtands in the ſouth-eaſt corner of this diviſion, at the confluence of the Ern and Tay, ſomewhat above twenty-four miles from Duplin. It is an ancient town, and is ſaid to have been the ſeat of the Pictiſh kings, as well as of an archbiſhop, afterwards removed to St. Andrews.

There are two caſtles on the banks of the Ern, one of them Tullibarbin, the ancient ſeat of the Murrays, which gives title of marquis to the eldeſt ſon of the duke of Athol; and the other is Duplin caſtle, the ſeat of the earl of Kinnoul, to whom it gives title of viſcount; the houſe is adorned with the fineſt paintings and carving, and his lordſhip has a park well planted with trees, and walled round.

Menteith, the next diviſion, is bounded on the north by Braidalbin and Strathern; on the eaſt by Fife; on the ſouth by Lenox and Stirlingſhire; and on the weſt by Lenox; extending forty-four miles from eaſt to weſt, and twenty-eight where broadeſt. This territory is ſaid to derive its name from the river Teith, and reaches to the mountains that encloſe the eaſt ſide of Loch-lomond.

The only place of note in this diviſion is the pleaſant little town of Dumblain, on the weſt ſide of the river Allan, where king David once erected a biſhopric, and the ruins of the biſhop's houſe and that of the regular canons are ſtill to be ſeen. There was alſo a magnificent church, part of which remains entire. The town is a perfect amphitheatre, in a fine bottom ſurrounded with hills, and gives title of viſcount to the duke of Leeds.

The fifth diviſion is Braidalbin, a country among the Grampian-hills, bounded on the north by Athol and Lochaber; on the eaſt by Athol; on the ſouth by Strathern and Menteith; and on the weſt by Lochaber, Lorn, and Knapdale; extending above thirty-two Scots miles from eaſt to weſt, and about thirteen from north to ſouth. It is inhabited by the Highlanders, who retain their ancient language.

Athol, the moſt northern diviſion, is bounded on the north by Badenoch; on the weſt by Lochaber; on the eaſt and ſouth-eaſt by Marr and Gowry; on the ſouth by Strathern and Perth Proper; and on the ſouth-weſt by Braidalbin; extending in length from the north-weſt to the ſouth-eaſt forty-three miles, and thirty-one where broadeſt. Here are many mountains, and the valleys are full of woods. It gives title of duke to the noble and antient family of Murray; but contains no place of importance.

SECT. XX.

Of Kincardinſhire, or Mearns; its Situation, Extent, Produce, and principal Towns.

THIS county is bounded on the eaſt by the Northern ocean; on the ſouth by the North Eſk; on the weſt by the Granſbain-hills; and on the north by Aberdeenſhire, from which it is divided by the river Dee; extending about twenty-ſeven miles in length, and twenty in breadth.

The country is pretty level, and enjoys a rich ſoil fruitful in corn and paſture. There are ſaid to be about five millions of fir trees in this county; beſides a prodigious number planted by the gentry about their ſeats. Upon the ſea-coaſts are ſeveral convenient creeks and ſome good harbours.

Kincardin, once the county-town, ſtands on the river Dee, eighteen miles to the eaſt of Aberdeen, and is the ſeat of a preſbytery conſiſting of fifteen pariſhes.

Stonehive, the preſent county town, has a very good harbour, ſecured by a ſtone pier. Near this town is Dunnotyre, where once ſtood a caſtle fortified with ſtrong walls and towers upon a high inacceſſible rock, waſhed by the ſea on three ſides, and joined to the land by a narrow iſthmus. By the entrance of the harbour is a huge rock near forty ells high, which ſeems every moment ready to fall; and at a ſmall diſtance is a dropping cave, where the water petrifies. This caſtle was for a long time the ſeat of the Keiths, the hereditary earl marſhals of Scotland.

Fourdon, or Mearns, ſtands twenty-one miles from Kincardin, and is the ſeat of a preſbytery conſiſting of ſixteen pariſhes. In the times of popery it was famous for the reliques ſuppoſed to have been depoſited there of St. Palladius, the firſt biſhop in Scotland, who was ſent over by pope Celeſtine in the year 431 to preach the Goſpel to the Scots, and confute the Pelagians.

SECT. XXI.

Of Aberdeenſhire; its Situation, Extent, Diviſions, Produce, and principal Towns.

THIS county is bounded on the ſouth by the river Dee and the Granſbain-mountains, which divide it from Angus, in the ſhire of Forfar, and Kincardinſhire; on the eaſt by the Northern ocean; on the north by part of Murray; on the north-weſt by Bamff; and on the north by Murray; extending, according to Templeman, ſeventy-three miles in length, and twenty-eight in breadth. It contains Mar, with its appurtenances, Strathdee, Strathdon, the braes of Mar and Cromar, with the greateſt part of Buchan, Garioch, and Strathbogy. The ſouth part contains Mar, with its ſubdiviſions, from whence it was formerly called the ſhire of Mar.

This county would be in general pretty fruitful, was it properly cultivated. It produces corn, particularly rye, and oats in great abundance, with ſome beans, peas, roots, and herbs, both for food and phyſic. The hilly parts, eſpecially the craigs of Pennau, where the eagles build their neſts, are covered with woods of oak and fir, and have plenty of game and paſture, therefore feed abundance of black cattle, ſheep, deer, and horſes. There are here alſo quarries of ſpotted marble, limeſtone, and ſlate, with a ſpecies of ſmall ſtones peculiar to this country, called elf-arrow-heads, which ſeem of a flinty kind, and are of different ſhapes; but moſt of them reſemble the head or point of an arrow or ſpear. In the rivers are found muſſels, which contain large pearls of a fine colour and ſhape. Here are ſprings of allum-water, and veins of ſtone from which allum is boiled.

The air of this country is cool, but healthful; and the fuel of the inhabitants is peat, turf, and wood. The winter is much leſs ſevere than might be expected ſo far north, and the inhabitants are reckoned of a mild temper, though with as much good ſenſe as their neighbours.

Aberdeen, a city and univerſity, has its name from the Don, it ſtanding at the mouth of that river, in the fifty-ſeventh degree ſix minutes north latitude, and the firſt degree fifty-eight minutes weſt longitude, eighty miles from Edinburgh. There are two towns, the Old and New. Old Aberdeen was the ſeat of a biſhop, it having a large and ſtately cathedral, generally called St. Machar's. On the ſouth ſide of it ſtands King's-college, in

which is a principal and ſub-principal, with three other regents or profeſſors of philoſophy. There are alſo profeſſors of divinity, civil law, phyſic, the mathematics, and the oriental tongues. Cloſe to the church is a library well furniſhed with books. This college is not inferior to any in Scotland. The church, with its turret or ſteeple, is of hewn-ſtone, and the top vaulted with a double croſs arch, ſurmounted by an imperial crown.

New Aberdeen is about a mile diſtant from the Old, and is ſeated at the mouth of the river Dee. It is the county town, and conſequently the ſeat of the ſheriff's courts. It exceeds all the cities in the north of Scotland in extent and beauty. Aberdeen ſtands in a wholeſome air, has a great revenue from its ſalmon-fiſhery, and the inhabitants are in general gay, rich, and courteous. It is ſeated on three hills, the main parts upon the higheſt; the ſkirts of it extending into the plain. The market-place is beautiful and ſpacious, and the houſes, which are neatly built, are generally four or five ſtories high, with handſome ſaſh windows, and have for the moſt part gardens and orchards belonging to them, which render the city pleaſant and healthful, and the proſpect of it beautiful at a diſtance. The ſtreets are extremely well paved.

Beſides the other public buildings, there is in the High-ſtreet a church neatly built of free-ſtone. The church of St. Nicholas is alſo a handſome edifice of free-ſtone, with a lofty ſteeple reſembling a pyramid: it was formerly divided into three churches; and the body of it is adorned with a tower and a ſteeple with pinnacles. The people of Aberdeen, and indeed of almoſt all this part of the country, are generally of the Epiſcopalian perſuaſion; ſo that were it not for the legal eſtabliſhment, the Preſbyterian preachers would have but ſlender incomes: almoſt every pariſh has a meeting-houſe, where the liturgy is read: at Aberdeen they have beautiful chapels, and even organs.

The principal of the public buildings is the college, founded by George Keith, earl marſhal, in 1593, and from him called the Marſhallian college; but ſince his time the city has adorned it with ſeveral additional buildings. In this college, which is an univerſity of itſelf, are a principal, four profeſſors of philoſophy, a profeſſor of divinity, a profeſſor of mathematics, and a profeſſor of medicine. It has a good library, which was founded by the city, and enlarged by the gifts of ſeveral learned men, and is alſo furniſhed with mathematical inſtruments.

In this city is alſo a grammar-ſchool, founded by Dr. Dune, which has a maſter and three uſhers. There is alſo a muſic-ſchool. Here are likewiſe a priſon and work-houſe, three hoſpitals, and an alms-houſe. Near the harbour ſtands the cuſtom-houſe.

The bridge over the Don conſiſts of one immenſe arch of ſtone, ſprung from two rocks, one on each ſide, which ſerve as abutments; ſo that it may be ſaid to have a foundation coeval with nature, and that will laſt as long. The other bridge is upon the river Dee, a mile to the weſt of New Aberdeen, and has ſeven ſtately arches. This city gives title of earl to an ancient branch of the family of Gordon.

There is very good anchoring in the bay, from ſeven to nine fathom water. It is a tide-haven, with a very difficult entrance; for though the river is large, the channel is narrow, and the bar often ſhifting, ſo that no ſhip of any conſequence ventures in without a pilot.

The quantity of ſalmon and perch taken in both rivers is aſtoniſhing. The proprietors of this fiſhery are united into a company, there being ſo many ſhares, of which no perſon can enjoy above one at a time. The profits are very conſiderable, the ſalmon being ſent abroad into different parts, particularly into England, France, and the Baltic. As to the herring-fiſhery, it is a common bleſſing to the whole eaſtern ſhore of Scotland; and enables the Aberdeen merchants to carry on a profitable trade to Dantzic, Konigſberg, Riga, Narva, Wybourg, and Stockholm.

This city has alſo a good manufacture of linen, and alſo of worſted ſtockings. Its pork is reckoned the beſt cured for long voyages of any in Europe, and they export a good deal pickled and packed up in barrels, which they ſell chiefly to the Dutch, for victualling their Eaſt India ſhips and men of war.

Peterhead, which ſtands on the ſouth ſide of the water of Ugie, is a market-town and ſea-port of conſiderable trade in the north-eaſt part of the county, upon the promontory called Buchannoſs, and is noted for the Pretender's landing there in 1715, and has a road which will hold a hundred ſail of ſhips.

Garioch is the ſeat of a preſbytery, conſiſting of fifteen pariſhes, and gives name to a diſtrict that extends near fourteen miles from eaſt to weſt, and eight from the north-weſt to the ſouth. It lies in a valley watered by two large and ſeveral ſmaller rivers, with ſeveral fertile hills on both ſides; particularly Mount Bennachy, which riſes ſo high as to be ſeen at ſea, though it is near fourteen miles from the coaſt.

Strathbogy, which ſignifies the valley upon the Bogy, ſtands twenty-four miles from Aberdeen, and has a market, with a bridge over the Dovern near its confluence with the Bogy. It is the ſeat of a preſbytery, containing eleven pariſhes. This valley, which is fruitful in corn and paſture, has black cattle, ſheep, and horſes, not only for the uſe of the inhabitants, but for exportation; and is remarkable for the fine linen yarn ſpun by the women here, and ſold to the merchants.

SECT. XXII.

Of the Shire of Fife; its Situation, Extent, Produce, and principal Towns.

THIS county conſiſts of a fine peninſula incloſed between the Forth and the Tay, bounded on the eaſt by the Northern ocean; on the ſouth by the firth of Forth; on the weſt by the Ochil-hills, Kinroſs-ſhire, and Perthſhire; and on the north is divided by the firth of Tay from Gaury and Angus; it being commonly reckoned thirty-two miles in length, and about ſeventeen in breadth.

The eaſt part is the moſt level, and the weſt the moſt mountainous. The north and ſouth parts are very fruitful in corn, and full of towns which have good bays and harbours; while the middle of the country is more fit for paſture, and has plenty of cattle, eſpecially ſheep, whoſe wool is much eſteemed; as are alſo the hides of their black cattle, deer, and goats. On the ſouth ſide are coal-pits, and much ſalt is made. The Ochil-hills on the weſt alſo afford good paſture, and the pleaſant and fruitful vallies between them have fields of corn. There is a quarry of excellent free-ſtone at Dalgate; near the water of Ore are lead-mines; and at the Bin and Orrock are many fine cryſtals of ſeveral colours.

There are here alſo ſeveral mineral waters at the ſpaw at Kinghorn and Ballgrigy. The principal rivers are the Leven and the Edin, which abound with ſalmon and other fiſh.

This coaſt is well planted with little towns that are nurſeries for ſeamen; and the ſea, beſides herrings and other fiſh, which are taken in great quantities in Auguſt and September, yields abundance of oyſters and other ſhell-fiſh.

The earl of Rothes is hereditary ſheriff. No county of Scotland ſends ſo many members to parliament, or is inhabited by a greater number of the nobility.

The principal towns are the following:

Bruntiſlan, or Burnt Iſland, a royal burgh, ten miles to the north-weſt of Edinburgh; it lies oppoſite to Leith, and a paſſage-boat goes thither from hence every day. The town ſtands in the middle of the north ſide of the river Forth, and enjoys a fine proſpect of Leith road, and of the city and caſtle of Edinburgh, with a ſafe harbour, where ſhips lie with their heads to the very houſes. It is ſo land-locked, that ſuch as are driven up the firth by ſtorms, or contrary winds, come hither for ſafety; and ſhips trading on this coaſt often winter here, the water being commonly eighteen, and at ſpring-tides twenty-ſix feet deep within the harbour, which has room enough for a hundred ſail of ſhips, and is capable of receiving and careening the largeſt men of war. The

town

town has a handſome church, with a large town-houſe and priſon; and a conſiderable manufacture of linen cloth.

Kirkaldy is ſeated on the ſame coaſt, ten miles north of Edinburgh, and is a market-town and royal burgh, the ſeat of a preſbytery, containing ſeventeen pariſhes. It is larger and better built than the former, it extending a mile in length. It conſiſts of two pariſhes, and is a place of good trade, here being ſome conſiderable merchants and large dealers in corn, who export great quantities of it both to England and Holland; others trade with linen to England, and make returns in the neceſſary foreign manufactures. Here is a convenient yard for the building and repairing of ſhips; ſeveral houſes for the making of ſalt; and in the neighbourhood are coal-pits.

St. Andrews had its name from St. Andrew, whoſe bones are ſaid to have been brought hither from Patras, a town in Peloponneſus. This is an ancient, and was once a flouriſhing city, the metropolis of all Scotland; the ſeat of its firſt univerſity, and, before the Revolution, was the ſee of an archbiſhop. It is ſituated thirty miles to the north-eaſt of Edinburgh, and is ſurrounded with extenſive corn-fields, abounding in excellent wheat and barley; with the pleaſant downs called the Links lying on the ſea-ſide towards the north. The town formerly conſiſted of four large ſtreets, which extend from eaſt to weſt, almoſt parallel to each other: but the northernmoſt, formerly the principal, is entirely ruined, and not a houſe remaining; each of the other three terminates to the eaſtward on the cathedral, which is now in ruins. This was eſteemed one of the largeſt and moſt beautiful Gothic ſtructures in the world, it being three hundred and ſeventy feet in length from eaſt to weſt, the croſs from ſouth to north a hundred and eighty, its breadth ſixty-five, and its height a hundred feet: the beauty of its pillars, with the ſymmetry and proportion of the whole building, have been greatly admired.

Near the ruins of the cathedral are ſtill remaining the wall of the moſt ancient chapel of St. Rule, with the ſpire, a hundred and five feet high, which is ſtill entire. On the north ſide of the city are the ruins of its ancient caſtle, of which nothing remains but the walls.

Though the town was formerly about two miles in circumference, there are now hardly a thouſand houſes; and of theſe near two hundred are become ruinous. The number of the inhabitants ſtill amounts to above four thouſand. It is a place of no trade, and its harbour is capable of receiving only ſmall veſſels. Near the town is plenty of free-ſtone, of which all the houſes are built.

Here is only one pariſh church, that of the Holy Trinity, remaining, and two chapels. This church is an ancient ſtately edifice, built with fine free-ſtone, in the form of a croſs, with a handſome ſpire in good repair. In it is a fine monument of archbiſhop Sharpe, who was aſſaſſinated upon a moor as he was coming home in his coach.

This city is particularly famous for its univerſity, conſiſting of three colleges, of which, during the continuance of epiſcopacy, the archbiſhops were chancellors. The rector is choſen annually, and by the ſtatutes ought to be one of the principals of the three colleges, which are called St. Salvator's, St. Leonard's, and the New-College.

St. Salvator's college was founded by James Kennedy, biſhop of St. Andrews, in 1448, who erected the edifice, furniſhed it with coſtly ornaments, and endowed it with ſufficient revenues for a doctor, a bachelor, and a licentiate in divinity, four profeſſors of philoſophy, and eight poor ſcholars. It has alſo a good library, founded by Dr. Sheen. The edifice itſelf is a ſtately pile of fine hewn ſtone; it has a large vaulted chapel covered with free-ſtone, and over it is a lofty ſpire. The common hall and ſchools are very large; and the cloiſters and private lodgings for the maſters and ſcholars have been very magnificent, but the college revenue is not ſufficient to keep it in repair.

St. Leonard's college was founded by John Hepborne, prior of St. Andrews, in the reign of James V. with ſalaries for a principal or warden, four profeſſors of philoſophy, and eight poor ſcholars; another profeſſor of philoſophy has ſince been added, with a handſome ſalary, and alſo a library. By an act which paſſed in the twentieth year of the reign of his late majeſty, theſe two colleges were united.

The New College was founded by archbiſhop Bethune, uncle to the cardinal of that name, with endowments for a principal, a profeſſor, and ſome ſtudents in divinity, which is only taught in this college. As the two laſt colleges have a better revenue than that of St. Salvator, they are in much better repair. In the latter king Charles I. held a parliament, in a ſpacious room able to ſeat four hundred perſons in regular order; and it ſtill retains the name of the parliament-room.

The laſt place we ſhall mention in this county is Falkland, which is a pretty neat large town, almoſt in the center, ſeated at the foot of Lomond-hill, which is ſaid to be full a mile in height, and covered with the fineſt paſtures for ſheep. From the top there is not only a proſpect of Fifeſhire, but of the country all round it, to the ſouth beyond Edinburgh and the Lothians almoſt to Berwick; to the weſt as far as the hills by Stirling; and to the north into Perthſhire and Angus. Near this town James V. built a palace, which, by its ruins, eſpecially the two ſides yet ſtanding in the inner ſquare, appears to have been a large and noble ſtructure. It conſiſts of two ſtories, adorned with rows of round marble pillars ſet in ſockets of ſtone; it has baſſo relievos between every window, and on the top of every pillar a ſtatue as big as the life. The entrance to it is like that of Holyrood-houſe, between two ſtately towers; and on the right hand is a chapel, with niches on the outſide, in which are ſtatues as big as the life. Here were alſo ſpacious gardens, and a park eight miles round, well planted with oak and ſtocked with deer.

SECT. XXIII.

Of the Shire of Angus, or Forfar; its Situation, Extent, Produce, and principal Towns.

THIS county is divided on the north from the brae of Mar by the ridge of the Brinchinnin-mountains; on the eaſt it is bounded by Mearns; on the ſouth by the firth of Tay and the Northern ocean; and on the weſt and north-weſt by Perthſhire; extending thirty-four miles in length, and twenty-ſix in breadth.

The ſhire of Angus, as it is generally called by the Scots, produces wheat and all other ſorts of grain, and is diverſified with large hills, lakes, foreſts, paſtures, and meadows. It is a good country along the coaſt, but is there very narrow; yet ſpreads wide among the mountains, which are inhabited by Highlanders, and abound with harts, hinds, roebucks, and fowl. They have alſo ſome mines of lead and iron.

The principal towns of this county are Forfar, Dundee, and Montroſe.

Forfar is a royal burgh, a market-town, and the ſeat of a preſbytery containing ten pariſhes. It ſtands fourteen miles weſt of Montroſe, is governed by a provoſt and bailiff, and was anciently the ſeat of ſeveral parliaments, and had a royal palace, though ſcarce any remains of it are now left.

Dundee is ſeated in a pleaſant plain at the foot of a hill on the north ſide of the Tay, near its entrance into the ocean. It is a pretty town and a royal burgh, the ſeat of a preſbytery, containing ſeventeen pariſhes. This is eſteemed the beſt town in the ſhire for ſtrength, ſituation, and trade. The town is two miles in compaſs, and better built than moſt in Scotland. Its market-place, from whence run four large ſtreets, inhabited by many merchants, is almoſt as ſpacious as that of Nottingham, it being the largeſt and fineſt in North Britain, except that of Aberdeen, and has a town-houſe built with free-ſtone. It has a great church, formerly collegiate, which is an exact croſs, larger than that of St. Giles's at Edinburgh; it is a lofty ſquare building, and a great ornament to the town. The weſt end next the ſteeple was beat down by Cromwell's army, and the other three parts

are

are now divided into three ſeparate churches. The ſteeple has a fine tower, like that at Wrexham in Wales, and very lofty. The church-yard is without the town, and adorned with fine monuments. There are here alſo one or two meeting-houſes for the Epiſcopalians.

The town is populous, and one of the gayeſt in Scotland. The houſes are not high, but well built, chiefly of ſtone, in a very beautiful manner, which, together with its fine ſituation, and the ſplendor in which the inhabitants live, have given it the name of Bonny Dundee. The inhabitants, who carry on a foreign trade, are generally rich, and for thoſe that are fallen to decay there is a large handſome hoſpital, with gardens that run down to the rivers.

The harbour, which is two or three leagues within the mouth of the Tay, has three entrances; it has alſo two or three ſmall piers, and is capable of containing two or three hundred ſail of ſhips of ſmall burthen. From the harbour is a pleaſant walk paved with flag-ſtones, and ſhaded with rows of trees on each ſide, which ſerves for an exchange to the merchants and maſters of ſhips; and on one ſide are alſo large ware-houſes for goods and granaries for corn. The river itſelf is a good harbour, with ſafe riding, good ground, and deep water.

As this is one of the beſt ports for commerce in all Scotland, it has a conſiderable inland trade, eſpecially for corn and linen, which the merchants buy up for exportation, and which enriches all the adjacent country.

Montroſe is ſeated at the mouth of the river Eſk, on the Northern ocean, forty-ſix miles to the north-eaſt of Edinburgh. It is well ſituated for trade, and has a harbour for ſhips of conſiderable burthen; hence the inhabitants carry on a good foreign trade, particularly to Norway. The town is adorned with many fine buildings, and principally conſiſts of one long handſome ſtreet, which runs parallel with the ſhore. It gives the title of duke to the chief of the family of Graham, and is famous for the eſcape of the Pretender, who took ſhipping here privately in 1716, for fear of a viſit from the late duke of Argyle and general Cadogan.

SECT. XXIV.

Of Inverneſsſhire; including Badenoch, Lochaber, with a ſmall Part of Roſs and Murray; their Situation, Extent, and Produce; with a Deſcription of Inverneſs, and ſome Account of Fort William and Fort Auguſtus.

INVERNESS-SHIRE, which was formerly much more extenſive than it is at preſent, is bounded on the north by Roſs and Cromarty; on the eaſt by Murray-land; on the ſouth by Lorn, Broadalbin, and Athol; and by the Weſtern ſea on the weſt; extending about ſixty miles from eaſt to weſt, and forty-five, where broadeſt, from north to ſouth.

This ſhire abounds with iron ore; it has ſome woods fifteen miles long, and large woods of oak. It alſo contains ſeveral remarkable lakes: one of the moſt extraordinary of theſe is ſeated upon a very high mountain; it extends about thirty fathoms in length, and ſix in breadth; yet no ſtream is obſerved to run either to or from it, it being entirely fed by its own ſprings, though ſo deep that it has never been fathomed. It is equally full at all ſeaſons of the year, and, though the water is always cold, it never freezes. About ſeventeen miles to the weſt, on the north ſide of a mountain called Glenintea, is a lake called Lochanwyn, or the Green-lake, which is covered with ice all the year round.

Badenoch has part of Murray on the north, Lochaber on the weſt, Athol on the ſouth, with part of Murray and the Braes of Mar on the eaſt, extending, according to Templeman, forty-nine miles in length, and twenty-two in breadth in the wideſt part. This tract particularly abounds with deer.

Lochaber is bounded on the north by Badenoch, on the eaſt by Athol and part of Badenoch, on the ſouth by Lorn and Broadalbin, and on the weſt by a mountainous tract towards the coaſt; extending, according to Mr. Templeman, fifty-ſeven miles in length, and fifty one in breadth.

This extenſive tract abounds with paſtures, woods, deer, and goats; and has ſome veins of iron, but not much corn; for though very pleaſant, it is reckoned one of the moſt barren countries in Scotland.

Inverneſs, from which this county has its name, is its principal town, and is ſeated at the bottom of the firth of Murray, where it receives the Neſs, a hundred and ſix miles to the north of Edinburgh: from that river and Euner, which in the ancient Scots tongue ſignifies an harbour, the town derives its name. It is a royal burgh, a market-town, the ſeat of a ſheriff, and of a preſbytery containing thirteen pariſhes. It ſtands on the ſouth ſide of the Neſs, over which it has a bridge of hewn-ſtone, with ſeven arches, that leads into what is properly called the North Highlands. It is conveniently ſituated for trade, of which it has a conſiderable ſhare, with a harbour for ſmall ſhips, a church for the Highlanders, and another for the Lowlanders, and the ruins of a caſtle in which the kings of Scotland formerly reſided, and ſtanding on a hill that affords a fine proſpect of the town and the adjacent country, which is very fertile. It is reckoned a well built, clean, and pleaſant town; it has in particular two very good ſtreets, with coffee-houſes and taverns, and the people are more polite than in moſt towns of Scotland. For Oliver Cromwell, who erected forts, and, like the Romans, placed his ſtationary legions in the moſt eminent parts of the country for keeping the people in awe, built a ſtrong citadel here, in which he left a garriſon; the ſoldiers of which ſettling in the country after the peace, and applying themſelves to the culture and improvement of the land, there is here ſpoken leſs of the broad Scots dialect than farther to the ſouth, and is more of the Engliſh method of huſbandry; but it only reaches a little way, for the mountains interſecting the pleaſant valleys, the rudeneſs of the Highlanders ſoon ſucceeds. Though Oliver's fort was demoliſhed after the Reſtoration, it was reſtored after the Revolution, and king William III. always kept a garriſon in it, on account of its being one of the moſt conſiderable paſſes between the Low-countries and the Highlands.

Innerlochy, Inverlochy, or Fort William, ſtands in the center between the North and Weſt Highlands, at the mouth of the river Aber, a hundred miles to the north-weſt of Edinburgh. It is a regular fort erected after the Revolution, and received the name of Fort William in honour of William III. It is intended as a curb on the Highlanders, and has a large garriſon. It is ſo ſituated that if it be ever ſo much ſtraitened by a blockade, or ſiege by land, it may receive conſtant ſupplies by ſea.

Fort Auguſtus is a regular fortification built by general Wade near the ſouth end of Lochneſs, to awe the Highlanders, and to prevent their diſturbing the ſoldiers he employed in making a road here, which, with extraordinary pains, they carried through mountains and moraſſes that ſeemed almoſt impaſſable. By this road the king's forces may eaſily enter and traverſe the country, which was before inacceſſible to all but the Highlanders.

SECT. XXV.

Of Argyleſhire, or Inverary, including Argyle Proper, Cawal, Lorne, Knapdale, and Cantyre; with the Situation, Extent, and Produce of each, and a Deſcription of the principal Iſlands belonging to Argyleſhire.

ARGYLESHIRE is bounded by Lochaber on the north-eaſt, by Perthſhire on the eaſt, by the Iriſh ſea and the firth of Clyde on the ſouth, and by ſeveral iſlands on the weſt and north. It extends a hundred and twenty miles in length, and forty in breadth.

This county comprehends Argyle Proper, Cawal, Lorne, Knapdale, Cantyre, and many of the Weſtern iſlands. It is the ſeat of a provincial ſynod, containing five preſbyteries and forty-nine pariſhes, and gives title of duke to the noble family of Campbell. It abounds with caſtles and gentlemen's ſeats, moſt of which belong to branches of that family, which are famous for having ſuffered for their ſtedfaſt adherence to the Proteſtant religion and the liberties of their country, par-

ticularly from the time of the Reformation to the Revolution.

The country is mountainous, and the inhabitants, who ſpeak Erſe, the ancient language of Scotland, live moſtly by hunting and fiſhing; for it has ſeven great lakes, with other leſſer ones, that abound with fiſh. The coaſt is covered with high rocks, and bleak mountains covered with heath, which feed great numbers of black cattle, deer, and other wild beaſts; for their cattle generally run wild, but are excellent meat.

The diſtrict of Argyle Proper has Knapdale and Cowal on the ſouth, Lenox and the Grampian hills on the eaſt, Lochaber on the north, and Lorne on the weſt. It lies between Loch-fyn, which is ſixty miles long and about four broad, and Loch-aw, a freſh-water lake, twenty-four miles in length, and one in breadth. This laſt lake contains twelve iſlands, and from it runs a river named Aw, which, after a courſe of ſix or ſeven miles, enters Loch-ediff, which abounds with ſalmon, and falls into the Weſtern ſea near the iſle of Mull.

Cowal, the next diviſion, lies between Loch-fyn on the weſt, the firth of Clyde on the eaſt, the iſle of Bute on the ſouth, Argyle Proper and the Grampian-mountains on the north, and abounds with lakes and bays.

The principal place it contains is Deroan, formerly a ſeat of the biſhop of Argyle, and now of a preſbytery conſiſting of eight pariſhes.

Lorne, the third diviſion, is a level country, the pleaſanteſt and fruitfulleſt part of Argyleſhire, eſpecially in barley; and it has alſo many lakes. It is bounded on the eaſt by Broadalbin; on the ſouth by Loch-leaven, a lake of great extent; on the weſt by the Weſtern Iſlands; and on the north by Lochaber; extending about thirty miles in length from north to ſouth, and about nine, where broadeſt, from eaſt to weſt.

In this diſtrict Lochaber runs ſo far into the land from the Weſtern ſea, that it is only disjoined from Loch-neſs, which runs into the Eaſtern ocean, by a very narrow ridge of hills which run between them.

Knapdale is bounded on the eaſt by Loch-fyn, which ſeparates it from Cowal, on the ſouth by Cantyre, on the weſt by the Weſtern Iſlands, on the north by Lorne, and on the north-eaſt by Broadalbin. It is twenty miles from north to ſouth, and thirteen where broadeſt from eaſt to weſt. It is joined to Cantyre by a neck of land ſcarce a mile broad. This part is alſo full of lakes, in ſome of which are iſlands with caſtles; but it is in general fitter for paſture than corn.

The principal town in this diviſion is Inverary, which is ſeated on Loch-fyn, ſeventy-five miles to the north-weſt of Edinburgh, and forty-five from Glaſgow. It is a royal burgh, a market town, and the ſeat of a presbytery conſiſting of twelve pariſhes. Near it is a fine large caſtle, adorned with gardens and a park, and is the chief reſidence of the duke of Argyle.

Cantyre, or Kintire, which ſignifies the Land's Head, is the moſt ſouthern diviſion of this ſhire, and is a peninſula that extends thirty-ſeven miles from north to ſouth, and ſeven in breadth. From the point of land, called the Mull of Cantyre, it is ſcarce ſixteen miles to the Fair Foreland in Colerain, on the north-eaſt of Ireland. It is a very fruitful populous tract, inhabited both by Highlanders and Lowlanders, and for the moſt part by the former, brought hither by the Argyle family, who have taken extraordinary care in civilizing the inhabitants.

The principal place here is Campbell-Town, which is ſeated on the lake of Kilkerran, on the eaſtern coaſt, ninety-ſeven miles from Edinburgh, and thirteen from the Mull of Cantyre. It has a weekly market, is the ſeat of a presbytery conſiſting of ten pariſhes, and has a ſafe harbour.

The principal of the Weſtern Iſlands belonging to Argyleſhire are Iſla, or Ilay, Jura, and Mull.

Ilay, or Iſla, is ſeated fifteen miles from Cantyre, and is reckoned the moſt weſterly of all the iſlands of Britain. It extends twenty-four miles in length, and from eight to eighteen in breadth; is not ſo healthy as Jura; but abounds with corn, black cattle, and deer; has ſeveral rivers and freſh-water lakes. The lake called Loch-finlagen, in the center of the iſland, is three miles round, and diſcharges itſelf into the ſea. In this lake is a ſmall iſland, called The Royal Seat of the great Macdonald, who was crowned and anointed king of the Iſles by the biſhop of Argyle and ſeven prieſts, in the preſence of all the heads of the tribes of the iſles and continent. The ruins of his palace, and the houſes of his courtiers and guards, are ſtill to be ſeen. Here are alſo many caves, one of which is big enough to contain two hundred men. Here are alſo ſix churches and a chapel. There are a multitude of little iſlands on the coaſt, ſome of which are inhabited.

Jura is twenty-four miles long, and ſeven broad. It is ſeparated by a narrow ſtreight from Ilay, one mile in breadth, and is reckoned one of the moſt healthful places in Scotland; it has a clear air from the middle of March till Michaelmas, and the inhabitants live to a great age. It belongs to the duke of Argyle, and the eaſt coaſt is well inhabited. It is famous for its medicinal waters, and its rivers which abound with ſalmon. The eaſt coaſt is well inhabited, and abounds with deer, horſes, black cattle, ſheep, goats, wild and tame-fowl; and on the weſtern ſhore are found coral and coroline. In the middle of the iſland are four very high mountains, the two higheſt of which are called by ſeamen The Paps of Jura; they are covered with heath and ſome graſs that affords paſturage for the cattle. Between the north end of Jura and the little iſle of Scarba is a whirlpool, that has an impetuous current not to be paralleled any where about the iſland of Great Britain; yet the ſmalleſt fiſhing-boat may croſs it at the laſt hour of tide without the leaſt danger. There is only one church in the iſland. The inhabitants are all Proteſtants, but ſpeak Erſe, and wear the Highland habit.

Mull, the largeſt of theſe iſlands, lies at a ſmall diſtance to the north of Jura, and is twenty-four miles in length, but in the broadeſt part is as much in breadth, and is divided from Lochaber by a channel not half a league broad. The air is temperately cold and moiſt. A ridge of mountains run through the middle of the iſland, and one of them is ſo high, that it is ſeen from all the weſtern iſlands and from a great part of Scotland. The iſland is well watered with rivulets, and affords good paſturage: the horſes and black cattle are ſmall but ſprightly, and the latter very good meat. It has alſo a great number of ſheep, goats, deer, and wild fowl; with barley, oats, great variety of plants, ſome wood, and plenty of turf and peat. The coaſt, eſpecially Lechleffin bay, abounds with herrings, cod, ling, oyſters, cockles, muſſels, clams, &c. Here are alſo ſeals and otters. Several of the rivers abound with ſalmon and pearl muſſels, and ſome freſh-water lakes have plenty of trouts and eels. The iſle of Mull has ſeveral bays, and places for anchorage, of which that of Duart, on the eaſt ſide, is moſt frequented. It has three caſtles, of which caſtle Duart, on a promontory near the ſouth-eaſt corner of the iſland, is the principal.

The inhabitants, who, except a very few, are Proteſtants, have, according to Mr. Martin, only two pariſh-churches, and a little chapel. The late duke of Argyle became its proprietor, upon its being forfeited by the family of Maclean.

On the weſtern coaſt of Mull are many little iſlands, among which is Jona, which is but two miles long and one broad; yet on ſeveral accounts is worthy of notice. Marble is found upon it of various colours, with very beautiful veins. The eaſt ſide is all arable and plain, abounding in corn and graſs, and has nine ports for landing; but the weſtern coaſt is exceeding bad, and full of rocks; the tides here are alſo very violent.

This iſland had two monaſteries, and has a church famous for the burial of the kings of Scotland, of whom here lie no leſs than forty-eight; and is alſo famous for being the reſidence of Columbus, the apoſtle of the Picts, from whoſe cell this iſland, ſays Bede, was called Columb-hill. After the Scots left the iſle, a biſhop's ſee was erected in Sodor, a little village, from which all the iſlands within his dioceſe were called Sodorenſis. Its church, firſt dedicated to St. Columbus, now called St. Mary's, was formerly the cathedral, and is a beautiful ſtructure: the ſteeple is large, the doors and windows curiouſly

curiouſly carved, and the altar of the fineſt marble. There are likewiſe two other churches in the iſland. Here are what are termed black ſtones, though their real colour is grey. On theſe black ſtones, it is ſaid, Macdonald king of the Iſles kneeled, and with hands lift up to heaven, delivered the rights of their lands to his vaſſals in the iſles and continent, ſolemnly ſwearing that he would never recal the privileges he then granted.

SECT. XXVI.

Of the Shires of Nairn and Cromarty; their Situation, Produce, and principal Towns.

NAIRN is in ſome meaſure united to Cromartyſhire, by their ſending alternately one member to parliament. Nairn is bounded on the north by Murray firth; on the eaſt by Elgin; and on the weſt and ſouth by Inverneſs comprehending the weſt part of Murray, which lies between the river Findorn and Nairn; extending in its greateſt length twenty miles, and in its greateſt breadth fourteen.

The air is very wholeſome, and the winters pretty mild. The lower part of the country bears much corn, which is ſoon ripe; but the high country is fitter for paſture. It has many woods of fir and other trees, eſpecially in the ſouth-weſt part of the ſhire, on the banks of the river Nairn. It has many lakes and mountains, yet abounds with little towns and villages.

Nairn, the principal town, is a royal burgh, one hundred and four miles from Edinburgh, and had formerly a harbour, which is now choaked up with ſands that cover the ruins of an ancient caſtle.

Cromartyſhire is but a ſmall country in a peninſula, ſeparated on the ſouth from Nairnſhire by a part of Murray firth which runs up to Inverneſs; and on the north from Roſsſhire by the firth of Cromartie; it being bounded on the weſt by the ſhires of Inverneſs and Roſs; and only twelve miles long and three where broadeſt.

Cromarty, the capital, is delightfully ſeated fourteen miles from Inverneſs, on the branch of the Murray firth called the firth of Cromarty; a road where the whole royal navy might ſecurely anchor, and have ſea room enough; though it is not much uſed either by the natives, or by any one elſe. At the entrance to this firth are dangerous rocks called the Craigs: and at this town is a ferry which croſſes into Roſsſhire, from which the inhabitants are ſupplied with peat for fuel. It is a market town, and has ſpacious links, or a level green ſtrand. It gave title of earl to an unfortunate nobleman, who was alſo hereditary ſheriff of the county: but both titles are now fallen to the crown.

SECT. XXVII.

Of the Shire of Bamf; its Situation, Extent, Produce, and principal Towns.

THE ſhire of Bamf comprehends that part of Buchan north of the river Ugie, with the diſtricts of Strathavern, Euzie, Boyne, Balvenie, Strathyla, and Strathavin. On the north it is bounded by Murray firth; on the eaſt by the river Dovern and the northern ocean; on the ſouth by the river or water of Ugie, which ſeparates it from Aberdeenſhire; on the ſouth-weſt by the Braes of Badenoch and Braemer; and on the weſt by the water of the Spey and Elginſhire. Its dimenſions are variouſly given: but, according to Templeman's ſurvey, it is fifty miles in length from eaſt to weſt, and its greateſt breadth eighteen.

The climate and ſoil are nearly the ſame as in the neighbouring country of Aberdeenſhire.

That part called Buchan, extends north from the river Ugie to the ſea, and weſt as far as the river Dovern, that is, nine miles from north to ſouth, and twenty from eaſt to weſt. It is watered by abundance of brooks and rivers, and conſiſts of corn-fields and little hills; it being the moſt extenſive tract in the whole kingdom free from mountains. The Boyne is a little diſtrict that extends along the firth of Murray, and is fruitful near the ſhore, but in other parts mountainous, and has large quarries of ſpotted marble.

Balveny is a mountainous tract on the weſt ſide of the ſhire; it extends along the river Spey, and abounds with paſtures and woods. It is famous for a rock that produces hones and whetſtones ſufficient to ſerve the whole iſland; ſo that the people uſe them as ſlates, for covering their houſes. Here are alſo ſprings of alum water, and veins of a ſtone from which alum is extracted.

Strathyla, which lies to the north-eaſt of Balveny, is fruitful in corn and graſs, and ſuch plenty of limeſtone, that the inhabitants build their houſes with it. They are alſo conſiderable gainers by ſelling their lime for cattle and fine linen yarn at a weekly market in the village of Keith, on the river Dovern.

Strathavin is a diſtrict ſeated on the river Avon; Strathdovern alſo receives its name from its extending along the river Dovern.

The principal places in this county are the following:

Bamf, the county-town, is ſeated at the mouth of the Dovern, one hundred and ten miles to the north of Edinburgh; but has no port, and conſequently little trade, except for corn and ſalmon: for the townſmen are fonder of tillage than of commerce. It is a royal burgh, and here the ſheriff holds his courts. It has the ruins of a caſtle, and of an abbey which belonged to the Ciſtercian monks.

Tureff is ſeated ſeven miles from Bamf, on a river that falls into the Dovern; it is a market town, and the ſeat of a preſbytery. The adjacent country is very pleaſant, and abounds with gentlemen's ſeats.

Fraſerburgh, is a ſea-port on the coaſt of Murray firth, fifteen miles from Bamf, and is reckoned the chief town of the diſtrict of Buchan; it has two piers of free-ſtone, which renders the harbour ſo ſafe and commodious, that thirty ſhips may ſecurely winter here at a time.

Upon the banks of the Spey, which runs through this county, is Gordon caſtle, the nobleſt palace in the North, it being the duke of Gordon's chief ſeat, adorned with pleaſant gardens, a great park, and fine canal, with an agreeable fountain and ſtatues. The caſtle is ſo large, that it appears more like a little town than a nobleman's ſeat.

SECT. XXVIII.

Of the Shire of Sutherland; its Situation, Extent, Produce, and principal Towns.

THIS county, including Strathnaver, has Caithneſs and the Northern ocean on the eaſt; Roſs on the ſouth; the country of Aſſynt to the weſt; and the Northern ocean to the north; extending, according, to Mr. Templeman, eighty-eight miles in length, and forty-two in breadth.

The country is very mountainous, but leſs ſo than Roſs, and according to Camden, is more fit for breeding of cattle than bearing of corn. The valleys, however, are pleaſant, fertile, and well inhabited. It abounds with black cattle, ſheep, deer, and wild-fowl; and it is ſaid that all the deer bred on the mountain Arkil have forked tails. It has three remarkable foreſts, and many other woods that afford hawks and plenty of game, which the inhabitants are fond of hunting. Here are hills of white marble, and a great deal of free-ſtone, lime-ſtone, iron-ſtone, and good ſlate. It is remarkable, that though this county is ſeated ſo far north, ſaffron grows in it very well.

There is one ſort of bird ſaid to be peculiar to theſe moſt northern diſtricts, which the inhabitants call a knag: it reſembles a parrot, and digs its neſt with its beak in the trunk of trees.

In this county are above ſixty lakes, abounding with ſwans, geeſe, ducks, and other fowl of various kinds, and are full of fiſh. The largeſt is Loch-fin, which is fourteen miles long. In many of them are very pleaſant iſlands. In ſhort, this country is ſo full of bays, rivers, and lakes, that there is ſcarce a town in it that is not waſhed with ſalt or freſh water, and both its bays and coaſt

coaſts abound with ſeals, ſalmon, and ſhell-fiſh of all ſorts. It gives title of earl to the chief of the noble family of Sutherland, who has the titles of hereditary ſheriff and admiral. It has many commodious harbours, from which the inhabitants export barley, ſalt, coal, beef, hides, tallow, ſkins, wool, butter, cheeſe, ſalmon, &c.

The north part, called Strathnover, is ſeparated from the reſt by mountains, and bounded on the north and weſt by the ocean; on the eaſt by Caithneſs; and on the ſouth by Aſſynt and Sutherland. It is ſo called from the river Navern, which runs thro' it; it extends thirty-four miles from eaſt to weſt, and twelve from north to ſouth; but in others no more than ſix.

The ſnow lies a long time upon the high mountains. It has good harbours and many woods, with great herds of black cattle, ſheep, horſes, and goats. The inhabitants take their fat cattle and colts to the neighbouring fairs; but export their ſalt beef, hides, ſkins, tallow, butter and cheeſe. Here is alſo great plenty of veniſon, and the inhabitants deſpiſe thoſe who do not delight in hunting.

It is obſerved that the people of this and the neighbouring countries are ſtrong, courageous, frugal, capable of fatigue, civil to ſtrangers, chearful, and ſincere.

The day here in ſummer is computed at eighteen hours, and when the ſun is ſet, it is much more than twilight till it riſes again; but the nights are as long in the midſt of winter: however, the air is even then illuminated by the aurora borealis, or the northern lights. It is alſo obſerved, that the winters here are in general more temperate than they are farther to the ſouth, and that ſome of the rivers, particularly the Neſs, never freeze; which is aſcribed by naturaliſts to the ſalt and mild vapours from the neighbouring ſea, which fill the air, and as it were ſheathe the acute particles of the cold; and for the ſame reaſon the ſnow in the vallies neither lies ſo deep, nor ſtays ſo long on the ground, as in other places.

Dornoch, the capital of the county, is ſeated on the bank of the firth of Murray, one hundred and thirty miles to the north of Edinburgh, and was formerly the ſee of a biſhop; here was alſo a cathedral for the dioceſe of Caithneſs, with a caſtle for the earl of Sutherland, and the family burying-place. Dornoch is the ſeat of a preſbytery containing nine pariſhes, and has four annual fairs, which are much frequented. It has, however, at other times little or no trade, and is now remarkable for nothing but its antiquity.

Brora is a burgh of barony at the mouth of a river of its own name; in the neighbourhood are mines of excellent coal, and a great deal of ſalt is here made and exported.

SECT. XXIX.

Of the Shire of Clackmanan; its Situation, Extent, Produce, and principal Places.

CLACKMANANSHIRE is bounded on the north by the Ochill-hills, on the ſouth by the firth of Forth, on the eaſt by part of Perthſhire, and on the weſt by part of Sterlingſhire. It is about eight miles long, and where broadeſt but five,

This is a plain fertile country toward the firth; but the reſt is fitter for paſture; however, the lands below the Ochill-hills abound both with corn and paſture. About Alloa and Clackmanan are many coal-pits; and the inhabitants export great quantities of coal, not only to Edinburgh, but even to England, Holland, and France; for it yields the beſt and the greateſt quantity of coal of any part of Scotland, it being that diſtinguiſhed in England by the name of Scots coal. This county joins with the ſhire of Kinroſs in alternately ſending a member to parliament, though Kinroſs is generally included in Fifeſhire.

Clackmanan, the county town, ſtands on a riſing ground, upwards of thirty miles from Edinburgh, and has a noble caſtle, adorned with fine gardens.

But the moſt conſiderable place is Alloa, or Alloway, a ſea-port, five miles to the eaſt of Sterling, and the laſt on the Forth, where that river falls into the arm of the ſea called the Firth. This town, though a village, is larger and better built than moſt of the borough towns in the kingdom. There is in particular one ſtreet that runs down to the harbour, the broadeſt and beſt paved of any next to Edinburgh, with rows of lime-trees on each ſide, as at Dundee and in the towns of Holland. Alloa has a very conſiderable foreign trade, and ſeveral manufactures are erected there, all of which have ſome relation to navigation. They particularly make excellent ſail cloth, which is ſaid to be as good as that of Holland. There is a large rope-walk and ware-houſe of naval-ſtores, as hemp, tar, &c. imported from Ruſſia, Livonia, Norway, &c. from which laſt place deals are alſo imported, and here are ſeveral ſaw-mills employed in cutting or ſlitting them. A factory has likewiſe been ſettled here for the merchants of Glaſgow, who have erected ware-houſes for ſtowing their tobacco, ſugar, and other goods imported from the Britiſh colonies in America, in order to be ready for exportation to Holland, Hamburgh, Bremen, the Baltic, London, or where-ever they are wanted; and alſo for ſtowing ſuch commodities as they import from Sweden, Ruſſia, &c. The river is here as broad as the Thames at London-bridge, the water deep, and the tide flows ſo ſtrong, that ſhips may lay their ſides to the wharf, and load and unload their goods without the leaſt difficulty. There are ſalt-houſes all along the ſhore for boiling of ſalt, which is fetched away in great quantities by ſhips that bring other goods from Hamburgh, Bremen, or the Baltic.

The earl of Mar had a ſeat here, formerly called Alloway-caſtle, encompaſſed with fine plantations; the gardens taking up forty-two acres, and the wood, with the viſtos cut through it, a hundred and fifty. The entrance from the town on the weſt is by a pair of fine gates, through a ſpacious avenue, which leads to the area fronting the houſe, in the midſt of which is a gladiator, and on the right hand of the area a ſpacious garden, with a fine terrace and bowling-green, adorned with lofty evergreens. On the ſouth ſide of the houſe is a ſpacious parterre, beautifully adorned with ſtatues and vaſes; and from thence to the river runs a fine avenue, from which and from the parterre are thirty-two different viſtos, each terminating on a remarkable ſeat, or mountain, at ſome miles diſtance; one of them ſhews Sterling-caſtle, which though but four miles from hence by land, yet from the various windings of the river is twenty-four by water. In the middle of the terrace is a fine baſon of water, in the midſt of which is a group of Cain killing Abel; and at the end of the river is a pair of pyramidical gates, where a ſhip of three hundred tons burthen may unload. There is a very long and wide avenue to the eaſt through the wood, and between each viſto from the parterre are wilderneſſes and little grottos. The earl of Mar loſt this fine ſeat by his rebellion in 1715, and the government, to whom it was forfeited, ordered it to be kept in good order.

SECT. XXX.

Of the Shire of Roſs; its Situation, Extent, Produce, and principal Towns and Iſlands; as Sky, Lewis, and Harris.

THE ſhire of Roſs in general, including Tayn and Cromarty, for the laſt, though a ſmall county of itſelf, is alſo conſidered as a part of Roſsſhire, has the Weſtern ſea and the iſle of Sky on the weſt, Strathnaver and Sutherland on the north and north-eaſt, Cromarty and Murray firth on the eaſt, and Inverneſs on the ſouth. The form is very irregular, it being much contracted on the north-eaſt and ſouth by the neighbouring counties; but according to Mr. Templeman, it is eighty miles in length, and ſeventy-eight in breadth.

This extenſive country is for the moſt part mountainous and woody towards the Weſtern ocean; but on that ſide next to the German ſea it is better cultivated, more fruitful in corn, fruit, and herbs, than could be expected in a country ſo far north, and abounds in paſture. The ſtraths, or valleys near the rivers, are covered with woods, particularly upon the Charron and the water of Braau; and near Alfarig are woods of fir, fifteen

or twenty miles in length. It feeds great numbers of black cattle, horſes, goats, and deer; has abundance of land and ſea fowl, and is well ſupplied with freſh water fiſh by its lakes and rivers. The lochs, or lakes, on the weſt coaſt, in the proper ſeaſon, abound with herrings, particularly Loch-eu, which is divided into two parts, one a bay of the ſea, and the other a freſh-water lake, extending about nine miles in its greateſt length, and three where broadeſt. There are extenſive woods on its ſides, where abundance of iron was formerly obtained. Loch-bryan, on the ſame coaſt, is another bay, that runs ten miles up the country; is three miles broad at its mouth, and is alſo famous for herrings. It receives ſeveral rivers, and on the north ſide are many villages.

Coygach and Aſſynt are two mountainous diſtricts north from hence, but abound with deer, and have huge rocks of marble, with ſeveral gentlemen's ſeats towards the coaſt.

The middle part of the county, called Ardroſs, is mountainous and ſcarce inhabited; but affords ſome paſtures. The north-eaſt parts, on the rivers Ochill and Carron, and the firth of Tayn, are pretty fruitful, and abound with villages. This firth runs near twenty-five miles up the eaſt ſide of the county, dividing Roſs from Sutherland, and is ſeven miles broad at its mouth; but its quickſands render it unſafe for navigation.

Another diſtrict, called Ardmeanach, forms a part of a peninſula which lies between the bays of Cromarty and Murray, extending thirteen miles and a half from eaſt to weſt, and five and a half, where broadeſt, from north to ſouth. It has high mountains, ſome of which are both pleaſant and fertile.

There is likewiſe an inland tract called Strathcarron, from a river which divides it. This is a woody country, eſpecially in firs, and abounds in horſes and black cattle.

This county has ſome mountains ſo high, that they are covered with ſnow all the year round.

The principal places it contains are the following:

Channeriy, or Chanoury, a market-town ſo called from a college of regular canons that flouriſhed there. It ſtands on the peninſula between the bay of Cromarty and Murray, among pleaſant and fertile hills, and has a ferry over the firth into Murray. It was anciently the ſee of a biſhop, and had a large cathedral, a part of which is yet remaining, and a caſtle in which the biſhop reſided. It is at preſent the ſeat of a preſbytery, conſiſting of ſeven pariſhes; and has a ſtately houſe belonging to the earl of Seaforth.

Dingwell, a market-town and royal burgh, ſeated at the bottom of the firth of Cromarty, fifteen miles weſt of the town of Cromarty, is the ſeat of a preſbytery, containing thirteen pariſhes.

Tayne, a royal burgh and market-town, ſtands in a fruitful country, twelve miles to the north of Cromarty, and is the ſeat of a preſbytery, containing nine pariſhes. It is pretty well inhabited, and has a tolerable good trade, from its communication with the Weſtern iſlands and its herring-fiſhery.

We ſhall now give an account of the principal of the Weſtern iſlands generally included in the ſhire of Roſs.

Skie, or Sky, the largeſt but one of all the Weſtern iſlands, is divided from Roſsſhire by a ſtreight thirty-five miles in length, but in ſome places ſo narrow, that a man may be eaſily heard from one ſide to the other, eſpecially if the wind be favourable. It extends ſixty miles in length, and about twenty in breadth; and the coaſt is cut into a great number of gulphs and promontories. The ſoil is generally a black mould, though there is ſome of a red colour, in which iron is found. In ſome places there is fine white marble, black and white marcaſites, agate, and variegated ſtones of all colours, cryſtals alſo of different colours, plenty of free-ſtone and limeſtone, and after great rains ſtones of a purple colour rowl down the rivulets.

Though the channel which ſeparates it from Scotland is navigable by the largeſt men of war, yet the current is ſo violent, that no ſhip is able to ſail againſt it, be the wind ever ſo fair: yet in the narrow ferry, called the Kyle, they make cows ſwim over; for this purpoſe they tie a withy about the cow's lower jaw, and thus bind five of them together, after which a man in a boat holds the withy that ties the foremoſt, and thus rows over; and in this manner takes over three or four hundred cows in the ſpace of a few hours.

It is very high land both on the coaſt and within the country, where are ſeven high mountains, that lie near each other almoſt in the center of the iſland. The ſoil is fruitful enough in the lower grounds, and produces corn and cattle, as horſes, cows, ſheep, goats, and hogs; but the black cattle have ſeldom any thing to feed upon in winter except ſea-weeds, and therefore watch the ebb very ſtrictly; by this means, and by their being expoſed to the rigour of the coldeſt ſeaſons, the cows become ſuch ſkeletons in the ſpring, that many of them are unable to riſe from the ground without help; but as the graſs grows up they recover their ſtrength. The iſland ſupplies the neighbouring continent with barley and oats. Cod and ling are common upon the coaſt, and herrings in great abundance, for the taking of which they have many convenient bays and harbours, with about thirty ſmall rivers that afford ſalmon and other fiſh, and abundance of freſh-water lakes well ſtored with trouts and eels. They have land and water-fowl in great abundance, and among the reſt eagles and hawks. They have likewiſe otters and ſeals, and of the former are a large ſpecies with a white ſpot on the breaſt; but theſe are very ſcarce, and hard to be killed. They have likewiſe ſerpents of ſeveral kinds.

The iſland is divided into three parts, belonging to three different proprietors; is the ſeat of a preſbytery, and has ten pariſh-churches. Both the proprietors and all the people are Proteſtants, except ſome of the meaner ſort, who are of the Romiſh religion.

Lewis and Harris, which have been ſuppoſed to be two iſlands, form only one, which lies ſixty-eight miles weſt of the main-land of Scotland, and twenty-two in the ſame direction from the Iſle of Sky. It is ſubdivided into Lewis and Harries, or Harris, by a narrow channel, which runs ſo far within the country, that it is only joined by a ſmall neck of land: the whole extending near a hundred miles in length from north to ſouth, and ten or twelve in breadth, it being commonly called the Long Iſland. It is healthy, eſpecially in the middle. The ſoil is arable for about ſixteen miles on the weſt coaſt, and in ſome places on the eaſt; but it is generally ſandy, except the muirs or heaths, which are partly of red and partly of black clay; of which the women here make veſſels for boiling their meat, and for preſerving their ale. It produces barley, oats, rye, flax, and hemp. Their manure is ſea-weeds, ſoot, and peat-aſhes. The iſland alſo abounds with cows, horſes, ſheep, goats, and hogs: their black cattle are ſmall, but very prolific, and make excellent meat: their horſes are likewiſe ſmaller than on the main-land, but as ſerviceable for all domeſtic uſes, and live very hard, having little to feed on in winter but ſea-weeds.

All the coaſt and numerous bays abound with cod, ling, herrings, and every other kind of fiſh taken in the Weſtern iſles: but the fiſhery is very much interrupted by whales, the young ones of which are eaten by the common people, who reckon their fleſh very good food. They yield alſo plenty of ſhell-fiſh, as ſcallops, oyſters, cockles, muſſels, lympits, periwinkles, and ſpout-fiſh; of which laſt they are ſaid to have ſuch multitudes every ſeventh year, that the inhabitants manure the ground with them. On the ſhore are many caves, which ſhelter vaſt numbers of ſea and land-fowl, otters, and ſeals; and the laſt they eſteem nouriſhing food.

The inhabitants are of a good proportion and ſtature, generally of a ruddy complexion, healthy, ſtrong, and long-lived. The ſmall-pox proves very fatal to the young people; but ſeldom comes among them. The moſt common diſeaſe here is a cough. They are in general very acute and ſagacious, have a mechanical genius, and when they have an opportunity ſhew that they have no deſpicable turn for the ſciences: ſome of both ſexes are ſkilled in poetry and muſic, and ſome elegant ſpecimens of the former have been tranſlated and publiſhed in Engliſh from the original Erſe. The natives are likewiſe very dexterous at ſwimming, and are ſuch ſtout mariners, that they will tug at the oar a whole day with no other refreſhment

refreſhment than only a little bread and water, except their favourite ſnuff: but the ſea on their coaſt is very tempeſtuous, and ſubject to ſudden ſqualls, by which the light veſſels they uſe in viſiting the neighbouring iſlands are frequently overſet. The natives are extremely hoſpitable, but poor. Once every ſummer they viſit the neighbouring iſlands, to purchaſe fowls, eggs, down, and feathers; and, as ſoon as they come on ſhore, turn round with the ſun, uncover their heads, and return thanks to God.

Here are ſeveral natural and artificial ſorts, with heaps of ſtones upon the heaths, ſuppoſed to be monuments of perſons of note, or a general memorial for all who fell there in battle; and in the village of Claſſerneſs is a druidical temple, as is ſuppoſed. It conſiſts of a circle of twelve obeliſks, each ſeven feet high, and ſix feet diſtant from each other. In the center ſtands a ſtone thirteen feet high, exactly reſembling the rudder of a ſhip: directly ſouth from the circle ſtand four obeliſks, running out in a line: another like this goes due eaſt; and a third to the weſt: the number and diſtances of the ſtones being the ſame in the wings. But towards the north is a kind of avenue in two ſtraight ranges of obeliſks of the ſame ſize, and at the like diſtance as thoſe of the circle: yet the ranges themſelves are eight feet aſunder, and conſiſt of nineteen ſtones each, the thirty-ninth being at the entrance of the avenue. It is obſerved, that this temple ſtands aſtronomically, as denoting the twelve ſigns of the zodiac, and the four principal winds on the wings ſubdivided each into four more; by which, and the nineteen ſtones on each ſide the avenue, repreſenting the cycle of nineteen years, it appears to have been dedicated to the ſun, and ſubordinately to the elements and ſeaſons, particularly the winds and the ſea, as is manifeſt from the rudder in the middle.

SECT. XXXI.

Of the Shire of Elgin; its Situation, Extent, Climate, Produce, and principal Towns.

THIS county comprehends the weſt parts of Murray, and is bounded on the eaſt and ſouth-eaſt by the river Spey, by Aberdeenſhire and Badenoch on the ſouth, and by the ſhire of Nairn and the Northern ocean on the weſt and north, it being about twenty-four miles in length, and twenty-one in breadth. The ſouth ſide is called the Braes of Murray, and the ſouth-eaſt the Strath or valley of Spey.

The air is ſalutary, and the winter mild; for Murray-land, which includes this ſhire, Nairn, and a part of Inverneſs-ſhire, is thought to enjoy the beſt climate and ſoil of all the north of Scotland; ſo that the inhabitants boaſt that they have forty clear days in a year more than their neighbours.

The ſouth ſide of the country is mountainous, but abounds with paſture, as the low country does with corn, which is ſoon ripe. Here are ſeveral woods of firs and other trees, that extend ten miles in length, with ſome large woods of oak. The ſoil is generally ſand mixed with clay, and very fruitful when manured: whence it produces whatever is to be found in the other parts of the kingdom, none being more plentifully provided with bread, meat, fruit, and fiſh. The common drink here is ale; they have alſo French wine, and ſpirituous liquors of their own making.

The chief rivers of this county are the Spey, which next to the Tay, is the moſt conſiderable in the north of Scotland, and the moſt rapid in the whole kingdom. It riſes in Badenoch, and after a courſe of ſeventy-ſix miles, beſides its turnings and windings, falls into the North ſea. It has an excellent ſalmon fiſhery, and in the heat of ſummer is obſerved to ſwell by a weſt wind, though there be no rain.

The Neſs, which has likewiſe a good ſalmon fiſhery, riſes from a lake called Caich, near the Iriſh ſea, and is for ſome miles called Coich, after which running north-eaſt it falls into the lake called Loch-garrif, afterwards into a lake called Eawic, and then turning to the ſouth-eaſt, falls into the Loch-neſs, which is twenty-four miles in length, and of an unknown depth. It is obſerved that this river never freezes, but ſmokes, and diſſolves ice thrown into it during the greateſt froſt; the ſame is obſerved of the lake from which it riſes.

The Loſſie riſes a few miles above Elgin, and falls into the ſea, a few miles below it. It abounds moſt with ſalmon of any river in the iſland, except the Dee and the Don, eighty or a hundred laſts being unnually pickled and exported, all taken in a few ſummer months and within the ſpace of one mile. It abounds with fiſh indeed up to its ſource, but moſt of theſe are uſed for home conſumption, and taken either with ſpears by day, or in wicker baſkets, or little boats covered with hides, by night.

The principal places in this county are the following:

Elgin, a royal burgh ſeated in a pleaſant plain, one hundred and four miles to the north of Edinburgh. It is waſhed on the eaſt and north by the river Loſſie, over which it has a bridge, and conſiſts of one very long ſtreet, and ſeveral ſhorter, with a neat church in the middle. The houſes are almoſt all built upon arches, which, with their intermediate pillars, form agreeable piazzas, and ſerve to defend the inhabitants from the rain, wind, or ſun. It is alſo famous for the ruins of one of the moſt ſtately cathedrals in the kingdom: moſt of the end walls are ſtill ſtanding, and many noble pillars which ſhew its former grandeur. At the other end of the town are the ruins of an ancient caſtle, though demoliſhed by the Danes. Theſe ruins are upon a large mount, which affords a fine proſpect all over the town, and of the adjacent country even to the ſea, and of the winding courſe of the river. The ſheriff keeps his court here. It has a weekly market, and is the ſeat of a preſbytery, conſiſting of thirteen pariſhes. The highland gentry come to reſide here every winter; and in this part of the country there are ſome commoners of the beſt eſtates in all Scotland; it being a rich country almoſt all the way from hence to Strathern.

Forres, a market town and royal burgh, pleaſantly ſeated on the weſt ſide of the county on a river that falls into the Findern, ten miles from Elgin, and at the end of ſeveral ridges of mountains, and conſiſts of one long ſtreet, with a church, a tolbooth or town-houſe, and the ruins of an old caſtle, in which it is ſaid, the kings of Scotland uſed to reſide. It is the ſeat of a preſbytery, containing ten pariſhes. Near the town is a large pillar of one ſtone adorned with baſſo relievos, much obſcured by time; this is a monument of a victory obtained by Malcolm Mackenneth over Sweno king of Denmark.

SECT. XXXII.

Of the Iſles of Orkney and Shetland. Their Situation, Extent, Climate, Soil, and Produce, with the Manners, Cuſtoms and Trade of the Inhabitants.

THE Orcades or Orkney iſlands, with thoſe of Shetland, make one ſtewartry, and ſend one member to parliament; the former lie north of Dungſby-head, in Caithneſs-ſhire, the moſt northern promontory of Scotland, between fifty eight degrees twenty-ſeven minutes, and the fifty nineth degree, ten minutes, of north latitude, and between the firſt degree thirty minutes, and the ſecond degree fifty minutes weſt longitude. They are divided from the continent by the ſtreight called Pentland firth, which is twenty four miles long, and from twelve to ſixteen in breadth. They are reckoned about thirty in number, and, according to Mr. Templeman, contain an area of ſix hundred ſquare miles; but they are not all inhabited, a conſiderable number, which are called Holms, being only uſed for paſture for ſheep and goats.

The longeſt day among them exceeds eighteen hours by ſome minutes, and for the greateſt part of June, one may ſee to read at midnight without a candle. The winters have leſs ſnow than rain, which ſometimes falls in violent ſpouts, and the wind is often very boiſterous. But nothing can be a finer ſight in calm weather, than to ſee the ſea in the narrow ſounds and paſſages between the iſlands; where the different tides run as from a ſluice,

as

as well one way as the other, and the boats flying along thoſe rapid currents, like an arrow out of a bow; it being as impoſſible to row againſt them, as to ſhoot London bridge againſt the ſteep fall at low water.

In Pentland firth, behind the iſland Swinna, are two great whirlpools called the Wells of Swinna, which ſwallow up any veſſel that comes within their draught, and the paſſage of that ſtreight itſelf is very dangerous, from the many ſtrong tides, which are no leſs than twenty-four, and upon the leaſt contrary wind, make the ſea run very high.

As theſe iſlands are larger, and have more towns and inhabitants than thoſe of Shetland, ſo the ſoil is alſo better, and more improveable. The fields in ſummer every where abound with a variety of plants and roots, the latter of which are generally very large; but in winter and ſpring, when graſs is ſcarce, their horſes are fed with ſea-weeds: but there is ſcarce a tree or ſhrub except myrtle, juniper, wild roſes, heath, and ſome fruit trees, with others in their gardens. Theſe iſlands produce corn in abundance, but the chief of it is oats, barley, and beer; for they have no wheat, rye or pulſe, except in the gentleman's gardens. Their corn land is every where incloſed; but their ſheep, ſwine, and moſt of their cattle feed at large, without a herdſman to look after them.

Their ews commonly bring forth two lambs at a time, and ſome three or four; but they often die of a diſeaſe occaſioned by a little animal about half an inch long breeding in their liver. Their horſes are very ſmall, but hardy and ſerviceable. They have all ſorts of wild fowl, as partridges, moor-fowl plover, ducks, teal, widgeon, &c. with numbers of eagles and kites, and the former are ſaid to ſeize ſometimes upon young children and carry them a great way; and therefore if any one kills an eagle, he may, by law, claim a hen from every houſe in the pariſh where it is killed. Hawks and falcons have neſts in ſeveral parts of the iſland, and the king's falconer comes annually and takes the young, for which he has a ſallary of twenty pounds, and a hen or dog out of every houſe in the country, except ſome houſes that are privileged. The country alſo abounds with ſwans, geeſe, ducks, and ſolan geeſe; but there are no venomous animals, and it is ſaid that if any be brought here they immediately die.

There are many ſmall whales round the coaſt, with thoſe amphibious animals otters and ſeals. They have alſo an amazing plenty of herrings and other ſea fiſh, with abundance of oyſters, muſſels, crabs, cockles, &c. Though it cannot be expected that they ſhould have any large rivers in a country divided into ſo many ſmall iſlands, yet there are ſome rivulets full of trouts, and many lakes; but they are of no other uſe than to ſupply their cattle with water, and turn their mills.

As to minerals, there are ſome mines of ſilver, tin, lead, and perhaps of other metals, but none of them are improved. There are in many places quarries of freeſtone, with grey and red ſlate, and ſome marble and alabaſter.

The inhabitants are well proportioned, and of a healthy conſtitution; but as they feed very much, eſpecially the poorer ſort, upon ſalt meat and fiſh, they are ſubject to the ſcurvy: but living with great frugality, they generally enjoy life to a great age, and ſeldom die of the doctor. The generality of the people ſpeak Engliſh, with the Scots accent, but many of them uſe the Daniſh or Norwegian tongue among themſelves, which they have retained ever ſince the Norwegians firſt peopled theſe iſlands. The people of diſtinction are hoſpitable and obliging, and even the vulgar are generally civil. They dreſs like the Lowlanders, only ſome of them wear a kind of ſandals made of ſeal ſkin, which they tie about their feet with leather thongs. They are able and ſtout ſoldiers; and the common people, who are very laborious, undergo great hazards as well as fatigues at ſea. To prevent the frequent incurſions of the Norweigans, and thoſe of the weſtern iſlands, each village was formerly obliged to fit out a large boat well manned; and all the inhabitants were forced to appear in arms upon an alarm from the beacons that were ſet on the top of the higheſt hills and rocks.

Several gentlemen have eſtates in theſe iſlands; but the king is proprietor, and one half of the whole belongs to the crown, beſides the biſhop's rates, which amount to about nine thouſand marks ſcots per annum. There is here a yearly roup, or ſale by auction, of Orkney rents, and the higheſt bidder is preferred to be the king's ſteward for the time, and as ſuch is principal judge of the country.

The churches of both the Orkney and Shetland iſlands were formerly under the government of a biſhop, whoſe cathedral was St. Magnus, in Kirkwall. There are in all thirty-one churches, and about a hundred chapels in the country, making up in the whole about eighteen pariſhes.

The trade of the Orkneys differs from that of Shetland, only in not depending on the reſort of ſtrangers, but on their own produce. They annually export a very great quantity of corn, black cattle, ſwine, and ſheep, as alſo of butter, tallow, and ſalt, together with ſelch ſkins, otter-ſkins, lamb and rabbit ſkins, &c. great quantities of down, feathers, quills, hams, and wool. Their corn, in particular, is ſold as far as Edinburgh, from whence they bring what goods they want in exchange. But the chief of their commerce conſiſts in their fiſhing for herrings and white fiſh, and in their corn and cattle. But as they have not merchants to export their fiſh, when taken, they moſt commonly fiſh for the Dutch, and the merchants of Inverneſs; and though this ſometimes obliges them to go far from home, yet being an adventurous hardy people, they make no difficulty of fiſhing in the darkeſt nights, at a diſtance from the iſlands, and in boats that are none of the beſt.

The principal of the Orkney iſlands are the following.

Hoy is about twelve miles long, and ſix where broadeſt. The eaſt part called Waes, is fertile and well inhabited, and it has ſome good harbours, with freſh-water lakes and rivers abounding with trout and other fiſh. About the ſummer ſolſtice the reflection of the ſun may be ſeen all night, as if covered with a cloud. There are here valleys ſo deep and gloomy as to ſtrick terror into the mind of a traveller, the rocks riſing to a prodigious height, and meeting ſo near at the top, that very little of the ſky can be ſeen below. In one of the valleys is a ſtone called the Dwarf-ſtone, thirty-ſix feet long, eighteen broad, and nine thick, in which is a ſquare hole about two feet high for an entrance, with a ſtone of the ſame ſize for a door. Within this entrance is the reſemblance of a bed, with a pillow cut out of the ſtone, big enough for two men to lie on. At the other end is a couch, and in the middle a hearth, with a hole cut out above for a chimney. It lies in a heath about a mile from any houſe, and is ſuppoſed to have been an hermitage. On the tops of the mountains are wild ſheep, and in a promontory here called Lyne-head, a bird called a lyre, builds its neſt: it is about the ſize of a duck, very fat, and ſuch delicious eating, that the natives climb for it at the hazard of their lives; and, like the bird-catchers we have mentioned in treating of Norway, are let down by ropes two hundred fathoms in ſearch of the neſts and the young ones, which when they find, they put in a bag, and ſell for a very good price. Here are alſo hares as white as ſnow. The miniſter of Hoy has two churches, one at Hoy, and the other at Gramſey, a pleaſant iſland about one mile long to the north of this; and the miniſter of Waes, in the eaſtern part of the iſle, has alſo two churches, one at Waes, and the other in the little pleaſant iſland of Flotta.

Pomona is the largeſt of all the Orkney iſlands, and on that account is called the main-land. It is twenty-four miles in length, and from ſix to nine broad. It has nine pariſh-churches, ſeveral mines of white and black lead, and has four remarkably good harbours, Kirkwall, Deic Sound, Grahamſhall, and Kairſton. The eaſt part, called Deirneſs, is a peninſula joined to the other by a ſmall neck of land. The iſland is, in general, very fertile, and both parts pleaſant and well inhabited. It has lakes and rivulets abounding with ſalmon and other fiſh, and ſeveral bays and promontories. The cape at the north

north end, called the Mule, is very high, and the ſea in a tempeſt beats againſt it with ſuch force, that it riſes higher than its top. In this iſland are two temples, where the natives believe the ſun and moon were worſhipped: theſe are one on the eaſt and the other on the weſt ſide of a lake. The largeſt is a hundred and ten paces in diameter, and the other is ſemi-circular.

The only good town in the Orkneys is Kirkwall, which is ſeated forty-five miles from Dungſby-head, and is a royal burgh, narrow, but near a mile long. The houſes are of ſtone covered with ſlate, and the inhabitants are governed by a provoſt, four bailiffs, and a common-council, like the other burghs of Scotland. Its cathedral, called St. Magnus, is now a pariſh-church, built of free-ſtone, and is larger than St. Giles's at Edinburgh. Its roof is ſupported by fourteen pillars on each ſide, and its ſteeple, in which is a good ring of bells, by four large pillars. The three gates of the church are chequered with red and white poliſhed ſtones, emboſſed and elegantly flowered. There is here a public grammar-ſchool, and ſeveral others for reading and writing. The ſeat of juſtice is kept here for all the reſt of the iſlands; and here the the ſteward, ſheriff, and commiſſary keep their ſeparate courts. Its ancient privileges are ſtill kept up, and they have a power to arreſt by their own officers, to impriſon, to make by-laws, to chuſe their own magiſtrates, &c. yet they cannot try in capital cauſes, that part of juſtice being left to the lords of juſticiary. This iſland has a large ſafe harbour in a bay on the north ſide of the iſland.

Beyond theſe, and ſtill farther to the north, lies Sanda, the ſoil of which is very dry, and exceeding ſandy, from whence it received its name. It is eleven or twelve miles in length, but very narrow, and well ſtored with corn. It is in ſhort reckoned the moſt fruitful and beautiful of all the Orkney iſlands. Here is not only variety of fiſh, but of black cattle, ſheep, corn, hay, and paſture, plenty of rabbets, which, next to fiſh, are the chief food of the natives; but they are in great want of fuel. Here are many buildings, two churches, and two paſtors.

Fair is an iſland ſeated nine leagues from the Orkneys, and five from Shetland, and is ſeen from both. It is fruitful in corn and cattle, and abounds in all ſorts of fiſh. This iſland has three very high rocky promontories, inacceſſible, except on the north-eaſt, where the land is lower, and forms a ſafe harbour. Its hawks are reckoned the beſt that are to be found, and go as far as the Orkneys for moor-hens and other prey. On the north-weſt ſide is a vaſt rock, which riſes like a tower, is covered with graſs, and feeds many ſheep. The iſland has but few inhabitants, they being often plundered by the mariners who come this way to fiſh. The Dutch Eaſt India ſhips that chuſe to come north-about paſs by this iſland, where they often find men of war ſent from Holland to wait for and convoy them home.

We now come to the Shetland or Zetland iſles, which are about forty-ſix in number, with many holmes, or little uninhabited iſlands, on which cattle are fed, and barren rocks. They lie to the north-eaſt of Scotland, between the fifty-ninth degree fifty minutes and the ſixtieth degree forty-eight minutes north latitude, and between fifty minutes eaſt and one degree fifty minutes weſt longitude.

There are only about twenty-ſix of theſe iſlands inhabited, and of theſe there are only three or four of note, whoſe principal towns are little better than villages, frequented by the many ſtrangers employed in the fiſhery: yet ſome learned men have contended for theſe being the Ultima-Thule of the ancients, in which they placed their Elyſian Fields; and the ſurpriſing length of the days during the months of June and July, when the people can ſee to read by the midnight-lights, probably raiſed an opinion, that the inhabitants enjoyed everlaſting day. In the mean time it muſt be obſerved, that theſe iſlands, which, during four months in the year, enjoy almoſt perpetual day, are during our winter involved in darkneſs, and encompaſſed by ice, ſtorms, and tempeſts: not a ſhip is to be ſeen near them, their ſea not being navigable in moſt of the ſounds; but when the ſun returns to their coaſts with his warm enlivening beams about the middle of May, or the beginning of June, a moſt chearful ſcene ſucceeds this ſolitary gloom; the ſea is covered with ſhips and boats, two thouſand ſail frequently crouding into their ports; and as it were covering the ſea, ſpreading their nets for the herrings in all the ſounds and channels among the iſlands. It is to this concourſe of foreigners, and particularly of the Dutch, who often come with fifteen hundred, and ſometimes with two thouſand buſſes, all the trade of Shetland is owing. The Dutch, for the ſake of trade, ſet up booths on ſhore, as in a fair, where they ſell many uſeful things, eſpecially wine, brandy, and ſpices; and, in return, receive fleſh and vegetables. During this fair, as it may be called, the iſlanders enrich themſelves by ſelling ſeveral ſorts of Scots manufactures to the Dutch ſeamen, as well as all ſorts of proviſions; and alſo by fiſhing with their own barks and cobles, and taking great quantities of fiſh on their own accounts, which they ſell to the Engliſh or Dutch.

Though the air of winter is extremely cold, yet many of the natives live to a great age. Whatever were the original inhabitants, they are ſaid to be at preſent mixed with Scots Lowlanders, dreſs like them, and talk Engliſh. They are a plain good-natured people, and often make feaſts to compoſe quarrels. The people in general ſeem to be of a religious diſpoſition, and are almoſt all of them Proteſtants. The ſhortneſs of their days, with the length of the nights in the winter, and the tempeſtuous ſtate of the weather at that ſeaſon, render them generally ignorant of whatever paſſes in the world from October till May: thus they knew nothing of the revolution which happened in November 1688, till May 1689, when being told of it by a fiſherman, they put him in priſon for high-treaſon; but the news was confirmed ſoon enough to reſtore the poor man to his liberty.

The natives live ſo much upon ſalt-fiſh, that they are very ſubject to the ſcurvy, againſt which nature has furniſhed them with plenty of ſcurvy-graſs; and they cure the jaundice by mixing powder of ſnail-ſhells in their drink; for they have neither phyſicians nor ſurgeons. No corn agrees with the ſoil ſo well as barley, and therefore barley-bread is moſt in uſe. Their common drink is whey, which the natives barrel up, and keep in cold cellars: ſome drink butter-milk mixed with water; but thoſe in more affluent circumſtances have beer, ale, and wine. They make their oil, which they burn during their long winter nights, of the livers of fiſh. The inhabitants of the leſſer iſles maintain themſelves in ſummer by catching fowl, and taking their eggs; and get conſiderably by ſelling their down and feathers. They catch them by climbing the rocks, at which they are very dexterous, and alſo by being let down from the top by ropes, while they ſit in a baſket. Their fuel is turf, peat, and heath. They make coarſe cloth, knit ſtockings and gloves for their own uſe and for ſale to the Norwegians; but their moſt profitable export is fiſh.

They have abundance of little horſes, called ſkeltries, fit both for the plough and ſaddle, being naturally pacers, very ſprightly, and ſtrong enough to carry double, though they have ſmall legs, and are ſo light that a man may lift them from the ground. They are of two ſorts, the pyed and the black; but the latter are the beſt. They are never houſed, and when they have no graſs, live upon ſea-weeds, which can only be had at the tide of ebb; yet live to thirty years of age, and are all the while of ſervice.

They have fowl of many ſorts, particularly geeſe and ducks of ſeveral kinds; but though Shetland abounds with heath, yet heath-cocks and other fowl that frequent heaths will not live there. There are ſometimes ſuch numerous flights of ſea-fowl, that they darken the air. The ſeveral ſpecies of them build and hatch apart. Theſe commonly arrive in February, and after they have hatched their young, and find they can fly, go away together to ſome unknown place.

The chief iſland, called Shetland, and alſo the Mainland, is above ſixty miles in length, and twenty where broadeſt; but is much indented by bays. It is for the moſt part full of bogs and mountains, except on the ſhores, and is therefore fitter for paſture than corn, with which the inhabitants are chiefly ſupplied from the Orkneys; but they have barley and oats of their own.

The

The principal town is Lerwick, on the eaſt ſide of the iſland, which is encreaſed by the fiſhing-trade to about three hundred families.

On the weſt ſide is a ſmall town called Scalloway, the inhabitants amounting to only about a hundred: yet this is the only place for adminiſtring juſtice, and had anciently a caſtle, which is fallen to decay. This little town has likewiſe the only preſbytery in all the Shetland iſles.

Braſſa, to the eaſt of the Main-land, and oppoſite to Lerwick, is five miles long, two broad, and has ſome arable land, and two churches. It is famous for the herring-fiſhery in its ſound. The Hamburghers and people of Bremen come hither about the middle of May, ſet up ſhops and exchange linen, muſlin, bread, &c. for fiſh, mutton, fowls, ſtockings, &c. The natives are at this time conſiderable gainers by letting out their houſes and ground to the ſeamen for ſhops.

The Skerries are two dangerous little iſlands, on which ſhips are often caſt away; they lie about ſeventeen miles to the north-eaſt of the Main-land.

Yell is ſixteen miles in length, and the coaſt is indented in ſuch a manner, as to make it reſemble a figure of eight; it alſo lies north-eaſt from the Main-land, and has three churches, with ſeveral little chapels; but the country is ſo mooriſh, that the miniſter is obliged to go near eight miles to church wading almoſt up to the knees in mire.

SECT. XXXIII.

A Deſcription of the moſt remarkable of the Weſtern Iſlands not included in the Shires of Scotland; with a particular Deſcription of St. Kilda.

THE Weſtern iſlands were by the ancients called Æbudæ and Hebrides, and have been computed at three hundred in number. No country abounds more with the neceſſaries of life, they having fleſh and fiſh in prodigious plenty. Their cattle of all ſorts, as cows, ſheep, hogs, and goats, are exceeding numerous and prolific, ſmall indeed, as are their horſes, but of a delicious taſte, as are their deer, which freely range on the mountains. The natives ſalt their beef in cow-hides, which they think contribute to preſerve it, and give it a better taſte than caſks; they ſend a great deal of it to Glaſgow, where it is barrelled up and exported to the Weſt Indies.

Here are large eagles and hawks, which are very deſtructive to the lambs and fawns; but no place in Europe can compare with them for tame and wild-fowl, as pheaſants, moor-fowl, ſwans, tarmagans, plovers, pigeons, with many ſorts extremely beautiful and rare, or utterly unknown elſewhere; among the latter is a fowl called colk, ſomewhat leſs than a gooſe, that has beautiful feathers, or rather down, of various colours; it has a tuft on its head, and its tail is longer than that of a houſe-cock. There is another named gawlin, which is ſomewhat leſs than a duck, and is ſaid to ſing always before good weather; and ſome of the Highland pipers have formed an agreeable tune of its notes. Another, called a rain-gooſe, is ſaid always to make a doleful noiſe before rain. Another extraordinary bird is called the biſhop of Catara; it is as large as a gooſe, and has a white ſpot on its breaſt; it is party-coloured, and its fat is uſed by the natives againſt the ſciatica. Another bird is called ſcreachanaitin, which ſhreaks moſt hideouſly: it is as big as a large mull, but longer in the body, of a blueiſh colour, and its bill of a carnation: it is obſerved to be extremely fond of its mate, for when either the cock or hen is killed, the other makes a lamentable noiſe about the place for eight or ten days after. A bird called ſaſkidor, about the ſize of a ſea-mew, flies very ſwift after other birds, forcing them to drop their food, which it catches before it falls to the ground.

Theſe birds are very common in moſt of the Weſtern iſlands, particularly in thoſe we are going to deſcribe.

The principal of thoſe properly called the Weſtern Iſlands, are a range of narrow iſlands, extending from north to ſouth, namely, Lewis and Harris, already deſcribed, as making a part of Roſs-ſhire, and Viſt, which is divided into North and South; and behind them, farther to the weſt, the iſle of St. Kilda, which, though ſmaller than the other, merits a more particular deſcription.

Viſt, which lies to the ſouth of Harris, is a long ſlip indented with ſeveral bays. North Viſt is nine miles in length from north to ſouth; it is in part mountainous and heathy, yet ſerves for paſturage; but the weſt ſide being plain and arable, is exceeding fruitful in barley, oats, and rye, and feeds abundance of cows and ſheep. This, with the iſland of Benbecula and South Viſt, are by ſome geographers eſteemed one iſland, becauſe at low water there is an eaſy paſſage from one to the other, either upon dry ſands or by wading; and together they are about thirty-three miles in length, and contain ſuch a multitude of freſh-water lakes, bays, and iſlands, that it is ſaid to be impoſſible to number them, and moſt of the lakes abound with fowl and fiſh. North Viſt has an excellent harbour on the ſouth-eaſt ſide in a bay called Lochmaddy, famous for a great fiſhery of cod and ling, and where ſuch quantities have been taken, that four hundred veſſels have been loaded with them in one ſeaſon.

North Viſt is ſeparated from a little iſland named Benbecula on the ſouth by ſeveral rocks, and a channel about three miles broad. This ſmall iſland is only three miles long, and the ſame broad; but has a harbour for ſmall veſſels, and ſeveral freſh-water lakes, well ſtocked with fiſh and fowl; but in its neighbourhood are ſeveral dangerous iſlands.

South Viſt is ſeparated from Benbecula by a channel, which, though two miles broad, is at ebb not above knee-deep. It is twenty-one miles in length, and three or four miles in breadth: the eaſt ſide is mountainous; but the weſt, being level, bears good crops of barley, oats and rye, and abounds with cattle. The natives live to a very great age, and ſpeak the Erſe tongue in perfection.

We now come to St. Kilda, a little iſland that may be ranked among the greateſt curioſities of the Britiſh empire; and therefore, notwithſtanding its ſmall extent, deſerves particular notice, on account of the genius of its inhabitants, their manners and cuſtoms, and the conſtitution of their little commonwealth.

All the territories belonging to the inhabitants of St. Kilda are no more than three ſmall iſlands, and five naked rocks. The principal iſland, together with the reſt, is ſituated in about fifty-eight degrees thirty minutes north latitude, eighteen leagues to the weſt of North Viſt, juſt deſcribed. The length of the whole iſland is not much more than nine miles, and its breadth does not much exceed ſix. It is encompaſſed by an inacceſſible barrier of rocks, two places excepted, one to the north-weſt, and the other to the north-eaſt. The latter has a large bay, formed by two promontories, the firſt running out to the north-eaſt ſide of the iſland, and the other to the ſouth end.

The hand of Nature has divided this iſland into four diſtinct parts by five mountains, which to the ſea-ſide are faced with frightful precipices; particularly that which riſes gradually from the head of the bay, and may not improperly be called the Britiſh Teneriff. Its top in a clear day commands a proſpect of land and ſea above a hundred and forty miles in length. On the north ſide it hangs over the deep in a moſt frightful manner; where a view of it from the ſea fills a man with aſtoniſhment, and a look over it from above ſtrikes him with horror; yet a St. Kildian will ſtand or ſit on the very brink of this ſtupendous precipice with the moſt careleſs indifference; though its perpendicular height is no leſs than eighteen hundred yards.

The ground of St. Kilda, like the greateſt part of that of the Highlands, is much better calculated for paſture than tillage, and all the arable land ſcarcely exceeds eighty acres; but a great deal more might be added, was induſtry and a deſire of improvement ſufficiently encouraged: but all the lands already cultivated lie very com-

pactly together within the precincts of the village in which the whole community dwells. In the lower grounds are many excellent plots of graſs, which is in ſome places intermixed with a beautiful variety of the richeſt plants, on which the cattle feed luxurioufly during the ſummer ſeaſon; and here yield more than ordinary quantities of milk. All the arable land is divided into many unequal plots, and each of theſe is incloſed by the ſtones picked out of the land; theſe boundaries are eſteemed ſacred, and have been kept up for many ages; whence it would be impoſſible for a St. Kildian, however cunning or avaricious, to encroach on his neighbour's farm. Every inch of ground within theſe incloſures, is cultivated; which they thus perform; after turning up the ground with a ſpade they rake or harrow it very carefully, picking out every ſtone, every noxious root or weed that falls in their way, and pound to duſt every clod with a mallet. They then ſow their little fields, ſtrew them over with a manure of turf and peat aſhes, and having harrowed them over again, leave them, to ſpeak in their own ſtile, in the hands of Providence, with a firm perſuaſion that their honeſt induſtry will be amply rewarded.

Tho' this iſland is ſituated ſo far north, the harveſt is commonly over before the beginning of September, and ſhould it fall out otherwiſe, the whole crop would be almoſt deſtroyed by the equinoctial ſtorms, which, with the exceſſive quantity of rain that falls generally throughout ſeven or eight months in the year, are the moſt diſadvantageous circumſtances of their ſituation.

Thus they raiſe their oats, and their barley, which is larger than in any other of the Weſtern iſlands: but they have not one tree in all the iſland. Their horſes and cows, though very ſmall, are alſo ſomewhat larger than in the adjacent iſlands.

The St. Kildians owe a great part of their felicity to their ſheep and wild fowl. They have conſiderable flocks of ſheep; which are all of the ſmalleſt kind, and their wool is ſhort and coarſe. Every one of them has two horns, and many of them four.

The wild fowl appear here in innumerable flocks, and according to the Rev. Mr. Macaulay, from whoſe hiſtory we have extracted this account, it is literally true, without any exaggeration, that in ſummer time ſeveral of the rocks are totally covered with ſolan geeſe and other fowls, and appear at a diſtance like ſo many mountains covered with ſnow. The neſts of the ſolan geeſe are ſo cloſe, that when one walks between them, the hatching fowls on either ſide can always take hold of one's cloaths, and they will often ſit ſtill till they are attacked, rather than expoſe their eggs to the danger of being deſtroyed by ſea gulls; at the ſame time an equal number fly about and furniſh food for their mates that are employed in hatching. The ſolan geeſe repair hither in the month of March, and continue till after the beginning of November. Before the middle of that month, they and all the other ſea fowl that are ſo fond of this coaſt, retire much about the ſame time, into ſome other favourite regions; ſo that not a ſingle fowl is to be ſeen from the beginning of winter to the middle of February.

Another ſea-fowl highly eſteemed in this iſland, is the tutmer, which the inhabitants ſay, furniſhes oil for the lamp, down for the bed, the moſt ſalubrious food, and the moſt efficacious ointment for healing wounds. It is of the ſize of an ordinary barn-door fowl, but its legs and wings are much longer. The back, wings, and tail, are of a light grey; round the breaſt and neck of a lighter colour: his head is round, his neck ſhort and thick; his bill is made for ſtrength, bending inwards, pointed like that of an eagle, and in length about an inch and a half. He is a moſt ravenous fowl, and feeds only on ſorrel and the fat of fiſh. Pieces of whale and ſeal blubber are often found in his neſt. The young tutmer is no ſooner attacked in his neſt, than he endeavours to diſconcert the fowler by ſpouting a quantity of oil out of his wide noſtrils directly into his face and eyes: which frequently gives him an opportunity of making his eſcape. But thoſe who are verſed in this diverſion take all poſſible precautions to ſurprize him; for thinking his oil incomparably precious, they exert all their ſkill and dexterity to ſave it. Every tutmer yields near a pint of this liquid ſubſtance, which drops out of the noſtrils of the fowl while warm, and a conſiderable quantity of it is annually preſerved. Of the fowls themſelves every family has a great number ſalted in caſks for winter proviſions.

The third ſpecies are the lavie, which being the earlieſt viſitants in February, no ſooner appear, than the moſt conſiderable perſons in this ſtate aſſemble together to congratulate each other, on ſeeing theſe harbingers of plenty and happineſs; and to divide the people into parties made up of their ableſt fowlers. The lavie in ſize reſembles a duck, though rather longer. He is black above, but the whole breaſt and belly white, with a circle of the ſame colour round the neck; the bill is black and ſharp at the point, and the egg beautifully variegated with black, white and red, blue, green and yellow; but ſcarce any two are alike. This fowl builds no neſt, and like ſeveral other ſpecies of water fowl, lays but one egg, which ſhe fixes in ſo nice a manner, that if once touched, one will find it impoſſible to fix it in the ſame place again; and if the fowls are ſurprized ſo as to ſtart away in a hurry, they tumble down into the ſea in thick ſhowers.

Theſe are caught by letting down a man with ropes into the well-known ſhelves of the rocks, each having a broad piece of linen, or any thing remarkably white fixed on his breaſt. This is done in the night, when the bird miſtaking an object ſo conſpicuous for a part of the rock, endeavours to cling to it, and is immediately caught and diſpatched. Thus employed the fowler continues till the dawn, when making the wonted ſignal by pulling the rope, his companions pull up, by another rope, the prey he has taken, which ſometimes conſiſts of four hundred lavies, and then pull up the fowler, whom they careſs for his courage and dexterity.

They have alſo a great number of puffins; and too frequently a large ſea-gull which is deteſted by every St. Kildian, it deſtroying every egg that falls in its way, very often the young fowl, and ſometimes the weakeſt of the old. It is hardly poſſible to expreſs the hatred with which thoſe otherwiſe good-natured people endeavour to exterminate theſe gulls; if one happens to mention them, it puts their whole blood into a ferment. To eat any of its eggs, though amongſt the largeſt and beſt the iſland affords, would be moſt a flagitious action; they therefore extract the meat out of the ſhell, and leaving it empty in the neſt, the gull ſits upon it till ſhe pines away.

Among the land birds are very large ravens, a few eagles, with herons, curlews, plovers, pigeons, ſtarlings, larks, wrens, and ſparrows.

Every one of the natives of St Kilda who is poſſeſſed of a bit of land there, has a proportionable ſhare of the rocks in which the fowls hatch. The diviſions are made with ſingular exactneſs, and the ſmalleſt encroachment on a St. Kildian's property in theſe rocks, is by an ancient cuſtom ſeverely puniſhed.

The whole body of this little people live together like the inhabitants of a town or city, their houſes being built in regular rows forming a ſtreet: theſe habitations are built with ſtone without either lime or mortar, from eight to nine feet high. All their dwellings are divided into two apartments by partition walls. In the diviſion next the door, which is much the largeſt, they have their cattle ſtalled during the winter ſeaſon; the other ſerves for kitchen and bed-chamber. There are alſo a prodigious number of little cells diſperſed over the iſland; theſe conſiſt intirely of ſtones, and in them they ſecure their eggs and wild fowl.

The men are ſtout and hardy, ſhort, thick and clumſy; but are remarkably ſtrong, will carry heavy burthens, and tug at the oar for many hours, with an almoſt undiminiſhed vigour: but the women are moſtly handſome: their complexions are freſh and lively, and their features fine and regular.

The cloathing of the people is quite coarſe, and made for warmth. All the colours known among them, till of late, were black, white, grey, and brown, the natural colours of their ſheep; and yellow was their only artificial one. All the linen manufactured among them

is

is a mere trifle, and extremely coarſe: one holiday ſhirt will ſatisfy the ambition of the greateſt beau among them; and what they wear next their ſkin, on ordinary occaſions, is made of wool. The weavers are but indifferent workmen. Every man is the taylor and ſhoe-maker of his own family: all the leather in the iſland, and thoſe neareſt to it, is tanned with the tormentil root, and done to great perfection.

The St. Kildians ſpeak a corrupt dialect of the Galic, with a little mixture of the Norwegian: their manner of pronouncing is very ſingular, for every man, woman, and child, has an unconquerable liſping.

Theſe people are extremely fond of muſic, whether vocal or inſtrumental; to a bad violin indifferently played they will dance with rapture, and even the old women will bear a part in theſe aſſemblies. They delight much in ſinging, and their voices are abundantly tuneful. The women, while cutting down the barley in the field, or grinding their corn with their hand-mills in the houſe, are almoſt conſtantly employed that way; and the men, if pulling at the oar, exert all their ſkill in animating each other by ſinging ſome ſpirited ſongs adapted to the buſineſs in hand; and indeed ſome bright ſparks of fire, and ſome noble flights of fancy, may be diſcovered in their otherwiſe homely compoſitions. The ſubjects handled by the bards of St. Kilda, in their odes, are the beauty and accompliſhments of their favourites among the fair-ſex, the heroic actions of their friends, their dexterity in climbing rocks, their ſuperior ſkill in fiſhing, their extraordinary vigour, ſkill, and conſtancy while at the oar; beſides the common topics of perſonal advantages, and intellectual merit.

They all in general poſſeſs the virtue of hoſpitality in an eminent degree, and behave with the utmoſt generoſity, humanity, and reſpect, to the ſtrangers who come among them.

They marry early, and their gallantries are generally innocent: impurities faſhionable elſewhere, if committed here, are never unattended with infamy; and, as Tacitus obſerves of the ancient Germans, "No one makes "a jeſt of vice; to debauch, or be debauched, is not "called the way of the world." Here wives with great portions never rule their huſbands: here a cruel ſtepmother never perſecutes her guiltleſs ſtep-ſon for the ſake of pelf: here the nuptial tie is always held ſacred. An honeſt deſire of preventing or removing the inconveniences of a ſingle life, or pure diſintereſted love, are the ruling paſſions in the advances they make to matrimony. If a young fellow be poſſeſſed of a ſpade, rake, creel, and fowling-rope, he marries without the leaſt fear or ſolicitude, will maintain himſelf, his wife, and children, live contentedly on a ſmall ſpot of ground, and pay his rents to the proprietor's ſteward with barley and feathers.

Drunkenneſs is not yet introduced here; but the St. Kildians have a moſt violent paſſion for tobacco. They buy an annual ſtore of this favourite plant from the ſteward; which, in ſpite of their fondneſs for it, they muſt manage with the moſt exact œconomy, as it is impoſſible to procure a new ſupply, till the market of another year returns with him. For this univerſally bewitching article, and for ſome other goods indiſpenſably neceſſary, particularly ſalt, iron, and timber, they barter away their cows, ſheep, grain, and feathers. Their riches conſiſt in theſe commodities; they have ſcarce any wants, and conſequently ſcarce any deſires of the pecuniary kind.

It appears that Chriſtianity was very early introduced into this iſland. The largeſt church was dedicated to Chriſt, and called his temple. It was built of ſtone without any cement. It is twenty-four feet in length, and its breadth fourteen. This was in former times the principal place of worſhip in the iſland, and here they continue to bury their dead. At the diſtance of a mile from the village is a chapel, which has an altar within, and ſome monkiſh cells without. The people have for ſome time been Proteſtants of the church of Scotland, and a miniſter from thence is ſent thither. They are devout; attend Divine worſhip regularly every Sunday; but, with all their virtues, make no ſcruple of lying, and uſing all the arts of cunning to deceive the ſteward, when he makes them his annual viſit to receive a heavy tax they are obliged to pay him in proportion to the ſtock of various kinds they poſſeſs; and, among other things, every ſecond he lamb, every ſeventh fleece, and every ſeventh ſhe lamb.

The preſent proprietor is a gentleman named Norman Macleod, whoſe anceſtors have poſſeſſed the iſland for at leaſt two hundred years. He has given a leaſe of this iſland, and of every thing belonging to it, to a cadet of his own family, for the yearly rent of about eleven pounds ſterling. This is the perſon called the ſteward, who before this, or his own rent can be made effectual, muſt be at the annual expence of fitting out a large Highland boat, to bring his grain, feathers, or any other perquiſites that fall to his ſhare, or any commodities he buys from the people, to Harris, where he generally reſides.

To conclude the moral character of theſe people; being at a diſtance from the ſeats of juſtice, they are abſolute ſtrangers to the chicanery and delay of the law. And though they are ignorant, and ſo illiterate, that few of them can read, they firmly believe the exiſtence and providence of a Supreme Being, the immortality of the human ſoul, the obligations of morality, righteouſneſs, and temperance.

CHAP.

CHAP. XXXI.

Of IRELAND.

SECT. I.

Of IRELAND *in general.*

Its Situation, Extent, Air, Soil, Produce, Rivers, and Lakes.

THIS is a large, and in general a fertile iſland, ſeated to the ſouth of the little iſles juſt deſcribed; to the weſt of England and Scotland, from which it is divided by St. George's Channel and a ſtreight about fifteen miles broad, which ſeparates it from part of Scotland: it has the mouth of St. George's Channel on the ſouth; and the great Atlantic ocean, which lies between it and the frozen region of Newfoundland and Labrador, or New Britain, in North America, on the weſt. It is ſeated between the fifth degree ten minutes and the tenth degree thirty-ſeven minutes weſt longitude from London, and between the fifty-firſt degree ſixteen minutes and the fifty-fifth degree fifteen minutes north latitude. It is allowed to be above half as large as England, and is two hundred and eighty-five miles from Fairhead, the north point of Antrim, to Miſſenhead, the ſouth point of Cork, which is its greateſt length; but it is much indented on the ſouth-eaſt by St. George's Channel; and on the weſt and north by the Atlantic ocean, which renders its length very unequal. The greateſt breadth, which is from the eaſt part of Down to the weſt part of Mayo, is a hundred and ſixty miles: but in the middle, from Dublin on the eaſt, to the weſt of Gallway, it is only a hundred and forty-ſix.

The air is much the ſame with thoſe parts of England that lie under the ſame parallel; only in ſome parts it is more groſs and unhealthy, eſpecially to ſtrangers, on account of its many lakes, bogs, and marſhes; but in this particular alſo it agrees with England; where the marſhes of Kent, Cambridgeſhire, and Suſſex, are at leaſt equally unhealthful. It has been obſerved, that the air is warmer in winter and cooler in ſummer than in England, but the difference in this reſpect is not very great. The air is alſo allowed to be more moiſt than in England; but this is probably true only of Dublin, and the other places near the ſea and the lakes, which occaſion more frequent rains.

In general it is a level country, watered by many lakes and rivers, and the ſoil is in moſt places very good and fruitful; even thoſe where the bogs have been drained are good meadow ground. Their paſtures feed prodigious numbers of cattle; but in ſeveral parts they are not ſo large as in England, on which account a bounty has long been given for the importation of Engliſh bulls, and large ſtone-horſes, which have mended the breed. Indeed the far greateſt part of the land is uſed for grazing, whence they are enabled to ſupply the ſhips of all the European nations, particularly the Engliſh and Dutch, with beef and butter; but advantageous as this trade is, it is carried to an exceſs that is very prejudicial to Ireland, as it cauſes agriculture to be neglected, which would employ many more hands, and prevent their being frequently obliged to purchaſe great quantities of corn from England; from whence it is alſo not uncommon to purchaſe ſhip loads of potatoes, which in many places ſupply the want of bread. They alſo raiſe flax and hemp; and the gardens of Ireland produce all the fruits and vegetables fit for the kitchen, that are to be found in Great Britain, though fine fruit is dearer there than in England.

It ought not to be omitted, now we are treating of the ſoil, that there are ſome bogs in this country ſo deep, as entirely to ſwallow up a man and horſe, who ſink an unknown depth, though they are covered with turf which ſeems to promiſe ſolid ground; however, roads have been made for horſes and carriages over theſe dreadful bogs, by ranging rows of faggots faſtened together, and covered with earth, which forms a kind of bridge that ſhakes under the feet of the paſſenger. There are other bogs that have too ſtrong a cruſt of turf to be eaſily broken, and are conſtantly paſſed in ſafety, though they ſhake and quiver at every ſtep of the foot.

The turf which grows upon many of the bogs is taken off, dried, and ſold for fuel; and is of great uſe where coals are ſcarce. There are, however, ſeveral pits of excellent coal, and navigable canals are forming in order to convey it by ſea to Dublin, and all the other towns on the coaſt. This country has likewiſe quarries of ſeveral kinds of beautiful marble, alſo free-ſtone, a beautiful kind of hard white ſtone fit for building, full of ſhining particles which glitter in the ſun, and ſlate; with mines of copper and iron.

The principal rivers of Ireland are the following:

The Shannon, which riſes in Loch-Allen, in the province of Connaught, which it divides from Leinſter and Munſter, and running from north to ſouth, after forming ſeveral lakes, turns to the weſt and falls into the Atalanic ocean, after a courſe of one hundred and forty-five miles. This river is in moſt parts wide and deep, and has within it ſeveral fine and fruitful iſlands, with a fertile ſoil on both its banks: but it is not navigable above fifty miles for ſhips, on account of a cataract.

The Suir, the Neor, and the Barrow, riſe from branches of a mountain named Slieu-Bloom. The Suir has its ſource in the branch called Bein-Duffe, in the county of Tipperary, and making firſt a ſouth-eaſt, and then a ſoutherly courſe for upwards of forty miles, it turns to the north and afterwards to the eaſt, and at length unites its ſtreams with the Neor and the Barrow.

The Neor riſes out of the ſame branch, and taking a ſouth-eaſt courſe, unites its ſtream with the Barrow.

The Barrow riſes out of the ſame mountain in Queen's county, and after taking a northerly courſe, turns to the ſouth, and before it arrives at Roſs is joined by the Neor, from whence it continues a ſoutherly courſe under the name of the river of Roſs, and being joined by the Suir, they all loſe themſelves in the ſea at the mouth of the harbour of Waterford.

The Black-water, ſometimes called the Broad water, riſes out of a mountain in the county of Kerry, from whence being ſwelled with many ſtreams, it takes firſt a ſoutherly, and then an eaſterly courſe, till at length turning ſuddenly to the ſouth, it purſues that courſe till it falls into the bay of Youghall. There are ſeveral other rivers in Ireland called the Black-water, one of which falls into the Boyne, another into the Shannon, and another in the county of Wexford, falls into the ſea.

The river Bann, famous for its pearl fiſhery, but more ſo for its ſalmon, ariſes from the mountains in the county of Down, from whence it flows northward, and after a courſe of about thirty miles, falls into the lake called Lough-neagh, and paſſing through it, continues its courſe to the north, dividing the counties of Antrim and Londonderry, and falls into the ſea a little to the north-weſt of Colerain.

The Lee riſes out of a lake in the county of Cork, and taking an eaſterly courſe of about twenty-ſix miles, is enlarged by its receiving ſeveral rivers and rivulets, till at length paſſing by Cork, it diſcharges itſelf into the ſea.

The Liffey is only remarkable for having the metropolis of the kingdom ſeated on its banks. It riſes in the county of Wicklow, and making a circling courſe through that county and the counties of Kildare and Dublin, diſcharges itſelf into Dublin bay, a little below that city;

city; being navigable for barges no higher than the tide reaches.

The Boyne is a much more conſiderable river than the Liffy: it riſes in the King's county, is famous for its excellent ſalmon, and falls into the ſea at Drogheda.

In Ireland are more lakes than perhaps in any other country of the ſame extent; and theſe abound more in the provinces of Ulſter and Connaught, than in any other parts of the kingdom. They are properly ranked under two denominations, freſh-water lakes, which have no acceſs of the tide or mixture of the ſea, and ſalt lakes, into which the ſide flows twice a day, and may more properly be called inlets of the ſea.

Of the freſh water lakes, one of the moſt extraordinary is Lough-lene, in the county of Kerry, which is remarkable for its ſingular beauties. It is about ſix miles in length, and, at a medium, near half as much in breadth; and is interſperſed with a variety of beautiful iſlands, many of them rich in herbage, and well inhabited. Eagles and oſprays are here in great numbers, and the iſlands and rocks around the lake are adorned with groves of the arbutus, which for the greateſt part of the year bears a ſcarlet fruit, like the ſtrawberry, with bloſſoms, leaves, and berries, green or yellow, according to the different ſtages of their approach to ripeneſs. The trunks of theſe trees are frequently four feet and a half in circumference, and nine or ten yards high. In ſhort, the beauties of this lake are not to be deſcribed or ſeen without rapture.

Lough-erne and Lough-neagh are by much the largeſt in Ireland. The former is divided into two branches, the upper and lower, which are ſeparated by the water being contracted into the compaſs of a conſiderable river for ſome miles, after which enlarging itſelf, it forms the lower lake. This lough, in both its branches, takes its courſe through the whole length of the county of Fermannagh, from the ſouth-eaſt point to the north-weſt, dividing it almoſt into two equal parts, extending about thirty miles in length, but of an unequal breadth. It is diverſified with ſo many little pleaſant fertile iſlands, that they are ſaid to amount to about four hundred, moſt of them well wooded; ſeveral of them inhabited by huſbandmen, and others covered with cattle. It likewiſe abounds with a great variety of fiſh, as pike of a prodigious ſize, large bream, roach, eels, and trout; but it is chiefly valued for its ſalmon, which are caught in great draughts by nets, in the river which flows out of the lake, the fiſhing of which is valued at five hundred pounds a year.

Lough-neagh is ſomewhat of an oval form, but indented on every ſide. It is eſteemed the largeſt lake in Ireland, and is exceeded by few in Europe; it being twenty miles long from the north-weſt point to the ſouth-eaſt, near fifteen miles from the north-eaſt to the ſouth-weſt, and ten or twelve broad at a medium. Within theſe dimenſions is not included a ſmall lake called Lough-beg, or the Little-lake, which is joined to the north-weſt end by a narrow channel, and is four miles long and as many broad. Lough-neagh communicates its benefits to five ſeveral counties, Armagh, Tyrone, Londonderry, Antrim, and Down; the latter of which it only touches by a ſmall point on the ſouth-eaſt ſide. It receives ſix conſiderable rivers, four of leſſer note, and ſeveral brooks; yet has but one narrow out-let to diſcharge this great flux of water. This lake is remarkable for its ſalutary effects in curing ulcers and running ſores on thoſe who bathe in it; and for incruſting the wood which lies in it with ſtone. On the ſhores of this lake have been found a variety of beautiful pebbles, cryſtals, cornelians, and agates. It alſo abounds with fiſh of various kinds, in innumerable quantities, and of a large ſize. It is particularly remarkable for two ſorts of trouts, one called the dologhan, which is ſaid to be from fourteen to eighteen inches in length, which it never exceeds, and always ſpawns in the rivers that ſupply the lake: the other is called the bodach, or churl, ſome of which have been taken that weigh thirty pounds weight.

There are a conſiderable number of ſuch lakes as may more properly be called inlets of the ſea; among theſe are,

Loch-foyle, a large oval lake, about fourteen miles long, and from ſix to eight miles broad, into which the ſea flows by a channel not much more than a mile over.

The lake of Strangford, in the county of Down, which extends from Newtown in the north to Strangford in the ſouth, about thirteen Iriſh miles; and in ſome places it is three, in others four, and in others five miles broad. There are diſperſed in it fifty-four iſlands, ſmall and great, known by particular names, and others nameleſs. On the ſide of it, near the coaſt of the barony of Dufferin, is a group of ſmall iſlands called the Scatterick iſlands, ſome of which are noted for reſtoring and fattening diſtempered horſes; others are ſtocked with rabbits, and to others reſort a multitude of ſwans, wild-geeſe, widgeon, teal, and four or five ſorts of divers.

There is perhaps no country in the world that abounds more with ſpacious and commodious harbours than Ireland; yet there are few countries to which leſs benefits ariſe from trade: but theſe harbours will be mentioned in treating of the ſeveral provinces and counties of this kingdom.

SECT. II.

The Perſons, Character, Habits, Genius, Temper, Dreſs, Religion, Government, and Trade of the Iriſh.

THE Iriſh are in general a ſtrong-bodied, nimble, active people; many of both ſexes are tall, handſome, and genteel; but this is far from being a characteriſtic of that nation, ſince a ſtill greater number are deficient in theſe natural endowments, and are as clumſey, as ill-ſhaped, and have as diſagreeable features as the majority of other nations. The men are bold, hardy, and far from being deficient in true bravery and manly courage: but thoſe who are well-bred have an aſſured addreſs, a fluency of ſpeech, and a flow of compliments, eſpecially when in the company of the ladies, that is not eaſily acquired by the more baſhful Engliſh; who are too apt to want that graceful aſſurance which is neceſſary to ſet their own merit in a proper light. It will not be doing injuſtice to the character of the Iriſh to ſay, that they are haughty, vain-glorious, quick in reſenting a ſuppoſed affront, and violent in all their affections. On the other hand, they have generally a fund of good-nature, and all ranks are particularly remarkable for their hoſpitality. However, the morals of children are leſs attended to in their education, than they generally are in thoſe of people of the middle rank in England; and hence a diſregard for truth, and many other faults, are too often ſuffered to take root in their ductile minds; thoſe at leaſt of the lower claſs have been frequently charged with having little or no regard to the ſacredneſs of an oath. Indeed evil diſpoſitions often ariſe from trivial cauſes; it is cuſtomary in the meaner trades, if any thing be miſſing, for the maſter to make each of his journeymen ſwear that he has not taken it, by handing the Bible or the maſs-book to each, and for a drunken fellow, when ſeverely lectured by his wife, to take up his maſs-book and kiſſing it, ſwear never to enter a public-houſe for a ſtated time; theſe reſolutions are ſeldom kept; and thus perjury, being rendered familiar, all idea of the awful ſolemnity of an oath is entirely loſt, and the unhappy wretch is prepared, for the ſake of the ſmalleſt profit, to practiſe in a court of judicature what he has too often performed at home. But, notwithſtanding this, there are in Ireland many perſons of the ſtricteſt integrity, humanity, virtue, and honour,

The Iriſh have been reproached for want of genius, and by the ignorant have been frequently termed a nation of blunderers; but theſe aſperſions are very unjuſt, ſince Ireland has produced many perſons whoſe genius and learning would have done honour to any nation: among which are the learned Dr. James Uſher, that great philoſopher, the honourable Mr. Robert Boyle, ſeveral of the earls of Orrery, Mr. Molineaux, the friend of the great Mr. Locke, Sir Richard Steel, dean Swift, &c.

The ancient habit of the Iriſh was a doublet and cloſe breeches, over which they wore a frize cloak, with a fringed or ſhaggy border. The women wore a kind of mantle, or a blanket called a caddah over, their head and

ſhoulders, and underneath a long gown; and both men and women had a kind of ſhoe without a heel made of half tanned leather, called a brogue: but at preſent all ſorts of perſons conform to the Engliſh dreſs, except in the brogue, which is worn by the poor in the country, and ſometimes the caddah. But it is very common for the loweſt of the people to wear neither any ſort of ſhoes, nor ſtockings, except when they are dreſſed: particularly when they travel on foot, they uſually walk without their ſhoes and ſtockings, which they put on before they enter any town, and pulling them off, when they have left it, put them in their pocket. This they alledge keeps their feet cool, and prevents their loſing their time by picking their way through the dirt, or going round to eſcape croſſing a rivulet.

The Iriſh tongue bears ſome affinity to the Welch and Erſe; and all three are ſuppoſed by ſome to be only different dialects of the ſame language, more particularly the firſt and the laſt. Some of the Iriſh characters are very different from ours; however, very few of thoſe who ſpeak the language very fluently, are able either to write, or even to read it. Buſineſs is principally tranſacted in Engliſh, and in the great towns the chief traders are deſcended from the Engliſh and Scots, and are intirely ignorant of the Iriſh tongue.

The eſtabliſhed religion in Ireland is the ſame as in England. The church is under the government of four archbiſhops, namely, the archbiſhop of Armagh, who has the title of primate of all Ireland; the archbiſhop of Dublin, who is ſtiled primate of Ireland; and thoſe of Caſhel and Tuam. Under theſe four archbiſhops are nineteen biſhops; namely, under Armagh are the biſhops of Meath, Clogher, Down, Kilmore, Dromore, Raphoe and Derry. Under the archbiſhop of Dublin, the biſhops of Kildare, Oſſory and Ferns. Under the archbiſhop of Caſhel, the biſhops of Limerick, Waterford, Cork, Cloyne, and Killaloe. Under the archbiſhop of Tuam, Elphin, Clonfert, and Killala. Theſe ſeveral prelates have their deans, and other dignitaries, except Meath, which has neither dean, chapter, nor cathedral; but the archdeacon is the head officer of the dioceſe, the affairs of which are tranſacted by a ſynod in the nature of a chapter, who have a common ſeal, which, by a vote of the majority, is annually lodged in the hands of one of the body.

Diſſenters of all denominations are tolerated in Ireland, particularly Preſbyterians, Baptiſts, and Quakers. But the far moſt numerous body are the Papiſts, who have their biſhops and other dignitaries like the eſtabliſhed church; but neither they, nor the inferior clergy of that communion, have any other revenues than the voluntary contributions of the laity. It is ſuppoſed that throughout Ireland there are about eight Papiſts to one Proteſtant; but in the capital the diſproportion is only as four to one.

For the promotion of learning in Ireland, there is one univerſity, and ſeveral free-ſchools erected for the education of youth; and for promoting the principles of real Chriſtianity among the poor Popiſh natives of Ireland, and enuring them from infancy to induſtry, and obedience to their ſovereign, is inſtituted the incorporated ſociety for promoting Engliſh Proteſtant working ſchools.

With reſpect to the conſtitution of the Iriſh government, it is nearly the ſame with that of England. The power of the lord lieutenant, who repreſents the king, is in ſome meaſure reſtrained, and in others enlarged, according to the king's pleaſure, or the exigencies of the times. On his entering upon this honourable office, his letters patent are publicly read in the council chamber; and having taken the uſual oath before the lord chancellor, the ſword, which is to be carried before him, is delivered into his hands, and he is ſeated in the chair of ſtate, attended by the lord chancellor, the members of the privy council, the peers and nobles, the king at arms, a ſerjeant at mace, and other officers of ſtate, and he never appears publicly without being attended by a body of horſe-guards. Hence with reſpect to his authority, his train and ſplendor, there is no viceroy in Chriſtendom that comes nearer the grandeur and majeſty of a king. He has a council compoſed of the great officers of the crown, namely the chancellor, treaſurer, and ſuch of the archbiſhops, earls, biſhops, barons, judges, and gentlemen, as his majeſty is pleaſed to appoint.

The parliament here, as well as in England, is the ſupreme court, which is convened by the king's writ; but the repreſentatives of the people enjoy their ſeat in the houſe during life, or till the death of the king. The laws are made in Ireland by the houſe of lords and commons, after which they are ſent to England for the royal approbation; when, if approved by his majeſty and council, they paſs the great ſeal of England, and are returned. Thus the two houſes of parliament make laws which bind the kingdom; raiſe taxes for the ſupport of government, and for the maintenance of an army of twelve thouſand men, who are placed in barracks in ſeveral parts of the kingdom. The houſe of lords conſiſts of the four archbiſhops, thirty-five earls, forty-five viſcounts, eighteen biſhops, and thirty-five barons; and the houſe of commons of three hundred members.

For the regular diſtribution of juſtice there are alſo in Ireland, as well as in England, four terms held annually for the deciſion of cauſes; and four courts of juſtice, the chancery, king's-bench, common pleas, and exchequer. In the firſt the king's chancellor and keeper of the great ſeal alone preſides; but in the courts of king's bench and common pleas, are three judges in each; and in the exchequer, a treaſurer, chancellor, and three barons, and in all of them ſeveral ſubordinate officers. Here is likewiſe a court of Exchequer chamber for correcting errors in the other courts; in which the lord chancellor and lord treaſurer preſide, with other aſſiſtant judges. Here are alſo judges of aſſize and jail delivery; theſe are thoſe of the ſupreme courts, who take their circuits twice a year, into the ſeveral counties, that of Dublin excepted, for the trial of priſoners, and ſuits of niſi prius between party and party; as alſo a court of admiralty, which has juriſdiction, in maritime affairs, and is adminiſtered by commiſſion from the admiralty of England.

Beſides theſe there are ſpiritual courts; as the courts of prerogative, where a commiſſary, judges of the eſtates of perſons deceaſed, whether in eſtate or by will; and in every dioceſe is a conſiſtory court, from whence appeals lie to the ſupreme court of prerogative, and from thence to a court of ſpecial delegates appointed by the king.

There are likewiſe governors of counties, and juſtices of the peace, appointed by the king's commiſſions, through the ſeveral counties, to preſerve the peace in the place where they reſide; and alſo high and petty conſtables, and other officers, inſtituted for the ſame purpoſe: but the chief officer of every county is the high ſheriff, who was formerly choſen in the county court by the ſuffrages of the people, but is now nominated by the chief governor.

With reſpect to the trade of Ireland, the diſcouragement laid upon it by the act of navigation and other laws made in England, are ſo numerous, that it cannot be expected it ſhould flouriſh to ſuch a degree as its natural ſituation, extended coaſts, commodious harbours, bays, and rivers ſeem to promiſe; a diſcouragement that will ever continue, till the Engliſh ſhall become ſenſible that it is for their intereſt to allow Ireland a free trade, which will probably be one time or other the caſe, as it will be for the advantage of both kingdoms; ſince this will enable Ireland to pay greater taxes, and the wealth of that country muſt in a great meaſure center in this. The chief exports of Ireland conſiſt of linen cloth and yarn, lawns and cambricks, which are manufactured to great perfection, and exported to conſiderable advantage; the Engliſh laws giving great encouragements to this branch of trade, which, with a few exceptions, may be ſaid to be the ſource of all the wealth in Ireland. To theſe may be added wool and woollen yarn exported to England only; beef, pork, green hides, ſome tanned leather, calf-ſkins dried, great quantities of butter, tallow, candles, ox and cow horns, ox hair, a ſmall quantity of lead, copper ore, herrings, dried fiſh, rabbits-ſkins, and furr, otter-ſkins, goat-ſkins, ſalmon, and a few other particulars. Wool and yarn are allowed to be exported only to England, but from the thirſt of gain, all hazards are run to ſend them by ſtealth to France, to the great detriment of the Engliſh woollen trade; and perhaps the beſt method of preventing it for the future,

would

would be to reſtore the woollen manufacture to Ireland, at leaſt in the coarſe branches of it, and to make it the intereſt of the Iriſh to employ their wool at home.

The Iriſh, notwithſtanding the diſcouragements laid on their woollen manufactories, import conſiderable quantities of broad-cloth, which they certainly might make at home; alſo all kinds of groceries, coals, braſs, hardware, and a great number of other particulars; beſides a conſiderable quantity of wine from France, Spain, and Portugal.

We ſhall conclude this ſection with obſerving, that Ireland is divided into four provinces, which, beginning at the ſouth, are Munſter, Leinſter, Connaught, and Ulſter; the firſt and laſt of which extend from one ſea to the other.

SECT. III.

Of the Province of Munſter, containing the Counties of Cork, Waterford, Tipperary, Limerick, and Kerry; their Situation, Extent, Produce, Rivers, and principal Towns.

THE province of Munſter is bounded on the eaſt and ſouth-eaſt by the province of Leinſter and St. George's Channel, on the ſouth and weſt by the Atlantic ocean, and on the north by the provinces of Connaught and Leinſter. It extends a hundred and thirty miles in length from Waterford haven in St. George's Channel to the weſt point in Kerry, and a hundred and twenty in breadth from the north parts of Tipperary to Baltimore in Cork; but from Baltimore to the north parts of Kerry it is only ſixty-eight miles. The circumference, including the great windings and turnings, is above ſix hundred miles.

It is divided into five counties, namely, Cork, Waterford, Limerick, Kerry, and Clare, which are ſubdivided into fifty-two baronies, containing one archbiſhoprick, and five biſhopricks, ſeven market-towns, eighty pariſhes, and twenty-five boroughs.

It enjoys a mild temperate air, has many excellent bays, havens, and good towns. The ſoil is in ſome parts hilly and woody, mixed with wild ſolitary mountains; but the vallies are adorned with pleaſant meadows and corn-fields. Its principal commodities are cattle, wood, wool, and fiſh, eſpecially herrings and cod.

Cork was formerly a kingdom, and contained all the country between Liſmore and Brandon-hills, in Kerry, where it faces Deſmond to the weſt, and includes a part of it. It is bounded on the eaſt by Waterford; on the weſt by Kerry, where it is alſo waſhed by the ſea; on the north by Limerick; and on the ſouth and ſouth-eaſt by the Atlantic ocean and St. George's Channel. The form is very irregular both in length and breadth.

It is divided into fifteen baronies, and is partly woody and mountainous, and partly fenny; yet it has many good towns, and abounds in fine rivers, and good harbours: the inhabitants are induſtrious, and the county is both rich and populous. A copper mine has been diſcovered near Cork. This county gives title of earl, as well as Burlington in England, to the noble family of Boyle, and ſends twenty-ſix members to parliament, namely, two knights for the ſhire, and two burgeſſes for each of the following towns, the city of Cork, Youghal, Kinſale, Bandon-bridge, Moyallow, Baltimore, Clougwikelty, Shareville, Caſtlemartyr, Middletown, Rathcormach, and Doneraile.

The principal places in this county are the following:

Youghal, a conſiderable ſea-port, ſeated at the mouth of the Broadwater, is not very large, but is walled round, and divided into two parts. The upper part, which extends to the north, and is the largeſt, has a church within the town, and a little abbey without the walls. The lower part towards the ſouth has another abbey. The convenience of the harbour, its good quay, and the fertility of the adjacent country, draw ſo many merchants to it, that the town is pretty populous and rich. It has in particular a good fiſhery; but before the harbour is a bar, which can only be paſſed at high-water.

Cork, a large, populous, and wealthy city, is ſeated on the river Lee, in the fifty-firſt degree forty-five minutes north latitude, and in the ſeventh degree thirty minutes weſt longitude, a hundred and twenty-nine miles north-weſt of Dublin, andis of an oval form, incloſed with walls and the channel of the river, which alſo croſſes it. It is ſaid to contain above eight thouſand one hundred houſes, chiefly inhabited by Engliſh Proteſtants, who, by their induſtry, have ſo far improved their eſtates, and their trade, that it is eſteemed the richeſt city in Ireland, next to Dublin. It ſtands abont ſeven miles up the river from the ſea, where the mouth of the harbour is two miles broad. Large ſhips generally ride at a place called Paſſage, but ſmaller veſſels come quite up to the quay. This is the chief port for merchants in the kingdom; and there is, perhaps, more beef, butter, and tallow, ſhipped off here, than in all the other ports of Ireland put together. Hence there is a great reſort of ſhips to this port, particularly of thoſe bound from England to Jamaica, Barbadoes, and all the Caribbee Iſlands, which put in here to victual and compleat their lading. This city, with its liberties, is about three miles round, and forms a county of itſelf. It has two gates, one to the north, and the other to the ſouth. The cathedral and the red abbey are on the ſouth ſide of the town; St. Francis's abbey and Shandon church on the north ſide. Here is alſo a ſteeple, ſuppoſed to have been built by the Danes, and to have been at firſt uſed by them as a watch-tower; and near the river is a cuſtom-houſe and ſtore-houſe.

Five miles below Cork, the channel of the river dividing, forms a large and pleaſant iſland, on which are ſeveral villages.

Kinſale is a neat, handſome, populous, and rich town, ſeated in a fruitful ſoil, near the mouth of the river Bann, a hundred and eighteen miles from Dublin. It has an admirable harbour, and a good bay, with a light-houſe upon a peninſula called the Old Head of Kinſale, which forms the bay, and guides the ſhips in the night to the mouth of the river. There is a bar before the port, but the pilots find from three and a half to four fathoms water in the ſhoaleſt place upon the bar at low-water, ſo that ſhips of any burthen may go over it when the tide is up; and even at the quay, where is the cuſtom-houſe, is twenty feet water. This is reckoned the ſecond town in the county, many ſhips belonging to it; and great quantities of proviſions are exported from hence to Flanders, Holland, France, and the Engliſh iſlands in the Weſt Indies. Within two miles from the quay, below the town, are two very ſtrong forts, one on each ſide of the river, almoſt oppoſite, which effectually ſecure the harbour from all attacks by ſea; the town is alſo ſo fortified with good lines and out-works, as to be ſafe from any ſudden alarm by land. It gives title of baron to the ancient family of Courcy.

Cape Clear is an iſland ſo called from its Cape, where is a caſtle for the ſecurity of ſhips, which take ſhelter under its cannon; for it is far advanced into the ſea, and is of great advantage from its being an opening to the ſouth coaſt, whence, in war-time, there are generally ſome men of war ſtationed to cruize and keep the coaſt free from privateers; this being the ſouthermoſt iſland, as Mizen-head to the weſt is the ſouthermoſt land of Ireland. Between this and the mouth of the Shannon are innumerable bays and creeks, harbours and roads for ſhipping.

The county of Waterford is ſo ſurrounded by the Blackwater, the Suir, and the ſea, that it forms a peninſula.

It is divided on the eaſt by its haven from the county of Wexford, in the province of Leinſter; on the ſouth it is bounded by the ocean; on the weſt by the county of Cork; and on the north by the river Suir, which ſeparates it from Tipperary and Kilkenny. It extends forty-ſix miles in length, and twenty-four in breadth; though in ſome places it is pleaſant and fertile, yet for the moſt part it is mountainous, and has a very indifferent ſoil. It is ſubdivided into ſix or ſeven baronies, and, as well as Wexford and Shrewſbury, gives title of earl to the ancient and noble family of Talbot. It ſends ten members to parliament, namely, two for the county, and

and two for each of the following towns, the city of Waterford, Liſmore, Dungarvan, and Tallow.

The principal places in this county are the following:

Waterford, the only city in the county, is conveniently ſeated for trade, ſeventy-five miles from Dublin; but has a thick air, and barren ſoil. It lies four miles and a half from the mouth of the river Suir, where it joins with the Nure and the Barrow; theſe together form the haven, which runs about nine miles up the country, and is all the way deep and clear. It is commanded by Duncannon fort, and on the weſt ſide of the town is a citadel. There are likewiſe a block-houſe and ſtore-houſe on the ſouth ſide of the quay. The city and its liberties, which take up a great extent, form a county of themſelves. The town is cloſe built, and has a handſome cathedral. It alſo encreaſes in fine buildings; and as ſhips of burthen come up cloſe to its fine quay, which is a very noble work, it has a very great foreign trade.

Dungarvan is ſeated upon a bay of its own name, twenty-one miles from Waterford, and ninety-two from Dublin. It is a walled town, defended by a caſtle; but though it has a commodious road for ſhips, it has now but little trade, and is a place of no great conſequence. It gives title of viſcount to the earl of Cork.

Liſmore is ſeated on the river Broadwater, thirteen miles from Dungarvan, and is adorned with the chief ſeat of the earl of Cork and Burlington, which has a noble park. It was formerly the ſee of a biſhop, and has a handſome cathedral; but moſt of its poſſeſſions being alienated, it was long ago annexed to the ſee of Waterford. It has alſo a free-ſchool, and an alms-houſe.

Tallow is ſeated near the borders of Cork, in a fine fruitful vale, five miles from Liſmore, and is a handſome, flouriſhing town. It ſtands near the river Bride, which being navigable from hence to Youghal, renders it a place of good trade.

The county of Tipperary is bounded on the eaſt by Queen's-county and the county of Kilkenny, on the ſouth by thoſe of Cork and Waterford, on the weſt by the county of Limerick and the river Shannon, and on the north and north-eaſt by King's-county and the territory of the O'Carrols. It is of a very irregular form, but is computed to be ſixty miles in length, and thirty-ſix in breadth.

This county is ſubdivided into fourteen baronies, and has four boroughs, with ſeveral other market-towns. It ſends eight members to parliament, namely, two for the county, and two each for the city of Caſhel, and the boroughs of Clonmel and Fethard.

The ſouth part of this county being fruitful, produces much corn, and is well inhabited; both that and the weſt point abound in good paſtures, and fine ſheep-walks, which furniſh the greateſt and beſt flocks of ſheep in Ireland; but the north part is barren, and very mountainous.

Caſhel, the only city of this county, and the ſee of an archbiſhop, ſtands eighty miles ſouth-weſt of Dublin. The cathedral is ſeated without the city, on a ſteep rocky hill; but the height of its ſituation expoſes it too much to the wind. In the aſcent to it is a great ſtone, at which, it is ſaid, every new king of Munſter uſed to be publickly proclaimed. The city gives title of viſcount to the family of Moore, but is ill inhabited, and is a place of no conſequence.

Clonmell is a rich, populous, neat, and pretty ſtrong town, ſeated on the Suir, on the borders of Waterford, twelve miles from Caſhel, and eighty-two from Dublin. It is walled round, and has barracks for two troops of horſe. It is the county town, and has a fine court-houſe and jail.

Carrick is alſo a fine town on the ſame river, and has barracks for horſe. It ſtands ten miles from Clonmell, and had one of the ſeats of the late duke of Ormond, with one of the fineſt parks in the world.

The county of Kerry is bounded on the ſouth and eaſt by the county of Cork, and on the weſt by the Atlantic ocean, extending ſixty miles in length, and forty-ſeven in breadth. It is ſubdivided into eight baronies, and ſends eight members to parliament, namely, two for the county, and two for each of the boroughs of Dingle, Trailey, and Ardfert.

It is in general a woody mountainous country, but has in many places good corn and graſs.

The principal places it contains are Trailey and Dingle.

Trailey, or Trally, the county town, where the aſſizes are kept, ſtands near a large bay of the ſame name, four miles from the ſea, and a hundred and thirty from Dublin, and is a thriving place.

Dingle ſtands almoſt at the end of a peninſula, near a bay of its own name, upwards of a hundred and ſixty miles from Dublin. It has a good convenient harbour for trade, is walled round, and is the chief market-town of the county, as alſo the moſt weſterly town of note in the kingdom. The bay, which is one of the largeſt of Ireland, runs twenty-eight miles up the country, is fifteen miles broad, and has ſeveral harbours.

SECT. IV.

Of the Province of Leinſter; containing the Counties of Lowth, Eaſt-Meath, Weſt-Meath, Longford, Dublin, Kildare, King's-County, Queen's-County, Wicklow, Catherlogh, Kilkenny, and Wexford; their Situation, Extent, Diviſions, and Produce; with an Account of their principal Towns, and a particular Deſcription of Dublin.

THIS province is waſhed on the ſouth and eaſt by the ſea, and is much indented by the provinces of Munſter, Connaught, and Ulſter; the two former of which bound it on the weſt and ſouth-weſt, and the latter on the north. It is ſeparated from Connaught by the Shannon, and from a part of Munſter by the Suir; extending in length about a hundred and twelve miles from the moſt northern parts of Eaſt Meath to the ſouthern point of Wexford, about ſeventy in breadth from Wicklow to the moſt weſtern part of the King's-county; and the circuit, including the turnings and windings, is computed at about three hundred and ſixty miles.

This province is divided into the counties of Lowth, Eaſt-Meath, Weſt-Meath, Longford, Dublin, Kildare, the King's county, the Queen's county, Wicklow, Catherlogh, Kilkenny, and Wexford; containing ninety baronies, and nine hundred and twenty-ſix pariſhes, under one archbiſhop and three biſhops, with forty-ſeven parliamentary boroughs. The market towns, and other places of trade, amount to ſixty three.

The principal rivers of this province are the Barrow, the Boyne, the Nure, the Liffey, the Slaine, and the May in Queen's-county, which falls into the Shannon.

This province has a temperate, clear air, with a ſoil fruitful in corn and paſture, and tho' ſome parts of it are woody, it in general abounds with cattle, fowl, milk, butter, cheeſe, fiſh, and thoſe little ambling horſes called hobbies.

The county of Lowth, which was formerly reckoned a part of Ulſter, is waſhed on the eaſt by St. George's channel; and on the ſouth-eaſt by Meath, from which it is parted by the Boyne; on the weſt, it has Monaghan and Eaſt Meath; and on the north Armagh and Carlingford bay. This is the leaſt county in the kingdom, it being only twenty-five miles from north to ſouth, and thirteen, where broadeſt, from eaſt to weſt; but in many places is much ſhorter and narrower. It is divided into four baronies: beſides the town and liberties of Drogheda, which are a diſtinct county, it ſends two members to parliament, namely, two for the county, and two for each of the following burghs, Atherdee, Carlingford, Dundalth, and Dunleer. It is fruitful in corn and paſture. The places of moſt note, as they lie from north to ſouth, are thoſe which follow.

Carlingford, one of the beſt harbours in Ireland, is ſeated on the ſouth ſide of a large bay of its own name, where the road is exceeding good, quite to the ſea, as is alſo the harbour, which has room for the whole royal navy of Great Britain, ſince it extends three leagues up the country, is two miles broad where narroweſt, and has from ten to twenty fathoms water. There is a bar, indeed, acroſs the mouth of the main port or bay, but it

is even there nine or ten feet deep at low water, and two fathom more at high tide. However, the town being a little out of the way of buſineſs, has not a trade equal to the extent of its harbour. It ſtands forty-nine miles from Dublin, has a well frequented market, and is far from being a deſpiſable or poor place, there being ſome merchants here and trade with their own ſhips, built in the dock of this town, and uſe them in the coal trade to Whitehaven, as alſo in the fiſhery, which is the life of trade in all this ſide of Ireland. Carlingford has likewiſe a conſiderable trade in linen and linen yarn. The town is rather neat than fine, and rather large than populous; and though it is not a place of ſtrength, is ſtrong enough to defend itſelf in ordinary caſes, particularly on the ſea-ſide. It has barracks for a company of foot, and is famous for being an important paſs between the northern and ſouthern counties.

Dundalk is ſeated on a large open bay, but its haven is ſo ſhallow at low water, that people may walk over it dry ſhod. It is ſeated forty miles from Dublin, and was formerly walled and defended with fortifications, but is now an open place; it is the county town, and has a good market. It has a manufactory of cambricks, which is brought to great perfection, and corn is frequently ſent from this port to Dublin. An infirmary has been lately erected here. Near the town are ſeveral ſalt works, which employ a great number of hands.

Drogheda is the largeſt town in the county, and ſeated on a bay of its own name, twenty-two miles from Dublin. It has a good harbour, but it is of difficult entrance, and requires the aſſiſtance of a pilot. It is a handſome well built town, is very populous, has a town houſe, and is divided into two parts by the river Boyne, over which is a good bridge. They have a good trade here to the north parts of England, and the inhabitants are ſupplied with a great quantity of coals from Whitehaven, which they ſend by land to all the country round, as well as up the Boyne. It gives title of Earl to the family of Moore.

The county of Eaſt-Meath is bounded on the north and north-eaſt by thoſe of Cavan and Lowth; on the eaſt by St. George's channel; on the ſouth by the counties of Kildare and Dublin; and on the weſt by Longford and Weſt-Meath; extending thirty-two miles from north to ſouth, and twenty-five from eaſt to weſt. It is ſubdivided into eighteen baronies, and ſix boroughs, which ſend two members each to parliament, beſides thoſe for the county; theſe are Trim, Athboy, Navan, Kells, Duleck, and Ratoath.

This is a plain, fruitful, pleaſant, and populous county, which feeds many herds of cattle, and abounds in corn. It gives title of earl to the family of Brabazon.

The principal town in this county is Trim, which has a ſmall market on the Boyne. It had formerly a caſtle, and was walled. It ſtands twenty-three miles from Dublin. This and the town of Navan have each of them barracks for a troop of horſe.

The county of Weſt-Meath is thus called from its being ſituated to the weſt of the former, and extends weſt to the Shannon, which parts it from Roſcommon: it alſo lies between Longford on the North, and King's-county on the ſouth. According to ſome it extends forty miles in length, and twenty in breadth, while others ſay that it is only thirty miles either way. It contains thirteen baronies, and ſends ten members to parliament, namely, two knights of the ſhire, and two burgeſſes each for Mullingar, Fore, Athlone, and Killbeggan.

Mullingar, which lies in the center, is forty miles from Dublin, and is a market-town of conſiderable note, with barracks for a troop of horſe. This is the head of the county by act of parliament, and here the ſeſſions of the county are held.

Athlone is ſeated about fifty miles from Dublin, on the banks of the Shannon, over which it has a bridge, which leads into the county of Roſcommon, in which is part of the town, and is defended by a caſtle. It is a place of conſiderable ſtrength, it being reckoned the key of Connaught. General Ginkle, for the valour he ſhewed at the ſiege of this town, was erected earl of Athlone, by king William, and the title is ſtill enjoyed by his deſcendants.

The county of Longford is bounded on the eaſt and ſouth by Weſt-Meath; on the weſt by the Shannon, which ſeparates it from Roſcommon; on the north-weſt by Leitrim; and on the north by Cavan; extending twenty-ſeven miles in length, and ſixteen in breadth. It is ſubdivided into ſix baronies, and contains twenty-four pariſhes, four boroughs, and ſends ten members to parliament, namely, two for the county, and two for each of the following towns, Longford, Granard, Laneſborough, and St. Johnſtown. It has ſome bogs and fenny paſtures, yet is in the main a rich pleaſant country, and has ſeveral lakes, which abound with fiſh. The principal towns are Longford and Laneſborough.

Longford ſtands on the banks of the Camlin, and is the capital of the county. It has a caſtle and barracks for a troop of horſe.

Laneſborough is alſo ſeated on the Shannon, is ſixty-ſix miles from Dublin, and has alſo barracks. It gives title of viſcount to the family of Butler.

The county of Dublin is bounded on the eaſt by St. George's Channel; on the ſouth by the river Bray, which parts it from Wicklow; on the weſt by the county of Kildare; and on the north by Eaſt Meath and the river Nanny. Its greateſt extent from north to ſouth is twenty-ſix miles, and from eaſt to weſt fifteen.

It is divided into ſix baronies, and ſends two members to parliament, namely, two for the county, two for the city of Dublin, two for its univerſity, two for the borough of Swords, and two for that of Newcaſtle.

The ſouth parts are but little cultivated, being ſomewhat mountainous, but the reſt is level and fruitful, and abounds with fiſh, tame and wild fowl, beſides deer in the noblemen's parks.

Dublin is pleaſantly ſeated at the mouth of the little river Liffey, in the fifty-fifth degree twelve minutes north latitude, and in the ſixth degree fifty-five minutes weſt longitude, ſixty-four miles to the weſt of Hollyhead in Wales, and two hundred and ſixty-eight to the north-weſt of London. This is the mart and center of commerce for the whole kingdom, excepting ſuch ports as are eminent for ſome particular branch of trade; though its harbour is ſo far from being commodious that it has a bar at its mouth, ſo that ſhips of great burthen cannot venture in; nor can thoſe which are able to paſs the bar, come up loaded to the quay, they being obliged to lie at Poolbeg, three miles below Dublin, and to deliver their goods by lighters. Great pains and expence have, however, been beſtowed in order to render this bay as ſafe and commodious as poſſible: banks faced with ſtone have been extended for a conſiderable length on both ſides, and particularly, a new wall has been lately built on the ſouth. By theſe means, a great extent of land which uſed to be overflowed every high tide, has been taken from the bay, in order to render the harbour deeper; and to prevent ſhips leaving the proper channel, a durable row of piles has been fixed, between which ſhips may ſail in the utmoſt ſecurity.

The Caſtle of Dublin, which twenty years ago was an ancient ſtructure, conſiſting of ſeveral round towers of ſtone, mouldering into ruins, has been rebuilt in a magnificent manner; and contains many ſtately apartments. Before it is a handſome area, with a very fine ſtreet, leading down to Eſſex bridge, which has been lately rebuilt after the model of that at Weſtminſter, though the Liffey, over which it is extended, is not more than one fourth as broad as the Thames. Juſt below the bridge, on the ſouth ſide of the river, is a very noble Cuſtom houſe, with the front ſupported by piazzas. Before it is a handſome and ſpacious quay, with conveniencies for landing of goods. Beſides the bridge juſt mentioned, there are ſeveral others of ſtone; but theſe are not worthy of a particular deſcription.

To the eaſtward of the caſtle is a ſpacious area, on one ſide of which is the parliament houſe, the front of which is ſupported by very lofty columns; theſe are extended on each ſide in the wings, which reach to the ſtreet. Theſe columns riſe almoſt to the top of the building,

is only terminated by a very large and grand entablature, that ſeems to want a baluſtrade, which if adorned with ſtatues or vaſes, would render the building compleat, and for want of which it ſeems unfiniſhed; though it muſt be acknowledged to be a magnificent ſtructure. In the area before the parliament houſe, is an equeſtrian ſtatue of king William the Third.

Near the parliament houſe is Trinity college, which was founded by queen Elizabeth in 1591, and made an univerſity by that princeſs. Its revenue has been ſince encreaſed by ſeveral donations. The building conſiſts of two ſquares, one behind the other: in the firſt is a noble library. The univerſity has alſo an elaboratory, and a great number of ſkeletons and curioſities relating to anatomy, particularly a mummy remarkably perfect. The front, and all the old parts of this ſtructure, have been lately rebuilt in an elegant manner with ſtone.

Near the other ſide of the area, behind the houſes which front the parliament houſe, is the round church, which in the inſide is very beautiful, it being covered with a dome, and adorned with a great deal of carved work and gilding. The form of this rotunda has a very pleaſing effect, and its elegant decorations render it ſtill more agreeable to the eye of the beholder.

At a ſmall diſtance to the ſouth, is St. Stephen's Green, a very fine ſquare, in which are many noble buildings, and a large area in the middle. This affords a very pleaſant walk, a mile in circuit.

Among the churches, the cathedral, dedicated to St. Patrick, is a fine old Gothick ſtructure, famous for its curious workmanſhip within, arched roof, and high ſteeple, and alſo for its moveable pulpit, which till the people are ſeated, and divine ſervice is ready to begin, ſtands in a corner of the church; but to the ſurprize of the ſtranger, is removed into the great iſle frequently without being obſerved; and he ſees a miniſter in the pulpit, where a minute or two before was an open ſpace. To this church belong a dean, a chanter, a chancellor, a treaſurer, two archdeacons, and twenty-two prebendaries.

In the heart of the city is the collegiate church, called Chriſt-church, though it was dedicated to the Holy Trinity. This is a handſome ſtructure in the inſide, but it has nothing remarkable without. Thither the lord lieutenant and lords juſtices always go in ſtate, on ſolemn occaſions, though there is a church belonging to the caſtle.

Among the other churches there are ſeveral very beautiful ſtructures.

At the weſt end of the town are the Barracks, which are very handſome and extenſive ſtone buildings, raiſed upon an eminence, and ranged in ſeveral fronts and wings, joined together, with a very beautiful proſpect of the open country before it. A neat chapel, with a ſteeple, has been lately added, where divine ſervice is duly performed.

A little beyond the Barracks is the Phœnix-park, which conſiſts of a pleaſing variety of hills and vales, is planted with trees, and ſtocked with deer. A commodious road extends through it to the ring, where it encircles a very fine Corinthian column, bearing on the top a phœnix in the flames, erected by the earl of Cheſterfield when lord lieutenant of Ireland. Hither a train of the nobility and gentry go in their coaches on the fine ſummer evenings, and make a very ſplendid appearance, there being frequently two hundred coaches and upwards, many of them drawn by ſix horſes, with the ſervants of the greateſt number of them in rich liveries; theſe coaches are drove round the ring, as was formerly the cuſtom in Hyde-park: and as there is room for ſeveral coaches to go abreaſt, perſons frequently converſe together through the windows. In the park there are alſo very handſome ſeats for thoſe who walk.

Oppoſite the Barracks, on the other ſide of the river Liffey, at a conſiderable diſtance, ſtands the Royal Hoſpital, founded by king Charles II. a very noble ſtructure, in which there are apartments for old and diſabled ſoldiers, five hundred of whom are maintained here, with their officers, much after the manner of Chelſea.

At a ſmall diſtance from the above edifice is Stephens's hoſpital, founded by Dr. Stephens and his ſiſter, a maiden lady, for the cure of all ſick and wounded perſons who are objects of charity. This is a neat and elegant ſtructure, and is endowed with a great revenue.

Near it is the hoſpital for idiots and lunatics, erected in purſuance of the will of the late dean Swift, celebrated for his wit and his writings.

Beſides theſe truly charitable and humane endowments, there are three hoſpitals, or infirmaries, for the ſick and wounded, namely, the Charitable infirmary, Mercer's hoſpital, and the Meath hoſpital; with one particularly appropriated to the uſe of incurables; a Lying-in-hoſpital, lately built in a ſuperb manner, and in imitation of which the Lying-in-hoſpitals in the cities of London and Weſtminſter were founded.

One of the moſt conſiderable of the charitable foundations of this city is the Poor-houſe, in which a great number of old and decayed perſons are maintained; infants are alſo received, brought up, educated, and inured to labour. The girls in particular are taught to ſpin, and the boys to dreſs flax. The Blue-coat-hoſpital and Free-ſchool was erected in 1680 by king Charles II. for educating, maintaining, and putting out apprentices to trades or ſea-ſervice the ſons of the reduced citizens of Dublin, and contains about a hundred and ſixty boys.

The city is governed by a lord mayor, who is granted a conſiderable ſum to enable him to ſupport the dignity of his office, and wears a collar of SS. and by twenty four aldermen. Every third year the city and its ſuburbs are ſurveyed by the lord mayor and the twenty-four corporations, which are, 1. The merchants, 2. The taylors, 3. The ſmiths, 4. The barber ſurgeons, 5. The bakers, 6. The butchers, 7. The carpenters, 8. The ſhoemakers, 9. The ſadlers, 10. The cooks, 11. The tanners, 12. The tallow-chandlers, 13. The ſkinners and glovers, 14. The weavers, 15. The ſheer-men and dyers, 16. The gold-ſmiths, 17. The coopers, 18. The felt-makers, 19. The ſtationers, cutlers, and paper-ſtainers, 20. The bricklayers and plaiſterers, 21. The curriers, 22. The hoſiers, 23. The brewers and maltſters, 24. The joiners and wainſcoters. All theſe ſeveral companies vie with each other in making a ſplendid appearance, and ſeveral of them have very fine pageants, conſiſting of large and beautiful carriages, in which are exhibited ſome remarkable particulars, or circumſtances, relating to the company to which they belong. Thus, in that belonging to the ſtationers, of whom the printers make a part, is ſometimes a printing-preſs, in which men work off a poem in praiſe of printing, and throw off every ſheet to the mob: the weavers work at the loom: the ſmiths have their Vulcan: the furriers a man dreſſed in ſkins; and the upholſterers one in feathers.

We now come to the county of Kildare, which has thoſe of Dublin and Wicklow on the eaſt, the King's and Queen's-counties on the weſt, Catherlogh on the ſouth, and Eaſt-Meath on the north; extending twenty-three miles from eaſt to weſt, and thirty-ſeven from north to ſouth; but both are very unequal, it running in a narrow ſlip between the counties of Dublin and Wicklow, and between the latter and Queen's-county.

This is an open, pleaſant, and plentiful country, abounding in corn and paſturage; and is well watered by the Barrow, Liffey, and other rivers. It is divided into ten baronies, gives title of earl to the noble family of Fitzgerald, and ſends ten members to parliament, namely, two for the county, and the ſame number for each of the following towns, Kildare, Naas, Harriſtown, and Athy.

Naas is the county town, but Kildare is the capital of the county. It is ſeated twenty-ſeven miles from Dublin, and is the ſee of a biſhop. It is a pretty good town, and has ſome trade. Near it is a plain called the Curragh, large enough for a camp of ten thouſand men, and in which is a celebrated courſe, where are frequent horſe-races.

The King's-county was formerly called Offaly, but had its preſent name in honour of Philip of Spain, queen Mary's huſband. It is bounded on the eaſt by Kildare; on the ſouth by Tipperary and the Queen's-county; on the weſt by part of Tipperary and Galloway, from which laſt it is ſeparated by the Shannon; and on the north

by West-Meath. According to ſome authors it is thirty-ſeven miles from north to ſouth, and twenty-eight from eaſt to weſt; but, according to others, is forty-eight miles in length, and fourteen in breadth; however, it is very unequal both ways, and runs with a narrow ſlip between Tipperary and Queen's-county. It is a populous and well improved country, divided into eleven baronies, and ſends ſix members to parliament, namely, two for the county, two for Philipſtown, and two for Banagher.

Philipſtown, or Kingſtown, is the capital of the county, and is ſeated twenty-eight miles from Dublin. It has barracks for a company of foot, and gives title of baron to the lord viſcount Moleſworth.

Bir is ſaid to be much the beſt town in the county: it ſtands on the borders of Tipperary, on a river that runs into the Shannon; has a conſiderable trade in wool, and employs a great number of hands in the woollen manufacture.

Queen's-county is ſo called in honour of Mary, the ſiſter of queen Elizabeth, in whoſe reign it was made a county. It is bounded on the eaſt by Kildare and Catherlogh, on the ſouth by Catherlogh and Kilkenny, and on the north and weſt by King's-county and part of Tipperary; extending thirty-five miles in its greateſt length from north to ſouth, and near the ſame from eaſt to weſt. It is divided into ſeven baronies, and ſends eight members to parliament, two for the county, and two each for Portarlington, Maryborough, and Ballynekil.

Maryborough, or Queen's-town, ſtands ſeventy-two miles from Dublin. It was ſo called in honour of queen Mary, and has barracks for a troop of horſe. It gives title of baron and viſcount to the lord Molyneaux.

The county of Wicklow, which was once a part of that of Dublin, is bounded on the eaſt by St. George's Channel, on the ſouth by the county of Wexford, on the weſt by Kildare and Catherlogh, and on the north by Kildare and Dublin; extending thirty-ſix miles in its greateſt length, and twenty-eight where broadeſt.

It is divided into ſix baronies, and ſends ten members to parliament, two for the county, and two each for the towns of Wicklow, Baltinglaſs, Carysford, and Bleſſington. It is pretty mountainous, but the low lands are fruitful, and, among other advantages, contains a copper mine.

Wicklow, the county town, is ſeated twenty-four miles from Dublin, at the mouth of the river Leitrim, and has what is called a caſtle; but it is only a rock, with a ſtrong wall round it. It has no great trade; what it has is chiefly managed in ſmall veſſels, which carry proviſions to Dublin: but the haven, which was in a manner choaked up by ſands, has been deepened, and conſiderable works added to improve it. This place is famous for its excellent ale, and has barracks for three companies of foot.

Arklow is a pretty market-town near the ſea, twelve miles from Wicklow. It has barracks for two companies of foot, and alſo ſends boats loaded with proviſions to Dublin.

The county of Catherlogh, or Caterlough, has Wexford on the ſouth, part of Queen's-county and Kilkenny on the weſt, part of Kildare and Wicklow on the north, and part of Wicklow and Wexford on the eaſt, lying for the moſt part between the rivers Barrow and Slaine. It extends twenty-eight miles from north to ſouth, and eighteen from eaſt to weſt; but is very unequal, it running with a narrow ſlip between Kilkenny and Wexford. It is woody, but pretty fruitful; is divided into five baronies, and ſends only ſix members to parliament, namely, two for the county, and two each for the towns of Catherlogh and Old Leighlin.

Catherlogh, which is the county town, ſtands thirty-eight miles from Dublin. It is ſeated on the river Barrow, and hath a caſtle, with barracks for a troop of horſe. It is well built, and is a pretty trading town, inhabited by the chief gentlemen of the county.

The county of Kilkenny is bounded on the eaſt by Wexford and Catherlogh; on the ſouth by Waterford, from which it is parted by the Suir; on the weſt by Tipperary; on the north-weſt by Upper Oſſory; and on the north by the Queen's-county. Its greateſt extent from north to ſouth is forty miles, and from eaſt to weſt twenty. It comprehends ten diſtricts and baronies, and ſends ſixteen members to parliament; namely, two for the county, two for the city of Kilkenny, and two for each of the following towns, St. Kennis, or Iriſhtown, Gowran, Thomaſtown, Eniſteoge, Cullen, Knocktopher.

This is a plentiful country, ſo populous as to be adorned with more towns and caſtles than any in the kingdom; and, though it is mountainous in the ſouth part, is ſaid to have fire without ſmoke, earth without bog, water without mud, and air without fog: thus having all the four elements in perfection, it is eſteemed an healthful as well as pleaſant country. It is remarkable for its coal mines, as well as for its quarries of marble. Near Oſſory are the mountains called Sliewbloamy, or Bladin hills, out of which ſpring the Suir, the Neor, and Barrow. They deſcend in three ſeveral channels, but join in one before they fall into the ſea. The Neor, or Nure, divides this county into two parts.

The principal places in this county are the following:

Kilkenny, which was once a biſhop's ſee, is ſeated on the Neor, fifty-ſix miles from Dublin. It has two ſtone bridges over the river, and is a large, ſtrong, populous, neat, and well-built city, which has as good a trade as any inland town of Ireland. It is divided into the Engliſh and Iriſh towns, of which the former is the principal, and the latter, as it were, the ſuburbs; but contains the cathedral, which is pleaſantly ſeated on a hill of a gentle aſcent, from which there is a delightful proſpect of the city and the adjacent country. The Engliſh town is much newer, and is remarkable for its ſtreets being paved with marble, and its being fortified with a caſtle by the Butlers, of the family of the earls of Ormond, who made it their principal ſeat, and built and liberally endowed a free-ſchool, which is a fine ſtructure, called the college. Here are barracks for a troop of horſe and four companies of foot.

Thomaſtown is ſeated on the banks of the Neor, and is reckoned the ſecond town in the county; but is a ſmall place, with ſome fortifications.

The laſt county we ſhall mention in the province of Leinſter, is that of Wexford, which is bounded on the north by Wicklow; on the eaſt, ſouth, and ſouth-weſt, by St. George's Channel; and on the weſt by Catherlogh and Kilkenny, extending forty-ſeven miles in length, and twenty-ſeven in breadth. It is divided into eight baronies, and ſends eighteen members to parliament; namely, two for the county, and the ſame number for each of the following boroughs, Wexford, New Roſs, Enniſcorthy, Feathard, Newborough, Banno, Clonmines, and Taghman. It is in ſome places fruitful in corn and paſture, but in others the ſoil is very indifferent.

The principal towns in this county are the following:

Roſs, which is ſituated on the borders of Kilkenny, was once a large, trading, populous city, with a cathedral, and was the ſee of a biſhop, afterwards annexed to that of Cork. It is now a town of trade, by means of its river, formed by the junction of the Neor and the Barrow, which brings up ſhips of very conſiderable burthen to its quay, and has barracks for a troop of horſe.

Duncannon is a fort on the ſame river more to the ſouth, which ſo commands it, that no ſhip can paſs either to Roſs or Waterford without its permiſſion; and there are here barracks for three companies of foot. From hence to the north of the river, a narrow neck of land projects into the ſea, on which ſtands Hook-tower, formerly built by the citizens of Roſs, and now augmented with a light-houſe for the direction of ſailors into the mouth of the river.

Wexford, the chief town of the county, ſtands at the mouth of the river Slaine, ſixteen miles from Roſs, and ſixty-five to the ſouth of Dublin. This is remarkable for being the firſt town in the whole iſland that ſurrendered to the Engliſh, who took poſſeſſion of it in the year 1170, when it was reckoned the principal town in all Ireland. It has a very good harbour for veſſels that do not draw above twelve or fifteen feet water; but it has

has two or three ſand-banks juſt before it, and ſeveral ſhallows within; ſo that all veſſels which draw more water are obliged to lade and unlade in a creek three miles from the town, where there is water enough, but no ſhelter from the ſouth-weſt wind. Here are barracks for two companies of foot. This town has a conſiderable trade in corn and butter, and is famous for its fine ale.

SECT. V.

Of the Province of Connaught; containing the Counties of Thomond or Clare, Gallway, Mayo, Roſcommon, Sligo, and Leitrim; their Situation, Extent, Diviſions, Rivers, Produce, and principal Towns.

THIS province is ſeparated from that of Leinſter by the Shannon, which alſo parts it on the ſouth and ſouth-eaſt from Munſter, and is bounded on the north and weſt by the Ocean. It is one hundred and thirty miles in length from Cape Lean, the moſt ſoutherly point of Thomond, to the north parts of Leitrim; about eighty-four in breadth, from the eaſt point of Leitrim to the Black-Harbour in the weſt part of Mayo; and about five hundred in circumference.

In ſome places this province is extremely pleaſant, but in others is gloomy and ſubject to great fogs, on account of its many bogs, woods, and lakes. The ſoil is very fruitful, and abounds with cattle, deer, hawks, and honey. It has many convenient bays and creeks for navigation, but few rivers of conſiderable note, except the Shannon. The chief are the Moy, in the county of Mayo, which, for a ſmall diſtance, divides it from Sligo, and falls into the ocean by Mayo and Killala. The Suck divides Roſcommon from Gallway, and falls into the Shannon near Clonfert. The Droſos, a river in the county of Clare, which falls into the Shannon to the eaſt of Clare; and the Gyll, a ſmall river in Gallway, which runs into the bay of that name.

This province contains one archbiſhopric, five biſhopricks, ſeven market-towns, eight places of trade and commerce, twelve boroughs that return members to parliament, and three hundred and ſixty-ſix pariſhes; with ſix counties, which are ſubdivided into fifty-one baronies. Theſe counties are Thomond or Clare, Gallway, Mayo, Roſcommon, Sligo, and Leitrim.

Thomond, or the county of Clare, was formerly joined to Munſter, but has been annexed to Connaught. On the eaſt and ſouth ſides, it is parted by the Shannon from Tipperary, Limerick, and Kerry in Munſter; on the north it is bounded by the county of Gallway; and on the weſt by the Atlantic ocean. It is about fifty-five miles in length, and thirty-eight in breadth; and is ſuppoſed to contain ten thouſand houſes. It is divided into nine baronies, in which are two market-towns, and but one borough, which is that of Ennis; it therefore ſends but four members to parliament.

It is a hilly, irregular country, but is not deficient in good paſtures, which produce the beſt horſes in Ireland. The ſoil alſo bears corn and rape.

Ennis, the county town, is ſeated about one hundred miles from Dublin. It ſtands near a lake formed by the Shannon, has a market, and is by much the beſt town in the county.

Killalo, the other market-town, ſtands on the Shannon, on the borders of Tipperary, eighteen miles from Ennis, and ten to the north-eaſt of Limerick. It is the ſee of a biſhop, and was once a very conſiderable place; but is at preſent decayed. There is here a cataract in the Shannon, which ſtops veſſels from going farther up.

The county of Gallway is bounded on the eaſt and ſouth-eaſt by part of Roſcommon, King's-county, and Tipperary, from which laſt it is parted by the Shannon; on the ſouth-ſide by the county of Clare; on the weſt by the Atlantic ocean; and on the north and north-eaſt by Mayo, Meath, and Roſcommon. It is eighty-two miles in length, and forty-two in breadth; and is divided into ſeventeen baronies, containing one hundred and thirty-ſix pariſhes, about fifteen thouſand four hundred and twenty houſes, and ſends eight members to parliament; namely, two for the county, two for the town of Gallway, two for Athenry, and two for Tuam. The river Shannon here forms a lake ſeveral miles in length; and Lough Corrib, which runs into the bay of Gallway a little above the city, is twenty miles long, and in ſome places five broad. As this country abounds with a warm lime-ſtone ſoil, which rewards the induſtry of the huſbandman and ſhepherd, it in general abounds with corn, paſture, and cattle; but the ſouth and eaſt parts are beſt inhabited. The weſt ſide runs out in the form of a peninſula. It is much indented with little bays, and bordered all along with a mixture of verdant iſlands and rugged rocks, among which are four iſlands called South Arran, which give title of Earl to the family of Gore.

Gallway, the county town, ſtands on an iſland, by the fall of the Lake Corbes, or Lough Corrib, into the bay of its own name, one hundred miles to the weſt of Dublin, and thirty-ſeven to the north of Limerick. It is a very ſtrong, neat, and rich city, the capital of all the weſt part of Ireland. In beauty and compactneſs it is inferior to none but Dublin. It is extremely well ſituated for commerce, and has a large, ſafe, and excellent harbour, called the Bay of Gallway, which is ſheltered at the mouth by the ſouth iſles of Arran, thro' which are three paſſages for ſhips, beſides the north-paſſage at the mouth of the bay, and is capable of containing a vaſt fleet of ſhips. The buildings, eſpecially the public ſtructures, are generally of ſtone, very handſome and lofty, and inhabited by ſubſtantial merchants and ſhopkeepers. It is encompaſſed by a wall, and has barracks for ten companies of foot. This city was once the ſee of a biſhop, but it is now included within the archbiſhopric of Tuam.

Tuam has been the ſee of an archbiſhop, ever ſince the beginning of the ſixth century. It ſtands ſeven miles from the borders of Mayo, and was once a famous city, but is now greatly reduced; however, it has ſtill ſome trade.

Mayo is bounded on the eaſt and north-eaſt by Roſcommon and Sligo; on the ſouth and ſouth-eaſt by Gallway; and on the weſt and north by the Atlantic ocean; extending ſixty-two miles in length, and fifty-two in breadth. It is divided into nine baronies, in which there is but one borough town, and it ſends only four members to parliament; two for the county, and two for Caſtlebar. It has ſeventy-three pariſhes, and is ſaid to contain upwards of thirteen thouſand houſes. It is rough and mountainous on the ſide next the ſea; but in other parts has paſture, and is well ſtocked with cattle and deer; it is watered with many large lakes and rivers, and gives title of viſcount to the family of Bourke.

Mayo, the chief town, was once a biſhop's ſee, but is ſince annexed to Tuam. The town ſtands at the mouth of the river Moy, on the borders of Sligo, one hundred and fifteen miles from Dublin, and was once a flouriſhing place; but it is now much decayed.

Roſcommon is bounded on the eaſt by Longford and Eaſt-Meath; on the north by Sligo and Leitrim; on the ſouth by Gallway and Mayo, and on the weſt by another part of Gallway and Mayo; extending fifty miles in length, and twenty-eight in breadth. It is ſubdivided into ſix baronies, in which are three boroughs, fifty-nine pariſhes, and about eight thouſand ſeven hundred and eighty houſes. It ſends eight members to parliament; two for the county, and two each for Roſcommon, Boyle, and Tulſk. It is, for the moſt part, a level and fruitful country, that with little cultivation yields plenty of corn and graſs, which feeds large herds of cattle. On the north-ſide of the county, are the Curlew mountains, which were ſteep, and impaſſable, till with much difficulty a way was cut through them.

Roſcommon, which gives name to the county, was formerly defended by a caſtle, which is now in ruins. It is a mean place, conſiſting chiefly of one ſtreet, with great part of the houſes thatched; yet here is kept the ſeſſions-houſe and jail, and it gives title of Earl to the family of Dillon.

Boyle is a good market town and corporation, by the lake Key, near the borders of Sligo. It is a place of ſome trade, and is remarkable for an old abbey, of which only

only the ruins now remain. It has alſo a fine ſeat which belonged to the late lord Kingſborough.

Sligo is bounded on the eaſt by the county of Leitrim; on the ſouth and ſouth-weſt by Roſcommon and Mayo; and on the north and north-weſt by the Atlantic ocean; extending thirty-five miles in length, and as much in breadth. Great part of this county is mountainous, and covered with bogs; but the lower grounds have a good ſoil, proper for grazing. It is ſubdivided into ſix baronies, and contains forty-one pariſhes, and about five thouſand nine hundred and ſeventy houſes. It has but one borough, and ſends four members to parliament, two for the county, and two for Sligo, the capital town.

Sligo, the county town, is ſeated on a bay of the ſame name, a hundred and ten miles to the north-eaſt of Dublin, and is the only town of note in the county. It has a very commodious harbour, and ſhips of two hundred tons burthen may come up to the quay. Here is alſo a good caſtle. The town is populous, but not large; nor is the trade conſiderable, though much better than in any other places beyond it.

A mile from Caſtle-connor, in this county, is a round hill, an entrance into which was diſcovered in 1646, leading to quadrangular chambers, arched over. The caves of the rock of Corin are equally remarkable, where, within a ſteep and almoſt inacceſſible entrance, are many ſtrange receſſes. Before theſe caves is a path, about a hundred paces in length, alſo cut out of the rock. This work, which is called the Giants-houſe, is ſuppoſed to be formed either by the Iriſh or Danes.

The county of Leitrim is bounded by Sligo on the weſt and ſouth-weſt; by Donegal bay on the north; by Longford, in Leinſter, on the ſouth-eaſt; and by the counties of Fermanagh and Cavan on the eaſt and north-eaſt. It is forty-four miles in length, but only eighteen in breadth, and is a wild mountainous country, but abounds in graſs, which feeds a prodigious number of cattle. It is divided into five baronies, and contains twenty-one pariſhes, about four thouſand houſes, two boroughs, and ſends ſix members to parliament, two for the county, and two each for Jameſtown and Doumruſk.

Leitrim, the county town, ſtands near the Shannon, which riſes in this county; but the town is decayed, and of little conſequence.

SECT. VI.

Of the Province of Ulſter; containing the Counties of Down, Armagh, Monaghan, Cavan, Fermanagh, Tyrone, Antrim, Londonderry, and Donegal; their Situation, Extent, Lakes, Rivers, Soil, Produce, Mountains, and principal Towns; with a particular Deſcription of the Giant's Cauſeway.

THIS province is encompaſſed on three ſides by the ſea, it being bounded on the eaſt by St. George's Channel, on the north by the Northern ocean, on the weſt by the Atlantic ocean, on the ſouth-weſt by the province of Connaught, and on the ſouth by that of Leinſter; it being about a hundred and ſixteen miles in length, and a hundred in breadth. It is ſubdivided into fifty-five baronies, and contains ten counties, twenty-nine boroughs, three hundred and ſixty-five pariſhes, and about a hundred and fifteen thouſand five hundred inhabitants, with one archbiſhopric, and ſix biſhoprics.

The air is temperate and ſalubrious, being cooled by various winds in ſummer, and qualified by moderate rains in winter. It has many great lakes and rivers that abound with fiſh, many woods, plenty of corn and graſs, and a great number of black cattle and ſome ſheep.

The principal rivers and lakes are the following: the river Rann, which riſes in the county of Down, receives the river Tanwagee, paſſes through Lough-neagh, and, after dividing the counties of Antrim and Londonderry, falls into the Northern ocean a little below Colerain.

Lough-foyle, which paſſes by St. John's-town and Londonderry, forms a bay of the ſame name at its entrance into the Northern ocean.

The Swilly, in the county of Donegal, alſo falls into the ſame ocean, with a kind of lake.

Lagan-water, in the county of Down, paſſes by Dromore, Liſburn, and Belfaſt, into the bay of Carrickfergus.

Newry-water parts Down from Armagh, and falls into Carlingford bay.

With reſpect to the ſoil of this county, it ought farther to be obſerved, that it is apt to run into wood, unleſs conſtantly kept open, and the low grounds, where the drains are neglected, ſoon degenerate into bogs; but by the induſtry of the inhabitants it produces good crops of oats, and, where marl is found, barley. The ſtaple commodity of this county is the linen manufacture, which has been of the greateſt benefit to all ranks of people. Hence this province may be ſaid to be in general populous, flouriſhing, and daily encreaſing in the number and wealth of its inhabitants.

Its higheſt mountains are thoſe of Mourne, the baſe of which terminates on the ſea-ſhore. Among theſe that named Slive-Donagh is three miles in gradual aſcent, and half a mile in perpendicular height. Theſe are reckoned among the higheſt mountains in Ireland, and are uſeful land-marks for ſailors. They afford variety of plants, and many ſprings: beſides, a multitude of cattle graze on them in ſummer. In one of them are quarries of milſtones, and in another are found cryſtals. Theſe mountains are famous for the goats whey preſcribed by phyſicians for ſcorbutic and nephritic ailments and diſorders of the lungs; and in April, May, and June, are much frequented by the gentry of both ſexes, many of whom have found relief; theſe ſhrubs and medicinal herbs affording the fitteſt nouriſhment to thoſe animals. There has been a pearl-fiſhery on the river Bann, but it is not now much purſued.

This province is divided into the nine following counties, Down, Armagh, Monaghan, Cavan, Fermanagh, Tyrone, Antrim, Londonderry, and Donegal.

The county of Down is bounded on the eaſt and ſouth by St. George's Channel, on the weſt by the county of Armagh, and on the north by the county of Antrim. It lies oppoſite to the Iſle of Man, Cumberland, and Weſtmoreland; and the north part of it fronts the Mull of Galloway, which is viſible at about five leagues diſtance. It is about forty-four Engliſh miles in length, upwards of thirteen in breadth, and divided into ſeven baronies, which contain about nineteen thouſand two hundred and ſeventy houſes, ſeventy-two pariſhes, and ſends fourteen members to parliament, namely, two for the county, and twelve for the ſix following boroughs, Newry, Downpatrick, Newtown, Killeleagh, Bangor, and Hillſborough.

Newry is a borough and market-town on the ſide of a ſteep hill, at the bottom of which runs the Newry-water, having over it two ſtone bridges, one on the road from Dublin, from which it is forty-nine miles diſtant, and another in the way to Armagh. The turnpike-road from Dublin to Belfaſt, Antrim, and Armagh, go through the town; and here is a lock of the new canal, lately formed by parliamentary encouragement; and over this canal is a third bridge. The town has ſuffered greatly by the rebellions that have happened in this province; and was burnt down by the duke of Berwick in 1689: but it is now ſo much improved in its trade and buildings, that it is the largeſt town in the county. At one end of it is a ſpacious church ſeated on a hill, and at the other a ſchool-houſe near the river. It has the moſt trade of any town in the county, to which the increaſe of the linen manufacture has greatly contributed. It has alſo a manufacture of earthen-ware, and houſes for baking of ſugar. It is likely to receive farther buſineſs by means of the navigable canal juſt mentioned. In its neighbourhood is plenty of a hard gritty free-ſtone, which is eaſily cut into ſquares, and is uſed for building. There is alſo a caſtle built on an eminence, to command the head of the bridge, which was formerly a conſiderable paſs, to ſecure the road through the bogs and mountains between Dundalk and this town. It is almoſt encompaſſed with mountains, except to the north, where it opens into a good country, through which the New Canal is carried.

Roſtrevor is a ſmall town, with a church, on the north ſide of Carlington harbour, defended from the winds by the hills, which are cloathed with wood; and an arm

of the ſea forming a noble baſon at the foot of theſe hills, affords an agreeable proſpect. Here is a quay for ſhips, which ſafely ride at anchor within a few yards of the ſhore, a ſalt-houſe, and a pottery for white earthen-ware, made of the fine potters clay found near Carrickfergus.

Rathfryland, or Rathon-iſland, probably ſo called from Rath, a high fort on an iſland, it riſing above all the neighbouring grounds. It ſtands on a hill where four great roads, laid out in almoſt ſtraight lines, lead up to it, and meet in the center of the town, at one end of which is the church, built on a rock of free-ſtone, and at the higheſt point of the hill are the ruins of a caſtle, and on its ſide is a warren well ſtocked with excellent rabbits. This is one of the greateſt marts for linen in this county. Two miles from it is a ſmall pleaſant lake, which hath on the verge of it a large plantation of young foreſt trees, called Ballyrony.

Killogh, or Port St. Ann, is a town with a commodious harbour on the north-eaſt ſide of St. John's Point. A rock ſtands in the middle of the entrance of the harbour, which is covered at half flood; but there is a ſecure paſſage, either to the eaſt or weſt of it. A mile within that rock, on the weſt ſide, is a quay and baſon for ſhips, where they may lie defended from all winds. In this town is a neat chapel, barracks for two troops of dragoons, a Proteſtant charter working ſchool for the linen manufacture, &c. and ſalt works: but its principal trade at preſent ariſes from the exportation of barley, and the importation of moſt ſorts of commodities conſumed in the adjacent country.

Downpatrick, which ſignifies Patrick's-Mount, ſtands five miles from Killogh, and is eſteemed one of the moſt ancient places in the kingdom. It is a market-town and biſhopric, erected in the fifth century by St. Patrick; but is now united to the ſee of Connor. Within two hundred paces of the town, on the aſcent of a hill, are the ruins of an old cathedral, remarkable for a tomb, which contained the body of St. Patrick, St. Bridget, and St. Columb; and there were anciently four religious houſes, beſides the cathedral, in and near the town. It is ſituated on a branch of the lake of Strangford, and is adorned with ſeveral handſome public buildings; the pariſh-church is lately rebuilt, and it has a ſeſſions-houſe, the dioceſe ſchool, and an alms-houſe for old and decayed Proteſtants, with an Engliſh ſchool for forty children, who are clothed and educated in the Proteſtant religion; the two laſt built and endowed by Edward Southwell, Eſq; principal ſecretary of ſtate for Ireland: an alms-houſe for three clergymen's widows, with good gardens, and twenty pounds per annum for each of them; a barrack for a troop of dragoons, and a large market-houſe. From this place the family of Dawny have the title of viſcount.

Here is a variety of fine proſpects from the ſouth branch of Strangford lake. Among the hills and many iſlands are flights of ſwans and other water-fowl, and the lake abounds with good ſalmon, mullets, and other ſea-fiſh. Over a branch of the lake, upon the road to Killeleagh and St. Field, is a handſome ſtone bridge of ſix arches. About a mile from the town is St. Patrick's well, to which, at certain ſeaſons of the year, many thouſand people reſort, ſome in expectation of receiving benefit from the water bleſſed by that ſaint, others to perform a penance enjoined by the Popiſh prieſts.

Strangford is a ſmall but ancient town, belonging to the earl of Kildare, ſeated on the river of Strangford, five miles from Down, and is ſo called from the great rapidity of the tides here, it being reckoned the ſtrongeſt current in Europe. It gives title of viſcount to the family of Smythe. The ſea runs here both at flood and ebb like a ſluice, at the rate of ſix knots, or miles, an hour. The lake is near four miles broad at a medium, and about ſeventeen long. It abounds with many kinds of excellent fiſh, as baſs, mullet, whitings, large ſea trouts, oyſters, lobſters, ſhrimps, &c. and there are great quantities of kelp burnt on the iſlands in the lake, and on the ſtony flat coaſts.

Bangor, a market town on Carrickfergus bay, ſix miles from Carrickfergus, is governed by a provoſt and twelve burgeſſes who elect the members of parliament. It is remarkable for a very old abbey, and the firſt church built of ſtone in the province of Ulſter, alſo for being the landing place of duke Schomberg, when ſent againſt the rebels in 1689. The town contains about two hundred houſes, has little trade, but ſpins conſiderable quantities of fine linen yarn. It has ſome noble ruins of an ancient abbey, and the walls of an old cuſtom-houſe.

Belvoir, a pleaſant ſeat of the honourable Arthur Hill, Eſq; three miles from Belfaſt. The avenue to it is large and handſome; the gardens adorned with regular canals, caſcades, ſlopes, and terraces: the kitchen garden is encloſed with eſpaliers; part of the garden lies over the Lagan river, and at a ſmall diſtance is a neat church.

Killeleagh is ſeated on an arm of the lake of Strangford, ten miles from Newtown, and is agreeably built upon a riſing ground, commanding a proſpect of part of the lake. The caſtle ſtands at the head of the ſtreet; and at the lower end is a little ſafe bay, where ſhips lie ſheltered from all winds. On one ſide is a ſmall river running under a ſtone bridge into the ſea. Adjoining to the caſtle are gardens and plantations. This borough is governed by a provoſt, who, with twelve burgeſſes, elect their repreſentatives in parliament. Here the linen manufacture has ſpread to advantage, and it is remarkable for its fine white thread. Here is a barrack for a troop of dragoons, a handſome church, and a good parſonage houſe. This town gave birth to that eminent naturaliſt and phyſician Sir Hans Sloane, preſident of the royal ſociety, and who may be juſtly termed the founder of the celebrated Muſeum in London.

Hillſborough, a market town, finely ſituated on a heathy gravelly ſoil, in view of the Maze courſe, and the town of Liſburn. The chief magiſtrate here is called ſovereign, who with twelve burgeſſes elect repreſentatives in parliament. Here are good gardens, and fine plantations, with the ruins of a noble houſe, deſtroyed by an accidental fire, belonging to the family of Hill, to which Hillſborough gives the title of Viſcount. The pariſh church is a ſpacious and well contrived building, ſeated on a riſing ground, near the riuns of an old manſion houſe.

Dromore takes its name from its ſituation, it ſignifying the back of a great hill. It ſtands twelve miles from Belfaſt, and is a market town, and the ſee of a biſhop, the cathedral of which was founded by St. Coleman, who flouriſhed in the ſixth century. Here is a decent church with a ſteeple, but it has no revenue for the ſupport of the cathedral ſervice; the miniſter of the pariſh, who is treaſurer of Dromore, diſcharging the duties of it. Here are two alms-houſes for clergymen's widows of the dioceſe, erected by the contributions of the biſhop and clergy. The dioceſe ſchool is kept here, and near it is an Engliſh proteſtant ſchool, where poor children are trained up in the proteſtant religion, and ſome of them ſet to work; twelve of them are cloathed at the expence of the pariſh. The river Lagan divides the town, at the eaſt end of which is a Daniſh mount, which is always green, and has its top encircled with a rampart, between eighty and ninety feet over, having a ſtrong battlement, and a ſpacious parapet. The trenches are between ten and twelve feet wide, terminating on a precipice, with two arms embracing a ſquare fort, about one hundred feet in diameter, whoſe rampart is forty feet high, with a large battlement; and from the Lagan water to the fortification, upon the eaſieſt aſcent at the precipice, is a covert way about two hundred and ſixty feet long, ſeven wide, and nine deep. In and near the town are many linen weavers.

The county of Armagh, or Ardmagh, is ſeparated in part from that of Down by the river Newry; it is bounded on the ſouth by Lowth; on the weſt by Tyrone and Monaghan; and on the north by Lough-Neagh, extending thirty-two miles in length, and ſeventeen in breadth; and is divided into five baronies. It ſends ſix members to parliament; two for the county; two for the city of Armagh; and two for the borough of Charlemont.

Armagh is ſeated near the river Kalin, thirty miles to the ſouth of Londonderry. It gives name to the county of Armagh, and is the ſee of an archbiſhop, who has the title

title of primate of all Ireland. It was a very ancient and conſiderable city, it being once the metropolis of the whole kingdom, yet is now a ſmall place, but has ſome good houſes, with a very ſpacious church ſeated on the top of a hill, and the ruins of a monaſtery, priory, and the archbiſhop's palace. The hill on which the church is ſeated, affords a view all round of a very delightful country.

The county of Monaghan is bounded on the north by Tyrone; on the ſouth by Cavan; on the ſouth-eaſt by Lowth and part of Eaſt-Meath: on the eaſt by Armagh; and on the weſt by Fermanagh. It is thirty-two miles in length from north-weſt to ſouth-eaſt; and thirty from eaſt to weſt. It abounds with hills, woods, and marſhes; is divided into five baronies; but ſends only four members to parliament, two for the county, and two for the town of Monaghan.

Monaghan, the county town, is a ſmall neat place, and has a ſeſſions houſe in which the aſſizes are held. Here are ſold conſiderable quantities of linen, and it has in other reſpects a pretty trade.

The county of Cavan is bounded on the north by Fermanagh; on the eaſt by part of Monaghan, Meath, and Lowth; on the ſouth by Longford and Weſt-Meath; and on the weſt by Leitrim; extending forty-ſeven miles from the ſouth-eaſt to the north-weſt, and twenty-five from eaſt to weſt in the broadeſt part. It is divided into ſeven baronies, and gives title of earl to the noble family of Lambert. It ſends ſix members to parliament, two for the county, two for Cavan, and two for Belturbet. It contains thirty-ſeven pariſhes, and about eight thouſand three hundred and twenty houſes. It has ſeveral pleaſant lakes, and much fenny paſture; but in other parts has a rich fertile ſoil, well planted and improved.

Belturbet is ſeated three miles from Lough-ern, and ſtands on the river of that name. It is a ſmall place, but has a conſiderable fair for linen cloth.

Cavan, the county town, ſtands ſeven miles from Belturbet, is larger than that town, but is a place of no great trade.

The county of Fermanagh is bounded on the north and north-eaſt by Tyrone; on the eaſt by Monaghan: on the ſouth by Cavan; on the ſouth-weſt by Leitrim; and on the north-weſt by Donegal; extending thirty-eight miles in length, and twenty-four in breadth. It is divided into eight baronies, in which there is not one market town, and but one borough, which is named Enniſkilling; ſo that it returns only four members to parliament.

This county is full of woods and bogs, a third part of it being filled with Lough-ern, the greateſt lake in all this part of Ireland, of which we have already given an account in deſcribing the lakes in general.

Enniſkilling is ſeated in the middle of the lake, where the waters are contracted into the breadth of an ordinary river, and thus continue for ſix miles. At this town is a ſtrong fort, it being a paſs of the greateſt importance, from the north part of Ireland to the ſouth; and is famous for its obſtinate defence againſt queen Elizabeth's army in 1595, and that of the proteſtants in 1689 againſt king James's forces.

The county of Tyrone, or Tir-Oen, is bounded on the north by Londonderry; on the eaſt by part of Antrim, from which it is divided by Lough-neagh; on the ſouth and ſouth-weſt by part of Fermanagh, Monaghan, and Armagh; and on the weſt by the river Liffer, which divides it from Donegal and part of Fermanagh. It is forty-ſix miles in length, and thirty-ſeven in breadth. Though great part of it is rough and mountainous, yet in other parts it is not inferior to many counties in the kingdom for the richneſs of its ſoil, and the goodneſs of its paſtures. It is divided into four baronies, which contain thirty pariſhes, about twelve thouſand ſix hundred and eighty houſes, and ſends ten members to parliament, two for the county, and two each for Dungannon, Strabane, Clogher, and Augher.

Lough-neagh, in this county, is about thirty miles in extent, full of fiſh, and the banks variegated with ſhady groves, meadows always verdant, and rich corn-fields, adorned with gentle hills and pleaſant brooks.

Clogher is a city and the ſee of a biſhop, ſeated in Lower Tyrone, founded by St. Patrick, and well endowed; but the town is ſmall, and much decayed.

Dungannon, which is reckoned the county town, is a place of ſome ſtrength, ſituated upon a hill ſeventy-two miles from Dublin, and has a conſiderable trade in linen and linen yarn.

The county of Antrim, which is the moſt northern part of all Ireland, is bounded by St. George's Channel on the eaſt; the county of Down on the ſouth-eaſt; part of Armagh on the ſouth; Londonderry on the weſt, from which it is ſeparated by the river Bann; and the Northern ocean on the north; extending forty-ſix miles in length, and twenty-ſeven in breadth. It gives title of earl and baron to the ancient family of Mac Donnel. It is ſubdivided into eight baronies, and contains fifty-ſix pariſhes, about eighteen thouſand one hundred houſes, and ſends ten members to parliament, two for the county, two for Liſburn, two for Belfaſt, two for Antrim, and two for Randalſtown.

The moſt remarkable curioſity in this county, and indeed, in all Ireland, is the Giants Cauſeway, a ſurprizing ſtructure of ſtones, extending a great way into the ſea, where the ſame work ſeems to have been begun on the oppoſite ſhore of Scotland. This ſtupendous cauſeway was ſuppoſed to be the work of the giants, undertaken in order to form a communication between Ireland and Scotland. Nor is it at all wonderful that ſuch a ſuppoſition ſhould obtain credit among the vulgar; ſince though it is a work far above human ſtrength, yet it has the greateſt appearance of art. The ſea cliffs are very high in the place where the cauſeway begins; and what is commonly called the cauſeway, is a low head extending from the foot of the cliffs, like a mole, into the ſea. This head, when conſidered attentively, ſeems a ſtupendous production of art; and Dr. Pococke, late biſhop of Oſſory, and fellow of the Royal Society, informs us that he meaſured the moſt weſterly point at high water, to the diſtance of three hundred and ſixty feet from the cliff; but was told that at low water, it extended ſixty feet farther upon a deſcent, till it was loſt in the ſea. Upon meaſuring the eaſtern point, he found it five hundred and forty feet from the cliff; and ſaw as much more of it as of the other, where it winds to the eaſt, and is like that loſt in the water.

The cauſeway is compoſed of pillars of all angular ſhapes, from three ſides to eight. The eaſtern point, where it joins the rock, terminates in a perpendicular cliff, formed by the upright ſides of pillars, ſome of which are, thirty-three feet four inches high. Each pillar conſiſts of ſeveral joints or ſtones, lying one upon another, from ſix inches to about a foot in thickneſs; and what is very ſurprizing, ſome of theſe joints are ſo convex that their prominences are nearly quarters of ſpheres, round each of which is a ledge which holds them together with the greateſt firmneſs, every ſtone being concave on the other ſide, and fitting in the exacteſt manner the convexity of the upper part of that beneath it. The pillars are from one to two feet in diameter, and generally conſiſt of about forty joints, moſt of which ſeparate very eaſily, and one may walk along upon the tops of the pillars, as far as the edge of the water.

But this is not the moſt ſingular part of this extraordinary curioſity, the cliffs themſelves being ſtill more ſurprizing. From the bottom, which is of black ſtone, to the height of about ſixty feet, they are divided at equal diſtances by ſtripes of a reddiſh ſtone, that reſembles a cement about four inches in thickneſs; upon this there is another ſtratum of the ſame black ſtone, with a ſtratum five inches thick of the red. Over this is another ſtratum ten feet thick, divided in the ſame manner; then a ſtratum of the red ſtone twenty feet deep, and above that a ſtratum of upright pillars: above theſe pillars lies another ſtratum of black ſtone twenty feet high; and, above this again, another ſtratum of upright pillars, riſing in ſome places to the tops of the cliffs, in others not ſo high, and in others again above it, where they are called the chimneys. The face of theſe cliffs extends about three Engliſh miles.

About

About a quarter of a mile to the ſouth-eaſt of the cauſeway, is ſeen what is called the Organs, compoſed of the ſame kind of pillars as thoſe we have already deſcribed. Notwithſtanding the great appearance of art, it is certain that all theſe are merely the work of nature, ſince if this cauſeway had been built by human beings, they muſt likewiſe have built not only theſe cliffs but alſo the rocks, which even at ſeveral miles diſtance from the ſea are formed in the ſame manner of convex and concave ſtones, nicely fitted to each other.

The principal towns in this county are the following:

Antrim is a conſiderable thriving market-town and corporation, thirteen miles to the weſt of Carrickfergus, and is pleaſantly ſeated on both ſides of what is called the Six-mile Water, over which is a handſome bridge. Here is a harbour for boats, and a ſtately manſion-houſe which belonged to the late lord viſcount Maſſareen, with a fine park.

Carrickfergus, or Knockfergus, is a rich and populous borough, ninety miles from Dublin, ſeated on a bay of its own name, where it has an excellent harbour, with a ſtrong caſtle on a high rock, and had an ancient palace converted into a magazine for arms. It is a fortified place walled round, and has ſome modern outworks. The town and liberties have the privilege of being a diſtinct county, yet the aſſizes and quarter-ſeſſions for the county of Antrim are kept there.

Belfaſt is ſeated at the bottom of the bay of Carrickfergus, three leagues from that town, and is the chief place of trade, as well as of beauty, in all this part of Ireland. It has a very long ſtone-bridge over the river, and ſhips come up the Cormoyl-road, which is a ſafe commodious harbour below the town, with good depth of water. There are here many rich merchants, and a very conſiderable trade from this part to Scotland, particularly to Glaſgow; the town and moſt of the adjacent county being inhabited by the Scots, who have their regular preſbyteries, kirk-ſeſſions, and other judicatures here as in Scotland, tho' not with equal authority.

The county of Londonderry, or Colerain, is bounded on the north by a part of Donegal and the Northern ocean; on the eaſt by Antrim, from which it is ſeparated by the river Bann; on the ſouth and ſouth-weſt by the county of Tyrone; and on the weſt by Donegal; extending thirty-ſix miles in length, and thirty in breadth. It is ſubdivided into four baronies, which contain thirty-eight pariſhes, about thirteen thouſand ſix hundred houſes, and ſends eight members to parliament, two for the county, and two for each of the towns of Londonderry, Colerain, and Newtown-Amivady.

It is a pretty champaign country, and very fruitful, its boggy and heathy ground being manured by ſhells brought from the ſea-coaſt. Its chief river is the Bann, which is remarkable for its beauty and clearneſs: it riſes out of the Mourne hills in the county of Down, and after loſing both itſelf and name for about thirty miles in the lake called Lough-neagh, recovers its name again at Tome-caſtle, from whence, being ſhaded with woods on both ſides, it paſſes to the ſea. There is a ſmaller river of the ſame name, and therefore this is called the Great Bann; though it is not very large.

This county, which was formerly wild and uncultivated, has been greatly improved by the citizens of London, to whom king James I. by letters patent, granted this county, with the city of Londonderry, and the town of Colerain by the name of 'The ſociety of the governor and aſſiſtants of London of the new plantation of Ulſter, in the realm of Ireland, in conſideration of their ſettling a colony there.'

Londonderry, the ſee of a biſhop, and the capital of the county, is ſeated on the weſt ſide of the river Foyl, one hundred and four miles north-weſt of Dublin, and is the center of trade for this part of the country, though its river is not ſo large as that at Colerain; but it has a much better port; for ſhips of the greateſt burthen go up without interruption; and though it is twenty miles up the river, very large ſhips ſail up even to the quay, where it is from four to five fathoms deep. It is a modern place, built by a company of London-Adventurers, in the reign of James I. and has three or four caſtles on the north bank of the river, beſides a fort, which lies below the town: it is likewiſe encompaſſed by a ſtrong wall; and beſides the above forts, there are ſome out-works. This city is not very large, but is handſomely built: the ſtreets are wide, well paved, and all the houſes of ſtone. The church is very large and well built, and king William III. cauſed a town-houſe to be erected for the inhabitants, in conſideration of their brave defence againſt his enemies. There are a great number of ſhipping belonging to the city; and the merchants not only carry on a great trade in the herring-fiſhery, but have a conſiderable ſhare in many other branches of foreign trade; eſpecially to the Weſt-Indies, for which they are very advantageouſly ſituated; for, being open to the Northern and Weſtern ocean, they are not expoſed to the dangers and delays which frequently attend a paſſage through the Channel. The city of Londonderry is inhabited entirely by Proteſtants.

This city has rendered itſelf remarkable by the bravery of its inhabitants in three ſieges, in each of which they were driven to the greateſt extremity; but obliged the enemy to retire. The laſt gallant defence was made againſt the French and Iriſh troops of king James II. from the ſeventh of December, 1688, to the laſt day of July 1689, which was the more remarkable from its being beſieged at a time when it was neither well fortified, nor had any garriſon, or ſtores of proviſion or ammunition, and when relief was ſo long coming from England that many died for want, beſides what were killed in defence of the town, in making ſallies. But while the people were reduced to the utmoſt diſtreſs by famine, two ſhips with proviſions bravely forced their way to the town, notwithſtanding a boom being laid acroſs the river and the fire of the enemy's cannon from ſeveral forts.

Colerain lies on the eaſt ſide of the mouth of the Great Bann, three leagues from Londonderry, and is a neat, handſome, populous, and walled town; and a place of good trade, particularly in that kind of linen called Coleraine; but the river, though of a long courſe, and bringing with it the water of all the rivers that diſcharge themſelves into the great Lough-neagh, being confined within a narrow channel, pours its waters out with ſuch a furious current, that the tide is hardly ſtrong enough to ſtem it, ſo as to promote its navigation: hence it is very difficult for veſſels to make their way in; nor can any ſhips of great burthen go in at all. Beſides the linen trade, it has a ſalmon-fiſhery, which is very beneficial. This town gives the title of baron to the family of Hanger.

The county of Donegal, or Tyrconnel, is bounded on the eaſt by the counties of Londonderry, Tyrone, and part of Fermanagh; on the ſouth by the bay of Donegal and Fermanagh; and on the weſt and north by the Atlantic and Northern oceans. It extends ſixty-four miles from the ſouth-eaſt to the north-weſt, and is ſubdivided into five baronies, in which are contained forty pariſhes, with about ten thouſand eight hundred houſes, and it ſends twelve members to parliament, two for the county, and two for each of the following towns; St. Johnſtown, Donegal, Ballyſhannon, Kilbeg, and Lifford.

Ballyſhannon is ſeated on a river that runs out of Lough-Ern into Donegal bay, where it has a harbour and a tolerable trade. It is pretty well inhabited, conſidering that this part of the country abounds with bogs and large lakes.

Donegal, from whence the county has its name, ſtands nine miles from Ballyſhannon, at the bottom of a ſpacious bay which has many good roads and harbours, but no trade; nor is there any thing conſiderable in the town itſelf. The harbour is ſpacious, but the entrance has ſuch dangerous ſhelves and rocks, that it is not ſafe to attempt entering without a pilot.

Lough-Swilly, into which runs a river of the ſame name near Letterkenny, a little market-town, is a ſalt-water lake that runs about twenty miles ſouth into the country; it is about five miles broad at the mouth, has an iſland called Inch, and abounds with fiſh. A thouſand ſail of ſhips may ride ſafe here for twenty miles together. There are many villages and gentlemens ſeats

I

on its banks, and yet it has no trade, there being only a few fiſhing-boats which reſort there to catch herrings and ſalmon, of which there is a prodigious plenty.

Lough-Dirg is famous for an iſland, in which is a cell where the popiſh friars uſed formerly to make their votaries believe St. Patrick had his purgatory; and that he obtained it from God by his prayers, in order to convince unbelievers of the immortality of the ſoul and future torments. It was anciently much frequented by people of the Romiſh church, as well foreigners as natives, who came thither in pilgrimage, to do penance, and perform religious ceremonies, though it was invented ſome ages after St. Patrick's death. Certain friars reſided on the iſland, who, after having made the pilgrims watch and faſt till their minds were prepared to receive any impreſſions, amuſed them with ſtories of the ſtrange apparitions they ſhould behold there, and ſhutting them up left them for ſome hours in the dark; and thus, when let out, their diſordered imaginations made them tell ſtrange ſtories of what they had ſeen and ſuffered. The cell was, however, demoliſhed in the year 1497, by the authority of pope Alexander VI; but was afterwards reſtored, and again viſited by pilgrims; but in the latter end of the reign of James I. ſome gentlemen being ſent by the government to ſearch into the affair, found that this pretended entrance into purgatory was only a little cell hewn out of a rock, ſo low that a tall man could but juſt ſtand upright in it, and of ſuch ſmall extent, that it could not contain more than ſix or eight perſons; but when the door was ſhut, was quite dark: upon which the lords juſtices baniſhed the friars, demoliſhed their houſes, and had the cell laid open.

CHAP. XXXII.

Of ICELAND and GREENLAND.

SECT. I.

Its Situation, Extent, Climate, Face of the Country, Minerals, Volcanos, and remarkable hot Springs: its Vegetables and Animals.

ICELAND, which received its name from its exceſſive coldneſs, and the great flakes of ice ſeen near it, is a large iſland in the Northern ocean, about four hundred and eighty miles diſtant from the coaſt of Norway, and four hundred to the northward of Scotland, lying between the eleventh and twenty-ſeventh degree of weſt longitude, and between the ſixty-third degree forty-five minutes and the ſixty-ſeventh degree of north latitude. It extends four hundred miles in length, and a hundred and fifty in breadth.

This iſland is ſeated ſo far to the north, that, during two months of the ſummer, the ſun never goes entirely below the horizon, one-half remaining above it from ten at night till two in the morning, when it riſes entirely; and about the winter ſolſtice, for two months, it never riſes wholly above the horizon, one-half of it being only to be ſeen from ten in the morning till two in the afternoon.

They have always a ſhort ſpring and autumn in Iceland before and after the ſummer ſeaſon. The cold is ſevere in winter, and the heat very intenſe in ſummer, on account of the length of the days, and there being no night to cool the air: but neither of them is inſupportable, at leaſt to the inhabitants, or the Norwegians and Danes. The air is alſo ſalubrious, and agrees very well with foreigners as well as the natives.

Iceland properly conſiſts of a prodigious range of mountains running from eaſt to weſt, on the declivities of which, and in the vallies lying between them, the inhabitants live. Several of theſe high mountains are always covered with ice and ſnow: but on others, ſeated near the coaſt, are plains covered with verdure, ſeveral miles in extent, that produce fine graſs. Though the country is ſo mountainous, there are roads paſſable for horſes in every part of the iſland, and even carriages were formerly uſed, but they are now laid aſide, on account of the trouble attending them; and every year ſome hundreds of pack horſes come over the mountains from the north to the trading places in the ſouth parts of the iſland, loaded with butter, woollen manufactures, &c. which are bartered for other commodities.

In the rocks of Iceland cryſtals are ſometimes found, many of which repreſent an object viewed through them double; but theſe are properly only a ſpecies of talc. There are likewiſe evident ſigns that the mountains contain iron, copper, and even ſilver ore, near which are found two kinds of agate, which will burn like a candle; a ſpecies of bitumen, black, ſhining, and pretty hard; with another ſort of black earth, that is ſtill harder, and breaks into thin diaphanous laminæ; this laſt is not inflammable, but vitrifies in the fire. In one part of the iſland ſulphur is dug out of the ground, but the ſulphur trade is now diſcontinued.

Though this iſland is ſeated ſo far to the north, earthquakes and volcanoes are more known than in many countries in much warmer climates: the former have ſeveral times laid the country deſolate, particularly in the years 1734, 1752, and 1755, when fiery eruptions broke out of the earth, and produced very fatal conſequences. Many of the ſnowy mountains have alſo gradually become volcanoes. Of theſe burning mountains Hecla is the beſt known, eſpecially to foreigners. It is in the ſouth-eaſt part of the iſland, not far from the ſea. This mountain has frequently ſent forth flames and a torrent of burning matter. The inhabitants formerly imagined, that this is the place where the ſouls of the damned are tormented. Its eruptions have been very frequent, eſpecially in 1693, when they were moſt dreadful, and occaſioned terrible devaſtations, the aſhes being thrown all round the iſland to the diſtance of a hundred and eighty Engliſh miles; but ſince that time it is ſaid that Hecla has been free from eruptions. This mountain takes up four hours to aſcend from its foot to the ſummit, and on the north-weſt ſide is a vaſt chaſm, reaching from the top almoſt to the bottom; and it is remarkable, that while flames and ignited matter iſſued from this chaſm, the huge maſſes of ice and ſnow, with which the other ſide was covered, were not melted, though the heat was ſo intenſe as to calcine large ſtones and other ſubſtances.

Notwithſtanding the eruptions of Hecla have been ſtopped for a conſiderable time, others have ſince broke out. The huge mountain of Crabla in particular began on the ſeventeenth of May, 1724, to eject, in a terrible manner, ſmoke, fire, cinders, and ſtones, which were followed by a fiery ſtream like fuſed metal. The lava continued to move ſlowly on, for about eight or nine miles, as far as the lake of Mynat, into which it diſcharged itſelf; but did not ceaſe till the end of September, 1729, when the eruptions of the mountain ſubſided. They were, however, ſoon followed by the eruption of three of the adjacent mountains; and it is a common obſervation among the inhabitants, that when the ice and ſnow are ſo accumulated on one of the mountains that formerly ejected fire, as to ſtop the clefts and chaſms, which were the ſpiracles whence proceeded ſmoke and flame, a new eruption is not far diſtant. In 1756 a mountain, named Cotligiau, which had twice before caſt forth fire and ſmoke, began again to flame.

It is alſo remarkable, that ſprings naturally warm, and even thoſe that are hot, are frequently found in Iceland, with others that have a mineral taſte. About mount Hecla are ſeveral ſmall baſons of warm water, which ſometimes emit a copious ſteam, though at others this vapour is not ſo viſible. Theſe hot ſprings are of three ſorts; ſome are a little more than tepid, ſo that a perſon may hold his hand in the water without any inconvenience: others are ſo hot as to riſe in ſmall bubbles, like water ſimmering over the fire; but in other the ebullition is ſo ſtrong as to force the waters up to a conſiderable height. The laſt ſort are obſerved to be either periodical or variable in their ebullitions; particularly in a diſtrict named Reyker-harbour, are three hot ſprings, about thirty fathoms diſtance from each other, which bubble up alternately; and this ebullition generally happens in each of them about three times in a quarter of an hour. Though theſe wells lie in a plain, they ſpring from a hard ſtony bottom, where two of them eject the water from the interſtices between the ſtones, about an ell in height; but in the bottom of the third is a round aperture, through which, in its turn, it throws the water five or ſix ells high. After this it ſubſides about two ells, and one may go down, during that interval, and take a ſurvey of this wonderful ſpring. Its ebullition has three gradations: during the firſt, the water riſes half way up the cavity; afterwards it fills to the top; and the third time ſhoots up to the above-mentioned height. When the water is ſubſiding it abſorbs any light ſubſtance, as a piece of wood; but at the return of the ebullition ejects even the heavy ſtones that are thrown into it.

Gyſer, a ſpring in the valley of Hacadel, riſes in a hollow rock at the foot of a mountain. Mr. Olave, who ſaw it in 1746, ſays the cavity is about twenty fathoms in circumference, and three in depth. There is a ſmall aperture at the bottom, though which the water generally riſes till it runs over the baſon: then follows a terrible noiſe like the diſcharge of ſmall arms, which ſhakes the very rock. After this noiſe has been repeated four or five times, the water, which is hot, emits a thick ſteam, like ſmoke, is violently agitated, and ſprings up to the height of ſixty fathoms, in ſuch quantities as to form ſeveral hot rivulets on every ſide of the rock. The riſing and violent agitation of the water ceaſes in ſix or ſeven minutes, and the cavity, or baſon, becomes empty. This aſtoniſhing phænomenon happens once a day, and is periodical, returning at a certain hour: but whether the agitations of this ſpring correſpond with the tides in the neighbouring ſea, has not been determined.

In ſeveral of theſe hot ſprings the inhabitants who live near them boil their victuals, only by hanging a pot, in which the fleſh is put in cold water, in the water of the ſpring: they alſo bathe in the rivulets that run from them, which, by degrees, become luke-warm, or are cooled by their being mixed with rivulets of cold water. The cows that drink of theſe ſprings are ſaid to yield an extraordinary quantity of milk; and it is likewiſe eſteemed very wholeſome when drank by the human ſpecies. The hot ſpring near Cryſevig emits a very ſtrong and fetid ſulphureous vapour; and ſome of theſe ſprings are ſaid to be ſo intenſely hot, as to calcine bones.

Salt ſprings are not known here; however, ſalt has been found at the foot of the burning mountains; and that ſalt might be made here by art is unqueſtionable, from the ſucceſs of former trials.

There are but few woods in the iſland, though here and there a ſmall wood is to be ſeen; but great numbers of large and ſmall trees are driven hither by the ſea, eſpecially on the north coaſt, where they generally lie and rot, the inhabitants having no ſhips to convey the wood for ſale to their countrymen. There are here a great quantity of ſhrubs, on which grow all ſorts of berries, as juniper, blackberries, &c. and theſe are burnt every year for charcoal, which is uſed by the natives in their forges. The common fuel of the country is turf, ſome of which has a very ſtrong ſulphureous ſmell, and in ſome parts of the iſland they even burn fiſh bones.

Very good graſs grows not only in the vallies, which border on the lakes and rivers, but alſo in the hollows between the mountains, and ſometimes on their ſummits. The fineſt paſtures are in the northern parts of the iſland, where the graſs ſprings up very faſt to a great height. The cattle are generally driven to graze among the mountains, where they find good paſture; but the graſs that grows near the habitations of the Icelanders is reſerved for winter fodder.

Here are alſo many ſalubrious and medicinal herbs, as ſcurvy-graſs, ſamphire, angelica, which is much uſed by the inhabitants, and berg-graſs, a kind of odoriferous moſs that is very nouriſhing, great quantities of which are laid up by the inhabitants for occaſional uſes. Hitherto few eſculent vegetables have been cultivated in Iceland; but as all kinds of culinary herbs thrive in the gardens at Beſſeſtader, and thoſe of the epiſcopal palaces, it is probable that, with proper culture, they would alſo grow in moſt parts of the iſland.

The inhabitants are entirely diſcouraged from purſuing agriculture, as they have not yet been able, in this ſoil, to bring any corn to maturity; yet ſome parts of the iſland are known, by ſeveral evident traces, to have been formerly cultivated.

Bread is but little known among the common people, for though a large quantity of meal and bread is annually imported into the harbours of Iceland, the lower claſs of people can purchaſe but little or none of it, on account of the price. They, however, make a kind of meal, and bread, of a ſort of wild barley, which grows there; and in times of ſcarcity have recourſe to a ſea vegetable, called in Latin *alga marina ſacrarifera*, which is dried before the fire, and ſold at half the price of dried fiſh. The cattle feed on this ſea-weed at low water, and prefer it to any other marine vegetables.

Bears are frequently driven on this iſland with the large flakes of ice from Greenland; but the inhabitants are ſo vigilant and dexterous in deſtroying them, that the only ſpecies of wild beaſts to be found in Iceland are foxes, ſome of which are brown and others white.

The horſes here, as in all other northern countries, are ſmall, but ſtrong and full of mettle, and, except thoſe broke for the ſaddle, lie in the open air all the year round. In winter they ſubſiſt only on what fodder they can ſcrape from under the ice and ſnow. Such horſes as the owners have no immediate occaſion for, are turned out among the mountains; and when wanted they go in queſt of them, every one knowing his own horſe by certain marks.

Great numbers of ſheep are to be ſeen in Iceland, and where the inhabitants are chiefly employed in grazing, it is not uncommon for a man to be maſter of a flock of four or five hundred of them. In the winter ſeaſon they drive their flocks to ſhelter at night, and in very ſevere weather alſo keep them under cover in the day-time. The grazing countries lie chiefly in the northern and eaſtern parts of the iſland; for the inhabitants of the ſouthern, being moſtly employed in fiſhing, leave their flocks abroad both in ſummer and winter. Nature, however, ſeems to have provided a ſhelter for them, there being large caves into which they are ſure to retire in ſevere weather. In winter, when the ſnow is not very deep, and the weather is inclinable to be fair and mild, the ſheep are turned out to pick what they can find under the ſnow: when if they happen to be ſurprized by its falling in a great quantity, they inſtantly form themſelves into a cloſe compact body, by laying their heads together in the center. In this poſture they are quite covered with the ſnow, and are ſometimes ſo benumbed with cold, as not to be able to help themſelves till their owner happening to find them, clear their way out. This is often a work of ſome days, and frequently the weight of the incumbent ſnow is ſo great, that they are cruſhed down by it, and killed before their maſters can come to their relief. When they paſs ſome days under the ſnow, the ſheep, in the extremity of hunger, have been known to eat one another's wool; but this is apt to diſorder them very much; on which account, when the inhabitants have any apprehenſions of bad weather, they take care to keep their flocks at home.

The wool of their ſheep is very coarſe; but a ſomewhat finer ſort lies under the other. Thoſe writers are miſtaken who obſerve, that all the ſheep in this iſland have

more

more than two horns: a few of them indeed have five, ſome have four horns, but they have generally only two. As for goats they have no great number of them. Some of the Iceland cows and oxen have no horns; and in the ſouthern parts they are fed with fiſh bones, and the water in which fiſh has been boiled. Here are no hogs. As to domeſtic animals, there are a ſufficient number of dogs, and but very few cats.

The keeping of poultry and all other tame fowl is ſo expenſive, that very few of them are to be ſeen here: but they have plenty of ſwans, wild geeſe, and ducks, among which may be reckoned the eider, the eggs and feathers of which are much valued. There are likewiſe ſnipes, woodcocks, and other wild-fowl. At certain times an incredible number of eggs of ſea-fowl, of which the inhabitants are very fond, are found along the ſea-coaſt.

The birds of prey are the eagle, hawk, raven, and falcon: ſome of the laſt are entirely white; others are partly of that colour, and others brown. In every diſtrict are certain falconers, who are alone empowered to catch falcons: theſe carry them to the king of Denmark's falconry at Beſſeſtader, where the king's falconer, who annually viſits that place, picks out the beſt. The governor of Iceland pays the falconers fifteen rix-dollars for every white falcon, ten for one that is partly white, and ſeven for every brown falcon that is choſen; beſides which the falconers receive a gratuity of five or ſix rix-dollars when they firſt bring them in.

The rivers, lakes, and bays, with the other parts of the ſea, ſupply the Icelanders with prodigious quantities of various kinds of fiſh.

SECT. II.

Of the Perſons, Food, Dreſs, Employments, Language, Religion, Government, and Trade of the Icelanders; the Diviſions of the Country, and Number of Inhabitants.

THE Icelanders are naturally of a robuſt and vigorous conſtitution; but are often worn out by the continual fatigues and hardſhips they undergo at ſea in their fiſheries; and when about fifty years of age become afflicted with various diſeaſes, eſpecially thoſe of the breaſt and lungs; whence few of them arrive at an advanced age. In caſe of ſickneſs they entirely reſign themſelves to nature and Providence, for there is not one phyſician or ſurgeon in the whole iſland. Indeed a few perſons keep medicines by them, with which they are ſupplied from Denmark; but they are not very well acquainted with their virtues, or the method of adminiſtering them.

The uſual food of the inhabitants is freſh and dried fiſh, milk, oat-meal, and fleſh; but they chiefly live on dried fiſh with butter. They eat all their proviſions without ſalt. Their common drink is milk, which, when ſweet, they drink by itſelf; but when it turns ſour, mix it with water. They are very fond of beer and ſpirituous liquors, and the moſt wealthy among them ſometimes purchaſe red and white French wines.

The Icelanders are wiſely contented with what apparel their own country furniſhes. The cloth which they wear is called wadmal; beſides which they alſo uſe a garment of cloſe linen. However, ſome of the gentry are fond of appearing in cloths and ſtuffs made in Denmark, though a ſtuff manufactory has lately been ſet up at Beſſeſtader. Their fiſhing-dreſs is made of untanned leather, which is kept pliable by being rubbed with the liver of fiſhes.

As they are obliged to buy their timber of the Daniſh company eſtabliſhed here, they build their houſes as cheap as poſſible; ſo that they are neither very commodious nor handſome.

The Icelanders are chiefly employed in fiſhing and grazing, and when they are not engaged in either of theſe, eſpecially in winter, both the men, women, and children knit woollen waiſtcoats, ſtockings, gloves, and the like; and alſo employ themſelves in weaving Iceland cloth. Their looms indeed are but very indifferent; but thoſe made in Denmark now begin to be introduced among them.

The Iceland language is the ſame with the old Norwegian, though it is not at preſent quite pure and uncorrupted. They are not wanting in mental endowments, which is evident from the learned men and ingenious artiſts this iſland has produced. Several of their authors have written very accurate and elegant diſſertations relating to the northern hiſtory. They even began to cultivate the ſtudy of letters ſo early as the year 1130.

The only religion tolerated in Iceland is the Lutheran. The churches of the eaſt, ſouth, and weſt quarters are under the juriſdiction of the biſhop of Skaalholt, and thoſe of the north quarter are ſubject to the biſhop of Hoolum. The biſhops of Iceland cultivate the eſtates annexed to their reſpective ſees, and their annual produce is about two thouſand rix-dollars; but out of theſe revenues a ſtated ſum is appropriated to the rectors and aſſiſtants of the ſchool, and the miniſters of the cathedral: beſides this, a certain number of ſcholars muſt be lodged and clothed, and alſo the biſhop's palace, &c. muſt be kept in good repair out of the ſame revenues; and after theſe deductions the remainder is the biſhop's income. Some of the preachers are liberally provided for; others but indifferently; and many of them very ſcantily: among the latter not a few of them are obliged to be ſatisfied with the poor pittance of four rix-dollars, which amounts to about eighteen ſhillings a year.

The ſecular government of this iſland under the king of Denmark, is lodged in the general governor of Iceland and Faroe, who uſually reſides at Copenhagen, and deputes under him a prefect, who lives in the king's palace at Beſſeſtader. Here is alſo a collector, who levies all the king's revenues in the iſland, and paſſes his accounts at the treaſury.

The revenues of Iceland ariſe, Firſt, from the farms of the ports or harbours, which annually amount to above ſixteen thouſand rix-dollars. Secondly, from the taxes and tithes, which according to the cuſtom of the country are accounted for in fiſhes, and farmed to private perſons. Thirdly, from the farmers of the ſequeſtered convents and crown lands. Fourthly, from the king's boats; and, fifthly, from the hundred and thirty-eight ells and a half, and ninety-two pair of ſtockings, delivered in annually by every diſtrict, called a ſyſſel, and likewiſe one hundred and ſeventy-two pounds of fiſh payable by ſome ſyſſels. There are eighteen of theſe ſyſſels or diſtricts in Iceland.

With reſpect to the diſtribution of juſtice, here are two ſuperior judges, one of whom preſides over the ſouth and eaſt quarters, and the other over the north and weſt; each of theſe has uſually under him a deputy or inferior judge. There are alſo twenty-one ſyſſelmen, who are a kind of inferior officers, who, beſides levying the king's revenue farmed in their reſpective ſyſſels, hold ſeveral courts of judicature to which belong certain diſtricts; but an appeal lies from theſe to a provincial court. Every ſuperior judge determines the cauſes belonging to his diſtrict, and has eight aſſiſtants. The ſupreme court on the iſland is under the prefect, aſſiſted by twelve ſuperior judges. But if the cauſe amount to a certain ſum, an appeal lies from this court to the ſupreme court at Copenhagen.

For the regulation of eccleſiaſtical affairs, here is a provoſt court conſiſting of the provoſt and two aſſiſtants. The next is a conſiſtory, which, as well as the others, is held at Oxera, for the dioceſe of Skaalholt, to which belongs one hundred and ſixty-three pariſhes. In this conſiſtory the prefect, as the repreſentative of the governor, ſits as preſident; the provoſt and miniſters, and even the biſhop himſelf, being only aſſiſtants. In the dioceſe of Hoolum, which contains one hundred and forty pariſhes, a conſiſtory is held in autumn at a ſeat called Flige Myre, where the prefect deputes another to repreſent him as preſident. From the conſiſtories an appeal lies to the ſupreme court at Copenhagen.

The capital puniſhments inflicted on male criminals in Iceland is beheading with an ax, and hanging to a wooden beam fixed in the cliff of a rock; but females who have forfeited their life are put in a ſack and then drowned.

With reſpect to the commerce of Iceland it muſt be obſerved, that the company that farms it was eſtabliſhed in 1733 by a royal charter, and ſtiled The Iceland Company of Copenhagen. This company ſends twenty-three ſhips every year, with their factors and ſub-factors, who viſit all the ports on the iſland. Theſe ports and harbours are divided into fleſh and fiſh ports; the former are but eight in number, and lie on the north and eaſt coaſts of the iſland; but the latter are fourteen, and theſe lie on the ſouth-weſt ſide. There are alſo ſome ports from which both fleſh and fiſh are exported. The natives either barter their commodities for thoſe of Denmark, or receive ready money from them in Daniſh crowns and dollars, in proportion to the land tax or rate ſettled by the king's ordinance. The cattle are delivered to the factors at the fleſh ports about the end of Auguſt, and in the fiſh ports they purchaſe all the ſound dried cod, ling, and train oil, according to a fixed rate.

Accounts are kept here, and all calculations made by fiſhes; a fiſh, which is properly two pounds of fiſh, being equal to a lub-ſchelling, and conſequently forty-eight fiſhes are equal to a ſpecie dollar worth about four ſhillings and ſixpence ſterling. Daniſh marks at eight ſub-ſchellings are ſometimes current here, and alſo, though ſeldom, ſome lub-ſchelling pieces. A quarter of a ſpecie dollar, equal to twelve fiſhes, is the ſmalleſt piece of money current in Iceland; ſo that any balance under this not being payable in money, is made up in fiſh and tobacco.

The exports from Iceland chiefly conſiſt in dried fiſh, ſalted mutton, a good deal of beef, butter, and train oil; a great quantity of tallow, coarſe and fine jackets of Iceland woollen cloth, woollen ſtockings and gloves, red wool, ſheep-ſkins and lamb-ſkins, fox tails of ſeveral colours, feathers, and quills. In 1751 the late king Frederick V. in order to enable the Icelanders to improve their manufactures, and to promote trade and commerce, beſtowed on them a bounty of ten thouſand rix-dollars, and lent them five thouſand more. The imports to Iceland are chiefly iron horſe-ſhoes, timber, meal, bread, wine, brandy, tobacco, coarſe linen, a few ſilk ſtuffs, and domeſtic utenſils.

Iceland, according to the general diviſion, conſiſts of four quarters, which derive their names from the four cardinal points towards which they lie: this diviſion is cauſed by ſo many branches of mountains that ſeparate the quarters from each other. Hence the middle of the iſland is not inhabited, the people living only in theſe valleys, which are between twenty and thirty miles broad, and are properly the ſyſſels, juſt mentioned, to which other ſmall valleys among the mountains, where good paſture are found, likewiſe belong. From theſe mountains ſeveral brooks and rivers, ſome of which are very conſiderable, run into the valleys, and afford excellent fiſh.

The number of the inhabitants of Iceland, according to an authentic computation, amounts to about fifty thouſand. Yet there are no towns of any conſequence, though there are a number of trading places at each harbour. The villages are compoſed of thirty, or forty, and ſometimes fifty ſmall dwellings, placed at a diſtance from each other.

SECT. III.

Of GROENLAND, *or* GREENLAND.

Its Situation, Climate, Vegetables, Animals; particularly of the Whale, Fin fiſh, Sea-Unicorn, Sword fiſh, the Morſe, and Seal.

IT is not yet determined to which part of the earth Greenland properly belongs; yet as it extends as far to the eaſt as the laſt mentioned iſland, and is even ſuppoſed to join Spitzberg, which is ſeated in thirty degrees eaſt longitude, it can no where be more properly placed than here. Its full extent and dimenſions are entirely unknown. The moſt ſoutherly part lies in the fifty-ninth degree fifty minutes north latitude, from whence the coaſt ſtretches to the north weſt beyond the ſeventy-eighth degree of north latitude, while the eaſtern coaſt reaches, according to the Daniſh writers, to the eighty-ſecond. The weſt coaſt was firſt diſcovered in 1585 by Mr. John Davis, an Engliſhman, from whom the ſtreights that run between the continent of North America and Greenland are called by his name.

On the eaſtern and ſouthern coaſt vaſt flakes of ice, which may properly be called iſlands, are ſeen, and theſe are driven from Spitzberg towards the ſouth by a very ſtrong current.

The eaſt ſide of Greenland, which is oppoſite to Iceland, is at preſent inacceſſible, on account of the mountains of ice, which riſe to an aſtoniſhing height, with which the ſea is covered: this part is therefore unknown; but ſailing between theſe and Iceland, ſeveral adventurers have ſafely arrived there; and this courſe the Dutch, in particular, have actually ſteered.

The weſt ſide of Greenland towards Davis's Streights is, however, better known. On that ſide the coaſt is defended by rocks and ſeveral large and ſmall iſlands. It has alſo wide and deep bays, which run a great way into the land, ſome of which are the mouths of large rivers, and others form good roads and harbours. The main-land conſiſts of little more than confuſed heaps of rocks, the ſummits of which are always covered with ice and ſnow; as are alſo ſome of the valleys.

The climate as far as the Daniſh colonies have penetrated is not inſupportable; but the weather is very changeable and unſettled. During the ſummer ſeaſon, which laſts from the end of May to the middle of September, the ſun ſhines bright and very warm, and on the main-land, above which no cloud can be ſeen, the weather is very pleaſant and always clear: but a cold damp fog that intercepts the ſun-beams continually hovers over the iſlands, except in the month of Auguſt, which is the only time in the whole year when the vapours are diſſolved. The rains that fall here are neither frequent nor heavy. In this climate it ſeldom thunders, and ſtorms, which are very rare, are of no long continuance; but the moſt violent guſts of wind come from the ſouth. The winters, as far as the ſixty-fourth degree of latitude, are generally reckoned by the Danes and Norwegians pretty temperate, to which the calm and clear weather may greatly contribute. But when a north-eaſt wind blows, which comes from mountains covered with ice and ſnow, it is extremely ſevere; the air being thick and filled with clouds of icy particles, which cauſe a moſt piercing froſt. The ſnow falls in leſs quantities in that part of Greenland known to the Danes, than it does in Norway; for in the former, eſpecially near the rivers in the inland parts, the ſnow does not exceed half an ell in depth.

This account of the weather is true only of the ſouthern parts of this country ſubject to the Danes; for to the northward of the ſixty-eighth degree of latitude, the cold is in winter ſo exceſſive, that the moſt ſpirituous liquors, as French brandy, will freeze near the fire-ſide. As the weather is in this climate very calm, the ice in the bays between the iſlands is not diſturbed till the end of Auguſt; and even in the creeks it does not begin to thaw till the cloſe of May, when it is gradually waſhed away by the agitation of the waves. From June to Auguſt the ſun is continually above the horizon, and conſequently during that term they have no night; but in winter the ſun is inviſible to the Greenlanders, and their day is nothing more than the morning and evening twilight, which do not laſt above two hours.

In the valleys and plains the ſoil conſiſts of moor and turf-land, and in ſome few ſpots, particularly in the ſouth parts, in about ſixty-one degrees of latitude, grow fine graſs, with yellow flowers, the roots of which ſmell in the ſpring like roſes, angelica, ſcurvy-graſs, wild roſemary, and ſome good eſculent herbs. Indeed that part of the county which lies between the ſixtieth and ſixty-fourth degree of latitude has the beſt ſoil; ſo that in ſome places cabbages and turneps thrive very well, and the latter are remarkably ſweet. There is not a tree of any kind to be ſeen in the country, except on the ſides of a bay, ſixty Norway miles to the ſouth of Hope-colony, where a little coppice of birch trees grow; but their trunks

trunks are no thicker than a man's leg. Some ſhrubs are diſperſed here and there; as ſmall juniper, gooſeberry and bilberry buſhes, brambles, &c.

No trial has yet been made of what minerals are contained in the Greenland mountains. There are, however, rocks of aſbeſtos, from which conſiderable quantities have been hewn. Some mountains alſo conſiſt of an imperfect kind of variegated marble, of which the inhabitants make kettles and other utenſils.

On the main land are found ſome hares; but theſe, which are very ſmall, are grey in ſummer, and perfectly white in winter. Here is alſo a ſpecies of rein-deer; but they are very different from thoſe of Lapland. The foxes are white, brown, and grey; but are ſmall. White bears are ſometimes found here, and towards the north are very numerous; theſe differ from the bears of other countries, their heads being long like that of a wolf, which they much reſemble in form; but the Greenlanders are very daring and active in deſtroying them.

The only domeſtic animals found here are dogs that never bark, but ſnarl and howl: they are timorous and unfit for the chace; yet if not tamed when young, become wild and very miſchievous. The Greenlanders kill and eat theſe dogs, and alſo often uſe them to draw their ſledges, yoking four, ſix, and ſometimes eight or ten to a ſledge, loaden with five or ſix of the largeſt ſeals, with the maſter ſitting upon them, who drives as faſt with them as we can do with good horſes, for they often travel ſixty miles in a winter day upon the ice. Neither ſnakes nor any other venomous creatures can live in this climate; nor are they plagued with beetles, rats, mice, or the like.

The land-fowl in this country are the ryper, a ſort of large parrot, which is grey in ſummer and white in winter; but builds his neſt very high in the cliſts of the rocks; with eagles, falcons, large ſpeckled owls, ravens, different ſorts of ſparrows, and, in ſhort, all the kinds of land and ſea-fowl known in Norway are ſeen here in amazing numbers. Among the inſects the moſchettos, or gnats, ſwarm in this country, and are extremely troubleſome; but they have neither ants nor bees.

The freſh water in Greenland has been highly recommended for its ſalubrity and palatableneſs. The rivers afford plenty of trout, cray-fiſh, and ſalmon; and the ſea yields an inexhauſtible variety of all kinds of fiſh, except oyſters; but it abounds with excellent muſcles, and very large ſhrimps, or prawns. The ſmaller ſpecies of fiſh are dried here for winter ſtore, eſpecially the lodden, a ſort of ſmall herring. Here are alſo great plenty of cod, haddock, thornbacks, and the holybutt, by ſome called the turbot of the North, which is ſo big that it will fill a large caſk.

The Greenland ſea, and other parts of the Northern ocean that lie under the north pole, contain a very great number of the largeſt ſpecies of fiſhes, which there ſwim in vaſt ſhoals. In theſe regions the great Creator has dealt out their food with a liberal hand, and of all climates this is the beſt adapted to their hot conſtitutions and enormous bodies, which are, as it were, encloſed in fat. This ſpecies of fiſh differ from all other kinds in many particulars; for in their internal parts they reſemble land animals. They breathe with lungs, and conſequently cannot remain long under water. They alſo copulate like quadrupedes, bring forth their young alive, and ſuckle them with their milk. The fins of other fiſh conſiſt of bones, or cartilages, faſtened together by thin membranes running between them; but the whale has articular bones, like the fingers of a human hand, with their proper ligaments covered with a thick ſkin like that of the other parts of its body. By means of this mechaniſm the whale can move and turn about with greater eaſe than he could with fins of the common form, and ſecure himſelf from falling precipitately upon the rocks when he dives to the bottom of the ſea; for which end he lays his thick tail horizontally on the ſurface of the water, which is of great ſervice to him in this motion.

The whales are of ſeveral kinds, and may be divided into ſuch as have apertures in the head, and ſuch as have noſtrils for reſpiration. Some of the former have two holes or apertures; as the whale properly ſo called, the fin-fiſh, &c. others have only one, as the cachellotte, or ſpermaceti whale: but thoſe that reſpire through the noſtrils are ſeldom to be met with. This ſpecies may alſo be divided into thoſe that have plain, and thoſe that have prominent backs.

The Greenland whale with a flat back is thick and unwieldy, its head taking up one-third part of its bulk. Theſe are from ſixty to ſeventy feet in length, the fins on their ſides from five to eight feet, and the tail, which is in a horizontal poſition, or bent a little upwards on both ſides, is from three to four fathoms broad. When the whale is in danger, he turns upon his ſide and brandiſhes his tail, which it is dangerous to approach: the tail alſo ſerves him for an oar, with which he rows himſelf forward with ſurprizing ſwiftneſs. The ſkin of the back is black and ſmooth, but in ſome places variegated or marbled. Next to the ſkin, which is not thicker than ſtrong writing-paper, or thin parchment, is the rind, which is near an inch thick; and between this and the fleſh lies the fat, to the thickneſs of nine, and ſometimes twelve inches. Under the fat is the fleſh, which is dry and very red. In its upper jaw on both ſides are the ſpicula, or whale-bone, which ſerves him for teeth; and the largeſt of theſe, which are placed in the middle, are ſeven or eight feet in length, and ſometimes more. On each ſide are generally two hundred and fifty of theſe ſpicula; ſo that they amount in all to five hundred. The tongue is very fat, and ſo large that it fills ſeveral caſks. The eyes of the whale, which are no bigger than thoſe of an ox, are in the hind part of the head, where it is broadeſt, and are defended by eye-lids and eye-brows. This fiſh is very quick of hearing, though it has no external ears, and has only a black ſpot under the upper ſkin behind the eye, and under that ſpot a narrow duct, which ſeems to convey the ſound to the tympanum, or drum. They generally bring forth only one at a birth, though they have ſometimes two, and their milk is like that of a cow. Their uſual food is a ſmall, black, round inſect, of about the ſize of a horſe-bean, which abound in theſe ſeas, and of which the whale ſucks in prodigious ſwarms with his vaſt mouth, and afterwards grinds them with his ſpicula. The nord-caper, ſo called from the vaſt number of them ſeen about the North Cape in Norway, is much ſlenderer and ſmaller.

The fin-fiſh equals the whale in length, but not in thickneſs, and has a fin on his back, from whence he receives his name. He throws water higher than a whale of his ſize; has brown lips, which are twiſted like a rope; and his body in colour much reſembles a tench. He is extremely nimble, as well as ſtrong.

The narval, or ſea-unicorn, is chiefly remarkable for its long horn, which reſembles ivory, but is generally more ſolid and ponderous. This fiſh is ſmooth like an eel, its colour white, ſprinkled with black ſpots, and its eyes ſmall. It has two fleſhy fins, and a ſemi-circular hole on the top of its head, from whence it ſpouts water, like a whale. The horn, from which it receives its name, grows ſtraight forwards from the middle of its upper jaw, is curiouſly wreathed, and terminates in a point. With this it attacks the largeſt whale, and can ſtrike with ſuch violence as to pierce the ſide of a ſhip. The horn of this fiſh has a place in the cabinets of the curious, where it has been ſhewn for that of the unicorn.

The ſword-fiſh, ſo called from their ſharp pointed upper jaw, which reſembles a ſword, purſues the whale and fin-fiſh with great eagerneſs. They are of a ſlender form, of various ſizes, from three to twenty feet in length, and their eyes ſtand far out of their head. A few of them will diſpatch a large whale, and when they have killed him they feed chiefly on his tongue.

Among the amphibious animals are the morſe and the ſeal. The morſe is as large as an ox, with four feet, a thick round head, and a ſhort neck, in which lies his principal ſtrength. He has red eyes, ſmall ears, and large noſtrils, from whence he ſpouts water. His ſkin is very thick, and covered with hair, and from his upper jaw proceed two long teeth, as white as ſnow, and more eſteemed than ivory, as they keep their colour better.

This creature is very bold, making towards the boat as ſoon as attacked, and endeavouring to overſet it.

The ſeals are of the ſize of a large dog, and are moſtly black, but ſome grey, with very fine ſmooth hairy ſkins. The old ones make a noiſe like the howling of dogs, and the young ones like the bleating of lambs. Their head and body are ſhaped much like thoſe of a dog, whence they are by ſome called ſea-dogs. Theſe are the moſt ſerviceable of all animals to the Greenlanders, for their fleſh ſerves them for food, and the ſkin for clothing and for making their boats: of its entrails and membranes they alſo make ſails and windows; its ligaments ſerve them for thread and cords; and of the bones they make all kinds of domeſtic utenſils and implements of hunting.

SECT. IV.

Of the Perſons, Language, Dreſs, Houſes, Furniture, and Boats of the Greenlanders; their Method of catching Whales, Seals, and Salmon; their Manners, Cuſtoms, Religion and Trade.

THE Greenlanders of both ſexes are generally ſhort, but fat, plump, and well proportioned. Their faces are ſomething flat, their hair black and lank, and their complexion of a browniſh red. They are ſtrangers to the ſmall-pox, and are ſeldom afflicted with epidemical diſeaſes; but the ſcurvy is the reigning diſtemper, and on this occaſion their common remedy is ſcurvy-graſs and other ſimples. They have neither ſurgeon nor phyſician among them; but readily rely on certain impoſtors who pretend to foretel future events, and to be ſkilled in phyſic. They have ſome inſtances among them of longevity, and theſe perhaps would be more frequent did not their manner of life expoſe them to numberleſs dangers.

Their language has ſomething very ſingular in it, and is difficult to be learned, yet it is ſaid to have many elegant phraſes. Mr. Egede has publiſhed a dictionary of it, and for the inſtruction of the Greenlanders, the four Goſpels, with ſeveral ſmall tracts, have been tranſlated into the Greenland tongue, and printed at Copenhagen. The Greenland dialect is moſtly the ſame throughout the whole country known to the Danes, except ſome little difference in the pronunciation. The women have alſo a particular manner of pronouncing their words, which generally terminate in an *n*.

Their clothing is made of the ſkins of their deer, the dog-fiſh, and of certain birds, ſewed together with the ſmall guts of the dog-fiſh. There is very little difference between the dreſs of the two ſexes.

The men's dreſs conſiſts of a coat or jacket, with a cap or hood ſewed to it, that covers the head and ſhoulders. This coat reaches down to the knees. Their breeches are very ſmall, and ſit cloſe; they wear no linen, and the hair of the ſkins the coat is made of, is turned inward, to keep them warm. Over this coat they put a large frock made of ſeal-ſkins, dreſſed and tanned without the hair, in ſuch a manner as to keep out the water. Between the leathern frock and the under coat they wear a linen ſhirt, or for want of linen, one made of ſeals guts, which alſo helps to keep out the water from the under coat. Thoſe ſeated near the ports frequented by the Danes and Dutch, have ſhirts of ſtriped linen, with coats and breeches made of red and blue ſtuffs, which they buy of the Daniſh or Dutch merchants, but after their own faſhion, and theſe they wear upon extraordinary occaſions. They formerly wore ſtockings made of rein-deer or ſeal-ſkins; but now they have worſted ſtockings of different colours, as white, blue, and red, which they buy of the Danes: their ſhoes and boots are made of ſeal-ſkins well dreſſed or tanned.

The women's coats are higher on the ſhoulders, and wider than the men's, with higher and larger hoods. The married women who have children have much larger coats than the reſt, on account of their carrying their children in them upon their backs, for theſe are their only ſwaddling cloaths and cradle. They wear drawers, which reach to the middle of their thigh, and over them breeches. The drawers they keep on day and night; but the breeches, which come down to the knee, they only wear when they go abroad in winter, and as ſoon as they come home pull them off. Next to their body they wear a waiſtcoat made of a young fawn's ſkin, with the hairy ſide inward. The coat, or upper garment, is ſometimes made of fine coloured ſwan-ſkins trimmed and edged with white, neatly wrought in the ſeams and about the edges, which look very well. Their ſhoes and boots, with little difference, are like thoſe of the men.

Their hair, which is very long and thick, is braided, and tied up in a knot, which becomes them; they commonly go bare-headed, both without and within doors; and in theſe ſouthern parts ſeldom wear their hoods except it rains or ſnows. Their chief finery conſiſts in wearing glaſs beads of ſeveral colours, corals about their neck and arms, and pendants in their ears; ſome of them alſo wear bracelets of black ſkin ſet with pearls, with which they adorn their cloaths and even their ſhoes. The Greenland women have likewiſe another more extraordinary kind of embelliſhment: they make black ſtreaks between their eyes, on their forehead, upon the chin, arms and hands, by paſſing under the ſkin a needle and thread made black. Hideous as this renders them in the eyes of ſtrangers, they think it extremely ornamental, and ſay, that thoſe who do not thus adorn their faces, will have their heads turned into train oil tubs, that ſhall be placed under the lamps that burn in the land of ſouls.

They have two ſorts of habitations, one of which ſerves for the winter, and the other for the ſummer ſeaſon. The winter dwellings are the largeſt. Theſe are dug deep in the earth, and raiſed a little above the ſurface of the ground with ſtone and turf. In this hut the windows are on one ſide made of ſeals-guts dreſſed and ſewed together, or the maws of holy-butts, which are white and tranſparent. On the other ſide the beds are placed, which conſiſt of benches made with boards, raiſed half a yard from the ground. Their bedding conſiſts of the ſkins of ſeals and rein-deer. On the hearth is a great lamp in the form of a half moon, and over it are hung their kettles formed of a kind of marble, or, where they have the advantages of trade, of braſs or copper, in which they boil their proviſions. The entrance is dug narrow and winding under ground, and the door ſo very low, that they muſt creep on their hands and feet to get in, which is ſo contrived in order to keep out the cold. The inſide is lined with ſeal-ſkins. Some of theſe houſes are ſo large as to afford lodging for ſeven or eight families. Upon the benches where their beds are placed, is the ſeat of the women, who employ their time in ſewing and making up cloaths, while the men belonging to the family, or ſtrangers, ſit on the oppoſite ſide under the windows, upon benches placed there for that purpoſe. It is obſervable, that though in one of theſe houſes there are ten or twenty lamps of train oil kept conſtantly burning, their ſmoke is not perceived to fill the room; which is probably owing to the care they take to prevent it. Dry moſs rubbed very ſmall is laid on one ſide of the lamp, which being lighted, burns ſoftly, and if not laid on too thick does not cauſe any ſmoke. This fire gives ſuch a heat that it not only ſerves to boil their victuals, but alſo heats their rooms to that degree, that they are as hot as a bagnio; however, to thoſe who are not uſed to this method, the ſmell of the houſe is very diſagreeable, as well from the number of burning lamps, all ſupplied with train oil, as from various ſorts of raw meat, fiſh, and fat, heaped up in theſe habitations; but eſpecially their urine tubs ſmell inſufferably.

They betake themſelves to theſe winter retreats in October, and continue in them till the beginning of May. All the warm part of the year they lodge in tents, which are their ſummer habitations. Theſe are made of poles ſet in a circular form, bending to a point at the top, in the form of a ſugar-loaf, fenced by a double cover, the innermoſt of which is of the ſkins of ſeals or rein-deer, with the hairy ſide inward; and the outermoſt of the ſame ſkins, but without hair, and dreſſed with fat, that they may not be penetrated by the rain. In theſe tents they have their beds, lamps to dreſs meat, and a curtain made

made of the guts of ſeals ſewed together, through which they receive the day-light, inſtead of windows. Every maſter of a family has one of theſe tents.

They uſually eat when they are hungry, but their chief meal is at night: their common food is the fleſh of rein-deer and hares; all kinds of land and water fowl; ſeals; ſeveral ſorts of freſh water and ſea-fiſh; and even ſome parts of the whale. Their manner of dreſſing and eating of their victuals is indeed extremely diſguſtful. They are ſaid to prefer the blood of the ſeal to any other drink; but they uſually quench their thirſt with water, yet can drink a great deal of brandy, without being intoxicated.

In their marriages the chief qualifications required in the bride are ſkill in domeſtic affairs, and eſpecially in cutting out and ſewing their garments. On the other hand, nothing recommends a ſuitor more than boldneſs, activity, and ſucceſs, in fiſhing and hunting. But at the marriage feſtivities the bride puts on a ſhew of gravity, and a melancholy air. Here relations never intermarry, even to the third or fourth degree of conſanguinity. They have a reſpectful idea of marriage, and in general every Greenlander has but one wife. They are fond of their children, even to a culpable exceſs; and, inſtead of moderate correction, or checking them for their faults, let them do whatever they pleaſe.

The men are chiefly employed in hunting and fiſhing, for which they have very curious tackle. The boats in which the men row out to ſea are about ſix yards long, and only three quarters of an ell broad in the middle, ending in a very ſharp point at both extremities. They are made of very thin narrow boards faſtened together with whale-bone, and covered with ſeals-ſkins. Only one man goes out in theſe boats, the top of which is covered with ſkin, with only an opening in the middle, which, when the man has entered, is faſtened cloſe round his waiſt; ſo that no water can enter the boat; and thus equipped he will row ſixty or ſeventy miles a day, though he has but one oar, which is ſix or ſeven feet long, and flat at both ends. Theſe boats are eaſily overſet, which they look upon as no great damage if the owner eſcapes with his life. The larger ſorts of boats are uſed chiefly by women. They have alſo a kind of open barges, which are likewiſe pointed at both ends; but are not very deep: theſe are covered with ſeal-ſkins, and are high at the extremities. They make uſe of them in conveying their effects in their emigrations, or when they embark for the whale-fiſhery, and in coaſting from one part to another.

The Greenlanders are more frequently employed at ſea than on ſhore. When they go to catch whales they put on their beſt apparel, fancying that if they were not neatly dreſſed, the whale would ſhun them. Upon theſe occaſions about fifty perſons, men and women, ſet out together in one of the large boats. When they have found the whale they ſtrike him with their harpoons, to which are faſtened lines or ſtraps two or three fathoms long, made of ſeal-ſkins; at the end of which they tye a bag of a whole ſeal-ſkin filled with air like a bladder, that the whale, when he finds himſelf wounded and flies away with the harpoon ſticking in his body, may be the ſooner tired and eaſily found, the air-bag hindering him from keeping long under water. When he loſes ſtrength they attack him with ſpears and lances till he is killed, and then put on their coats made of dreſſed ſeal-ſkin, with boots, gloves, and caps, laced ſo tight together that no water can penetrate them. In this garb they leap into the ſea, and begin to ſlice off the fat all round the body, and are ſometimes ſo daring as to get upon the whale's back, while he is yet alive, in order to make the quicker diſpatch in killing him, and cutting away the fat.

They uſe much the ſame method in killing the ſeals, only the harpoon is leſs, to which is faſtened a line of ſeal-ſkin, ſix or ſeven fathoms long, and at the end of it a bag of ſeal-ſkin filled with air, to keep the ſeal when wounded from eſcaping by diving: but in the northern parts, where the ſea is frozen, they uſe other methods in catching of ſeals. They firſt look out for the holes, which the ſeals themſelves make with their claws, of about the bigneſs of a halfpenny, that they may fetch their breath. On their finding one of theſe holes, they ſeat themſelves near it; and as ſoon as they perceive the ſeal put his ſnout to it for air, immediately ſtrike him with a ſmall harpoon, which they have ready in their hand; to which is faſtened a ſtrap of a fathom long, which they hold in the other hand. After he is ſtruck and cannot eſcape, they cut the hole large enough to get him up through it; and as ſoon as they have got his head above the ice, kill him, and then lift him out.

They have alſo another way of catching ſeals: they make a great hole in the ice; or, in ſpring, find holes made by the ſeals themſelves, through which they get upon the ice, in order to lie and baſk themſelves in the ſun. Near theſe holes they place a low bench, upon which they lie down on their belly, having firſt made a ſmall hole near the large one, through which they ſoftly let down a pole headed with a harpoon, a ſtrap being faſtened to it, which one holds in his hand, while another, lying upon the bench with his face downwards, watches the coming of the ſeal; which when he perceives, he cries Ke, upon which he who holds the pole ſtrikes the ſeal.

They have another method in the ſpring when the ſeals lie upon the ice, near holes which themſelves make to get up and down; the Greenlanders, diſguiſed in ſeal-ſkins, with a long pole in their hands, move their heads forwards and backwards, and ſnort like a ſeal, till they come ſo near him, that they reach him with a pole and ſtrike him.

As their fiſhing is the principal concern of theſe people, we are from thence enabled to judge of their characters and capacities. This is of the utmoſt importance to them, ſince on their ability in hunting and fiſhing depends their whole ſubſiſtence. In fiſhing they make uſe of hooks of iron or bones, their lines are made of whale-bone cut very ſmall and thin, and with this tackle they catch abundance of fiſh. Their way of fiſhing for ſmall ſalmon, or ſea-trout, is as follows: at low water they build ſmall encloſures of ſtone, near a river's mouth, or any other place where the ſalmon comes: when the tide comes in, the ſalmon, which enter the river, paſſes at high water over the encloſure, and remains in the river till the water falls again, when they endeavour to return to the ſea; but the fiſhermen waylay them at the encloſure, and ſtop their paſſage till the time of low ebb, when the ſalmon are left on dry land, and may be caught with the hand: if they are left in holes, they take them with a pole headed with two ſharp hooked bones, or iron hooks.

The Greenlanders are ſtrangers to trades, arts, and ſciences. They have no traffic one among another, and their commerce with foreigners is very inconſiderable. They neither uſe nor have any knowledge of money; but fix a certain value on iron.

When the Greenlanders meet together they expreſs their mirth by drumming, ſinging, and dancing. They are accuſtomed from their very childhood to an unbounded liberty, all of them being on a level. They have indeed little regard to the forms of ceremony and decorum which in other places obtain the name of politeneſs; yet are free, open, and chearful in converſation, nothing pleaſing them better than merry jeſts and raillery. They live very ſociably, and repoſe great confidence in each other. Amorous intrigues of an unlawful kind are ſeldom or never heard of among them; and as they abſtain from theft, rapine, and violence, among themſelves, they are never known upon any pretence to make war on their neighbours. They think themſelves greatly ſuperior to the Danes, and make no ſcruple to pilfer any thing from them, when it can be done with ſafety; but it is probable they have little idea of property; and as they behave with ſuch integrity to each other, it is natural to ſuppoſe that they have learned this pilfering of the Dutch and Daniſh ſeamen. They exerciſe great hoſpitality, and indeed have moſt things in common; ſo that if there be any among them who cannot work, or get his livelihood, they do not let him ſtarve, but admit him freely to their table. They are remarkable for their good-nature and inoffenſive behaviour: hatred and envy, ſtrife and rage, are rarely heard of among them. They have as great an abhorrence

rence of ſtealing from each other, as any nation upon earth, and therefore keep nothing under lock and key; but leave all ſo free that every body may come at it without any fear of loſing it.

They are, however, charged with having no idea of a God, and ſome authors have ſaid that their language has not any expreſſion to denote a Supreme Being; though they themſelves acknowledge, that they are convinced of the immortality of the ſoul, and believe that as ſoon as a perſon dies he goes to the land of ſpirits, and there enjoys the felicity of hunting from age to age; while the body remains behind and moulders in the duſt.

They maintain that there is a ſpirit which they call Torngarſuk, to whom they aſcribe a ſupernatural power, though not the creation of the world. The Angakuts, or prophets, form very whimſical ideas of this being, ſome repreſenting him as without form or ſhape, others giving him that of a bear, and others pretending that he has a large body and but one arm. They aſſign him his abode in the lower regions of the earth, where they tell you is conſtantly fine ſun-ſhine weather, good water, deer, and fowls in abundance. They likewiſe maintain that a ſpirit reſides in the air, whom they name the Moderator, or Reſtrainer; for theſe Angakuts pretend, by his order, to command the people to abſtain from certain things, as preſervatives from evil and danger. They alſo believe that there are ſpirits who govern the elements.

Their notions of the heavenly bodies are alſo very whimſical; they ſay the moon was once a young man, and the ſun a young woman his ſiſter, with whom he was familiar in the dark; but that ſhe being deſirous to find out her lover, rubbed her hands with ſoot, with which ſhe marked his white bear-ſkin coat, and hence they ſay came the ſpots in the moon. The ſun flying from his embraces, aſcended the air, whither the moon followed her, and ſtill continues to purſue, without being able to overtake her; but this is probably only a fiction of their poets, like thoſe of Ovid in his Metamorphoſes, who alſo repreſents the loves of Diana and Endymion.

They do not compute or meaſure their time by weeks or years, but only by months, beginning their computation from the ſun's firſt riſing above their horizon in the winter, from whence they tell the moons, in order to know exactly the ſeaſon in which every ſort of fiſh, ſea-animals, or birds, ſeek the land, that by this knowledge they may regulate their different employments. According to their aſtronomical ſyſtem, the heavens turn around the point of a huge rock.

What ſeems moſt extraordinary in theſe people, thus ſeated in frozen regions, which might be ſuppoſed to damp the genius and extinguiſh the fire of imagination, is their talent for poetry, in which they take extreme delight. The poems they compoſe are a kind of lyric odes, the harmony of which depends both upon rhyme and quantity, there being a viſible regularity in the number of ſyllables of which their verſes are compoſed, and a plain regard to cadence even in their manner of reading them. They uſe this ſort of poetry, which, all things conſidered, is as far from being rude, as it is from being exact, to expreſs all their paſſions, ſuch as love, joy, grief, but more eſpecially anger; for when two people quarrel in this country, it is ſaid they challenge each other, not to fight, for that they never do but in jeſt, or by way of diverſion, but to contend in verſe; and he who firſt wants words to expreſs himſelf in this poetical duel, is held to be conquered, and ſo the controverſy ends without either blood or law-ſuit.

Mr. Egede, who was ſent to Greenland by the Daniſh Society for propagating the Goſpel, lived among this people fifteen years, which he ſpent with the moſt indefatigable zeal and laborious application, by which means he made a great number of converts. He returned to Copenhagen in 1736, and by his ſolicitation a ſeminary was founded in that city for educating able miſſionaries and catechiſts to be ſent to Greenland. The Miſſion-college alſo ſends young lads to Greenland to learn the language, and to be inſtructed by the miſſionaries there, in order to qualify them for that ſtation.

The Greenland trade is at preſent carried on by the Copenhagen company, who ſend thither three or four ſhips every year, and the Dutch are prohibited from coming within ſeveral miles of their colonies. The commodities Greenland affords for commerce are whale-blubber, whale-bone, ſea-unicorns horns, the ſkins of rein-deer, bears, ſeals, and fox-ſkins, which they barter for the following merchandizes; ſhirts made of white, blue, red, and ſtriped linen, coarſe woollen cloth; knives, ſaws, needles, large fiſhing-hooks, and other hard-ware; looking-glaſſes, rafts, poles, deal boards, cheſts, kettles of copper, braſs, and tin, with other articles.

A NEW SYSTEM OF GEOGRAPHY.

BOOK IV.

Of AMERICA in general.

WE are now entering upon a country of amazing extent, unknown to the ancients: a country diſcovered ſo lately as the year 1491, by the judgment, the vigilance, the perſeverance, and maritime ſkill of the great Columbus, a Genoeſe; who, by this diſcovery, extended geographical knowledge, perfected navigation, opened new ſources of commerce, and gave a new face even to the affairs of Europe.

America, the fourth grand diviſion of the earth, received its name from Americus Veſpucius, a Florentine, who was far from deſerving that honour, to which he had no other claim than a few inconſiderable diſcoveries, after Columbus had led the way, and his drawing a map of the country; and therefore if it was proper for it to receive the name of any European, it might with more juſtice have been called Columbia, from the great man who made it known to the Europeans.

This New World, as it is emphatically called, extends from the frozen regions of the North, where its limits are ſecured from the obſervation of the curious by the ſhortneſs of the ſummers and barriers of ice, through an extent of country in which ſucceſſively paſs all the climates to be found in the other regions of the earth; till you come on the ſouth to the ſnowy rocks of Terra del Fuego. Thus the continent of America extends from about the eightieth degree north to the fifty-ſixth degree ſouth latitude, and, where its breadth is known, from the thirty-fifth to the hundred and twenty-fifth degree of weſt longitude from London, without including the iſlands; ſtretching between eight and nine thouſand miles in length: but in its greateſt breadth, where certainly known, three thouſand ſix hundred and ninety; though in the middle it is not above ſixty or ſeventy miles over.

It is bounded on the north by the ſeas about the north pole; on the eaſt by Davis's Streights, which ſeparates it from Greenland, and by the great Atlantic ocean, which divides it from Europe and Africa; on the ſouth by the vaſt Southern ocean; and on the weſt by the Pacific ocean, which divides it from New Guinea, probably another very extenſive continent, and from China, Japan, and the eaſt part of Siberia.

It is very remarkable that the climates of North America are many degrees colder than any of the countries in the ſame latitude in Europe: thus New Britain, which is nearly in the ſame latitude with Great Britain, is inſufferably cold to an European: the greateſt part of the frozen country of Newfoundland, the bay of St. Laurence, and Cape Breton, lie oppoſite the coaſt of France: Nova Scotia and New England are in the ſame latitude as the Bay of Biſcay: New York and Penſylvania lie oppoſite to Spain and Portugal. Hence the coldeſt winds of North America blow from the north and the weſt, as they do here from the north and the eaſt.

This vaſt continent is divided almoſt in two by an iſthmus about fifteen hundred miles in length, and in one place ſo narrow as to be, as hath been already intimated, only about ſixty miles over; but being mountainous, it would be impoſſible perhaps to open a communication there with the Pacific ocean, which lies on the other ſide of it. All the continent to the north of this iſthmus, together with the iſthmus itſelf, is ſtiled North America; and all to the ſouth of it, including that even on this ſide the equator, is ſtiled South America.

North America is far from being mountainous, and chiefly conſiſts of gentle aſcents and level plains; the principal hills in this extenſive tract are called the Apallachian or Aligany mountains, which extend on the back of our ſouthern colonies. But in South America is the immenſely long and lofty chain called the Cordillera of the Andes, which in height and length exceed any chain of mountains in the other three parts of the earth; for beginning near the iſthmus of Darien, they extend to the ſtreights of Magellan, cutting the whole ſouthern part of America into two, and running a length of four thouſand three hundred miles.

America is alſo extremely well watered by rivers, not only for the ſupport of animal life, and all the advantages of fertility, but for the convenience of trade, and the intercourſe of the diſtant inhabitants by water. In North America the great river Miſſiſſippi, riſing from unknown ſources, runs above two thouſand miles chiefly from north to ſouth, receiving in its courſe the Ohio, the Ouabache, and other large rivers, ſcarcely inferior to the Rhine or the Danube, navigable almoſt to their ſources, and laying open the inmoſt receſſes of this continent. Near the heads of theſe are extenſive lakes of freſh water, which have a communication with each other, and with the great river St. Laurence, which is navigable for ſhips above four hundred miles from its mouth, where it is ſaid to be ninety miles broad. On the eaſtern ſide of North America are the fine rivers Hudſon, Delaware, Potowmack, Suſquehanna, and ſeveral others of great length and depth.

But in South America are the two largeſt rivers in the known world, the river of Amazons, and the Rio de la Plata: the firſt riſes in Peru, and, after a courſe of above

three thouſand ſix hundred miles, in which it receives a prodigious number of navigable rivers, falls into the ocean between Braſil and Guiana. The Rio de la Plata, or Plate-river, riſes in the heart of the country, and becomes ſo large by the acceſſion of other conſiderable rivers, that it pours ſuch an immenſe flood into the ſea, that it makes it taſte freſh for ſeveral leagues from the ſhore. Beſides theſe there is the Oronoko, and ſeveral other very conſiderable rivers.

A country of ſuch vaſt extent on each ſide the equator, muſt neceſſarily have a variety of ſoils as well as climates; but if we except the moſt northern and ſouthern parts, which here, as every where elſe, are naturally cold and barren; the reſt is an immenſe treaſury of nature, producing moſt of the metals, minerals, plants, fruits, trees, and woods, to be met with in the other parts of the world, and many of them in greater quantities and higher perfection. The gold and ſilver of America has ſupplied Europe with ſuch immenſe quantities of thoſe valuable metals, that they are become vaſtly more common; ſo that the gold and ſilver of Europe now bears little proportion to the high price ſet upon them before the diſcovery of America.

This country alſo produces an immenſe quantity of diamonds, pearls, emeralds, amethyſts, and other valuable ſtones, which are brought from thence into Europe, in ſuch quantities, as have alſo greatly lowered their value. To theſe may be added a great number of other commodities, which, though of leſs price, are of much greater uſe. Of this ſort are the conſtant and plentiful ſupplies of cochineal, indigo, anatto, logwood, braſil, fuſtick, pimento, lignum-vitæ, rice, ginger, cacao, or the chocolate-nut, ſugar, tobacco, banillas, cotton, red-wood, the balſams of Tolu, Peru, and China, Jeſuits-bark, mechoacan, ſaſſafras, ſarſaparilla, caſſia, tamarinds, hides, furs, ambergris, and a great variety of woods, roots, and plants, to which, before the diſcovery of America, we were either entire ſtrangers, or forced to buy at an extravagant rate from Aſia and Africa.

America has alſo a variety of moſt excellent fruits, which here grow wild to great perfection; as pine-apples, pomegranates, citrons, lemons, oranges, malicatons, cherries, pears, apples, figs, grapes, vaſt numbers of culinary, medicinal, and other herbs, roots, and plants. Add to this the ſurprizing fertility with which the ſoil is bleſſed, by which many exotic productions are nouriſhed in as great perfection as in their native ground.

With all this plenty and variety, the vaſt continent of America formerly laboured under the want of many neceſſary and uſeful commodities: for upon the firſt landing of the Europeans, they found neither corn, wine, nor oil; the inhabitants in many places knew not the uſe of corn, but made their bread of pulſe or roots: their drink was the water of the clear ſpring; and, with regard to money, they were ignorant of the uſe of it. Our kind of ſheep, goats, cows, aſſes, and horſes, were not to be found there, though the land abounded with paſtures; and at firſt the ſight of a man on horſeback would throw a whole troop of theſe innocent and ſimple inhabitants into a dreadful panic. But all theſe animals have been brought hither in ſuch plenty, and have increaſed ſo faſt in thoſe fertile paſtures, that the country has no want of them, as appears from the innumerable hides, particularly of oxen, continually exported from thence. However, in the room of theſe domeſtic animals they had others no leſs valuable, and to which we in Europe were utter ſtrangers; theſe we ſhall deſcribe in the countries where they are bred.

The ſame may be ſaid of the vaſt variety of birds to be ſeen there, ſome of which greatly ſurpaſs all that are to be found in any other parts of the world, for their ſurprizing beauty, fine ſhape, bright and glowing colours. The ſeas, lakes, and rivers, are no leſs fraught with the greateſt plenty and variety of fiſh.

Before the arrival of the Europeans they had arts of their own; they had ſome notion of painting, and alſo formed pictures by the beautiful arrangement of feathers of all colours, and in ſome parts built palaces and temples. Though the uſe of iron was unknown, they poliſhed precious ſtones, cut down trees, and made not only ſmall canoes, but boats of conſiderable extent. Their hatchets were headed with a ſharp flint, and of flints they made knives. Thus, at the arrival of the Europeans, they afforded a lively picture of the primitive ſtate of mankind in the infancy of the world. At that period the arts, the ſciences, and all the learning that had long flouriſhed in theſe more enlightened parts of the earth, were entirely unknown. Theſe, which had before travelled weſt from Egypt to Greece, and from thence to Rome, have proceeded in the ſame courſe, and are daily gaining ground where ignorance reigned triumphant; and the time may arrive when America may become the ſeat of mighty empires, and be diſtinguiſhed by cities extenſive as Babylon, and beautiful as Athens and Palmyra.

North America is divided

I. Into the dominions of Great Britain: containing Labrador, or New Britain, with the countries about Hudſon's-bay, Canada, Nova Scotia, New England, New York, the Jerſies, Penſylvania, Maryland, Virginia, Carolina, Georgia, Eaſt and Weſt Florida.

With many rich and fertile iſlands, the principal of which are Newfoundland, Cape Breton, Providence, Jamaica, St. Chriſtophers, Antego, Nevis, Dominica, Barbuda, Anguilla, Montſerrat, Tobago, St. Vincent, Barbadoes, the Granades, and Granada. To which may be added the Bermudas, or Summer Iſlands.

II. The dominions of Spain: containing Louiſiana, Old Mexico, New Mexico, and California, in North America. With the extenſive countries of Terra Firma, Peru, and La Plata, or Paraguay, in South America.

With the valuable iſlands of Cuba, half of Hiſpaniola, or St. Domingo, Porto Rico, Trinidad, and Margaretta, in North America. Chiloe, the Kings or Pearl Iſlands, Juan Fernandes, and the Gallipagos Iſlands, in the Pacific ocean.

III. The dominions of France, by the late peace confined to the farther ſide of the river Miſſiſſippi, are now ſaid to be exchanged with Spain.

The French have, however, the following iſlands: St. Martin's, St. Bartholomew's, Deſeada, Guadalupe, Marigalante, Martinico, St. Croix, and part of Hiſpaniola.

IV. The dominions of Portugal conſiſt of the rich and extenſive country of Braſil, in South America.

V. The dominions of the Dutch conſiſt of Surinam, on the continent of South America; with the iſlands of Curaſſao, Bonaire, and Aruba, near the coaſt of Terra Firma; with Euſtatia and Saba, two of the Caribbee Iſlands.

VI. Thoſe of the Danes conſiſt only of one of the Caribbee Iſlands, named St. Thomas.

VII. The parts ſtill poſſeſſed by the native Indians, which are the countries north-weſt of Mexico; the greateſt part of Guiana, and all the moſt ſouthern part of the continent, as Patagonia, and the iſland Terra del Fuego.

We ſhall begin with the dominions of Great Britain, which are bounded on the north by the ocean and lands near the north pole, on the eaſt by the Atlantic ocean, on the ſouth by the Gulph of Mexico, and on the weſt by unknown lands inhabited by the native Indians.

CHAP.

CHAP. I.

Of the Northern Part of the BRITISH AMERICAN Dominions, particularly of the Countries bordering on HUDSON'S-BAY; with the Iſlands of NEWFOUNDLAND, CAPE BRETON, and St. JOHN.

SECT. I.

Of the Countries bordering on Hudſon's-bay; a particular Account of the Climate, Soil, Vegetables, and Minerals; with a Deſcription of the Beaver.

THE moſt northern part of America ſubject to the Engliſh, particularly the countries bordering on Hudſon's-bay, which are ſituated between the fiftieth and ſeventieth degree of north latitude, and extend between the fifty-firſt and one hundredth degree of weſt longitude, including Hudſon's-bay; are bounded on the north by unknown lands and ſeas about the pole, on the eaſt by the Atlantic ocean, on the ſouth by the Gulph of St. Lawrence and Canada, and on the weſt by unknown lands. Were we to extend the country claimed by Great Britain as far as our mariners have diſcovered to the north, we might ſtretch it to eighty-one degrees thirty minutes north latitude; for ſo far captain Hudſon and captain Baffin have ſailed, and gave their names to the bays ſo called; but we are not ſolicitous to extend the bounds of the countries ſubject to Britain to regions where no Briton has ever ſettled, and which we have neither purchaſed nor conquered.

The knowledge we have obtained of theſe countries is owing to the repeated attempts that have been made to diſcover a north-weſt paſſage to the Eaſt Indies. But though theſe countries, which extend ſixteen hundred miles in length, are claimed by Great Britain, and diſtinguiſhed by Engliſh names, as the eaſt coaſt by that of New Britain, and the weſt by that of New North Wales and New South Wales; yet very little advantage has been made of them, except by the Hudſon's-bay company, who have ſeveral ſettlements on the coaſt of Hudſon's-bay, and therefore an accurate and diſtinct account of them cannot be expected. With reſpect to the climate we ſhall give ſome account of it from Mr. Ellis, who ſailed thither in 1746, and wintered in the country on the weſt ſide of the Bay.

This gentleman wintered in a creek about five miles above York Fort, in the fifty-ſeventh degree thirty minutes latitude, a ſituation ſo far to the ſouth, that the weather might be ſuppoſed to be tolerable; but fearing that they might be froze to death in their ſhips, they built a houſe of thick pieces of timber, with the ſpaces between ſtuffed with moſs, and plaſtered over with clay: the door was low and ſmall, the fire-place was in the middle, and over it a chimney to let out the ſmoke. It was placed on an eminence ſurrounded with trees; about a hundred and fifty yards from the front was a handſome baſon of water, called the Beaver-creek; and they were protected from the north and north-eaſt winds by thick and tall woods. On the ſecond of November the cold was ſo intenſe, that all the bottled beer was froze ſolid, though packed up in tow near a good fire; and on the ſixth the cold became inſupportable abroad. About this time they put on their winter-dreſs, which conſiſted of a robe of beaver-ſkins that reached to their heels, two waiſtcoats under it, a cap and mittins of the ſame lined with flannel, a pair of Indian ſtockings over their yarn ones, with ſhoes of ſoft tanned mooſe or elk-ſkin, under which they wore two or three pair of blanket or thick duffil ſocks; and a pair of ſnow-ſhoes about five feet long and eighteen inches wide, to prevent their ſinking in the ſnow, compleated their dreſs. This, with ſome alterations, is the garb of the Indians, who have taught it the Engliſh. They uſually put at leaſt an horſe-load of wood at a time into their ſtove, which was built of bricks ſix feet long, two wide, and three high. When the wood was near burnt they beat off the embers, threw out the brands, and then ſtopped up the top of the chimney. This cauſed a ſulphureous ſuffocating ſmell, and ſo great a heat, that, notwithſtanding the ſeverity of the weather, they often ſweat; yet if a door or window was but opened, the cold air ruſhed in with great fury, turning the incloſed vapours into ſmall ſnow; nor could all the heat they could raiſe keep the windows, the ſides, and cieling, free from ice: thoſe whoſe bed-cloaths touched the wall were generally froze faſt to it in the morning, and their breath ſettled in a white hoar froſt upon the blankets. This happened ſoon after the fire went out. As the houſe cooled, the ſap that had been thawed in the timbers with the heat froze, ſplitting the wood in cracks, with a noiſe reſembling the report of a muſket.

No liquid can here withſtand the cold; brandy, and even ſpirits of wine, froze; but the latter only to a conſiſtence like oil. All liquors under the proof of common ſpirits became perfectly ſolid, and burſt the veſſels that contained them, whether they were of wood, tin, or even copper. The ice in the river was above eight feet thick, and they could keep their proviſions ſweet as long as they pleaſed, without the aſſiſtance of ſalt; for their game froze the inſtant it was killed. The hairs, rabbits, and partridges, which in ſummer are brown and grey, change in winter to white. Every animal is here furniſhed by nature with extraordinary furs, to reſiſt the cold, which fall off as the warm weather returns; and even this is the caſe with the dogs and cats brought hither from Europe. If the men touched iron, or any other ſolid ſurface, their fingers were froze faſt to it; or if in drinking a dram of brandy out of a glaſs, they touched it with their tongue or lips, in pulling it away the ſkin was left upon it. They buried their beer twelve feet deep in the ground, on a bed of willow and graſs, both under and over it; and then covered it twelve feet deep with a ſoapy earth; yet ſome of the caſks of ſmall beer next to the ſides were frozen, and the ſtrong iron-bound caſks burſt, though the ſpirituous part remained fluid in the heart of the ice, and was ſtrong; but the ice, on being melted, taſted quite vapid; other caſks were not burſt.

From this account of the ſeverity of the winter one would imagine, that it muſt be extremely uncomfortable, and its inhabitants very unhappy; but this is far from being the caſe, for though the weather is cold, they have abundance of furs to ſhelter them from its violence, and many other conveniences that in ſome meaſure put them on a level with thoſe who live in a milder climate; and however extraordinary it may appear, there are Engliſhmen who have lived in the company's ſettlements for ſome years, who prefer that country to any other.

There are here frequently ſeen parhelia or mock ſuns, and halos about the ſun and moon, which are very luminous, and beautifully tinged with all the colours of the rainbow. Our author obſerves, that he has ſeen ſix of theſe parhelia at a time. The true ſun alſo riſes and ſets with a large cone of yellow light perpendicular to it; and no ſooner does it diſappear than the aurora borealis ſpreads a thouſand different lights and colours over the whole concave of the ſky, with ſuch reſplendent beauty, that even the full moon does not efface their luſtre, though they are more apparent when ſhe does not ſhine; for then one may diſtinctly read by them, and the ſhadows of objects are ſeen upon the ſnow tending to the ſouth-eaſt. The ſtars ſeem to burn with a fiery red, eſpecially thoſe near the horizon.

In the ſouthern parts of this country the ſoil is fertile, the ſurface being a looſe dark mould, under which are

layers of different coloured clay. Near the ſhore the land is low and marſhy, covered with trees of various ſorts: and within land are large plains, with little herbage except moſs, interſperſed with tufts of trees, and ſome lakes. In the country are a great variety of ſhrubs and plants, with many of thoſe known in Europe, as the gooſeberry, currant, and cranberry, ſtrawberries, angelica, wild auriculas, ſavine, many of the Lapland plants, and others that are unknown to us. There are great quantities of wild rice by the ſides of the lakes and rivers; there is alſo long graſs and good meadow ground, and at the factories are tolerable gardens, eſpecially at York Fort, Albany, and Mooſe-river, where moſt kinds of Engliſh garden-ſtuff grow very well, as beans, peas, cabbages, turnips, and many kinds of ſallads. Farther within land the country is much more fruitful, the ſummers warmer, the winters ſhorter, and leſs ſevere.

There are many ſorts of minerals here: lead-ore is ſaid to be found in plenty on the ſurface of the earth near Churchill-Fort: iron-ore is likewiſe to be met with, and the natives who live to the northward frequently bring pieces of copper to that factory. There are likewiſe a great variety of talcs, ſpars, and rock-cryſtals of different colours, as red and white, the former reſembling rubies, and the latter, which are very tranſparent, ſhooting into pentangular priſms. In the northern parts is found a kind of coal; the aſbeſtos, or ſtone-flax, is common here; and alſo a ſtone of a black, ſmooth, and ſhining ſurface, that eaſily ſeparates into thin tranſparent leaves, which the natives uſe as looking-glaſſes. The country likewiſe abounds in various kinds of marble, ſome ſpeckled with green, blue, and red; and others perfectly white.

Among the animals are deer, rabbits, beavers, and other beaſts; with a great variety of birds, as ſwans, wild-geeſe, plover, ducks, and many others that fly to the northward in the ſpring to breed, and return to the ſouthward in autumn. There are likewiſe eagles, hawks, partridges, pheaſants, crows, and owls.

As the inhabitants of this country are cloathed in the ſkins of beavers, and as the principal trade conſiſts in thoſe skins, with which they have ſupplied us by means of the Hudſon's-bay company, it will be proper to give here a deſcription of that curious animal. A large beaver is about twenty-eight inches in length, from the hind part of the head to the root of the tail, and weighs ſixty or ſeventy pounds, but their colour is different; in ſome places they are black, in others white, and in others almoſt of the colour of the deer. The beaver lives to a great age; the females generally bring forth four young ones at a time. Their jaws are furniſhed with two cutters and eight grinders; the upper cutter is two inches and a half in length, and the lower ſomething longer. The upper jaw projects over the lower one; the head is ſhaped like that of a rat, and is ſmall in proportion to its body; its ſnout is long, its eyes ſmall, and its ears ſharp and round; its legs are but about five inches in length, with paws formed like a man's hand; but the hind-feet are webbed like the toes of a gooſe. The tail is ſhaped like the blade of a paddle, and is four inches broad where it joins to the body, five or ſix in the middle, and three at the extremity: it is about fourteen inches in length, and about an inch in thickneſs. It is covered with a ſcaly skin, the ſcales being near a quarter of an inch long, and fold over each other, like thoſe of a fiſh.

The ancient writers of natural hiſtory are miſtaken in aſſerting, that the beavers bite off their teſticles when purſued by the huntſmen; for what the phyſicians call caſtoreum, is the inguinal glands of this animal.

The induſtry, foreſight, and good management of theſe animals is extremely ſurprizing, and ſcarce credible to thoſe who never ſaw them. When they want to form a ſettlement, three or four, or more of them, aſſemble together, and firſt pitch upon a place where they may have proviſions, ſuch as the bark of trees, particularly roots, or graſs, with every thing neceſſary for erecting their edifices, which muſt be ſurrounded with water; and if there be neither a convenient lake nor pond they make one, by ſtopping the courſe of ſome brook, or river, with a dam. For this purpoſe they cut down trees, above the place where they are reſolved to build, and take their meaſures ſo well, as always to make the tree fall towards the water, that they may have the leſs diſtance to roll it, when they have cut off the branches. This done they float it to the place appointed, and theſe pieces they cut bigger or leſs to ſuit their convenience. Sometimes they uſe the trunks of large trees, which they lay flat in the water; at others they faſten ſtakes in the bottom of the channel, and then interweaving ſmall branches, fill up the vacancies with clay, mud, and moſs, in ſuch a manner, as renders the dam very tight and ſecure. In theſe works their tails ſerve them for carts and trowels, and their teeth for axes; their paws ſupply the place of hands, and their feet ſerve inſtead of oars.

The conſtruction of their houſes is no leſs admirable; they are generally built upon piles, at ſome diſtance from the ſhore, but ſometimes cloſe to the banks of the rivers; the firſt make holes at the bottom of the water for planting ſix poſts, upon which each of their edifices is built in a moſt curious manner; their form is round, with a flat roof; the walls are two feet thick, and ſometimes more; they are formed of the ſame materials as the dams juſt mentioned, and every part is ſo well finiſhed, that no air can poſſibly enter; about two-thirds of the edifice is raiſed above the water; in this they lodge, and are careful to keep it clean. They have generally three or four different avenues to each houſe, which they enter under water. To provide proviſions againſt the winter, they draw the ſticks they cut from the trees, and thruſting one end into the mud, let them lie under the water to preſerve the bark green and tender for their winter proviſions. There are ſometimes found eight or ten beavers in one houſe; at others not more than three or four; and let them be as numerous as they will, they all lodge upon one floor.

When the ſnows melt and raiſe the ſtream, they leave their dwelling, and ſeparate till the ſeaſon returns for repairing them, or for building new ones, which is in the month of July. The Indians lay traps for the beavers in the paths they frequent, and bait them with freſh-cut poplar boughs, which they are very fond of. Sometimes the Indians open the ice near the beaver-houſes, at which opening one ſtands, while another diſturbs the houſe; when the beaver haſtening to make his eſcape at the opening, ſeldom fails of having his brains beat out the moment he raiſes his head above the water.

The beavers are excellent food, but the tongue and tail are the moſt delicious parts. The Indians ſometimes roaſt theſe animals in the ſame manner as we do pigs, firſt burning off their fur.

The coaſts are frequented by ſeals, and the rivers and lakes have very large ſturgeon, pike, and trout; with two very delicious kinds of fiſh; the one called titymag, the other reſembling an eel, ſpotted with yellow and white, and called by the natives muthoy: theſe are reckoned fatteſt in winter, when they are caught by making holes in the ice, and letting down a baited hook, at which the fiſh greedily bites. At the mouths of the rivers, eſpecially thoſe more to the north, are plenty of fine ſalmon, trout, and a fiſh called a ſucker, which reſembles a carp. There comes in with the flood tide a great number of white whales, which might eaſily be taken.

SECT. II.

The Perſons, Dreſs, Manners, Cuſtoms, and Religion of the Indians on the weſtern Coaſt of Hudſon's bay; with a Deſcription of York Factory.

THE natives are of the middle ſize, and of a copper colour: they have black eyes, and long, lank, black hair; but their features vary as in Europe. They are of a chearful diſpoſition, good-natured, affable, friendly, and honeſt in their dealings.

In ſummer the men are clothed in a cloſe coat made of blanket, which they buy of the Engliſh ſettled in their neighbourhood. They have a pair of leather ſtockings, which reach ſo high as to ſerve alſo for breeches, and they make their ſhoes of the ſame materials.

The

The cloaths of the women differ from thoſe of the men only in their generally wearing a petticoat, that in winter comes a little lower than their knees. Their ordinary apparel is made of the skins of deer, otters, or beaver, with the hair or fur on them. The ſleeves of their upper habit are generally tied on with ſtrings at the ſhoulders, ſo that their arm-pits, even in the depth of winter, are expoſed to the cold, which they imagine contributes to their health: their diſeaſes indeed are but few, and thoſe chiefly ariſe from colds caught after drinking ſpirituous liquors, which they buy of the Engliſh; and it is a melancholy truth, that thoſe who live near the ſettlements of the Hudſon's-bay Company, are, by drunkenneſs, become meagre, ſmall, indolent, and hardly able to encounter the hardſhips of the country; while thoſe who live at a diſtance are hardy, vigorous, and active.

They dwell in tents covered with mooſe and deer-skins ſewed together. Theſe are of a circular form, probably on account of its being moſt capacious and convenient for their ſitting round the fire, which is in the middle. They are formed of poles, which are extended at the bottom, and at the top lean to the center, where an opening is left to admit the light and let out the ſmoke. They ſtrew the bottom with the top of pine-trees, and lie with their feet to the fire, and their heads to the ſides of the tent. The entrance is generally on the ſouth-weſt ſide, and they go in by lifting up one of the skins, to which is faſtened a piece of ſtick, to make it flap cloſe.

They have no dependance for ſubſiſtence on the fruits of the earth, but live entirely on the animals they take in hunting or catch in traps. They every ſeaſon make a prodigious ſlaughter among the deer, from the abſurd opinion that the more they deſtroy, the greater plenty will ſucceed; hence they ſometimes leave three or four hundred dead on the plains, taking out only their tongues, and leaving their carcaſſes either to rot or to be devoured by the wild beaſts. At other times they attack them in the water, and bring great numbers on floats to the factories. They alſo live upon birds, and even feed on eagles, hawks, crows, and owls, as well as on partridges, wild-geeſe, and ducks. They generally boil their fleſh, and eat it by itſelf, drinking the water it is boiled in, which they eſteem very wholeſome; and in the ſame manner they dreſs their fiſh.

Theſe ignorant people have many amiable qualities: they are influenced in their behaviour by a natural love of rectitude, that reſtrains them from all acts of violence and injuſtice, as effectually as the moſt rigorous laws. The chiefs of every family, or tribe, who are generally choſen from among the moſt ancient of the people, uſually for their skill in hunting, their experience in trade, and their valour in the wars, in which they frequently engage, direct thoſe who reſide with them in their different employments; but their advice is rather followed through deference and reſpect than any compulſive obligation.

They have, however, ſome cuſtoms which muſt appear very whimſical, and others that are extremely cruel. It is eſteemed a great offence for a woman to ſtride over the legs of a man when he ſits on the ground, and they even think it beneath them to drink out of the ſame veſſel with their wives. They have another cuſtom that muſt appear ſhocking to every humane mind, and in which they are in ſome meaſure imitated by the Hottentots. The latter, as hath been mentioned in treating of California, expoſe their parents, when labouring under the infirmities of old age, to periſh with hunger, or to be devoured by wild beaſts, and theſe wretches ſtrangle theirs; for when their parents grow ſo old as to be unable to ſupport themſelves by their own labour, they require their children to ſtrangle them, and their performing it is eſteemed an act of duty. This is done in the following manner: the old perſon's grave being dug, he goes into it, and after having converſed and ſmoked a pipe, or perhaps drank a dram or two with his children, he informs them that he is ready; upon which two of them put a thong about his neck, then one ſtanding on one ſide, and the other oppoſite to him, pull violently till he has expired; they then cover him with earth, and over that erect a kind of rough monument of ſtones. Such old people as have no children, require this office of their friends; but in this caſe it is not always complied with.

They have alſo a very ſtrange maxim of policy, which is obliging their women to procure frequent abortions, by the uſe of a certain herb, common in that country, in order to eaſe themſelves of the heavy burthen of an helpleſs family. Savage as this cuſtom is, it is leſs barbarous than that anciently practiſed by the polite and civilized Greeks and Romans, as it is ſtill by the Chineſe and Hottentots, of expoſing their children, and leaving them to periſh with hunger or be devoured by wild beaſts.

They acknowledge a Being of infinite goodneſs, whom they ſtile Uckewma, or the Great Chief, whom they conſider as the author of all the bleſſings they enjoy, and ſing a kind of hymns to his praiſe, in a grave and ſolemn tone, that is not altogether diſagreeable; but their religious ſentiments are very inconſiſtent and confuſed. They likewiſe acknowledge another being, whom they call Wittieca, and repreſent as the author of all evil; of him they are much afraid; but it is not ſaid that they uſe any methods to appeaſe him.

Though theſe people ſpend the beſt part of their lives in procuring neceſſaries, and might eaſily lay up a ſtore of proviſions to ſecure them againſt want; yet they take little care of futurity. From their natural generoſity they are very free of their proviſions when they have plenty, and, except drying a little veniſon and fiſh, take no care to have a ſupply againſt winter. The Indians who come in the ſummer to trade at the factories, ſometimes not obtaining the ſuccours they expected, have been obliged to ſinge off the fur from thouſands of beaver-ſkins, in order to feed upon the leather: but when they are thus reduced to the greateſt extremity, they behave with a patience that is eaſier to admire than to imitate. They frequently travel two or three hundred miles, even in the depth of winter, through a wide open country, without meeting with any houſe to receive them, or carrying any tent for their protection. At the approach of night they raiſe a kind of fence with bruſhwood, by the ſide of which they kindle a fire, and having cleared away the ſnow, they lie down upon the ground, and ſleep between the fire and the fence: but when they happen to be benighted where no wood can be obtained, they are obliged to lie down under the ſnow, as is practiſed in Siberia and ſome other countries; and by this means they are in a great meaſure ſheltered from the ſharpneſs of the piercing air.

As York-fort is ſituated on the weſt coaſt of Hudſon's-bay, in the country, the manners of whoſe inhabitants we have juſt deſcribed, and is conſidered as the moſt valuable of the Hudſon's-bay Company's ſettlement, we ſhall here give a deſcription of it. It is ſeated on the ſouthern branch of Port Nelſon-river, called Hays's-river, within five miles of its fall into the ſea, in the latitude of fifty-ſeven degrees twenty minutes, and in the ninety-third degree fifty-eight minutes weſt longitude. This fort and factory is in a clear ſpace, ſurrounded on three ſides by the woods, with an open front to the water. The fort is a ſquare building, flanked with four ſmall baſtions, all of them covered, and at preſent converted either into lodging or ſtore-rooms. There are three ſmall patteraroes placed on each of the curtains; the whole is paliſadoed: a battery of pretty large guns commands the river, and a ſmall breaſt-work of turf is thrown up by way of defence of the battery; but even in time of war the number of people who reſide there amount to no more than between thirty and forty. On the ſouth-eaſt of the fort is a dock for rebuilding or repairing ſloops or boats, between which and the battery is a piece of land called The Plantation, where the Indians who come to the factory pitch their tents; and there are generally one or two tents of old infirm Indians, both men and women, who are maintained by the factory, from which this place is ſeparated by two rows of high paliſadoes: between theſe are ſtore-houſes, the kitchen, and ſome work-ſhops low built; and within the inner paliſadoes are ſmall ſpots ſowed with turnips, colworts, ſallads, and other garden-ſtuff. But however

formidable this fort may appear to the natives, it is incapable of defence, ſhould it happen to be attacked by an European army.

SECT. III.

Of the Perſons, Dreſs, Manners, and Cuſtoms of the different Tribes of Eſkimeaux, or Eſkimows, chiefly ſeated on the Eaſt Side of Hudſon's-bay.

IT would not be difficult, in treating of the countries which border on Hudſon's-bay, to give the names and ſituation of the number of little iſlands, harbours, and creeks, but it is impoſſible to give a good account of any of them, that will either anſwer the purpoſes of inſtruction or entertainment; we ſhall therefore confine ourſelves to the different inhabitants.

The principal inhabitants ſituated to the north of thoſe juſt deſcribed are the Eſkimeaux, which name is derived from an Indian word that ſignifies eaters of raw fleſh; for after thoroughly drying the fleſh of the beaſts they kill, they eat it without any other preparation; and it is evident that to this Indian term is added a French termination; but to adapt it to the Engliſh pronunciation, it ſhould rather have been written by our authors Eſkimows

Theſe people are of ſeveral tribes, and we ſhall begin with thoſe who live on the borders of the ſtreights which enter into Hudſon's-bay. They are of a middle ſize, robuſt, and inclinable to be fat. Their heads are large, and their faces round and ſwarthy; their eyes are black, ſmall, and ſparkling; their noſes flat, their lips thick, and their hair lank and black: they have broad ſhoulders, and their limbs are proportionable; but their feet are extraordinary ſmall.

The behaviour of the Eſkimows is chearful and ſprightly; but ſome nations of them are ſaid to be ſubtle, cunning, and deceitful, great flatterers, and much addicted to pilfer from ſtrangers; eaſily rendered bold by encouragement, but as eaſily frightened; and ſo attached to their own country, that ſome, who have been taken priſoners by the Southern Indians when they were boys, and brought to the factories, have for ſeveral years regretted their abſence from their native country, and the enjoyment of what they loved when they were there: thus one of them, after having been fed on Engliſh diet, being preſent when an Engliſhman was cutting up a ſeal, from which the train-oil ran very plentifully, ſcooped up what he could ſave with his hands, and ſwallowing it, cried, "Ah! commend me to my own dear "country, where I could get my belly-full of this."

The men's cloaths are made of ſeals-ſkins, and ſometimes of the ſkins of land and ſea-fowl ſewed together; their coats have a hood like a capuchin, are cloſe from the breaſt before, and reach no lower than the middle of the thigh: the breeches are cloſe before and behind, gathered like a purſe, with a ſtring, and tied about their waiſts: they have ſeveral pair of boots and ſocks, which they wear one over another, to keep them warm and dry. The difference between the dreſs of the men and that of the women is, that the latter have a narrow flap behind to their jacket, that reaches to their heels. Their hoods are likewiſe larger and wider at the ſhoulders, for the ſake of carrying their children in them at their backs; and their boots, which are a great deal wider, are commonly ſtuck out with whalebone, becauſe when they want to put a child out of their arms, they ſlip it into one of their boots till they can take it up again. A few of them wear ſhifts of ſeals bladders ſewed together. Their cloaths are in general ſewed very neatly: this is performed with an ivory needle, and the ſinews of a deer ſplit fine, and uſed for thread. They diſcover a good deal of taſte in adorning them with ſtripes of different coloured ſkins ſewed in the manner of borders, cuffs, and robings for their cloths, which altogether appear handſome as well as convenient.

One ſingular part of their dreſs is their ſnow eyes, as they properly call them. Theſe are bits of wood, or ivory, formed to cover the organs of ſight, and tied at the back of the head: in each piece are two ſlits of the ſame length with the eyes, but narrower; through which they ſee very diſtinctly. This invention prevents ſnow blindneſs, a very painful diſorder, occaſioned by the brightneſs of the light reflected from the ſnow, eſpecially in ſpring. Their uſe ſtrengthens the ſight, and becomes ſo habitual to them, that when they would obſerve an object at a great diſtance, they commonly look through them, as we do through a perſpective-glaſs.

The ſame ſpirit of invention is obſervable in their inſtruments for fiſhing and fowling, which, in ſeveral reſpects, reſemble thoſe of the Greenlanders. Their darts and harpoons are well made, as are alſo their bows and arrows. Their boats, which are eaſy of carriage, and quick in motion, reſemble thoſe of the Greenlanders, have their frames made of wood or whalebone, covered all over with ſeal-ſkin parchment, except a hole in the middle, which has a ring of wood or whalebone round it, to prevent the water running in from the deck, affording only room for one man to ſit in, his feet being ſtretched forward; and ſometimes the skin is laced about his waiſt at the above-mentioned rim, which effectually ſhuts out the water. They rub the ſeams with a kind of ſize made of ſeals blubber. In theſe boats they carry their little conveniences, and their inſtruments for killing whales, ſea-horſes, ſea-unicorns, ſeals, and the like. They alſo carry in their canoes ſlings and ſtones, with which they can do execution at a great diſtance. Their harpoons are headed and pointed with the teeth of the morſe, one end of it ſerving for a ſpear, and the other for introducing into the body of the fiſh a barb tipped with iron, which remains there, while the other part of the harpoon readily diſengages itſelf and comes out. To this barb is faſtened a thong of the hide of the morſe, at the end of which is a ſeal-skin blown up, which ſerves as a buoy, to ſhew them where the whale is when he goes down, and prodigiouſly fatigues him in ſwimming. As ſoon as he expires, they, with their canoes, tow him aſhore, and ſtrip him of his fat, which not only ſerves them for food, but to burn in their lamps during winter.

As the perſons who traverſed Hudſon's-bay, in order to diſcover a north-weſt paſſage, had no leiſure to examine the countries by which they paſſed, and had ſometimes opportunities of obſerving the natives, they were enabled to deſcribe the latter, without having it in their power to give much account of the former. In Mr. Ellis's voyage, which was attempted in order to find out that paſſage, the ſhip named the Reſolution was driven upon a ridge of ſtones, when ſix boats of Eskimows came off with whalebone, which, notwithſtanding their danger, they bought of them. Theſe people, ſo far from taking advantage of their diſtreſs, behaved with the utmoſt civility, and endeavoured to relieve them: for when the tide had floated them off, an old man, who ſeemed better acquainted with the place than the reſt, had the humanity to paddle before them, to point out the ſhoals, and direct their courſe, by keeping in deep water: thus, by his aſſiſtance, the Reſolution eſcaped being loſt, which is a ſufficient proof that theſe people do not deſerve to be termed artful and thieviſh, ſince they could not avoid being ſenſible that they would have reaped great advantage by the loſs of the ſhip. Our author therefore juſtly obſerves, that whatever others may ſay to their prejudice, it is but juſtice to own, that they behaved not only with humanity, but with great kindneſs and friendſhip. Nothing can be more admirable than the ingenuity and induſtry of theſe people, who, for want of iron, are frequently obliged to make not only the barbs of their harpoons, but alſo their hatchets and knives, of ſtones, ſea-horſe teeth, and ſea-unicorns horns; and it is difficult to conceive the dexterous uſe they make of materials that ſeem ſo very improper for the purpoſes to which they employ them. Theſe ſeem to be originally one people with thoſe juſt deſcribed; but are more affable and friendly, and likewiſe more skilful artiſts. The borders of their habits are generally fringed with cut leather, and are ſometimes hung with the teeth of fawns. The women do not, like thoſe of the other Eskimows, ſtick out the ſides of their boots with whalebone: they alſo differ from them in wearing a cap made of the skin of a buffalo's tail, which,

which, though it has a frightful appearance, is of great uſe in keeping off the musketoes, which are here exceſſively troubleſome. Indeed the hair hanging over their faces ſomewhat obſtructs their ſight, but it is eaſily removed with their hands; and, was it not for this defence, theſe inſects would be inſupportable. Hence their children wear them, while hanging at their mother's backs; and as, thus dreſſed, they make a moſt diſmal figure, it is apt to raiſe a ſhocking idea of the barbarity of theſe harmleſs and inoffenſive people. Their manner of kindling a fire appears very extraordinary, but is nearly the ſame in all countries where they have not the advantage of flints and ſteel: they prepare two pieces of dry wood, and making a ſmall hole in each, fit to them a little cylindrical piece of wood, round which a thong is put; then by pulling the ends of the thong, they whirl the cylindrical piece about with ſuch velocity, that the motion ſets the wood on fire; when lighting a little dry moſs, which ſerves for tinder, they make as large a fire as they pleaſe: but as the little timber they have towards the north of Hudſon's bay, is only what is driven on ſhore, this fails them in winter, and they are obliged, like the Greenlanders, to make uſe of their lamps, for the ſupply of their family occaſions.

Theſe ſimple people were ſo far from being jealous of their wives, that they offered them to the Engliſh ſailors, from an opinion that the children they had by them would be in every reſpect as much ſuperior to thoſe of their nation, as they took the Engliſh to be; for they imagine, ſays our author, that in the moſt literal ſenſe every man begets his like, and that the ſon of a captain muſt infallibly be a captain.

On their going to ſea, in order to catch fiſh, they uſually take in their boats a bladder filled with train-oil, as our people do a dram-bottle, and ſeem to drink the contents with the ſame reliſh; and when their ſtock is out, they have been ſeen to draw the bladder through their teeth with much ſeeming ſatisfaction. They are probably convinced by experience of the ſalutary effects of this coarſe kind of oil in this rigorous climate, which renders them ſo fond of it. They alſo uſe it for their lamps, which are made of ſtone, hollowed out with as much art as can well be expected, conſidering their tools.

We ſhall now leave Hudſon's-bay, which, conſidering its great extent, may as well be called a ſea as the Baltic, and ſeveral others that bear that name; and ſhall only obſerve, that in ſailing to the northward from York-fort every thing dwindles, the men become lower in ſtature, and in the latitude of ſixty-one degrees the very trees ſhrink into bruſhwood.

SECT. IV.

Of NEWFOUNDLAND.

Its Situation, Extent, Climate, Soil, and Produce; with a particular Account of the Manner of preparing the Cod in that Iſland.

NEWFOUNDLAND received its name from Cabot, who diſcovered it in 1497. It is of a triangular form, and ſituated to the eaſt of the gulph of St. Lawrence, between the forty-ſixth degree forty minutes and the forty-ſecond degree ſeven minutes north latitude, and between the forty-firſt degree fifty-two minutes and the fifty-ſeventh degree forty minutes weſt longitude; it being bounded to the eaſtward and ſouthward by the Atlantic ocean, on the north by the ſtreights of Belleiſle, and on the weſt by the gulph of St. Lawrence.

The coaſts are extremely ſubject to fogs, occaſioned by the vapours exhaled from the lakes, ſwamps, and bogs, with which the iſland abounds; yet the air is ſalubrious, and agreeable to moſt conſtitutions. The winters are ſevere, attended with almoſt continual ſtorms of ſnow and ſleet, the ſky being uſually overcaſt.

The ſoil is generally ſuppoſed to be barren, except only the banks of the rivers, which are tolerably fertile. There are however woods of different kinds throughout almoſt all the country for ſeveral miles from the coaſt, which contain abundance of timber fit for ſhip and boat building, as well as for erecting ſtages for curing and drying fiſh; and beyond theſe woods, where the lands are cleared, are in many places good paſturage. The inland parts of the country riſe into high hills, and ſink into bogs and ſwamps; where ſuch parts as are not covered with water, afford only ſhrubs, ſpruce, and white moſs. It however contains many fine rivers, lakes, and rivulets, which abound with beaver, otters, and the like, and afford great plenty of ſalmon and other fiſh. The foreſts are ſtored with deer, mooſe, bears, wolves, and foxes in great plenty; but here are few cattle, ſheep, or horſes; inſtead of the latter, the inhabitants make uſe of dogs for drawing of wood and other neceſſaries. Theſe they manage with great dexterity, fixing them in leather collars, and yoking together what number they pleaſe. There are here great plenty of wild fowl, but the ſtaple commodity of the iſland is cod-fiſh, which are here larger and in greater abundance than in any part of the world yet diſcovered; and a conſiderable part of Europe is at preſent chiefly ſupplied with this article from hence.

Great Britain and North America, at the loweſt computation, annually employ upwards of three thouſand ſail in this fiſhery; on board of which, and on ſhore, to cure and pack the fiſh, are not leſs than ten thouſand hands; ſo that it is at the ſame time, not only a very profitable branch of trade to the merchant, but a ſource of livelihood to ſo many thouſands of poor people, and a moſt excellent nurſery to the royal navy, which is hence ſupplied with a great number of able ſeamen: it might ſtill be greatly enlarged; for notwithſtanding the great trade carried on by the Engliſh here, the French are ſaid to have by far the beſt part.

On theſe coaſts are alſo taken a great number of whales, ſeals, porpuſes, &c. whence above five thouſand barrels of oil, beſides a great quantity of whale-bone, ſeal-ſkins, &c. are annually exported from hence to different parts of the world; all which ſufficiently ſhew the importance of the iſland, notwithſtanding the ſeverity of the climate, and the roughneſs and barrenneſs of the ſoil.

The number of Engliſh inhabitants on the iſland, is uncertain and fluctuating. They are indeed very inconſiderable, if compared with its extent, but there are not half the number in winter that there are in ſummer. The capital of the iſland, which is ſeated on the ſouthern point, contains no more than between three and fourſcore houſes.

As fiſhing is the ſtaple commodity of Newfoundland and the adjacent iſlands, it will not, perhaps, be diſagreeable to our readers, if we here give a conciſe account of the method of curing the cod, and preparing it for the market.

The veſſels employed in this buſineſs are ſmall ſhallops, which come to ſhore every day, where the fiſhermen throw the cod they have taken upon a ſtage prepared for that purpoſe. One of them, who is called the cut-throat, opens the fiſh with a two-edged knife, and cuts off his head; a ſecond hands the fiſh to the carver, who ſtands oppoſite to him at a table erected upon the ſtage, who with a ſingle-edged knife, ſix or eight inches long, and very thick on the back, to encreaſe its weight, ſplits the fiſh open; when it is conveyed to the ſalter, who places it with the ſkin undermoſt in a barrel, and then very ſlightly covers it with ſalt, laying the fiſh regularly one upon another.

After leaving the cod in ſalt three or four days, and ſometimes twice as long, according to the ſeaſon, they put it into a tub, waſh it well, make it up in piles, and, in fair weather, ſpread it out with the ſkin undermoſt, on a kind of ſtage raiſed with wattles about two feet from the ground; before night they turn the ſkin uppermoſt, which they alſo do whenever it rains. When the fiſh becomes a little dry, it is raiſed into larger piles, where it reſts a day or two; after which it is again expoſed to the air, and turned according as there is occaſion, before they again raiſe it into larger piles, where, after this is done, it ſometimes remains fifteen days without

out being moved; after which it is once more expoſed to the air, and when almoſt dry, gathered together again, in order to ſweat, which takes up twenty-four hours or more, according to the ſeaſon: it is then opened and expoſed to the air for the laſt time, and when thoroughly dried, houſed.

Fiſh cured in this manner are not only more fair to the eye, but more grateful to the taſte, than thoſe which are partly prepared at ſea; and that cured in the ſpring before the great heats, is generally the beſt.

SECT. V.

Of Cape Breton, *called by the French* L'Isle Royal.

Its Situation, Extent, Face of the Country, Climate, Soil, and Produce, with the advantages France received from it.

THE iſland of Cape Breton, which is ſeated fifteen leagues to the ſouth-weſt of Newfoundland, is in the forty-ſixth degree north latitude, and in the fifty-eighth degree thirty minutes weſt longitude, it being ſeparated from the continent by a narrow paſſage on the weſt. This iſland is about one hundred and ten miles from the north-eaſt to the ſouth-weſt. Round it are ſeveral harbours and bays, which, from its ſituation in the gulph of St. Lawrence, have made it conſidered as the key of Canada, it being a ſafe retreat for ſhips bound either to or from Canada.

It is of a very irregular figure, and ſo cut through by lakes and rivers, that its two principal parts are held together only by an iſthmus of about eight hundred paces in breadth; this neck of land ſeparates the bottom of Port Touloufe from ſeveral lakes, which are called Labrador. Theſe lakes diſcharge themſelves into the ſea to the eaſt by two channels, formed by the iſlands of Verderronne and la Boularderie.

All its ports open to the eaſt, turning a little to the ſouth, and are within the ſpace of fifty-five leagues, beginning at Port Dauphin, and continuing to Port Touloufe, which is almoſt at the entrance of the paſſage of Fronſac. In all other parts it is difficult to find anchorage. The northern coaſts are very high, and almoſt inacceſſible; and it is not eaſy to land on the weſtern coaſt, till you come to the paſſage of Fronſac, near which, as we have already obſerved, is Port Touloufe, which is between a kind of gulph called Little St. Peter's and the iſland of St. Peter: from hence proceeding towards the ſouth-eaſt is the bay of Gaborie, at twenty leagues diſtance; this bay is a league broad, between iſlands and rocks, and two leagues in depth; but it is not ſafe to come near the iſlands. The harbour of Louiſburgh, formerly called the Engliſh Harbour, is not above a league from the laſt-mentioned bay, and perhaps one of the fineſt in America, it being near four leagues in circumference, and having every where ſix or ſeven fathoms water. The town of Louiſburgh is ſituated on the ſouth-weſt ſide, in latitude forty-five degrees fifty minutes, and in fifty-eight degrees thirty-five minutes weſt longitude. It was pretty ſtrongly fortified, with as much regularity as the ſituation would admit. It had a good rampart, with irregular baſtions, a dry ditch, a covert-way, with an excellent glacis, and before two of the curtains a ravelin, with a bridge to the ſallee-ports; but the chief ſtrength of the place by land conſiſted in the thickneſs of the walls, and the impaſſable moraſſes, that extend from the foot of the glacis to a conſiderable diſtance. There was indeed one part without any walls for about a hundred yards, this being there abſolutely unneceſſary, the ſea flowing cloſe to the town, and therefore a paliſade was thought a ſufficient defence: nor can even ſmall barks approach it for want of ſufficient depth of water; and ſhips muſt keep at a very conſiderable diſtance, on account of the rocks and ſhoals. Beſides, there were two collateral baſtions, which flanked this part to very great advantage. In the center of one of the chief baſtions was a ſtrong building, with a moat on the ſide towards the town; and this was called the citadel, though it had neither artillery, nor was a ſtructure proper for receiving any: indeed the entrance to it was over a draw-bridge, on one ſide of which was a corps de garde, and advanced centinels on the other. Within this building were the apartments for the governor, the barracks for the garriſon, the arſenal, and under the platform of the redoubt a magazine always well furniſhed with military ſtores. The pariſh-church, or rather chapel, was alſo within the citadel, and without it was another belonging to the hoſpital of St. Jean de Dieu, an elegant and ſpacious ſtructure, built with ſtones. On an iſland at the entrance of the harbour was a ſtrong fort, and on the oppoſite ſide a very high tower, ſerving as a light-houſe. Here was a large fortification called the royal battery, and beyond it was another fort built on a point farther within the harbour. When the town of Louiſburgh was laſt taken from the French, it conſiſted of only ſeveral narrow lanes, and had few tolerable houſes in it, they being of wood, with a foundation of ſtone carried about ſix feet above the ground.

There are ſeveral other excellent ports; which are the more neceſſary, as the ſea round the iſland is ſubject to violent ſtorms of wind, with ſnow and ſleet, and ſuch fogs that it is frequently impoſſible to ſee the length of a ſhip: but what is ſtill more extraordinary, theſe fogs will, in the ſpace of one frofty night, caſe over the rigging of ſhips with ſuch thick ice, as to render them impoſſible to be worked till it is beaten off: the quantity beat off from only one of the ſhips employed in the conqueſt of the iſland in 1758, was computed to amount to ſix or eight tons weight; yet this amazing quantity was all congealed on the night of the fifth of May, when warmer weather might have been expected. Theſe circumſtances ſhew the advantages of an iſland filled with ſuch a number of excellent ports, ſeated in ſuch a tremendous ſea.

The ſoil and climate nearly reſemble thoſe of Newfoundland, and conſequently its produce is not very different. A conſiderable part of the land is barren; it, however, produces oaks of a prodigious ſize, pines for maſts, and all ſorts of timber fit for building. The moſt common ſorts are cedar, oak, aſh, beech, maple, aſpin, wild-cherry, and plane-trees. It likewiſe produces ſome ſorts of fruit, particularly apples, with herbs and roots, ſome kinds of grain, with hemp and flax.

It is obſervable, that the mountains may be cultivated up to the tops, and that the good ſoil always inclines towards the ſouth. There are here great numbers of fowl, particularly very large partridges, which in their feathers reſemble pheaſants. There are here likewiſe animals brought from Europe, as horned cattle, hogs, ſheep, goats, and poultry. The lakes, rivers, and bays, abound with beavers, otters, and excellent fiſh in the greateſt plenty; and what is got by hunting, ſhooting, and fiſhing, is ſufficient to maintain the inhabitants a good part of the year.

This induced the French, on their being excluded from Acadia and Newfoundland, to begin a ſettlement here in 1714, which they continued to encreaſe, and fortified it in 1720. They were, however, diſpoſſeſſed in 1745 by the bravery of the inhabitants of New England, with little aſſiſtance from Great Britain; but it was again, by the treaty of Aix la Chapelle, ceded to the French, who ſpared no expence to fortify and ſtrengthen it. However, it was again reduced in 1758 by the Britiſh troops under general Amherſt and admiral Boſcawen, who found in that place two hundred and twenty-one pieces of cannon and eighteen mortars, together with a very large quantity of ſtores and ammunition; and was yielded for ever to the crown of Great Britain by the laſt peace, ſince which the fortifications have been blown up, and the town of Louiſburgh diſmantled.

The importance of this iſland to the French may be eſtimated from the advantages they reaped from it when in their poſſeſſion. Though but a ſmall number of ſhips fiſhed near the harbour of Louiſburgh, in compariſon of thoſe employed in the French fiſheries on the banks of Newfoundland, the gulph of St. Lawrence, and the neighbouring ſhores, bays, and harbours; yet it is ſo ſituated, that all their fiſhing-veſſels could repair to it on any danger, or emergency, eſpecially thoſe which fiſhed in the gulph on the main, or at the north-weſt end of Newfoundland, none of which are above one or two days ſail

at

at moſt from thence; as might alſo thoſe veſſels which loaded with mud-fiſh on the banks; whence this iſland was the center and protection of their whole fiſhery.

According to a computation made by perſons intimately acquainted with every branch of it, the quantity of fiſh they caught in the year before the laſt war was one million one hundred and forty-nine thouſand quintals of dry fiſh, and three million nine hundred thouſand mud-fiſh; the value of both which, including three thouſand one hundred and ſixteen one quarter tons of train-oil, drawn from the blubber, amounts to nine hundred and twenty-ſix thouſand five hundred and ſeventy-ſeven pounds ten ſhillings, according to the prime coſt of the fiſh at Newfoundland; and with the addition of its freight to the ſeveral markets where it is ſold, makes nine hundred and forty-nine thouſand one hundred and ninety-two pounds ten ſhillings ſterling; and if to this be added the conſumption which is made of their coarſe woollens by the men employed in the fiſhery, reckoning for each a blanket, watch-coat, rug, pea-jacket, &c. in the whole thirty ſhillings per man, with the brandy they conſume; and alſo the canvas, cordage, nets, hooks, grapplings, anchors, &c. that the ſhips and ſhallops of this fiſhery muſt expend at ſea and on ſhore, the value of it will amount, at leaſt, to one million ſterling per annum, at which it is generally computed.

But in order to form a juſt eſtimate of the value of this branch of trade to the French, we ſhould alſo take in its beneficial conſequences, which principally conſiſt in the following articles: Firſt, the train-oil produced by it is neceſſary to the French in their woollen manufactory, in which they have already rivalled us with too much ſucceſs; and their ſugar colonies abroad, which cannot do without it, are ſupplied with it from France out of this fiſhery.

Secondly, the trade it opens for them in the Mediterranean, and all the Roman Catholic ſtates, where they carry their fiſh to market; and by this means force a vent for the French manufactures; which has been found ſo beneficial to their commercial intereſt, that they have been indefatigable in the cultivation of it, ſparing no pains nor coſt, and uſing every art to monopolize it.

Thirdly, the great encreaſe of their navigation and ſeamen ariſing from this fiſhery, in which five hundred and ſixty-four ſhips, beſides ſhallops, and twenty-ſeven thouſand five hundred ſeamen, were employed; circumſtances, eſpecially the latter, which, conſidered with regard to their maritime force, were of themſelves as valuable to France, as the revenue of the fiſhery itſelf: hence Charlevoix, in his Hiſtory of New France, juſtly obſerves, "That this fiſhery was a more valuable ſource of wealth "and power to France, than even the mines of Peru or "Mexico would be."

This great branch of trade may be ſaid to have depended upon the poſſeſſion of the Iſland of Cape Breton, on account of its affording them a convenient harbour to ſupply and protect it; but this they have ſince found means to carry on in a very profitable manner to themſelves without it. However, there are other great advantages which the French received from their poſſeſſion of this iſland. France has not one ſea-port for the relief and ſhelter of her trading ſhips, either to or from the Weſt Indies, open to them any where in North America to the northward of the river Miſſiſſippi; and conſequently the whole trade muſt for the future be expoſed to the Engliſh privateers from the northern colonies in time of war, without any place of ſtrength to which they can retreat; but Louiſburgh ſerved them as an harbour for their ſhips employed in this trade to reſort to for wood and water, to clean or repair, for convoy from thence to Old France, and on account of any diſtreſs. To all this muſt be added, that the poſſeſſion of this iſland put it into their power to annoy the trade of the Britiſh northern colonies in time of war, with their privateers from this harbour, to ſuch a degree, that it has ever been called by the Engliſh the Dunkirk of North America.

SECT. VI.

Of the Iſland of St. John.

Its Situation, Extent, and Produce.

THOUGH the iſland of St. John is ſeated in the neighbourhood of Cape Breton, and lies partly between it and the continent, and conſequently has nearly the ſame climate, yet it greatly exceeds the iſlands juſt mentioned, with reſpect to its pleaſantneſs and the fertility of its ſoil. It is computed to be about ſixty miles in length, and has not only a commodious harbour for carrying on the fiſhery, but abounds with a variety of uſeful timber and moſt kinds of game common to the neighbouring country. This iſland is ſo fertile, and was ſo well improved while poſſeſſed by the French, that it was juſtly ſtiled the granary of Canada, which it furniſhed with great plenty of moſt ſorts of corn, as well as great quantities of beef and pork; and, when laſt taken, had upwards of ten thouſand head of black cattle, and ſome of the farmers raiſed twelve hundred buſhels of corn annually. It has ſeveral rivers, which abound with ſalmon, trout, eels, &c. and the ſurrounding ſea affords plenty of ſturgeon, plaice, and moſt kinds of ſhell-fiſh. An iſland of this advantage was at once carefully cultivated, and its importance concealed from the Engliſh, leſt it ſhould induce them to make themſelves maſters of it, and by that means cut off the principal ſupplies from Quebec. In this iſland are yet conſiderable quantities of land uncultivated, which, by a proper improvement, would render it ſtill more valuable.

When this iſland was ſurrendered to colonel Rollo, it had four thouſand inhabitants; and, to the diſgrace of the governor, there were found in his houſe ſeveral Engliſh ſcalps, which were brought there to market by the ſavages of Nova Scotia; this being the place where they were encouraged to carry on this barbarous and inhuman trade.

The important conqueſt of the iſlands of Cape Breton and St. John filled the whole kingdom with exultation; and eleven pair of colours, taken at Louiſburgh, were, by his majeſty's order, carried in a pompous parade, eſcorted by a detachment of foot-guards, from Kenſington-palace to the cathedral of St. Paul, where they were depoſited as trophies, under a diſcharge of cannon, and other expreſſions of triumph and exultation.

Both this iſland and that of Cape Breton are at preſent under the governor of Nova Scotia, as are alſo ſeveral ſmall adjacent iſlands.

CHAP. II.

Of NOVA SCOTIA, CANADA, NEW ENGLAND, NEW YORK, the JERSEYS, PENNSYLVANIA, and MARYLAND.

SECT. I.

Of ACADIA, *or* NOVA SCOTIA.

Its Situation, Extent, Produce, Harbours, and Hiſtory.

ACADIA, or Nova Scotia, is the moſt eaſtern part of the continent of America. It is bounded by the gulph of St. Lawrence and the ſtreights of Canſo, which ſeparates it from Cape Breton, on the eaſt; on the ſouth by the Atlantic ocean; on the weſt by the bay of Fundy and the province of Main, belonging to Maſſachuſet-bay; and on the north by the river of St. Lawrence, which divides it from Canada; extending from the forty-third degree thirty-ſeven minutes to the forty-ninth degree thirty minutes north latitude, and from the ſixtieth degree fifteen minutes to the ſixty-ninth degree weſt longitude. It is ſo indented by what is called the bay of Fundy, that the ſouth-eaſt part, towards the ocean, forms a triangular peninſula, only joined by a ſmall iſthmus to the other part.

It is in general a fine country, the climate being tolerably temperate, though pretty ſevere in winter, when the cold is ſharp and the ſnow lies deep on the ground; but the air is there generally clear, with a bright ſunſhine, and azure ſky: the ſummer is, however, hotter than in England.

The ſoil of this province is various, in ſome places barren, and in others exceeding pleaſant and fertile; particularly round the bay of Fundy, and on the rivers which fall into it, where are large tracts of ground on both ſides theſe rivers, for fifty or ſixty miles into the country, and ſeveral miles from the bay, which were once marſhy, but, by being dyked, are improved to great advantage. The eminences in this province are alſo very pleaſant and fruitful, producing wheat, rye, Indian-corn, peas, beans, hemp, flax, and ſome kinds of fruit in great perfection, as gooſeberries, raſberries, ſtrawberries, which grow in the woods. Several parts yield fine timber, and particularly excellent oak fit for building of ſhips; with fir, ſpruce, birch, &c. It abounds with all the neceſſaries of life, particularly a great number of deer and other game, with plenty of wild-fowl, as teal, herons, wood-cocks, pigeons, buſtards, partridges, wild-ducks, and great numbers of beavers and otters. The rivers abound with ſalmon and other kinds of river-fiſh. There are alſo ſeveral fiſheries erected in the different harbours, which are carried on with great ſucceſs.

The coaſt has the advantage of many bays, harbours, and creeks; and the land is enriched by many rivers, ſome of which are navigated for a long courſe by the native Indians. The harbour of Chebucto, upon which is ſeated the metropolis, may be juſtly eſteemed one of the fineſt in the world, both for ſafety and convenience, it having good anchoring-ground, and water ſufficient for the largeſt men of war. This is therefore made the place of rendezvous for the royal navy in America, it having a royal dock, and conveniences for the largeſt ſhips to heave down and careen. The entrance into it is from the ſouth, with a large iſland of an irregular form, lying on the north-eaſt ſide, named Cornwallis Iſland, from the firſt governor of Hallifax. This iſland, as well as a ſmaller one that lies higher up the harbour, named George Iſland, is very commodiouſly ſituated for a fiſhery, and has conveniencies of all ſorts proper for drying and curing the fiſh.

On the weſt ſide of this harbour is ſeated the town of Hallifax, which, though founded ſo lately as the year 1747, is now a conſiderable place, conſiſting of above one thouſand houſes, laid out in handſome ſtraight ſtreets, and is the capital of the whole province.

There are alſo ſeveral other towns laid out round the bay, and partly inhabited; but the moſt conſiderable ſettlements are upon the bay of Fundy, and the rivers that fall into it.

About two miles up the harbour of Chebucto is a river on the ſouth-weſt ſide, with a ſmall harbour at its entrance. This river, which was called by the firſt ſettlers of Hallifax Sandwich river, is at the mouth about as wide and deep as the Thames at London-bridge, and is ſalt-water for about four or five miles up, when it terminates, where a ſmall freſh water rivulet falls into it from the north. From the mouth of Sandwich river to the oppoſite ſide of the harbour, is about two miles, with good anchoring-ground for the largeſt ſhips in any part of it, and a fine watering-place on the north-eaſt ſide: the land on both ſides is exceeding high, but covered with wood.

Four or five miles to the north of the above river, is a narrow entrance of half a mile, into Bedford-bay, which is about twelve miles in circumference, and has ſeveral creeks at the bottom of it, abounding with the fineſt ſalmon in the greateſt plenty: there are alſo ſeveral iſlands in it, and on the weſtern ſide of it, grow a great number of pines fit for maſts. This bay, with the harbour, and Sandwich river, divide the peninſula from the main-land.

Upon the oppoſite ſhore are ſeveral large rivers, among which that of St. John is the moſt conſiderable. It is ten leagues diſtant from the gut of Annapolis, and has a very long courſe; but has two prodigious cataracts near its mouth, one of them no leſs than thirty fathoms deep, which is ſuppoſed to be chiefly occaſioned by the great head of water above, and the channel being pent up between two ſteep mountains.

The inhabitants may be computed at about twenty thouſand, who export to other parts chiefly lumber, as planks, ſtaves, hoops, joiſts, and fiſh. The latter is, indeed, the ſtaple commodity, and employs a conſiderable number of hands.

The king of Great Britain, who is ſovereign of the ſoil, appoints the governor, the lieutenant-governor, and council, who form the upper-houſe; and the lower-houſe is formed of the repreſentatives of the people, who are choſen by the freeholders.

This country was diſcovered by Sebaſtian Cabot in 1497, but lay long neglected before any conſiderable ſettlement was made in it. The French, however, had landed and built houſes; but in 1614, captain Argal, by order of the governor of Virginia, ſailed thither, and obliged them to depart.

In 1621, king James gave a grant of this province to Sir William Alexander, afterwards earl of Stirling, and ſecretary of ſtate for Scotland, by whom it was called Nova-Scotia. The next year, Sir William ſent a number of people, and all kinds of neceſſaries for beginning a ſettlement; but in 1632, Quebec and Cape-Breton, which had been taken from the French, were, together with this province, ceded to them by a treaty concluded between Charles I. and Lewis XIII. when a number of Engliſh removed out of it, and the French kept it in their poſſeſſion till the year 1654, when Oliver Cromwell ſent major Sedgewick, who took Port-Royal, and obliged the French to quit the country.

Nova-Scotia continued in our poſſeſſion till the reign of Charles II. when it was again ceded to the French by the treaty of Breda. They kept it without moleſta-

tion

tion till the year 1690, when the people of New England, finding the inconvenience of having the French ſo near them, prepared a fleet, with a proper number of land forces, and gave the command to Sir William Phipps, a native of that province; who ſailing from New England, on the twenty-eighth of April 1690, arrived before Port-Royal, now Annapolis, in May following; and ſoon reducing that town, obliged the inhabitants there, and on St. John's river, amounting to about ſix thouſand, either to conſent to ſubmit to the Engliſh government, or to be tranſported to Canada: when moſt of them, for the ſake of keeping their eſtates and habitations, conſented to become Britiſh ſubjects; but ſoon ſhewed that they were ſtill bad neighbours to the people of New England. In 1710 queen Anne liſtening to their repeated complaints, ſent a ſquadron and ſome land forces under colonel Nicholſon, who took Port-Royal, which, in honour of the queen, he called Annapolis; after which Nova Scotia was yielded to Great Britain, by an expreſs article in the treaty of Utrecht. Thoſe of the inhabitants who choſe to remain, were to become Britiſh ſubjects, and freely to enjoy their religion. However, in order to ſecure their obedience, and keep poſſeſſion of the country, a garriſon was kept at Annapolis, and a ſmall one at Canſo: but as no government was yet eſtabliſhed, nor any proper encouragement given to the Britiſh ſubjects to ſettle there, the inhabitants, notwithſtanding their oaths of allegiance, aſſiſted a party of French, in 1744, in the reduction of the fort at Canſo, and made an attempt upon Annapolis, but without ſucceſs; that garriſon being ſeaſonably relieved from New England. They, however, ſtill continued to commit ſecret hoſtilities, and to ſupply and encourage the Indians in their neighbourhood to perpetrate the moſt horrid acts of cruelty and barbarity on the Engliſh, upon the frontiers of New England, whoſe ſcalps, ſays major Rogers, were carried to market to Louiſburgh, Quebec, &c. not only in time of war, but in peace, and there exchanged for powder, ball, or whatever they wanted. By theſe means there were at the concluſion of the peace, in the beginning of the year 1749, no other Engliſh in Nova-Scotia beſides the garriſon of Annapolis, and the inhabitants who lived within a few miles round that place.

The peace was, however, no ſooner concluded, than the earl of Hallifax projected the complete ſettlement of Nova-Scotia by the Engliſh, and uſed his utmoſt endeavours to carry it, in the moſt effectual manner, into execution. He, with the other lords commiſſioners of trade and plantations, having gained his majeſty's approbation, they in March 1749, publiſhed propoſals, offering proper encouragement to ſuch of the officers and private men as, after the concluſion of the peace, had been diſmiſſed his majeſty's land and ſea ſervice, and were willing to accept of grants, in order to ſettle in Nova-Scotia. Fifty acres of land in fee-ſimple were offered to every private ſoldier or ſea-man, free from the payment of quit-rent or taxes for the term of ten years, and at the expiration of that time, they were to pay only one ſhilling a year for every fifty acres. But this was not all, every private ſoldier or ſeaman who had a family, was to have ten acres for every perſon of which his family conſiſted, including women and children; and farther grants were to be made to them on the like conditions, in proportion as their families encreaſed, or to their abilities for cultivating the land.

The next care of the governor was to pitch upon a proper ſpot for the firſt ſettlement, and as the peninſula appeared preferable, both on account of its commodious ſituation, and the fertility of the ſoil, the able-bodied men on board each ſhip were employed in clearing ground in order to build a town at the ſouth point, at the entrance of Sandwich river; but many objections being ſoon found againſt that place, another ſpot was choſen by the governor, at about the diſtance of a mile and a half from it, on the ſide of Chebucto harbour, and on the declivity of a riſing ground that commands the whole peninſula, and would ſhelter the town from the north-weſt winds. The beach they found was a fine gravel, convenient for ſmall boats, the anchorage was every where good for large ſhips, within gun ſhot of the town, and ſmall but navigable rivers of freſh and wholeſome water flowed round it.

Here then they made a ſecond, and more ſucceſsful attempt; and, indeed, it would not have been eaſy to have choſen a more happy ſituation; they therefore cleared the ground in as expeditious a manner as poſſible, and having erected a large wooden houſe for the governor, with proper ſtore-houſes, the ground was laid out, ſo as to form a number of ſtraight and beautiful ſtreets, croſſing each other at equal diſtances, upon a moſt excellent plan, ſaid to have been formed by the earl of Hallifax. The work went on briſkly; the people of New England brought ſeveral ſhips laden with planks, door-caſes, doors, window-frames, and other parts of houſes; and the people being employed in ſhips companies, this created an emulation, that rendered their labours remarkably ſucceſsful; ſo that in about three years time, this town, which was named Hallifax, from that nobleman to whom the ſettlement owed its beginning, was finiſhed, and every family had a good houſe of their own, of which the maſter was landlord. Within the ſame ſpace of time were alſo erected a church, and wharfs, the town was palliſadoed, and other fortifications erected: ſome land was alſo cleared for agriculture, and already planted, notwithſtanding the oppoſition they met with from the French, and their tools the Indians.

To explain this laſt circumſtance, it is neceſſary to obſerve, that in the beginning of the ſettlement, and ſoon after the landing of the Engliſh, a hundred black cattle and ſome ſheep were brought them by land from a French ſettlement at Minas, a town about thirty miles from the bottom of Bedford-bay; and French deputies alſo coming to make their ſubmiſſion, it was propoſed to cut a road thither, thoſe deputies promiſing to contribute fifty men towards carrying on that work. The Engliſh alſo received the promiſe of friendſhip and aſſiſtance from the Indians, their chiefs waiting upon the governor for that purpoſe. But theſe ſubmiſſions, and theſe promiſes, were ſoon broken by the perfidy of the French court, which diſapproved of theſe proceedings, and reſolved to harraſs the Engliſh before their town was built, and their fortifications erected. Inſtructions were therefore communicated to the deſcendants of the French in Nova-Scotia, and the ſcene was inſtantly changed; they engaged the Indians to uſe their utmoſt endeavours to prevent the new colony from proceeding; and the year in which peace was proclaimed, and Cape Breton reſtored, was not expired, when the town began to be frequently attacked in the night, and the Engliſh could not ſtir into the adjoining woods, without the danger of being ſhot, ſcalped, or taken priſoners. They however proſecuted the ſettlement with indefatigable induſtry, and the town was ſoon finiſhed, notwithſtanding all the endeavours of the French to oppoſe it.

It was however impoſſible to clear woods and plough lands, without ſeparating into ſmall parties; and this work was attended with great danger; for though the French and Indians did not dare to attack any conſiderable body of the Engliſh, yet they frequently fell upon ſmall parties; and though they had been often repulſed, they always returned whenever they had an opportunity of doing it to advantage. Complaint of this open war, in a time of peace, was now made to the court of France, when his Moſt Chriſtian Majeſty propoſed that commiſſaries ſhould be appointed to ſettle the bounds of Nova-Scotia. This was done; but thoſe of the French endeavoured by all the arts of ſophiſtry to prove, that the Nova-Scotia ceded to the Engliſh by the treaty of Utrecht, was no more than the peninſula of that country. The Britiſh commiſſaries juſtified our claim to the whole by memorials filled with the ſtrongeſt and moſt evident proofs; and the moſt trifling anſwers being returned to theſe, admiral Boſcawen was ſent to ſeize the French ſhips in North America; and France evidently appearing to have concerted the means of conquering all the Britiſh dominions on that continent, the late war was entered into to prevent it. During all this time, the French of Nova-Scotia continued their cruel and infamous practices, till at the beginning of that war, when

the government being convinced that theſe French rebels, called neutrals, from their having ſworn allegiance to the crown of Great Britain, were more inveterate and dangerous enemies than thoſe who were under no ſuch obligation; and finding that all methods to render them good ſubjects were ineffectual, they were forcibly deprived of their eſtates, and with their families were obliged to leave the province.

SECT. II.

Of CANADA, *or* NEW FRANCE.

Its Situation and Extent; a conciſe Account of its Rivers, Mountains, Vegetables, and Animals.

CANADA, the largeſt province upon the continent, is now bounded on the north-eaſt by the gulph of St. Lawrence and St. John's river; on the ſouth-weſt by lands inhabited by the Indians; on the ſouthward by the province of New York, New England, and Nova Scotia; and on the north-weſtward by lands claimed by the Indians. Quebec, which is its capital, is ſeated near the centre, in lat. forty-ſix degrees forty-five min. and in ſixty-nine deg. forty-eight min. weſt longitude; and the country extends, according to Major Rogers, about five hundred miles in length, from the north-eaſt to the ſouth-weſt, and upwards of two hundred miles in breadth.

The French comprehended under the name of Canada, a much larger territory, taking into their claim great part of the New England provinces, and of the provinces of New York and Nova Scotia; northerly to Hudſon's-Bay; to the weſt as far as the Pacific Ocean; and to the ſouthward extending it to the gulph of Mexico. They even endeavoured to ſupport their claim, by erecting a chain of forts from the mouth of the river St. Lawrence to their ſettlements in Louſiana.

They began the ſettlement of this province in 1605 at Quebec, which is ſeated on the north ſhore of the river St. Lawrence, about three hundred miles from its mouth; and about the ſame time began to form ſettlements upon the iſland of Orleans, which is ſeated in that river, a little below Quebec; likewiſe on each ſide of the river, to its mouth, and on ſeveral ſmaller rivers that fall into it. They ſoon after began a ſettlement called Jecorty, about twenty miles up the river from Quebec, and erected a fort at Chamblee on the river Sorreil, near its influx into the lake Champlain. Soon after this the foundations of Montreal were laid on the iſland of the ſame name, in the river St. Lawrence, two hundred miles above Quebec. Another ſettlement was made at Trois Rivieres, or the Three Rivers, ſo called from a river diſcharging itſelf by three mouths into that of St. Lawrence; and is ſeated about half way between Quebec and Montreal, in a very delightful ſpot, that affords the moſt agreeable proſpect of any in the whole country. There are many other ſettlements on the banks of the river St. Lawrence, and of thoſe which flow into it, as well as on the iſlands formed in it.

While the above ſettlements were forming Sir David Kirk, in 1629, with the Engliſh under his command, took Canada, which was then conſidered as within the limits of the Britiſh dominions, attacked Quebec, and made themſelves maſters of all the French ſettlements. But they were reſtored by the treaty of 1632, and continued in their poſſeſſion till September 13, 1759, when Quebec was ſurrendered to the generals Monckton and Townſend, commanding the Britiſh troops that had been deſtined for the expedition againſt it the preceding ſpring, under the command of general Wolfe; and on the eighth of September, 1760, all Canada was delivered up to the Engliſh in the capitulation of Montreal; but we ſhall give a particular account of the taking of Quebec, after having deſcribed that city.

The climate here is cold, the winters long and tedious, eſpecially in the north-eaſterly parts of the province; notwithſtanding which the ſoil is in general very good, and in many parts both pleaſant and fertile, producing moſt kinds of Engliſh grain and vegetables in great abundance, eſpecially the iſland of Orleans, and the iſlands and lands near it, which are remarkable for the richneſs of their ſoil.

The ſummers of Canada are exceeding pleaſant, and are ſaid to have ſo happy an effect upon the ſoil, that the farmer expects to reap his crop in ſixteen weeks from the time of ſowing his ſeed. The meadow grounds, which are well watered, yield excellent graſs, and breed vaſt quantities of large and ſmall cattle; and where the land is well cultivated, it produces rich crops. The mountains abound with coal-mines. This province has in ſome parts very excellent timber, ſuch as white pines, oak of different kinds, and ſpruce in great abundance.

The rivers branching through this extenſive country are very numerous, and many of them navigable a conſiderable way; but they are all ſwallowed up by the river St. Lawrence. This river is eighty miles wide at its entrance into the ſea at Cape Roſire's, and in its courſe forms a variety of bays, harbours, and iſlands; the moſt pleaſant and fruitful of which is the iſland of Orleans, juſt mentioned, a little below Quebec, the ſoil of which is excellent, and being well improved, produces in abundance all the kinds of grain and vegetables common to the climate, it extending twenty-one miles in length, and three or four in breadth. The French, while in poſſeſſion of this province, induſtriouſly repreſented the navigation of the river St. Lawrence to be difficult and dangerous; but the contrary has been ſince found to be the caſe, ſhips of the line meeting with no difficulty in ſailing to Quebec.

The land in general on both ſides of the river is low and level; but oppoſite to Quebec are two conſiderable mountains, called the Lady Mountains, which run from thence ſouth-weſt through the continent to the country of the Creek Indians, on the north part of the Two Floridas, in one continued ridge; and wherever rivers paſs through them they riſe very ſteep on each ſide to their common height. This ridge of mountains is called the Apalachian hills.

The country affords plenty of ſtags, elks, bears, foxes, martins, ferrets, weazles, ſquirrels, hares, rabbits, and other animals.

The elk is near as large as a horſe, but reſembles the deer, and, like it, annually renews its horns. The Indians have a great veneration for this animal, and imagine that to dream of it portends good fortune and long life. The elk delights in cold countries, feeding upon graſs in ſummer, and moſs-buds, &c. in winter, when they herd together. It is dangerous to approach very near him when he is hunted, as he ſometimes turns furiouſly on his purſuers, and tramples them to pieces. To prevent this, the hunter throws his cloaths to him, and while the deluded animal ſpends his fury on theſe, he takes proper meaſures to diſpatch him.

The wild-cats are great enemies to the elk; and, notwithſtanding their being vaſtly inferior in ſize, often make a prey of him: for he has no other way to diſengage himſelf from them, but by plunging into the water.

The Indians ſcarce undertake any thing with greater ſolemnity than hunting the bear; and an alliance with a noted bear-hunter, who has killed ſeveral in one day, is more eagerly ſought after than that of one who has rendered himſelf famous in war; this chace ſupplying them both with food and raiment. The bears lodge during the winter either in hollow trees or caves; and, as they lay up no proviſions, have no food during that ſeaſon.

The bear is not naturally fierce, except when wounded or pinched with hunger. They run themſelves very poor in the month of July; and it is ſomewhat dangerous to meet them till their hunger is ſatisfied, and they recover their fleſh, which they do very ſuddenly. They are very fond of grapes, and moſt kinds of fruit. When proviſions are ſcarce in the woods, they venture out among the ſettlements, and make great havock of the Indian-corn; and ſometimes kill the ſwine. Their chief weapons are their fore-paws, with which they will hug any animal they ſeize immediately to death.

The ſkunk, or pole-cat, is very common, and called by the Indians the ſtinking beaſt, on account of its emitting a diſagreeable ſmell to a conſiderable diſtance, when purſued

Rooker Sculp.

A View of **QUEBEC** *from the Bason.*

purſued or diſturbed. It is about the ſize of a ſmall cat, has ſhining hair of a grey colour, with two white lines that form an oval on its back. The fur of this animal, with that of the ermin, otter, and martin, make up what is called the ſmall peltry.

The ermin is about the ſize of the ſquirrel; its fur is extremely white, its tail long, and the tip of it as black as jet.

The martin, or ſable, lives principally among the mountains; is as long as a common cat, but very ſlender: their fur is very fine and valuable.

The muſk-rat reſembles the beaver in every part, except its tail, which is round like that of a rat. One of theſe animals weighs about five or ſix pounds. During the ſummer ſeaſon the male and female keep together, but ſeparate at the approach of winter; and each ſeeks a ſhelter in ſome hollow tree, without laying up any proviſions.

The foxes here are of various colours, as black, grey, red, and white; who, by their craft and cunning, make great havock among the water-fowl in the lakes and rivers.

The country abounds with a vaſt variety of fowls; and the rivers and lakes are well ſtored with ſalmon, eels, and a multitude of various kinds of other fiſh.

SECT. III.

A Deſcription of Quebec and Montreal; with a particular Account of the Conqueſt of thoſe Cities, by which all Canada became ſubject to the Crown of Great Britain.

QUEBEC, the capital of Canada, ſeated about three hundred miles north-weſt of Boſton, in New England, is a handſome and large city, ſtrongly fortified. The harbour is flanked with two baſtions, which at high tides are almoſt level with the water. A little above one of them is a demi-baſtion, which is partly taken out of the rock; and above it, on the ſide of the gallery of the fort, is a battery of twenty-five pieces of cannon: above this is a ſquare fort called the citadel, and the ways from one fortification to another are difficult to paſs. To the left of the harbour, on the ſide of the road, are large batteries of cannon, and ſome mortars. It is encompaſſed with walls, and has a caſtle on the brow of a hill, about forty fathoms above the town; but it is irregularly built, and fortified with only two baſtions, and no ditch towards the town. It has alſo another fort at Cape Diamond of ſolid rock, four hundred fathoms high: but it owes its greateſt ſtrength to nature. The firſt place taken notice of upon landing here is a ſquare of an irregular figure, with well-built houſes on one ſide; on the back of which is a rock; on the left it is bounded by a ſmall church; and on the right has two rows of houſes parallel to each other. There is another between the church and the harbour; as alſo another long row on the ſide of the bay. This is called the Lower Town, which is moſtly inhabited by merchants; but it is too much crowded. Between this and the Upper Town is a very ſteep aſcent, in which are ſteps for the foot paſſengers to go up. This has noble edifices, and between two large ſquares is a fort, in which the governor reſides. Oppoſite the fort the Recollects have handſome houſes, and on the right is the cathedral, which is built in a mean ſtile, but has a large, high, and well-built tower, that may be ſeen at a great diſtance. Over-againſt this is the Jeſuits college, which is a fine building; and between them are well-built-houſes. The houſe of the Knights Hoſpitallers is a ſtately ſtructure, with two fine pavilions. In the ſecond ſquare are two deſcents to the river of St. Charles, an hoſpital called Hotel-Dieu is in the midway, and from thence are ſmaller houſes, which reach to that of the intendant. On the other ſide of the Jeſuits college is a pretty long ſtreet, in which is a nunnery. Almoſt all the houſes are built of ſtone, and there are above ſeven thouſand inhabitants. Beſides the Lower and Higher Towns, there is another beyond the latter, on the banks of the river St. Charles, along which are ſeveral noble country ſeats.

In 1711 the Engliſh fitted out a fleet, with a deſign to conquer Canada: but the expedition failed, from the raſhneſs of the admiral, who, contrary to the advice of his pilot, ſailed too near the Seven Iſles, and thus loſt his largeſt ſhips, with three thouſand of his beſt ſailors. But it has ſince been attacked with much better ſucceſs.

It will not be improper to give here a particular account of the taking of this city, one of the moſt difficult enterprizes that was ever effected by the united efforts of prudence and valour. The ſituation of the place, and the fortifications with which it is ſecured; the natural ſtrength of the country; the great number of veſſels and floating batteries the French had provided for the defence of the river; the ſkill, labour, ſuperior force, and uncommon vigilance of the enemy; their numerous bodies of Indians, who continually hovered about the poſts of the Engliſh to ſurprize parties and harraſs detachments; theſe, and many other obſtacles, formed ſuch a combination of difficulties, as was ſufficient to diſcourage and perplex the braveſt and moſt intelligent general.

But the ſpirit of Wolfe was not to be intimidated by danger; embarking the troops on board the tranſports, he paſſed with them up the river; while admiral Holmes made a motion with his ſhips to amuſe the enemy, now poſted along the north ſhore. But the tranſports being extremely crowded, and the weather very bad, the general thought proper to canton half his troops on the ſouth ſhore, where they were refreſhed. As no probability appeared of annoying the enemy above the town, it was agreed to convey the troops farther down in boats, and land them during the night within a league of Cape Diamond, in hopes of aſcending the heights of Abraham, which riſe abruptly with a ſteep aſcent from the banks of the river, that they might take poſſeſſion of the ground on the back of the city, where the fortifications were but indifferent: but the dangers and difficulties attending this undertaking were exceeding great. The ſtream was rapid; the ſhore ſhelving; the bank of the river lined with centinels; the landing-place ſo narrow as to be eaſily miſſed in the dark; and the ground ſo difficult as hardly to be ſurmounted in the day-time, had no oppoſition been expected. Had the enemy received the leaſt intimation from a ſpy or deſerter, or even ſuſpected the deſign; had the embarkation been diſcovered in conſequence of the rapidity of the river, or the ſteepneſs of the north ſhore, near which they were obliged to row; had only one centinel been alarmed, or the landing-place much miſtaken; the height of Abraham muſt have been inſtantly ſecured by ſuch a force as would have rendered the undertaking abortive; confuſion would have neceſſarily enſued in the dark; and this confuſion would naturally have produced a panic, which might have proved fatal to the greater part of the detachment. Theſe objections did not eſcape the penetration of the intrepid Wolfe, though he readily adopted the plan, and even executed it in perſon, though at that time afflicted with a ſevere dyſentery and fever.

Having prepared for this dangerous enterprize, admiral Holmes moved with his ſquadron farther up the river, about three leagues above the intended landing-place, in order to deceive the enemy, and amuſe M. de Bougainville, whom Montcalm had detached with fifteen hundred men to watch the motions of that ſquadron; but the Engliſh admiral was directed to fall down in the night, and protect the landing of the forces; this he punctually performed. On the twelfth of September, at one in the morning, the firſt embarkation, conſiſting of four complete regiments, the light infantry, commanded by colonel Howe, a detachment of Highlanders, and the American grenadiers, was made in flat-bottomed boats, under the immediate command of the brigadiers Monckton and Murray, though general Wolfe accompanied them in perſon, and was one of the firſt who landed: and they began to fall down with the tide to the intended place of diſembarkation, rowing cloſe along the north ſhore, in order to find it the more eaſily. The boats glided gently along without any diſorder; but by the rapidity of the tide, and the darkneſs of the night, they overſhot the mark, and the troops landed a little below the place intended.

This remarkable ſucceſs in landing without the leaſt knowledge of the enemy, was in ſome meaſure owing to the following accident: two French deſerters had been carried the evening before the embarkation on board the Engliſh fleet, and from them the general learned that the garriſon of Quebec expected that night to receive a convoy of proviſions, ſent down the river in boats, from the detachment above, commanded by M. de Bougainville. The knowledge of this particular was of the utmoſt conſequence, and tended to deceive the centinels poſted along ſhore to challenge boats and veſſels, and give the alarm. The firſt boat that contained the Engliſh troops being queſtioned accordingly, a captain of Fraſer's regiment, who had ſerved in Holland, and was perfectly acquainted with the French language and cuſtoms, anſwered without heſitation to *Qui vit*, which is their challenging word, *De la France:* nor was he at a loſs to anſwer the ſecond queſtion, which was much more particular and difficult. When the centinel demanded *A quel regiment?* to what regiment? the captain replied, *De la reine*, which he knew by accident to be one of thoſe that compoſed the body commanded by Bougainville. The ſoldier took it for granted that this was the expected convoy, and ſaying *Paſſe*, allowed all the boats to proceed without farther queſtion.

The troops were no ſooner landed, than the boats were ſent back for a ſecond embarkation, which was under the direction of brigadier Townſhend. In the mean time colonel Howe, with the light infantry and Highlanders, aſcended the woody precipice with admirable courage and activity; for the narrow path that ſlanted up the hill from the landing place had been broken up, and rendered impaſſable by croſs-ditches: and in every other part the hill was ſo ſteep and dangerous, that the ſoldiers were obliged to pull themſelves up by the roots and boughs of trees, growing on each ſide of the path. In their paſſage they diſlodged a captain's guard, which defended a paſſage, by which alone the reſt of the troops could reach the ſummit. After this the whole army mounted without moleſtation, and the general drew up the troops as faſt as they arrived.

M. de Montcalm no ſooner underſtood that the Engliſh had gained the heights of Abraham, than he determined to hazard a battle; and collecting his whole force without delay, marched towards the Engliſh.

Mean while the brave general Wolfe, perceiving that the French were croſſing the river St. Charles, formed his own line; the right commanded by brigadier Monckton, and the left by brigadier Murray, while colonel Howe, who had juſt returned with his light infantry from taking a four-gun battery, was poſted in the rear of the left. M. de Montcalm advancing in ſuch a manner as ſhewed his intention was to flank the left of the Engliſh, brigadier Townſhend was ſent with the regiment of Amherſt, which he formed, preſenting a double front to the enemy, and was afterwards reinforced by two battalions. The reſerve conſiſted of one regiment, drawn up in eight ſub-diviſions, with large intervals. The enemy's right was compoſed of half the colony troops, and a body of Canadians and Indians: their center conſiſted of a column of two other regular battalions; and on the left were poſted one battalion, and the remainder of the colony troops: the buſhes and corn-fields in their front were lined with fifteen hundred of their beſt markſmen, who kept up an irregular galling fire, which proved fatal to ſeveral brave officers, who were ſingled out for deſtruction. This fire was indeed choaked by the advanced poſts of the Britiſh line, who piqueered with the enemy ſome hours before the battle began. Both armies were almoſt entirely deſtitute of artillery; the French having only two pieces, and the Engliſh no more than one, which the ſeamen had with great difficulty drawn up from the landing-place; but this ſingle piece, being well ſerved, galled their columns ſeverely.

The enemy advanced to the charge with great order and vivacity, about nine in the evening, though their fire was both irregular and ineffectual. The Britiſh forces, on the contrary, reſerved their ſhot till the French approached within forty yards of their line, when they poured in a terrible diſcharge, and continued their fire with ſuch ſpirit and deliberation, as could not fail of producing a very remarkable effect. The general himſelf ſtood in the warmeſt part of the attack, at the head of Brag's regiment and the Louiſburgh grenadiers, conſpicuous in the very front of the line, where he was aimed at by the enemy's markſmen, and at laſt received a ſhot in his wriſt, which, however, did not oblige him to quit the field: wrapping a handkerchief about the wound, he continued to give his orders, without the leaſt emotion; and boldly advanced at the head of the grenadiers, with their bayonets fixed, when another ball unfortunately pierced the breaſt of the young hero, who fell at the moment when victory was crowning all his labours with ſucceſs; for at that inſtant every regiment of the Britiſh army ſeemed to exert itſelf for the honour of its own peculiar character. While the right puſhed on with their bayonets, brigadier Murray advanced briſkly with the troops under his command, and ſoon broke the enemy's center; when the Highlanders, ſupported by Anſtruther's regiment, drawing their broad ſwords, fell in among them with irreſiſtible impetuoſity, driving them with great ſlaughter into the city, and the works they had raiſed at the bridge over the river St. Charles. The action was leſs violent on the left and the rear of the Engliſh. Colonel Howe having taken poſt with two companies, behind a ſmall copſe, frequently ſallied out on the flanks of the enemy during the attack, and often drove them into heaps, while brigadier Townſhend advanced platoons againſt their front: ſo that the right wing of the French was prevented from executing their firſt intention. The brigadier himſelf continued at the head of Amherſt's regiment to ſupport this diſpoſition, and overcome a body of Indians poſted oppoſite to the light infantry, waiting for an opportunity of falling upon the rear of the Britiſh army.

General Wolfe being ſlain, and Mr. Monckton dangerouſly wounded at the head of Laſcelles's regiment, where he diſtinguiſhed himſelf with remarkable gallantry, the command devolved on brigadier Townſhend, who haſtened to the center; and finding the troops diſordered in the purſuit, formed them again with all poſſible expedition. He had hardly performed this neceſſary part of his duty, when M. de Bougainville, at the head of two thouſand freſh men, appeared in the rear of the Engliſh. He had begun his march from Cape Rouge as ſoon as he received intelligence that the Britiſh troops had gained the heights of Abraham; but did not reach the field of battle ſoon enough to have any ſhare in the action; for this body no ſooner approached the Britiſh rear, than Mr. Townſhend ordered two battalions, with two pieces of artillery, to advance; but the French prevented an attack by retiring among woods and ſwamps, whither general Townſhend, who had already obtained a complete victory, wiſely declined purſuing them; he having a great number of French officers priſoners, and being in poſſeſſion of a very advantageous ſituation. M. de Montcalm, the French general, was mortally wounded in the battle, and conveyed into Quebec; but before he died wrote a letter to general Townſhend, recommending the priſoners to that generous humanity which diſtinguiſhes the Britiſh nation. His ſecond in command was left wounded on the field, and being conveyed on board an Engliſh ſhip, expired the next day. About a thouſand of the enemy were made priſoners, including a great number of officers; and about eight hundred were ſlain on the field of battle. Among the Engliſh army, it is ſaid that no more than fifty men were killed in gaining this important victory, and about five hundred wounded; but the death of general Wolfe was a national loſs univerſally lamented.

This victory was no ſooner obtained than admiral Saunders, who had all along heartily aſſiſted the land-forces, for the advantage of the ſervice, ſent up all the boats of the fleet with artillery and ammunition; and on the ſeventeenth ſailed up with all the ſhips of war, in a diſpoſition to attack the Lower Town, while the Upper ſhould be aſſaulted by general Townſhend. That gentleman had employed his whole time ſince the action in ſecuring the camp with redoubts; in forming a military-road for the cannon; in drawing up the artillery; preparing

paring batteries; and cutting off the enemy's communication with the country. But on the ſeventeenth, before any battery could be finiſhed, a flag of truce was ſent from the city, with propoſals for a capitulation; which were accepted and ſigned at eight o'clock next morning. By theſe articles it was agreed, that the garriſon ſhould march out with all the honours of war, and be ſent to France: that the inhabitants, on their laying down their arms, ſhould be maintained in the poſſeſſion of their houſes and effects: that the effects belonging to the abſent officers ſhould not be touched: that the exerciſe of the Roman religion ſhould be fully permitted: that the artillery and warlike ſtores ſhould be delivered up; and the ſick and wounded taken care of.

Thus was the city of Quebec taken by a handful of troops, and at the ſigning of the peace was confirmed to Great Britain.

The moſt conſiderable place, next to Quebec, is Montreal, which is ſeated on an iſland of the ſame name in the river St. Lawrence, upwards of two hundred miles above Quebec, and is nearly as large and populous as that city. The iſland of Montreal is exceeding fertile, and well improved, producing great plenty of greens, and ſome fruit. It is about twenty-eight miles in length, and ten in breadth. The town is pretty well fortified, and is much more pleaſantly ſituated than Quebec. The ſtreets are regular, and the houſes well built, commodious, and agreeable. It ſtands by the ſide of the river, on a gradual eaſy aſcent to what is called the Upper Town, whence you may ſee every houſe at one view from the harbour, or from the ſouth ſide of the river. The public buildings exceed thoſe of Quebec for beauty, and are equal to them in number. The Hotel-Dieu, the magazines, and the place of arms, are in the Lower Town, which is alſo the reſidence of the merchants. The ſeminary, the pariſh-church, the houſe of the Recollects, the Jeſuits-college, and nunneries, are in the Upper. There is alſo a general hoſpital, and a church belonging to the Jeſuits, which is large and well built. The principal trade of the inhabitants has long conſiſted in the ſkins and furs they purchaſe of the Indians.

This iſland and city were taken on the eighth of September, 1760, by the generals Amherſt and Murray, without firing a gun, which completed the conqueſt of Canada; for by the terms of the capitulation, all the French forces in that country were to be ſent to France. Montreal has lately ſuffered by a moſt terrible fire, which conſumed great part of the city, the houſes of many of the merchants, and a number of ſtately buildings. This dreadful loſs inſtantly awakened the humanity of the inhabitants of this kingdom, and great ſums have been raiſed in the city of London, to remove the diſtreſſes of theſe new ſubjects to the Britiſh crown.

SECT. IV.

Of the interior Country of North America beyond the preſent Government of Canada; with a conciſe Account of the Rivers and Lakes, their Cataracts, and a Deſcription of the Countries and Indian Nations on their Banks.

THE river of St. Lawrence is repreſented as running through a conſiderable number of lakes, which ſome repreſent in Canada, and others on its ſouthern and weſtern borders; but ſurely nothing can be more improper, than to trace the courſe of a river through a number of lakes of a prodigious extent, merely becauſe thoſe lakes have in ſome part or other of them a communication by a ſtreight.

As theſe lakes are generally deſcribed in treating of Canada, it will be proper here to give ſome account of them, and of the Indians who dwell upon their banks. The fartheſt of theſe lakes, from which the river St. Lawrence is injudiciouſly ſuppoſed to ariſe, is named Nippiſſong, which in the Engliſh language ſignifies a large body of water. It is ſeated to the north-weſt of Lake Superior, in the fifty-ſecond degree of latitude. The northern bank of this lake is a bog, or moraſs, near four hundred miles in length, from the north-eaſt to the ſouth-weſt, and about a hundred and fifty miles broad. To the north of this bog is a ridge of mountains, extending from the north-eaſt to the ſouth-weſt, the whole length of the marſhy country, and beyond it to the weſtward: theſe are very high and ſteep, and are ſuppoſed to be the moſt lofty mountains in North America, whence they are called the Head of the country. To the ſouth-eaſt of theſe riſes a ſtream, which is ſuppoſed to be the head of the river St. Lawrence; on the north-eaſt riſes the river Chriſtino, which runs to the north-eaſtward, till it falls into Hudſon's-bay; and from the ſouth and ſouth-weſt of theſe mountains riſes the Miſſiſſippi, which runs to the ſouthward, and at length diſcharges itſelf into the gulph of Mexico; ſo that by theſe rivers the country is divided into ſo many departments as it were from a center, which may be placed at the above mountains.

The Indians who inhabit the country round this lake are called the Lake Indians, and have about five or ſix thouſand men. They chiefly live upon the weſt, ſouth, and ſouth-eaſt ſides of the lake, and on the iſlands it contains. Their country is of conſiderable extent, but of very difficult acceſs; on which account they have had little or no connection with the Engliſh or French; and as they have no fire-arms, they hunt with bows and arrows. They ſeldom concern themſelves with any other tribe of Indians, and live almoſt as independent as if they had the world to themſelves. They never pretend to plant or improve the land by labour, but live on ſuch food as the lake and the country affords them. From this lake a ſtream runs through a rough, broken, uninhabited country to Lake Superior, having in its courſe ſeveral cataracts, the moſt remarkable of which is about fifteen miles from the lake, where the water falls perpendicularly from a great height. The river here is a quarter of a mile wide, and a rock extending acroſs the ſtream, it falls from thence with a noiſe that may be heard at the diſtance of ſeveral miles. Below theſe falls is great plenty of fiſh, eſpecially of trout, which are very large and good.

At the entrance of this river into the lake is a town of Indians, called the Attawawas, or Souties, which dwell all along by the mouths of the rivers that fall into Lake Superior. They can raiſe about twelve thouſand fighting men, and by carrying on a conſiderable commerce with the French, are more improved than the Nippiſſongs. They live in huts built in the form of cones; the baſe is generally from ſixteen to twenty feet wide, and the top is left open for about two feet for a chimney and a window, their fire being kindled in the center. To render theſe huts a defence againſt the cold, they cover them with mats of ruſhes, which they weave very neatly, and place in ſuch a manner as to render theſe dwellings, which commonly contain ten or twelve perſons, very warm and comfortable.

When theſe people remove from one place to another for the ſake of hunting, fiſhing, or any other convenience, they carry their external covering with them; by which means they are able, in a ſhort time, to erect new towns, which have all the convenience of the old ones. They generally change their habitations in ſpring and autumn; ſpending the ſummer ſeaſon upon the banks of the rivers and lakes, where they fiſh and raiſe corn; and living during the winter among the mountains, ſometimes two or three hundred miles diſtant, for the ſake of meeting with a great quantity of game in hunting. They as yet make but little uſe of ſpirituous liquors; nor do they make any kind of drink, except of the juice of the maple-tree: when in health they live upon the ſimple gifts of nature, and when ſick the woods and lakes furniſh them with all the drugs they uſe; in the application of which ſome are allowed to have a ſuperior ſkill, but aſk no fee or reward for their trouble. They have private property, which they transfer to one another, by way of bargain and exchange; which, if taken from them unfairly, brings contempt on the aggreſſor; but there can here be little temptation to fraud or robbery, as no individual or family is allowed to ſuffer by poverty, ſickneſs, or any other misfortune, while their neighbours can ſupply their wants.

On the north of Lake Superior is another tribe of the Indians called the Bulls. Theſe dwell round what is called the

the North Bay, and differ little from the Souties in their manners, they being originally of the ſame nation, as appears by there being ſuch an affinity between the two languages, that they can perfectly underſtand one another. They can raiſe about four thouſand fighting men, and their chief trade is to Hudſon's-bay, where they carry fur and ermines in great abundance, and exchange them for blankets, arms, and ammunition.

Lake Superior is deſcribed by major Rogers as two thouſand miles in circumference, and is very deep, except near the weſt end, where are ſeveral iſlands; and near the place where it is joined by the river is a large iſland, ſeparated from the main by a ſtreight five or ſix miles wide. The ſoil of this iſland is very good, and on it are ſeveral Indian towns. The banks to the north, ſouth, and eaſt, are very high and ſteep, they riſing in ſome places above two hundred feet from the ſurface of the water, and almoſt perpendicular; ſo that it is very difficult landing, except where the rivers of this iſland fall into the lake. There are alſo ſome good iſlands in the north bay of the lake, forty or fifty miles in length, but not near ſo much in breadth.

The Indians in this territory enjoy the greateſt plenty of the neceſſaries, and even of the luxuries of life. Here are beaſts, fowl, and fiſh, of every ſize and kind common to the climate, in the greateſt abundance; and it may become a rich and valuable country, ſhould it ever be inhabited by a civilized people. It has not only rivers, but what may be termed a ſea of its own, which, by its communication with the river of St. Lawrence, makes great amends for its inland ſituation, by affording all the advantages of trade and commerce, from one part of the country to the other, by a cheap and eaſy conveyance; nor do the Indians entirely neglect this advantage, but make great uſe of canoes on the rivers and lakes. Theſe they form of the bark of birch, ſpruce, and elm; but thoſe made of the former are ſaid to be much the largeſt and beſt, as they are well ſuited to the country; ſince they will carry from four or five hundred to two thouſand weight, and are ſo light that a ſingle Indian, on his coming to a cataract, will carry it upon his back, till he thinks proper to take the water again.

Lake Superior has a communication with Lake Huron by a ſtreight upwards of a hundred and fifty miles in length. The ſtream is here generally very rapid, and has one conſiderable cataract, round which the Indians are obliged to carry their canoes when they paſs this way. The land near the ſtreight between the two lakes is hilly and broken, but a great deal of it is capable of being improved to good advantage. The timber is thick and lofty; iron ore is here found in the greateſt plenty; this is ſaid to be the beſt in America: and there are ſtreams ſufficient for any kind of water-works.

Lake Huron, which is nine hundred miles in circumference, is of a triangular form; one of the extremities points to the north-weſt at the ſtreights of Michlimacana; another to the ſouth, where a ſtreight runs into the lake of Erie; and a third to the north-eaſt, where a conſiderable ſtream flows into it, called the Souties river, from which there is but a ſhort carrying-place to the river of the Attawawas, which joins the river of St. Lawrence near Montreal.

The country about Lake Huron is to the north and north-weſt rocky and mountainous; but on the ſouth-eaſt the land is low, and covered with lofty trees, as oaks, white-pine, walnut, aſh, and maple. On the ſouth-weſt the land is level and plain, having few trees upon it of any kind, but the ſoil is pretty good and covered with tall graſs; among which are great plenty of deer, elks, bears, and racoons. It alſo abounds in a great variety of land and water-fowl, and every thing neceſſary to ſupply the natural wants of mankind. There are about three thouſand inhabitants who dwell round this lake, ſix hundred of whom are capable of bearing arms.

On the weſt ſide of the above plain is Lake Mechigan, which is nearly of the ſame form as Lake Huron; but is larger, and extends farther to the ſouth. Between theſe lakes a communication is formed by the ſtreight of Michlimacana, which is fifteen miles wide, and forty in length. At the point adjoining to Lake Mechigan ſtands our fort of Michlimacana, which is a good ſtockade near twenty feet high. There are in this place ſome French inhabitants, who come here for the ſake of trading with the Indians, and for the trout-fiſhery, which is here very valuable: the trout in theſe ſtreights being in great plenty; and of an extraordinary ſize, ſome having been taken that weighed upwards of eighty pounds. The Indians annually reſort hither from all the adjacent countries for the ſake of theſe fiſh, and yet their numbers ſeem to be not at all diminiſhed. On the ſouth-eaſt ſide of Lake Mechigan are ſome towns of the Souties; and on the ſouth and weſt ſides live the Pottawatamies. In ſhort, the Indians around this lake amount to about four thouſand fighting men.

On the north-weſt ſide of Lake Mechigan is a ſtreight about forty miles wide, and a hundred long, in which are many iſlands, ſome of which are inhabited by the Attawawas, and others by the Pottawatamies. This ſtreight leads into what is called the Green-bay, a lake of conſiderable extent, into which flows a large river that lies between Lake Superior and the Miſſiſſippi, and is called the river of Foxes. On the banks of this river live a nation called the Fox Indians, who have no leſs than four or five thouſand men.

The extended country upon this river, and on the ſtreight from the lake of Mechigan to the Green-bay, is uniformly fertile and pleaſant, and wants nothing but the cultivation of an induſtrious people to render it perfectly delightful. The timber is tall, but not ſo thick as to prevent the growth of graſs, which is here ſo luxuriant as to riſe five or ſix feet in height. This invites a multitude of buffaloes, wild cows, elks, deer, bears, beavers, and other animals, which, with plenty of wild game and fiſh, render this a moſt deſirable region, for the air is no leſs agreeable than the ſoil. The winters are never ſevere, and, during great part of the year, the country wears a delightful verdure. Here alſo grow ſpontaneouſly a great variety of grapes, which are agreeable to the taſte, and might be improved to conſiderable advantage. The Indians have learned that their juice will revive the ſpirits, and therefore make from them a kind of rough claret; but not knowing how to manage it properly, it is greatly inferior to what it it might be made under the management of ſkilful perſons; and this liquor they put in their empty rum-kegs. This country likewiſe produces a kind of wild oats, or rice, which grows in the greateſt plenty in ſhallow water, above which it riſes two or three feet. The ear reſembles that of oats, but the kernel is more like rice; and there is ſo much of it, that canoes may be loaded in a ſhort time. The Indians in this country raiſe Indian-corn, and have many horſes. Their cabbins reſemble thoſe deſcribed near Lake Superior.

From the ſouth point of Lake Huron a ſtreight, as hath been already obſerved, runs eaſterly about eighty miles into Lake Erie, paſſing in its way through Lake St. Clair. The country on both ſides is level and good, abounding with tall oaks, maple, &c. The ſtreight on its entering Lake St. Clair, or, as it is ſometimes called, Lake Sinclair, is divided into ſeveral branches, which form five or ſix iſlands of various dimenſions. Lake St. Clair is nearly circular, and about eighteen miles over. On the eaſt ſide are large marſhes, and at the lower end of that ſide a ſtreight of a conſiderable ſize enters it, from which, by a ſhort carrying-place, is an eaſy conveyance to Lake Ontario, uſed by the inhabitants who dwell on its banks.

The ſtreight at the entrance of Lake Erie forms a bay, below which is the fort of Detroit, and the French are ſettled on both ſides of the ſtreight for about eight miles. The Engliſh fort is built of ſtockades: it is about twenty-five feet high, and twelve hundred yards in circumference. It is in a pleaſant ſituation, the land is very good, and the inhabitants not only raiſe a great deal of wheat and other grain, but have plenty of cattle. They, however, chiefly enrich themſelves by their trade with the Indians, which is here very lucrative.

Lake Erie extends three hundred miles in length from the ſouth-weſt to the north-eaſt; it is eighty or ninety miles

miles wide at the weſterly end, and about forty at the lower end, where it tapers off to ſeven or eight miles, near the ſtreight which joins it to Lake Ontario. At the weſt end of the lake the river Miamee flows into it, which has an eaſy communication with the Ohio by the river Walbach, there being no more than twelve miles land-carriage between the two rivers. At the ſouth-weſt corner of Lake Erie the Lake Sanduſky has a communication with it by a ſtreight half a mile broad. This laſt lake is thirty miles in length, and eight or ten wide. Into it flows the river Sanduſky, or Huron, upon the banks of which, and round the Sanduſky, the Huron Indians have ſeveral towns in a very pleaſant fertile country; they can raiſe about ſix or ſeven hundred fighting men, and differ in their manners from any of the Indians yet mentioned. They build regular houſes, which they cover with bark, and are eſteemed the richeſt Indians upon the whole continent, they having not only many horſes, but ſome black cattle and ſwine. They likewiſe raiſe great quantities of corn, not only for their own uſe, but in order to ſupply other tribes, who purchaſe it of them. Their country extends a hundred and fifty miles to the weſtward of the lake, and is a hundred miles broad. The ſoil is not exceeded by any in this part of the world; the timber is tall and beautiful; the woods abound with game; here is the greateſt plenty of water-fowl, and both the rivers and lakes contain a variety of fiſh. In ſhort, if it was properly improved, the land would equal that in any of the Britiſh colonies on the ſea-coaſts.

The country on the ſouth ſide is claimed by the Indians of the Five Nations, who do not inhabit it, but keep it for the ſake of hunting. The country is level and very fine for ſeveral miles, having many ſtreams flowing through it into the lake. Our fort at Preſque Iſle is on the ſouth ſide about a hundred miles from the eaſt end; and from this fort is a carrying-place of about twelve or fourteen miles, to a branch of the Ohio. From the eaſt end of Lake Erie a ſtreight runs north-eaſterly about fifty miles, and nearly oppoſite to the place where it leaves the lake is Fort Erie, which has been lately built. The current from thence is rapid, on account of the rocks and falls of the water for about a mile; yet veſſels are worked up by the help of windlaſſes. Lower down are ſeveral ſmall iſlands, and at about ſix or ſeven miles diſtance the ſtreight is divided into two branches, which form the Great Iſland, which extends almoſt to Little Niagara fort, and contains forty thouſand acres of good land.

Near Little Niagara fort, which is nothing more than a ſtockade, is a remarkable cataract in the ſtreight which runs into Lake Ontario, and is generally called the river of St. Lawrence. Its courſe is here ſouth-ſouth-eaſt, and it is about half a mile wide, where the rock croſſes it in the form of a half moon. Above the fall is an iſland, about half a mile in length, the lower end of which extends to the edge of the fall. The current of the ſtreight above the iſland is quite ſlow, but on its approaching it, and being divided, it runs more ſwiftly, and, before it comes to the fall, with great violence, eſpecially on the weſt ſide of the iſland, where the whole ſtream appears in a foam, for even here the deſcent is equal to the ſide of a pretty ſteep hill: but when it comes to the perpendicular fall, which is an hundred and fifty feet, no words can expreſs the conſternation of the traveller, on his firſt ſeeing ſo great a body of water falling, or rather violently thrown from ſuch a height upon the rocks below, from which it again rebounds, appearing white as ſnow, it being all converted into foam, through theſe repeated violent agitations. The noiſe of this fall is frequently heard at the diſtance of fifteen miles, and ſometimes much farther. The vapour that riſes from it reſembles a cloud, or pillar of ſmoak, and in it may be ſeen the appearance of a rainbow, whenever the ſun and the poſition of the traveller favours it. Many beaſts and fowls here loſe their lives, by attempting to ſwim acroſs the rapid ſtream above, and are found daſhed in pieces below.

Farther down the ſtream are ſmaller falls for ſeveral miles, which render the ſtreight unnavigable. Its bank on the eaſt ſide is three hundred feet high, till you come to another Engliſh fort nine miles diſtant from Little Niagara; and this length goods are obliged to be carried by land, on account of the cataract and the many leſſer falls of the ſtreight. Perhaps no place in the world is frequented by ſuch a number of eagles as this, they being invited hither by the deer, elks, and bears, which are daſhed to pieces.

The ſtreight enters Lake Ontario at the ſouth-weſt corner, at which place is Niagara fort, an handſome well-built fortification of conſiderable ſtrength. This lake is of an oval form, two hundred and ſixty miles in length, and a hundred and fifty wide in the middle. At its ſouth-eaſtern extremity the river Oſwego falls into it, where we have another fort, and a garriſon kept up of conſiderable force. This is about two hundred miles from Niagara. The river Oſwego riſes from Lake Oneoida, which is about thirty miles in length, and has at the eaſt end a royal block-houſe, which is garriſoned to keep up a communication with the lakes: at the weſt end is Fort Brewerton, another poſt built for the ſame purpoſe; and about half way between this and Oſwego is a block-houſe to command the ferry over the Seneca river.

The country between Oſwego and the river St. Lawrence is level and good for ſeveral miles, and belongs to the Five Nations; ſeveral rivers flow through it, the moſt conſiderable of which is the Sable, which joins the Lake Ontario eighty or ninety miles eaſt of Niagara, and riſes near a branch of the Ohio. In it are ſeveral cataracts, and one higher than that of Niagara. About a hundred and fifty miles up this river are remarkable ſprings greatly eſteemed by the Indians, as a remedy for many diſeaſes: they are called the oil-ſprings on account of an oleous ſubſtance that iſſues forth with the water, and riſes upon its ſurface. The water of theſe ſprings is drank by the Indians as a remedy for conſumptions, aſthmas, and various internal diſorders; and they bathe in it with great ſucceſs for rheumatic pains and ſtrains. In the rivers round Lake Ontario are great plenty of ſalmon during the ſummer ſeaſon; and at the entrance of the river St. Lawrence are in the winter abundance of what are called white fiſh, of which there are ſaid to be none elſe in America, except a few at Long Point. In ſummer they diſappear, and are ſuppoſed, during that ſeaſon, to lie in deep water, out of ſoundings. They are about the ſize of a ſhad, very agreeable to the palate, and it does not appear that there are any of them in Europe. The country round the lake is, to appearance, fertile, capable of valuable improvements, and abounds with water-fowl and variety of game.

The Five Nations have their towns at ſome diſtance from the lake, chiefly upon the rivers that flow into it; but of theſe people we ſhall hereafter give a particular deſcription.

The river St. Lawrence, on its taking leave of the lake, is ten or twelve miles wide, and has ſeveral iſlands; on the moſt northerly of which is a ſmall fortreſs erected by the French, and now kept by us. A little to the ſouth of this iſland it is joined by a conſiderable ſtream, that riſes near Hudſon's-bay, far to the north; it is called Oſwegotchy, and has frequent falls, after aſcending it forty or fifty miles. The above iſland is about twenty miles below the lake, and here the river grows narrower.

From Lake Ontario to the Cedars, the preſent weſtern boundary of the province of Quebec, is about eighty miles; and from thence to Lake St. Francis is near the ſame diſtance, and is conſidered as the next ſtage of St. Lawrence.

We ſhall conclude this ſubject with a conciſe account of the river Chriſtino, which runs far to the north, and ſhall leave the Miſſiſſippi and Ohio till we come to the more ſouthern provinces ſubject to Great Britain.

The river Chriſtino is ſo called from the Indians, who have the name of Chriſtineux, or Chriſtinos, who poſſeſs the country adjoining it. Its higheſt ſource is on the north-eaſt of the Central mountains, called by the Indians the Head of the Country, where it riſes in ſeveral ſtreams, all which bend their courſe towards Hudſon's-bay, and at different places unite, till in the courſe of about a hundred and fifty miles from their ſource they all join, and by their confluence form a large bay, round which live a tribe of Chriſtianos. Farther down the river are a few ſmall lakes, and ſeveral ſmall ſtreams on each

ſide flow into the river; by which means its waters are encreaſed, till it diſcharges itſelf into Hudſon's-bay, near two hundred miles to the north of York fort, and about five hundred from the Central mountains.

The country near this river is greatly inferior to that on the lakes and the river St. Lawrence, it extending from the fifty-fifth to the ſixtieth degree of north latitude. The winters are long and ſevere, the ſnow continues long on the ground, and the ſoil, which is cold and barren, is ſcarce capable of any valuable improvements. The timber here is beech and maple, and for a conſiderable way up the river the land is high; and ſo thickly covered with ſpruce, hemlock, &c. that it is difficult to travel through it, without being entangled; but nearer the mountains the ſoil is better. In the river are many kinds of fiſh; and beaver are taken here in great abundance, with ſome ermines, elks, mooſe, bears, &c. There is likewiſe an animal which reſembles the mooſe, but is much ſmaller, and ſeems peculiar to this country.

The inhabitants ſubſiſt entirely on their fiſh and game, for they raiſe no kind of grain, nor keep any animals, except dogs. The number of warriors in this country is ſuppoſed to amount to about two thouſand. They generally cover their houſes or huts with the ſkins of wild beaſts; and not only make them warm and ſecure, but, according to their taſte, both neat and elegant. Theſe Indians have nearly the ſame language with thoſe on the lakes; and, according to their own hiſtory, they all came round from the north into this country. Indeed, the only hiſtory they have is a verbal one, tranſmitted from father to ſon; yet they pretend to give an exact account for many generations back; for however negligent they are in the education of their children in almoſt every other reſpect, they are very careful in acquainting them with the ſtory of their anceſtors.

SECT. V.

The moſt remarkable Beaſts and Birds in the interior Part of North America.

THE beaſts and birds we ſhall here deſcribe are thoſe principally found in the northern part of the extenſive country of which we have been treating, and particularly thoſe near the river Chriſtino. The moſt remarkable of theſe are the porcupine, and the wolverene, or quick-hatch; the pelican, the white-tailed eagle, the brown and ſpotted heath-cock, and the white partridge.

The porcupine of this northern part reſembles in ſhape and ſize the beaver; but the head has ſome reſemblance to that of a rabbit: it has a flat noſe, entirely covered with hair: its mouth is armed with two teeth above and two below, that are yellow and remarkably ſtrong: its ears, which are ſhort and ſmall, ſcarcely appear through its fur: its legs too are remarkably ſhort; but its claws, of which it has four on its fore-feet, and five on thoſe behind, are very long, hollow within like ſcoops, and very ſharp-pointed. This animal is covered all over with a pretty ſoft fur about four inches long; but beneath the hair on the head, body, and tail, it is thick ſet with ſharp ſtiff quills, which are white with black points, bearded, and not eaſily drawn out when they have entered the ſkin. The porcupine uſually makes his neſt under the roots of large trees, and ſleeps much. He chiefly feeds upon the bark of trees, eats ſnow in the winter to quench his thirſt, and in ſummer drinks water; but carefully avoids going into it. The Indians eat theſe animals, and eſteem their fleſh a wholeſome and pleaſant food.

The wolverene, or quick-hatch, is another very extraordinary animal, and is of the ſize of a large wolf: the ſnout, with the upper and under jaw, as far as the eyes, is black; the upper part of the head whitiſh; the eyes dark; the throat and upper part of the neck white ſpotted with black; the ears ſmall and round; the whole body of a reddiſh brown, darker at the ſhoulders and rump, and lighter upon the back and ſides. The fur of the whole body is pretty long, but not very cloſe: the feet as far as the firſt joint, are covered with ſhort black hair; but the legs are brown, and the claws of a light colour: moſt of the tail is brown, but towards the tip buſhy and black. This creature in walking carries his head very low, ſo that his back riſes archwiſe. He defends himſelf when attacked with great force and obſtinacy, and it is ſaid will tear traps and gins to pieces in a very ſurprizing manner.

The pelican is ſomewhat bigger than a large tame gooſe; the upper mandible of the bill is narrower in the middle than at either end, and is received into the lower, except towards the point, which widens and receives the lower into it; the point is red, but the upper and under part towards the head are yellow: the pouch when dry reſembles an ox's bladder blown, and is prodigiouſly large while the creature is living. The head and neck are covered with white feathers; the body is of a dirty aſh-colour; the quills of the wings are black, and all the under part is of a dark aſh-colour. The legs are ſhort, with four toes webbed together; the middle toe is longer than the leg; the claws are dark, and both the legs and feet are of a dirty yellow mixed with green. Theſe birds live chiefly on fiſh; they are found in many other countries, and in ſome places are much larger.

The white-tailed eagle is about the bigneſs of a turkey-cock, flat-crowned, ſhort-necked, and full breaſted, with brawny thighs. Its wings are very long, and broad in proportion to its body; but darker on the back, and lighter on the ſides. The quills of the wings are black, and the breaſt ſpotted with white: the tail when cloſed is white both above and below, except the very tip of the feathers, which is black or brown: the thighs are covered with dark brown feathers, through which in ſome places a white down appears: the legs, to the very feet, are covered with ſoft feathers of a reddiſh brown. It has four toes on each foot, which are very thick and ſtrong, ſtanding three forward and one backward, covered with yellow ſcales, and armed with very ſtrong and ſharp claws of a ſhining black. There are alſo ſeveral kinds of falcons, hawks, and other birds of prey.

The great horned-owl is a very ſingular bird, with a head very little inferior in ſize to that of a cat; what are called the horns, are compoſed of feathers riſing juſt above the bill, intermixed at the bottom with white, becoming of a red brown by degrees, and tipped with black. The great white owl of a bright ſhining colour, ſo as ſcarce to be diſtinguiſhed from the ſnow, is alſo common in the northern part of this country, and continues there throughout the whole year, where it is frequently ſeen flying by day, and preys upon white partridges.

The white partridge is common in ſome other countries, but is no where in ſuch plenty as in the northern part of this near Hudſon's-bay. It is of a middle ſize, between that of our common partridge and the pheaſant, ſhaped very much like the former, except its tail being ſomewhat longer. Theſe birds are moſtly brown in ſummer, but in the winter become perfectly white, except the outward feathers of the tail, which are black tipped with white. In that ſevere ſeaſon they repoſe in the ſnow all night, and in the morning fly directly up to ſhake it off their feathers. They ſtay in theſe parts all the year, feed only in the mornings and evenings, and ſun themſelves in the middle of the day.

The brown and ſpotted heath-cock, which alſo continues in the north all the year, is ſomewhat bigger than an Engliſh partridge; it is likewiſe longer-bodied, and has a longer tail in proportion. The bill is black, covered with brown feathers; the ſkin above the eye red; the top of the head, the upper part of the neck, and down the back covered with feathers of a dark brown, mixed with a dull orange and aſh-colour: the tail is of a dark brown, the throat under the bill of a yellowiſh white; the neck and breaſt of a dull orange, with ſpots in the form of half moons. The legs from the knee joint down to the feet are covered with a kind of hairy feathers of a brown colour, intermixed with black: the feet are of a reddiſh brown; and three toes forward have pretty long and black claws; theſe toes are jagged; but the hinder toes are ſmooth on the ſides.

SECT.

SECT. VI.

A particular Deſcription of the Perſons, Dreſs, Cuſtoms, Manners, Religion, and Government of the Five Nations and other Indians: their Method of going to War, the Manner in which it is carried on, and Peace concluded, &c.

WE ſhall now more particularly deſcribe the cuſtoms and manners of the Indians who inhabit the interior part of America. They formerly inhabited the ſea-coaſts, where they were very numerous; but have retired into the weſterly parts of the country, ſo that few of them are to be found within leſs than two or three hundred miles of the ſea: for though many of them have been inſtructed in the knowledge of Chriſtianity, and parcels of land have been allotted them in ſeveral of the Britiſh colonies, where they have been formed into ſocieties; yet it has been found that in proportion as they lay by their ancient cuſtoms, and conform to our manner of life, they dwindle away, either becauſe the change is prejudicial to their conſtitutions, or becauſe when ſettled among the Engliſh they have greater opportunities of procuring ſpirituous liquors, of which both ſexes are generally inordinately fond; very little care being ever taken to prevent thoſe who are inclined to take advantage of them in trade, from baſely intoxicating them for that infamous purpoſe: this has a worſe effect on their conſtitutions than on ours, and ſoon proves fatal, producing diſeaſes to which they were formerly ſtrangers. Thus where a few years ago there were conſiderable ſettlements of them, their name is almoſt forgotten; and thoſe who ſtill remain, have, for the moſt part, joined themſelves to other nations in the interior part of the country, on the banks of the lakes and rivers.

The Indians of America are tall and ſtraight beyond the proportion of moſt other nations: their bodies are ſtrong; but it has been obſerved, that this is a ſtrength rather ſuited to endure much hardſhip, and the exerciſes of the chace, than much hard labour, by which they are ſoon conſumed; hence it has been ſaid to be rather the ſtrength of a beaſt of prey, than that of a beaſt of burthen; an odious compariſon when ſpeaking of the human ſpecies: however, they have generally ſtraight ſupple limbs, and the leaſt degree of deformity is very rarely ſeen amongſt them. Their features are regular, their complexion ſomewhat of a copper colour, or a reddiſh brown; their hair, which is long, black, and lank, is as ſtrong as that of a horſe; and what is very ſingular, is their not having any beards, nor hair on any part of their body but the head.

They generally wear only a blanket wrapped about them, or a ſhirt, both which they purchaſe of us: but when the Europeans firſt came amongſt them they found ſome nations entirely naked, and others with a coarſe cotton cloth, wove by themſelves, round their waiſt: but in the northern parts their whole bodies were in winter covered with ſkins.

Among the various nations and tribes within the vaſt extent of country of which we have juſt given a deſcription, the Five Nations deſerve particular notice; theſe being dreaded and revered by all the others for their ſuperior underſtanding, activity, and valour in war; in which conſtant practice has rendered them expert, they being generally at war with one nation or other, and ſometimes with ſeveral at a time. Their manners, cuſtoms, and modes of dreſs, are, as near as poſſible, adopted by ſeveral of the other nations; and thoſe are eſteemed the politeſt and beſt bred, who the neareſt reſemble theſe. Their moſt northern ſettlement is a town called Chockonawago, on the ſouth of the river St. Lawrence, oppoſite to Montreal; but their largeſt ſettlements are at the head of the rivers Mohocktaneſee, Oneoida, and Oneneaga, between Lake Ontario and the provinces of New York and Penſylvania. They claim the whole country that lies to the ſouth of the river St. Lawrence, as far as the Ohio, and down that river to the Wabach, from the mouth of the Wabach to the bounds of Virginia: on the weſtward they extended to the lakes of Ontario and Erie, and to the river Miamee: their eaſtern boundaries are Lake Champlain and the Britiſh colonies. When the Engliſh firſt ſettled in America, they were able to raiſe fifteen thouſand fighting men; but at preſent, including the Delawares and Shawanees, they do not amount to more than between three and four thouſand. Thus have they been reduced by the perpetual wars they have carried on againſt the other Indians and the French in Canada.

The Mohocks, once the moſt numerous tribe among them, are now the ſmalleſt; yet ſtill maintain a ſuperiority over the reſt, and are conſulted and appealed to by the others in all great emergencies. About a hundred years ago they deſtroyed the greateſt part of the Hurons, who dwell on the ſouth ſide of the lake of Ontario; and the remainder fled for protection to the French in Canada; but moſt of them have ſince returned to their own country, and, by permiſſion of the Five Nations, dwell on the lands at the weſt end of Lake Erie. The Mohocks alſo made priſoners of the whole nation of the Shawanees, who lived upon the Wabach, and afterwards, by the mediation of Mr. Penn, at the firſt ſettlement of Penſylvania, gave them liberty to ſettle in the weſterly parts of that province, giving them the appellation of couſins, and allowing them to claim kindred with the Five Nations, as their uncles. They about the ſame time conquered the Delawares, whom they brought into a like ſubjection; and alſo the Mickanders, or Mohegons, who dwelt on the banks of Hudſon's river. The two laſt nations they ſuffered to live in any uninhabited part of their ſouthern territories; but the latter upon condition of paying them an annual tribute. They alſo conquered ſeveral nations upon the frontiers of New England.

Some nations to this day are not allowed to appear painted at any general meeting, or congreſs, where the Five Nations attend; that being an expreſs article in the capitulations. They have been the inveterate enemies of the French ever ſince their firſt ſettlement in Canada; and are almoſt the only Indians within many hundred miles that have been proof againſt their ſolicitations to turn againſt us; the greateſt part of them having maintained their integrity, and been our faithful friends and allies. They once burnt great part of the city of Montreal, and put the French into great conſternation. They have conquered moſt of the Abnaques, or eaſtern Indians; and now maintain a conſtant war with the Cherokees, Chickeſaws, and Creeks, againſt whom many of their young men are annually ſent; while others of them go againſt the Miſauri; and, indeed, they ſometimes carry their hoſtilities as far ſouth as the iſthmus of Darien; but have long lived in peace with the Indians on the lakes and the Tweeghtwees.

The Indians are far from being deficient in good ſenſe and ingenuity, many of them ſhewing a great capacity for ſome art or ſcience. They have ſtrong imaginations, and their memories are ſo retentive, that when they have been once at a place, let it be ever ſo diſtant or obſcure, they will readily find it again. Thus the Indians about Nova Scotia, and the gulph of St. Lawrence, have frequently paſſed over to Labrador, which is thirty or forty leagues, without a compaſs, and have landed on the very ſpot they intended: even in dark cloudy weather they will direct their courſe by land with great exactneſs, merely by obſerving the bark and boughs of trees; the north ſide in this country being always moſſy, and the boughs on the ſouth ſide the largeſt.

Poligamy is practiſed by ſome nations, but it is not general. In moſt they are contented with one wife; but a divorce is admitted for the ſame cauſes that it was allowed among the Greeks and Romans: but no nation of the American Indians is without a regular marriage, in which are many ceremonies, the principal of which is ſaid to be the bride's preſenting the bridegroom a plate of corn.

Though the women are incontinent before wedlock, their chaſtity after marriage is remarkable. The puniſhment of the adulterer, as well as the adultereſs, is in the hands of the huſband himſelf, and is often ſevere, as being inflicted by one who is both the injured party and the judge. Their marriages are not remarkably fruitful, they ſeldom producing above three or four children; and theſe are brought forth with much leſs pain than our women ſuffer upon the like occaſions, and

are immediately followed but with little diminution of their uſual ſtrength. The mothers are ſo fond of their children, that they ſeldom wean them till they are upward of two years old, and carry them on their backs till the burden becomes quite inſupportable. They can no ſooner walk, than they are at liberty to go when and where they pleaſe; but their parents carefully inſtruct them very early in the uſe of arms, and frequently relate to them the exploits and great atchievements of their anceſtors, in order to lead them on to brave and heroic actions. They introduce them very young into their public councils, and make them acquainted with the moſt important affairs and tranſactions: this accuſtoms them to ſecrecy, gives them a compoſed and manly air, inſpires them with emulation, and makes them bold and enterprizing. They ſeldom chaſtiſe their children; for when they are young, they obſerve that they are not ſufficiently endowed with reaſon; for if they were, they would not do wrong: when they are more advanced in life, they ſay that they do not then chaſtiſe them, becauſe, being capable of judging, they ought to be maſters of their own actions, and not be accountable to any one. In the ſame manner they excuſe any ill treatment they receive from a perſon in liquor: "Should we blame "or puniſh him, ſay they, when he has not his reaſon, "and does not know what he does?" Yet when a mother ſees her daughter act amiſs, ſhe generally burſts into tears, and upon the other enquiring the cauſe, ſhe tells her the reaſon, and this admonition ſeldom fails of the deſired effect.

The Indians do not always enter into a formal obligation of marriage; but take a wife for a longer or ſhorter time, as they pleaſe; but their children, on theſe occaſions, ſuffer no diſgrace, and enjoy all the privileges of thoſe begotten in marriage.

The men are remarkable for their indolence, on which they even ſeem to value themſelves, ſaying that labour would degrade them, and belongs ſolely to the women, while they are formed only for war, hunting, and fiſhing: it is, however, their buſineſs to make arms for hunting and lines for fiſhing; to form their canoes, and to build and repair their houſes; but they frequently make the women aſſiſt them in theſe, beſides attending all domeſtic affairs, and cultivating the land.

The Indians are generally poſſeſſed with an aſtoniſhing patience and equanimity of mind, with the command of every paſſion except revenge. They bear the moſt ſudden and unexpected misfortune with calmneſs and compoſure, without uttering a word, or the leaſt change of countenance. Even a priſoner, who knows not whether he may not in a few hours be put to a moſt cruel death, ſeems entirely unconcerned, and eats and drinks with as much chearfulneſs as thoſe into whoſe hands he has fallen. Their reſolution and courage under ſickneſs and pain, is really aſtoniſhing. Nothing is more common than to ſee perſons of all ages, and both ſexes, ſupporting themſelves with the utmoſt conſtancy under the greateſt pains and calamities; even when under the ſhocking torture to which priſoners are frequently expoſed, they will not only make themſelves chearful, but provoke and irritate their tormenters by the moſt ſevere reproaches.

They treat thoſe in alliance with them with an high degree of complaiſance and good nature.

They are grave in their deportment upon ſerious occaſions, obſervant of thoſe in company, reſpectful to the old; of a temper cool and deliberate, by which they are never in haſte to ſpeak before they have well thought of the matter, and ſure the perſon who ſpoke before them has finiſhed all he had to ſay. In their public councils, every man is heard in his turn, according as his years, his wiſdom, or his ſervices to his country, have ranked him. Not a whiſper, nor a murmur is heard from the reſt, while he ſpeaks; no indecent commendations; no ill-timed applauſe. The young attend for their inſtruction; for here they learn the hiſtory of their nation, are animated by thoſe who celebrate the warlike actions of their anceſtors; are taught what is the intereſt of their country, and how to purſue it.

The laws of hoſpitality are executed among them with the utmoſt generoſity and good-will. Their houſes, their proviſions, even their young women, are preſented to a gueſt. To thoſe of their own nation, they are likewiſe very humane and beneficent. If any one of them ſucceed ill in his hunting, if his harveſt fails, or his houſe is burnt, he feels no other effect of his misfortune, than its giving him an opportunity to experience the benevolence and regard of his countrymen, who, for that purpoſe, have almoſt every thing in common. But to the enemies of his country, or to thoſe who have privately offended him, the American is implacable. He never indeed makes uſe of oaths, or indecent expreſſions, but cruelly conceals his ſentiments, till by treachery or ſurprize, he can gratify his revenge. No length of time is ſufficient to allay his reſentment; no diſtance of place is great enough to protect the object; he croſſes the ſteepeſt mountains, pierces the moſt impaſſable foreſts, and traverſes the moſt hideous deſarts; bearing the inclemency of the ſeaſons, the fatigue of the expedition, the extremes of hunger and thirſt; with patience and chearfulneſs, in hopes of ſurprizing his enemy, and exerciſing upon him the moſt ſhocking barbarities; and when this cannot be accompliſhed, the revenge is left as a legacy, transferred from generation to generation, from father to ſon, till an opportunity offers of taking what they think ample ſatisfaction. To ſuch extremes do the Indians puſh their friendſhip, or their enmity; and ſuch indeed is, in general, the character of all uncivilized nations. They, however, eſteem nothing ſo unworthy of a man of ſenſe, as a peeviſh temper, and a proneneſs to a ſudden and raſh anger; and this has ſuch an effect, that quarrels rarely happen among them, when they are not intoxicated with liquor.

On the other hand, they are highly ſenſible of the utility and pleaſures of friendſhip; for each of them, at a certain age, makes choice of ſome one nearly of the ſame ſtanding in life to be their moſt intimate and boſom friend; theſe two enter into mutual engagements, by which they oblige themſelves to brave any danger and run any riſque, to aſſiſt and ſupport each other. This attachment is even carried ſo far as to overcome the fear of death, which they conſider only as a temporary ſeparation, being perſuaded that they ſhall meet and be united in friendſhip in the other world, never to be ſeparated more; and that there they ſhall need one another's aſſiſtance as well as here.

It does not appear that there is any Indian nation that has not ſome ſenſe of a Deity, and a kind of religion; but this is ſo various, ſo perplexed, and confuſed, that it is difficult to give a minute deſcription of it. Their ideas of the nature and attributes of the Deity are very obſcure, and ſome of them abſurd; but they all acknowledge him to be the Creator and Maſter of the world; yet how the world was created they know not, and have various conjectures about it, ſome imagining that men were firſt rained down from the clouds, and that brute animals deſcended with them. They ſeem to have ſome idea that there are ſpirits of a higher and more excellent nature than man; and ſuppoſing them to be every-where preſent, frequently invoke them, and endeavour to act agreeable to their deſires. They likewiſe imagine that there is an evil ſpirit, who, they ſay, is always inclined to miſchief, and bears great ſway in the creation; this, indeed, is the principal object of their devotions; they generally addreſs him moſt heartily, beſeeching him to do them no harm: but ſuppoſing the others to be propitious, and ever inclined to do them good, they intreat them to beſtow bleſſings upon them, and prevent the evil ſpirit from hurting them. To procure the protection of the good ſpirit, they imagine it neceſſary to diſtinguiſh themſelves, and that in the firſt place they muſt become good warriors, expert hunters, and ſteady marksmen

The Indians have great dependance on their dreams, and really believe that from the dreams of youth, may be collected the whole hiſtory of their future life. On this account, when they arrive at a certain age, dreaming is made a kind of religious ceremony, which is thus performed: they beſmear their face all over with black paint, and faſt for ſeveral days, in which time they expect that the propitious ſpirit will appear to them in ſome ſhape or other while they ſleep. The effect this long

faſt

faſt muſt naturally have on the brain of a young perſon, is doubtleſs conſiderable, and the parents and other old people take care, during the operation, that the dreams they have in the night be faithfully reported the next morning. In favour to ſome conſtitutions they ſometimes limit the faſt to a ſhorter term than is generally judged neceſſary; however, the propitious ſpirit being conſtantly the ſubject of the perſon's waking thoughts, becomes alſo the ſubject of his dreams; at leaſt every phantom of their ſleep is regarded as a figure of him, whether it be bird, beaſt, fiſh, tree, or, indeed, any thing animate or inanimate, and is particularly reſpected by them all their lives after.

Their prieſts often perſuade the people that they have revelations of future events, and are authoriſed to command them to purſue ſuch and ſuch meaſures. They alſo undertake to unfold the myſteries of religion, and to ſolve and interpret all their dreams. They repreſent the other world as a place abounding with an inexhauſtible plenty of every thing deſireable, where they ſhall enjoy the moſt full and exquiſite gratification of all their ſenſes. This is, doubtleſs, the motive that induces the Indians to meet death with ſuch indifference and compoſure; none of them being in the leaſt diſmayed at the news that he has but a few hours or minutes to live, but with the greateſt intrepidity ſees himſelf upon the brink of being ſeparated from all terreſtrial things, and with great ſerenity talks to all around him: thus a father leaves his dying advice to his children, and takes a formal leave of all his friends.

They generally bury their dead with great decency, and depoſit in the grave ſuch things as the deceaſed had made the greateſt uſe of, and been moſt attached to; as his bow and arrows, pipes, tobacco, &c. that he may not be in want of any thing when he comes to the other country. The mothers mourn for their children a long time, and the neighbours make preſents to the father; and he in return gives them a feaſt.

The feaſts of an Indian, whether at a funeral, a triumph, or a viſit, are very ſimple. Inſtead of endeavouring to make a ſplendid appearance, he makes his friends heartily welcome, and values not ſpending the fruits of a whole ſeaſon's toil, to convince them that he is ſo. The gueſt is ſure to be treated kindly, and that he ſhall not be the ſubject of ridicule while preſent, nor of cruel remarks when departed. On theſe occaſions a ſervile regard is never paid to the diſtinctions of high and low, rich and poor, ſo as to leſſen the ſpirit and pleaſure of converſation, when the company happens to be made up a mixture of theſe.

Their phyſicians generally treat them, in whatever diſorder, the ſame way: they firſt incloſe them in a narrow cabbin, in the midſt of which is a ſtone red hot, on which they throw water till the patient is covered with warm vapour, and is in a profuſe ſweat, when they hurry him from thence and plunge him into the next river. This is repeated as often as they think neceſſary; and by this method extraordinary cures are ſometimes performed: but it alſo frequently happens that perſons die in the very operation; eſpecially where they are afflicted with the new diſorders brought to them from Europe; and it is partly owing to this manner of proceeding, that the ſmall-pox has proved ſo much more fatal to them than to us. It muſt, however, be acknowledged that they have the uſe of ſome ſpecifics of wonderful efficacy, the power of which they however attribute to the ceremonies with which they are adminiſtred.

Liberty, in its fulleſt extent, is their darling privilege; for it is the great and fundamental principle of their policy, that every man is equally free and independent; and that nothing can be a compenſation for the loſs of liberty. Avarice is unknown to them, and they are neither prompted by ambition, nor actuated by a love of gold; for the diſtinctions of rich and poor, high and low, noble and ignoble, do not ſo far take place among them as to create the leaſt uneaſineſs, or excite the reſentment of any individual; hence the brave and deſerving, let their circumſtances be what they will, are ſure to be eſteemed.

The generaliſſimo, who may be conſidered as their king, among all the nations who ſpeak the Roundock dialect, is elective, and his election is attended with ſinging and dancing: when choſen he makes a panegyric upon the perſon to whom he ſucceeds. He is rather reverenced as a father than feared as a monarch. He has no guards, no priſons, no officers of juſtice.

The other forms, which may be conſidered as a kind of ariſtocracies, have not more power among the Iroquois or Five Nations; there is no other qualification abſolutely neceſſary for their chiefs but age, with experience and ability in their affairs. However, there are generally in every tribe ſome particular ſtocks, which they reſpect, and who are conſidered in ſome ſort as their chiefs, unleſs they ſhew themſelves unworthy of that rank; and indeed there are ſome of the tribes themſelves who, on account of their number or bravery, have a pre-eminence over the reſt, which, as it is not exacted with pride, ſo it is never diſputed where due.

This great council is compoſed of the heads of tribes and families, with ſuch whoſe capacity has raiſed them to the ſame degree of conſideration. They meet in a houſe, built in each of their towns for that purpoſe, and alſo receive ambaſſadors, to deliver them an anſwer, to ſing their traditionary war ſongs, or to commemorate their dead. In theſe councils they propoſe all ſuch matters as concern the ſtate, and which have been already digeſted in the ſecret councils, at which none but the head men aſſiſt. The chiefs ſeldom ſpeak much themſelves at theſe general meetings, but intruſt their ſentiments with a perſon who is called their ſpeaker, or orator, there being one of this profeſſion in every tribe and town; and their manner of ſpeaking is natural and eaſy, their words ſtrong and expreſſive, their ſtyle bold, figurative and truly laconic, nothing being ſaid but what is neceſſary either to inform the judgment, or raiſe ſuch paſſions as the ſubject naturally excites.

When any buſineſs of conſequence is tranſacted, they appoint a feaſt upon the occaſion, of which almoſt the whole nation partakes. Upon matters of leſs general concern, are leſſer feaſts, to which none are invited but they who are engaged in that particular buſineſs. Before the entertainment is ready, the principal perſon begins a ſong on the remarkable events of their hiſtory, and whatever may tend to their honour or inſtruction. The others ſing in their turn. They alſo have dances, chiefly of a martial kind; and no ſolemnity or public buſineſs is carried on without ſongs and dances. Theſe ceremonies ſerve to preſerve order, and contribute to fix all tranſactions in their memory.

It ought not to be omitted, that the ſame council of elders, which regulates whatever regards the external policy of the ſtates, has likewiſe the charge of its internal peace and order. Their ſuits are few, and ſoon decided; they having neither property nor art ſufficient to render them perplexed and tedious. Criminal matters, when ſo flagrant as to become a national concern, are brought before the ſame juriſdiction: but in ordinary caſes, the crime is either revenged or compromiſed by the parties concerned. If a murder is commited, the family that has loſt a relation prepares to kill the murderer; and when this is done, the kindred of the laſt perſon ſlain think themſelves as much injured, and as juſtifiable in taking revenge, as if the violence had not begun among themſelves. But, in general, things are determined in a more amicable manner: the offender abſents himſelf; and his friends ſend a compliment of condolance to thoſe of the party murdered; they offer them preſents, which are rarely refuſed; and the head of the family appearing, delivers them in a formal ſpeech, one by one, ſometimes to the number of ſixty articles; ſaying, "By this I remove the hatchet from the wound.—By this I dry up the flowing blood." And thus, in a figurative manner, take away, one by one, all the circumſtances and conſequences of the murder. If the murder be committed by one of the ſame cabbin, that cabbin has the full right of judgment within itſelf, without appeal, either to puniſh the guilty with death, to pardon him, or to force him to give ſome recompence to the wife or children of the ſlain. Mean while the ſupreme authority of the nation looks on unconcerned.

As the Indians are of a vindictive diſpoſition, unreſtrained by the influence of religion, the moſt trifling provocations frequently rouſe them to arms, and prove the occaſions of bloodſhed and murder. Their petty private quarrels are often decided this way, and expeditions undertaken without the knowledge or conſent of a general council. Theſe private expeditions are winked at, and excuſed, as a means of keeping their young men in action, and inuring them to the exerciſes of war.

But when war becomes a national affair, it is entered upon with great deliberation. They firſt call an aſſembly of the ſachems and chief warriors, to deliberate upon the affair, and every thing relating to it. In this general congreſs among the Northern Indians and the Five Nations, the women have a voice as well as the men. When they are aſſembled, the chief ſachem or preſident, propoſes the affair they have met to conſult upon, and taking up the tomahawk, which lies by him, ſays, "Who among you will go and fight againſt ſuch "a nation? Who among you will bring captives "from thence to replace our deceaſed friends, that our "wrongs may be revenged, and our name and honour "maintained, as long as the rivers flow, graſs grows, "or the ſun and moon ſhall endure?" Then one of the principal warriors riſing, harrangues the whole aſſembly, and afterwards addreſſing himſelf to the young men, enquires who among them will go along with him, and fight their enemies? When they generally riſe, one after another, and fall in behind him, while he walks round the circle, till he is joined by a ſufficient number.

On ſuch occaſions they have uſually a deer, or ſome other beaſt roaſted whole, and each of them, as they conſent to go to war, cuts off a piece and eats, ſaing, "Thus "will I devour our enemies," mentioning the nation they are going to attack. This ceremony being performed, the dance begins, and they ſing the war-ſong, which has relation to their intended expedition and conqueſt, or to their own ſkill, courage, and dexterity in fighting, and the manner in which they will vanquiſh their enemies. Their expreſſions are ſtrong and pathetic, uttered with a tone that inſpires terror.

Such is the influence of their women in theſe conſultations, that the iſſue depends much upon them. If any one of them, in conjunction with the chiefs, has a mind to excite one, who does not immediately depend upon them, to take part in the war, ſhe preſents, by the hands of ſome truſty young warrior, a ſtring of wampum, to the perſon whoſe help ſhe ſollicits, which ſeldom fails of producing the effect. But when they ſollicit an offenſive or defenſive alliance with a whole nation, they ſend an embaſſy, with a large belt of wampum and a bloody hatchet, inviting them to come and drink the blood of their enemies.

The wampum uſed upon theſe and other occaſions, before their acquaintance with Europeans, was only ſmall ſhells, which they picked up by the ſea-coaſts, and on the banks of the lakes. It now conſiſts of a kind of cylindrical beads, made of white and black ſhells, which are eſteemed among them as ſilver and gold are among us. The black they think the moſt valuable; both of them are their greateſt riches and ornaments, anſwering all the ends of money among us. They have the art of ſtringing, twiſting, and interweaving them into their belts, collars, blankets, &c. in ten thouſand different ſizes, forms, and figures, ſo as not only to be ornaments for every part of dreſs, but expreſſive of all their important tranſactions. They dye the wampum of various colours and ſhades; and as they are made ſignificant of almoſt any thing they pleaſe, by theſe their records are kept, and their thoughts communicated to one another, as ours are by writing. Thus the belts that paſs from one nation to another, in all important tranſactions, are carefully preſerved in the cabbins of their chiefs, and ſerve both as a kind of record or hiſtory, and as a public treaſure; hence they are ever uſed on trifling occaſions.

The calumet, or pipe of peace, is of no leſs importance, nor is it leſs revered among them. The bowl of this pipe is made of a kind of ſoft, red ſtone, eaſily wrought and hollowed out; the ſtem is of cane, or a kind of light wood, painted with different colours, and adorned with the heads, tails, and feathers of the moſt beautiful birds, &c. The uſe of the calumet, is to ſmoke either tobacco, or ſome other herb uſed inſtead of it, when they enter into an alliance or any ſolemn engagement; this being eſteemed the moſt ſacred oath that can be taken, the violation of which is thought to be moſt infamous, and deſerving ſevere puniſhment in the other life. When they treat of war, the whole pipe, and all its ornaments, are red; ſometimes it is red only on one ſide, and by the diſpoſition of the feathers, &c. a perſon acquainted with their cuſtoms, knows at firſt ſight the intentions or deſires of the nation who preſents it. Smoaking the calumet is alſo, upon ſome occaſions, and in all treaties, conſidered as a ſacred oath, as a ſeal of their decrees, and a pledge of their performance of them. The ſize and decorations of their calumets are commonly proportioned to the importance of the occaſion, to the quality of the perſons to whom they are preſented, and to the eſteem and regard they have for them.

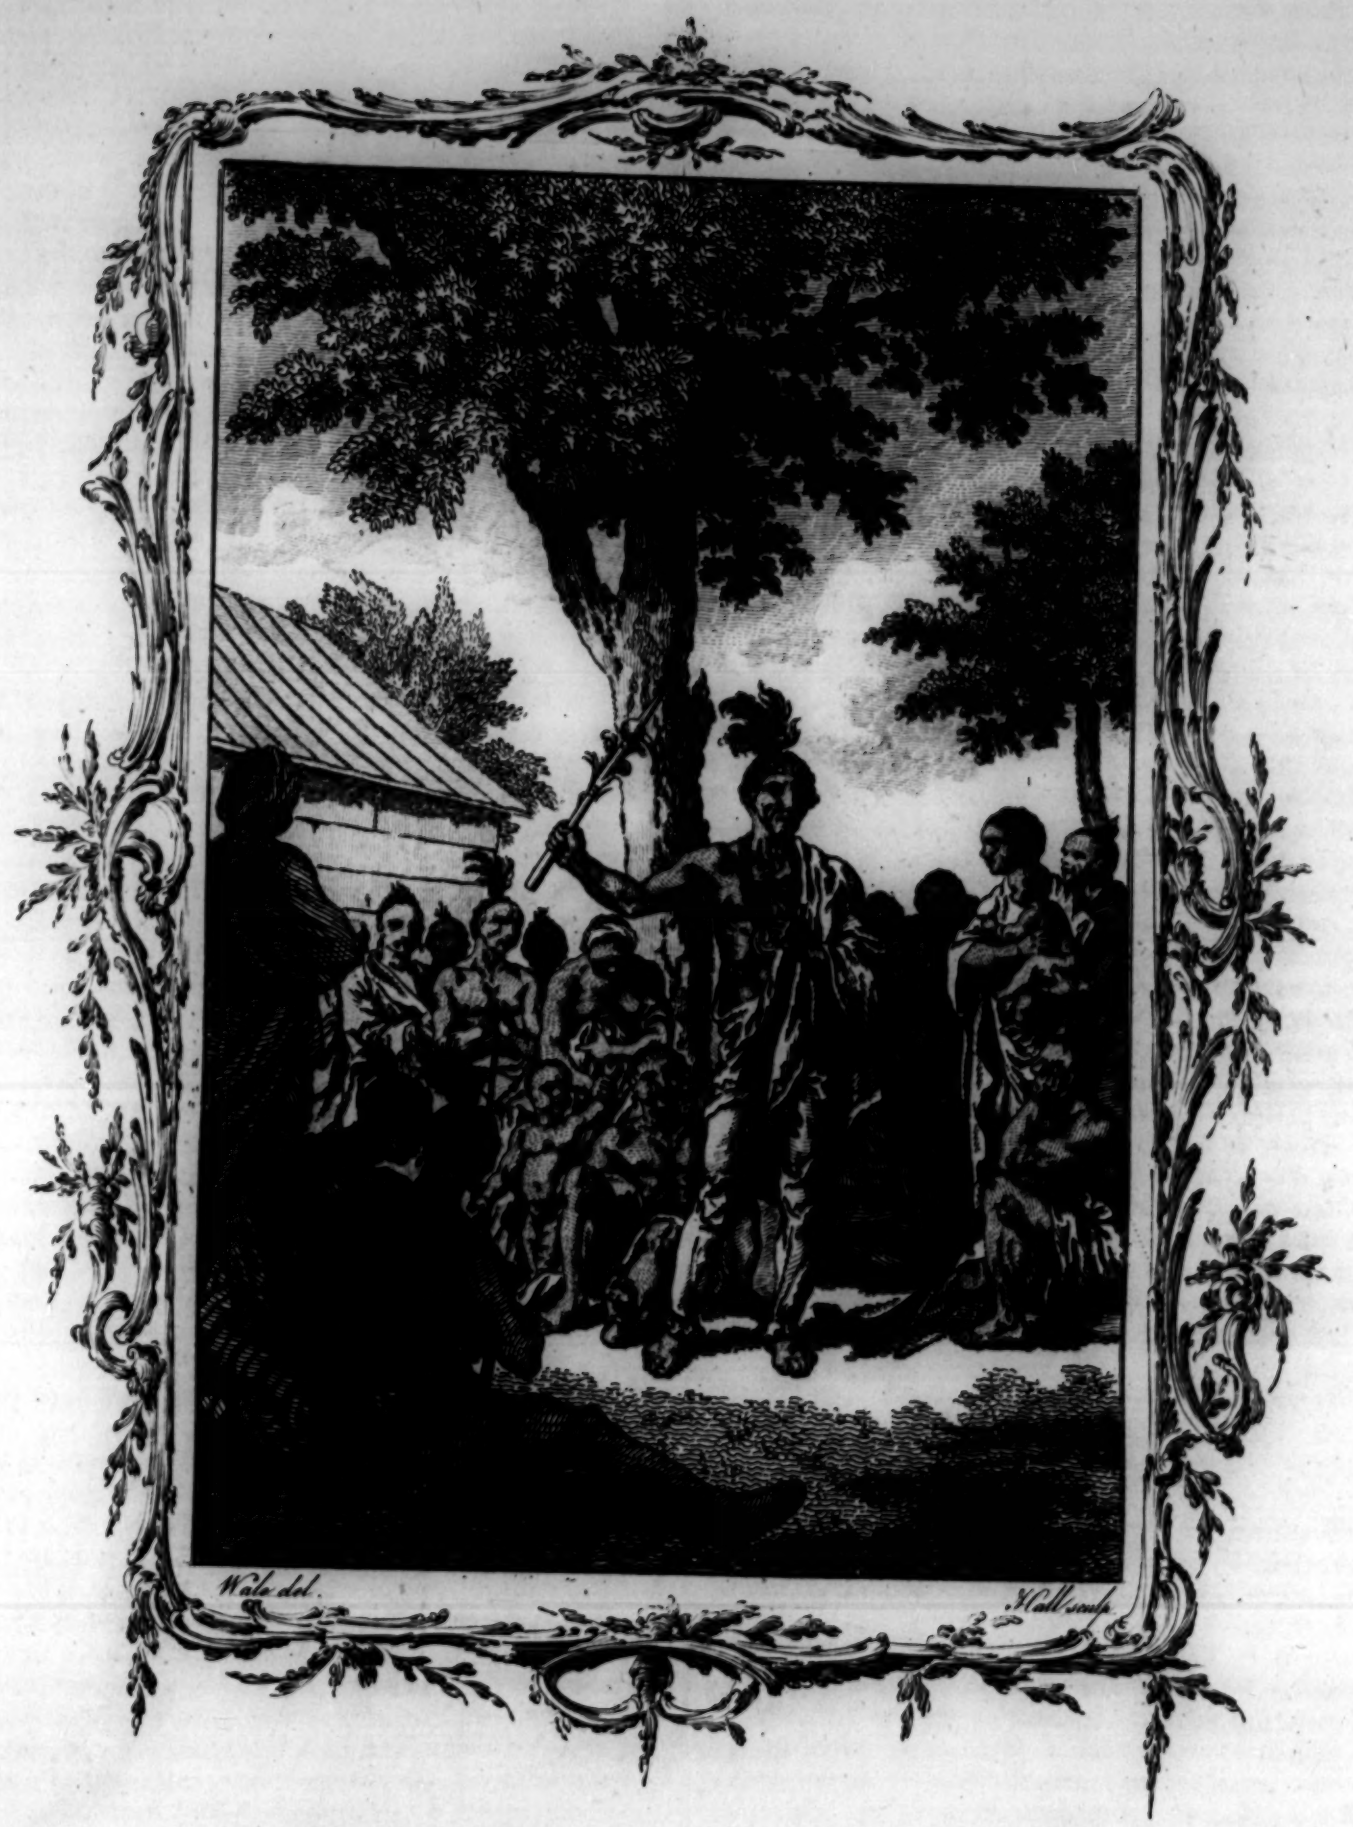
Another inſtrument of great importance among them, is the tomahawk. This is an ancient weapon, uſed by them in war, before they were taught the uſe of iron and ſteel; ſince which hatchets have been ſubſtituted in the room of them: but it ſtill retains its uſe and importance in public tranſactions, and, like the pipe, is frequently very ſignificant. This inſtrument is formed, in ſome reſpects, like an hatchet, having a long handle; the head, which is a round knob of ſolid wood, calculated to knock a man down, has on the other ſide a point, bending a little towards the handle; and near the centre, where the handle pierces the head, another point projects forward, of a conſiderable length, which ſerves to thruſt with like a ſpear. The tomakawk is alſo ornamented with painting and feathers, diſpoſed and variegated in many ſignificant forms, according to the occaſion and end for which it is uſed; and on it is kept a kind of journal of their marches and moſt important occurrences, in a ſort of hieroglyphics. When the council is called to deliberate on war, the tomahawk is coloured red; and when the council ſits, it is laid down by the chief; and if war be concluded upon, the captain of the young warriors takes it up, and holding it in his hand, dances and ſings the war-ſong. When the council is over, this, or ſome other of the ſame kind, is ſent by the hands of the ſame warrior, to every tribe concerned, who, with it, preſents a belt of wampum, and delivers his meſſage, throwing the tomahawk on the ground, which is taken up by one of the moſt expert warriors, if they chooſe to join; if not, it is returned with a belt of their wampum, ſuited to the occaſion.

Each nation or tribe has its diſtinct enſigns, or coats of arms, generally conſiſting of ſome beaſt, bird, or fiſh. Thus the Five Nations have the bear, otter, wolf, tortoiſe, and eagle: by theſe names the tribes are generally diſtinguiſhed, and the ſhapes of theſe animals are pricked and painted on ſeveral parts of their bodies. Generally, when they march thro' the woods, they, at every encampment, cut the figure of their arms on trees, eſpecially when they have had a ſucceſsful campaign, that travellers may know they have been there; recording alſo, in their way, the number of priſoners and ſcalps they have taken.

Their military appearance is very odd and terrible. They cut off all their hair, except a ſpot on the crown of the head, and pluck off the eyebrows. The lock left upon the head is divided into ſeveral parcels, each of which is ſtiffened, and intermixed with beads and feathers of various ſhapes and colours; the whole twiſted and connected together till it takes a form much reſembling the modern pompadour upon the top of the head; which is painted red, down to the eyebrows, and ſprinkled over with white down. The griſtles of their ears are ſlit almoſt quite round, and hung with ornaments that have generally the figure of ſome bird or beaſt drawn upon them. Their noſes are likewiſe bored and hung with beads, and their faces painted with various colours. On their breaſts are a gorget or medal of braſs, copper, or ſome other metal; and by a ſtring which goes round their necks, is ſuſpended that horrid weapon the ſcalping-knife.

Thus equipped, they march forth, ſinging their war-

ſong,



A Sachem exhorting the Indians to War.

ſong, till they loſe ſight of their village; and are generally followed by their women, who aſſiſt them in carrying their baggage, whether by land or water, but commonly return before they proceed to action.

They have generally one commander for every ten men; and if the number amounts to one hundred, a general is appointed over the others, not properly to command, but to give his opinion. They have no ſtated rules of diſcipline, or fixed methods of carrying on a war; but make their attacks in as many different ways as there are occaſions, but generally in flying parties, equipped for that purpoſe, with a thin light dreſs, uſually conſiſting of nothing more than a ſhirt, and ſometimes they are almoſt naked.

The weapons uſed by thoſe who trade with the Engliſh and French, are commonly a firelock, hatchet, and ſcalping-knife; but the others uſe bows, tomahawks, and pikes. As the commander in chief governs only by advice, and can neither reward nor puniſh, every private man may return home when he pleaſes, without aſſigning any reaſon for it, or any number may leave the main body, and carry on a private expedition in whatever manner they pleaſe, without being called to an account for it.

Every morning the commander harrangues his detachment, and gives his advice for the conduct of affairs during the day. If he wants to detach a party on any occaſion, he propoſes the affair, and gives his opinion how, and by what number, it ſhould be performed; and it ſeldom happens that he is oppoſed in any of his meaſures. For ſo greatly are the Indians influenced by a ſenſe of honour and love of their country, that upon theſe occaſions they are in no need of penal laws to reſtrain them: but then it muſt be obſerved, that the qualifications neceſſary to recommend a perſon to the chief command, are his being fortunate, brave, and diſintereſted; and they chearfully obey a perſon in whom they believe that all thoſe qualifications are united.

When the Indians return from a ſucceſsful campaign, they manage their march ſo as not to approach their village till towards the evening. They then ſend two or three forwards to acquaint their chief, and the whole village, with the moſt material circumſtances of the campaign. At day-light next morning they give their priſoners new cloaths, adorn their heads with feathers, paint their faces with various colours, and put into their hands a white ſtaff, toſſeled round with the tails of deer. This being done, the war-captain ſets up a cry, and gives as many yells as he has taken priſoners and ſcalps; and the whole village aſſemble at the water-ſide. As ſoon as the warriors appear, four or five of their young men, well clothed, get into a canoe, if they come by water, or otherwiſe march by land: the two firſt, carrying each a calumet, goes ſinging to ſearch the priſoners, whom they lead in triumph to the cabbin, where they are to receive their doom. The owner of this cabbin has the power of determining their fate, though it is often left to ſome woman who has loſt her huſband, brother, or ſon, in the war; and when this is the caſe, ſhe generally adopts him into the place of the deceaſed. The priſoner has victuals immediately given him, and while he is at this repaſt, a conſultation is held; and if it be reſolved to ſave his life, two young men untie him, and taking him by the hands, lead him to the cabbin of the perſon into whoſe family he is to be adopted, and there he is received with all imaginable marks of kindneſs. He is treated as a friend, as a brother, or as a huſband; and they ſoon love him with the ſame tenderneſs as if he ſtood in the one of thoſe relations to them.

But if the ſentence be death, how different their conduct! theſe people, who behave with ſuch diſintereſted affection to each other, with ſuch tenderneſs to thoſe whom they adopt, here ſhew that they are truly ſavages; the dreadful ſentence is no ſooner paſſed, than the whole village ſet up the death-cry; and, as if there were no medium between the moſt generous friendſhip and the moſt inhuman cruelty, the execution of him whom they had heſitated whether he ſhould not have a tender relation to them, is no longer deferred than they can make the neceſſary preparations for rioting in the moſt diabolical cruelty. They firſt ſtrip him, and fixing two poſts in the ground, faſten to them two pieces from one to the other; one about two feet from the ground, the other about five or ſix feet higher: then obliging the unhappy victim to mount upon the lower croſs piece, they tie his legs to it, a little aſunder: his hands are extended and tied to the angles formed by the upper piece. In this poſture they burn him all over the body, ſometimes firſt daubing him with pitch. The whole village, men, women, and children, aſſemble round him, every one torturing him in what manner they pleaſe, each ſtriving to exceed the other in cruelty, as long as he has life. But if none of the bye-ſtanders are inclined to lengthen out his torments, he is either ſhot to death, or incloſed with dry bark, to which they ſet fire: they then leave him on the frame, and in the evening run from cabbin to cabbin, ſuperſtitiouſly ſtriking with ſmall twigs the furniture, walls, and roofs, to prevent his ſpirit from remaining there to take vengeance for the evils committed on his body. The remainder of the day and the night following is ſpent in rejoicing.

This is the moſt uſual method of murdering their priſoners, but ſometimes they faſten them to a ſingle ſtake, and build a fire round them; at other times they cruelly mangle their limbs, cut off their fingers and toes, joint by joint, and at others ſcald them to death.

What is moſt extraordinary, if the ſufferer be an Indian, there ſeems, during the whole time of his execution, a conteſt which ſhall exceed, they in inflicting the moſt horrid pains, or he in enduring them: not a groan, not a ſigh, not a diſtortion of countenance eſcapes him, in the midſt of his torments. It is even ſaid, that he recounts his own exploits, informs them what cruelties he has inflicted upon their countrymen, and threatens them with the revenge that will attend his death: that he even reproaches them for their ignorance of the art of tormenting; points out methods of more exquiſite torture, and more ſenſible parts of the body to be afflicted. But perhaps theſe inſtances of intrepidity are ſomewhat exaggerated. However, they frequently kill their priſoners on the ſpot where they have taken them; or in their way home, when they find it inconvenient to carry them farther, or have any fear of their eſcape.

Theſe inſtances ſhew the inconſiſtencies to which human nature is ſubject, and the benefit theſe people would receive from a divine revelation, breathing an uniform humanity, and the forgiveneſs of their enemies; for had they theſe diſpoſitions, and were they taught to treat their enemies in the manner our holy religion inſpires, how conſiſtent, how amiable, would be their character!

SECT. VII.

Of NEW ENGLAND.

Its Situation, Extent, Climate, Vegetables, Beaſts, Birds, Fiſhes, and Rivers; with a particular Deſcription of Maize, or Indian Corn; and, among the Animals, of the Mooſe.

NEW ENGLAND, the moſt powerful colony in North America, is ſituated between the forty-firſt and forty-third degree fifty minutes north latitude, and between the ſixty fourth degree forty minutes and the ſeventy-third degree weſt longitude; it being bounded on the north eaſt and eaſt by Nova Scotia and the bay of Fundy, on the north-weſt by Canada, on the weſt by the province of New York, on the ſouth by the Sound, and on the ſouth-eaſt by the Atlantic ocean. Its extent from Kennebec river to the ſouth-eaſt boundary of New York, according to the late Rev. Mr. Neale, three hundred and thirty miles, from the ſouth-weſt to the eaſt-north-eaſt is four hundred and eighty miles, and it is a hundred and ninety miles broad from Cape Cod to the north-eaſt bounds of New York.

The ſummer-ſeaſon is here warmer than ours, and generally accompanied for two months together with a clear ſky, which renders the country extremely wholeſome; ſo that none of our plantations are more agreeable to the conſtitutions of the Engliſh; yet the winters of New England are much ſeverer than ours; and, though it lies conſiderably farther to the ſouth, the froſts continue longer,

longer, and are much ſharper than with us. The ſun riſes at Boſton on the longeſt day at twenty-ſix minutes after four in the morning, and ſets at thirty-four minutes after ſeven in the evening; and on their ſhorteſt day it riſes at thirty-five minutes after ſeven in the morning, and ſets at twenty-ſeven minutes after four in the afternoon: thus their longeſt day is about fifteen hours, and the ſhorteſt about nine.

The land next the ſea is generally low, and in ſome parts marſhy, but farther up it riſes into hills, and on the north-eaſt is rocky and mountainous.

The country abounds with mines of excellent iron, and ſome of copper; in the woods and ſwamps is plenty of good timber: oak, elm, aſh, cypreſs, pine, cheſnut, walnut, cedar, beach, aſpin, and ſaſſafras, are common here; as are alſo ſpruce and fir trees, which are of an extraordinary growth, producing pitch, tar, roſin, and turpentine, with maſts, yards, and planks, as the oak does other ſhip-timber; ſo that more ſhips are ſaid to have been built in this province than in all the other parts of America. The dwarf oak grows wild here. It likewiſe abounds with fruit-trees; ſo that it is eaſy for a planter to make a hundred hogſheads of cyder in a ſeaſon. They have beſides as good hemp and flax as any in the Baltic; great plenty of roots, as turnips, parſnips, carrots, radiſhes, much larger and richer than ours, though their ſeeds came originally from hence; with a great quantity of onions, cucumbers, ſquaſhes, pompions, and water-melons.

When the Engliſh arrived here they found a variety of fruits that grew wild, particularly grapes, currants, raſberries, ſtrawberries, &c. and Mr. Dudley, one of the council in New England, obſerves, that the peaches here are very large, all ſtandards, and the fruit better than ours; and that they commonly bear in three years from the ſtone. They have likewiſe a great variety of plants different from thoſe of England.

Nothing is ſo much planted here as Indian corn, which in ſome parts of America is called maize; it has an ear a ſpan long, containing eight rows of grain, or more, according to the goodneſs of the ſoil, and about thirty grains in a row. It is of almoſt all colours, ſometimes in the ſame field, and even in the ſame ear; but the white and yellow are the moſt common. The ſtalks grow ſix or ſeven feet high, are jointed like a cane, with long flags at every joint, yielding a juice like the ſugar-cane, from whence a ſweet ſyrup has been often extracted. Mr. Dudley ſays this corn generally produces twelve hundred, and often two thouſand grains for one; that ſix quarts of grain will plant an acre; and that an acre of good ſoil commonly produces fifty buſhels.

New England produces great plenty of beaſts, both tame and wild: among the former are cows, ſheep, goats, hogs, and horſes, all originally brought from hence; but their horſes are generally ſmaller than ours, though larger than the Welſh, and are extremely ſerviceable. Among the wild beaſts are deer, elks, racoons, bears, wolves, which are only a kind of wild dogs, and if taken when young may be made tame; with ounces, foxes, hares, rabbits, ſquirrels, opoſſums, ſables, beavers, otters, minks, and martens. One of the moſt ſingular animals of this and the neighbouring countries is the mooſe, of which there are two ſorts; the common light-grey mooſe, which reſembles the ordinary deer; theſe herd ſometimes thirty together: and the large black mooſe, whoſe hair is ten or twelve inches long on the ridge of his back. Of this ſort there are ſeldom more than four or five together. This is made much like a deer, as it parts the hoof, chews the cud, has no gall, and his ears are large and erect. A ſtag-mooſe is bigger than a large horſe. The horns, when full grown, are about four or five feet from the head to the tip, and have ſhoots or branches to each horn, which generally ſpread about ſix feet. When the horns come out of the head they are round like thoſe of an ox, but at about the diſtance of a foot begin to grow a palm broad, and farther up are ſtill wider; and of theſe the Indians make good ladles that will hold a pint.

When this animal goes through a thicket, or under the boughs of a tree, he lays his horns back on his neck, not only to place them out of his way, but to ſecure himſelf from being ſcratched in the woods; and theſe prodigious horns are ſhed every year. This animal does not ſpring or riſe in going, like a deer; but a large one in his common walk has been ſeen to ſtep over a gate five feet high. When a mooſe is unharboured he will run a courſe of twenty or thirty miles before he turns about or comes to a bay; but when chaſed he generally takes to the water. He is, however, not ſo ſwift as the common deer, though he runs much farther. As the mooſe is tall, and has a ſhort neck, he does not graze like other cattle; for when he eats graſs, it is only the top of that which grows very high, or on ſteep riſing-grounds. Theſe animals are fond of water-plants, for which they will wade far and deep. In ſummer they alſo feed upon other plants, herbs, and young ſhrubs; and in winter live upon the tops of buſhes and young trees. The fleſh of the mooſe is very good food; it is more ſubſtantial than common veniſon, and will bear ſalting. The noſe is admired as a great dainty.

There is hardly any where greater plenty of fowls, as turkeys, geeſe, partridges, ducks, widgeons, dappers, ſwans, heath-cocks, herons, ſtorks, black-birds, all ſorts of barn-door fowl, vaſt flights of pigeons, which come and go at certain ſeaſons of the year, cormorants, ravens, crows, bats, &c.

With reſpect to the diſagreeable reptiles, there are rattle-ſnakes, frogs, and toads, which ſwarm in the uncleared part of the country, where, with the owls, they make a moſt hideous noiſe in the ſummer evenings. But wherever the country is planted by the Engliſh, it is pretty well freed from all noxious animals.

The ſea and rivers afford a vaſt abundance of excellent fiſh, as ſturgeon, ſalmon, cod, thornback, mackarel, herrings, lampreys, whales, grampuſes, porpoiſes, ſeals, ſharks, and other fiſh great and ſmall. The beſt months for fiſhing are March, April, May, and June.

There are few countries better watered with ſprings, rivers, and lakes, though the latter are much ſmaller than thoſe to the north and weſt. Of its rivers ſeven are navigable, theſe are the Thames, which riſes from a lake to the north of Maſſachuſet's country, and running directly ſouth falls into the ſea below New London.

The river Patuxet, which riſing in the north-weſt, runs ſouth-eaſt through Providence plantation, and falls into a noble bay of the ſea, near Swanſey. The river Piſcataway, which runs from weſt to eaſt, and falls into the ſea near Portſmouth, in Hampſhire, with a mouth that reſembles an arm of the ſea, and is capable of receiving the largeſt ſhips; the Caſco river, which runs parallel with the former, and falls into a bay of its own name; Connecticut river; the great river Merrimac; and the river Saco, of which we ſhall give an account in treating of the rivers which flow from the White Mountains in the province of New Hampſhire. To the eaſt of theſe are many other conſiderable rivers, which riſing far to the north, run almoſt due ſouth, and fall into the ſea to the north-eaſt of Caſco-bay.

It is owing to the conveniency of ſo many fine rivers that this country is ſo full of large and populous towns; and in the country between the rivers is ſuch plenty of ſprings, that there is ſcarce any place where water may not be had by ſinking a well to the depth of ten feet.

SECT. VIII.

Of the Diviſions of New England, and a particular Account of the Manner in which its firſt Settlements were formed.

THIS territory is divided into four diſtinct governments; the moſt northerly, which was formerly called the province of Main, and now the county of York, is under the juriſdiction of Maſſachuſet's-bay; next to this county, and between it and Maſſachuſet's-bay, is the province of New Hampſhire; next to the bay government is the colony of Rhode Iſland; to the ſouth and weſt of theſe is the colony of Connecticut. Theſe ſeveral diſtricts took their riſe from the firſt ſettlement made by the Engliſh in this country, which was the

the colony of Plymouth, ſeated near Cape Cod, which now, as well as the province of Main, is incorporated into that of Maſſachuſet's-bay.

It will not, therefore, be here improper to give ſome account of the ſettlement of this colony. In 1614 the North Virginia company employing captain John Smith and captain Thomas Hunt to fiſh on this coaſt, the former went on ſhore, took a particular view of the country of the Maſſachuſets, and had ſome ſkirmiſhes with the natives; after which he ordered Hunt to diſpoſe of his fiſh, and then return to England; but Hunt treacherouſly inticing twenty-ſeven of the Indians on board his ſhip, ſet ſail with them to Malaga, and had the villainy to ſell them to the Spaniards for ſlaves, keeping only an Indian called Squanto. This outrage was ſo reſented by the Indians, that all commerce between them became impracticable, and no thoughts were entertained of making any ſettlement there till a congregation of Browniſts, or Independents, who had been perſecuted in England, were obliged to fly to Holland, where they formed the deſign of ſeeking an eſtabliſhment in the New World; and having, by means of intereſt, obtained the conſent of king James I. contracted with ſome merchants for a ſettlement on the banks of Hudſon's river.

This congregation ſold their eſtates in order to make a common bank to carry on the undertaking; then hired a ſhip of one hundred and eighty tons, which they freighted with proper goods and merchandize, and the whole company, conſiſting of one hundred and twenty perſons, with Mr. Robinſon their miniſter, firſt returned to England, embarked on board their veſſel on the ſixth of September 1621, and fell in with cape Cod in November following; and finding a ſafe harbour, fixed upon the place for their preſent ſettlement, called Plymouth from the place of their embarkation, which name it ſtill retains; and as this was out of the limits for which they had obtained a grant, they aſſociated themſelves into a body politic, by a formal inſtrument; in which, having declared themſelves the ſubjects of the crown of England, they ſolemnly engaged ſubmiſſion to the laws that ſhould from time to time be made for the good of the country.

The planters who agreed to ſtay in this place were about one hundred, including women and children, and of theſe there were only nineteen families; but ſuch were the fatigues endured by this infant colony during the firſt winter, that fifty perſons out of the hundred died within the ſpace of two months; and had the Indians attacked them, they had probably all periſhed.

The adventurers, however, ſaw none of the natives till the middle of March, when one of their chiefs came to them in a friendly manner, made them underſtand that they were welcome, and that his people would be glad to trade with them. The next day coming again with other Indians, he made them underſtand that Maſſaſſoiet, their ſachem, had his reſidence three days march to the northward, and intended them a viſit. He accordingly arrived a few days after, attended by ſixty people; and being received by captain Standiſh, was conducted to a kind of throne prepared for him. His face was painted red, and ſmeared with oil; he had a deer-ſkin mantle; his breeches and ſtockings, which were of a piece, were of the ſame materials, and his arms were covered with wild-cats ſkins. His attendants were dreſſed in the ſame manner, and there appeared little diſtinction between him and his followers. This chief had not been long ſeated when Mr. John Carver, whom they had choſen governor, came in with a guard of muſketeers; upon which Maſſaſſoiet roſe up and kiſſed him, and then both ſitting down, an entertainment was provided, of which no part appeared more acceptable to the ſachem than the brandy, of which he drank very plentifully.

In the retinue of this chief was Squanto, who had been carried to England by Hunt, where he had been treated kindly; and, after living here ſeveral years, had been brought back to his country. He had entertained an affection for the Engliſh, and from his favourable repreſentation the ſachem had made them this viſit, in which, by his means, was concluded an offenſive and defenſive alliance; which being founded upon the mutual intereſts of the contracting parties, was inviolably maintained for many years.

This infant colony was annually reinforced by freſh adventurers from the mother country, driven thither by the ſpirit of perſecution; ſo that by the year 1628 their number and improvements were conſiderable; and that year they obtained a grant from the North Virginia company of this colony, and another of all the lands within three miles north of Merrimac river to three miles ſouth of Charles river, where it falls into the ſea at the bottom of Maſſachuſet's-bay: and the next year ſix ſhips with three hundred and fifty paſſengers arrived at Salem, with a large ſtock of cattle of all ſorts, and other neceſſaries.

This new colony, which ſettled the town called Salem, was ſupported with the ſame ſpirit and vigour as the former, and ſoon after obtained a patent from king Charles I. whereby they were incorporated by the name of the governor and company of Maſſachuſet's-bay, and were impowered to make laws for the good of the plantation not repugnant to thoſe of England; and liberty of conſcience being granted to all who would ſettle there, great numbers of thoſe who could not obtain that privilege in England went over, and in a little time new ſettlements were made, particularly one ſtiled Charles Town, on the ſouth ſide of Charles river, and that of Dorcheſter, at the bottom of Maſſachuſet's-bay. Soon after part of the inhabitants of Charles Town, paſſing over to the oppoſite ſhore, erected Boſton, the preſent capital of New England.

In the mean while thoſe who had ſtrenuouſly contended for liberty of conſcience in favour of themſelves, became actuated with that ſpirit of perſecution which had driven them from their native country, and Mr. Roger Williams, a miniſter of Salem, advancing ſome religious ſentiments contrary to thoſe which had been generally received, and refuſing to recant, theſe people were ſo void of charity as to expel the miniſter and his followers from Maſſachuſet's colony: upon which they built a new town, which they called Providence, upon Newport river, near Rhode Iſland.

Hitherto they had not been in the leaſt moleſted by the Indians, but now a nation called the Pequots, who lived on Connecticut river, committed ſome murders; on which it was conſidered, that a town and fort on Connecticut river would make a good frontier on that ſide. Agents were therefore ſent to view the country, who made ſuch an advantageous report of the fertility of the ſoil, and the largeneſs of the river, as induced many of the planters in ſeveral of the towns, where they were ſtreightened for room, to remove thither. Mr. Hooper put himſelf at the head of about a hundred of theſe new adventurers, who ſet out in the month of July, and travelling on foot with their children and baggage, they arrived at the banks of the river, where they began a town which they called Hartford. After theſe came another draught, who built a little town which they called Windſor; a third detachment built Weathersfield; and a fourth Springfield.

In 1635 no leſs than twenty ſail loaded with goods and paſſengers arrived at Boſton, with whom came Mr. Henry Vane, afterwards Sir Henry Vane, intending with theſe people to begin another ſettlement on Connecticut river; but being choſen governor the year enſuing for the Maſſachuſets, he laid aſide the deſign of beginning a new colony for the preſent; but the next year he being inclined to favour the Baptiſts, they left him out, and choſe their old governor Mr. Winthrop. Upon which it was thought expedient for both parties to make a ſettlement upon Connecticut river, and towns were accordingly built on both ſides of it; but this being out of the limits of the other colonies, they formed themſelves into a ſeparate government, and for that purpoſe obtained a charter from king Charles II. authorizing them to elect their own governor, council, and magiſtrates; and to enact ſuch laws as ſhould be moſt advantageous to the colony, provided they were not oppoſite to thoſe of England.

The perſecution of the Proteſtant diſſenters in England ſtill continuing, great numbers of people removed to New England; and the old colonies being over-ſtocked, there was an abſolute neceſſity of forming new plantations; and therefore, in 1637, Theophilus Eaton, Eſq; and the Rev. Mr. Davenport, finding there was not room

at Maſſachuſet's-bay, purchaſed from the Indians the lands lying on the ſea-coaſt between Connecticut river and Hudſon's river, where they built a town, and named it New Haven, from whence the colony derived the name of the New Haven colony.

While the ſouth-weſt parts of New England were thus filling with inhabitants, others, induced by the profits ariſing from the fur-trade, ſettled to the north-eaſt between the rivers Merrimac and Kennebec, forming two diſtinct colonies, one named New Hampſhire, and the other, ſtill farther to the eaſtward, was called the province of Main.

Thus in the ſpace of about twenty years New England had above forty towns, and the Engliſh had taken poſſeſſion of this country from the river Kennebec on the north-eaſt almoſt to Hudſon's river on the ſouth-weſt, an extent of upwards of four hundred miles on the ſea-coaſt. Such was the firſt riſe and origin of the New England colonies, which, from theſe ſmall beginnings, are now become rich and of great importance.

SECT. IX.

Of the Province of Maſſachuſet's-Bay; its Situation, Extent, Soil, Produce, and Government; with a Deſcription of the Towns of Boſton and Cambridge.

THE province of Maſſachuſet's-bay contains what were formerly the colonies of Plymouth, Maſſachuſet's-bay, and the county of York; the latter of which is ſeparated from the others by New Hampſhire, which runs in between them, and is about thirty miles wide upon the ſea. That part of this province called the province of Main, or county of York, is bounded on the weſtward by New Hampſhire; on the northward by Canada; on the north-eaſtward by Nova Scotia; on the ſouth-eaſtward and ſouthward by the ſea for near two hundred miles. The other part of this province is bounded on the north by New Hampſhire; on the eaſt and ſouth by the ſea; on the ſouth and weſt by the colonies of Rhode Iſland, Connecticut, and the province of New York.

That part of the province called the county of York has a very cold ſoil, great part of it towards Canada being mountainous, and entirely unfit for agriculture; and that towards the ſea-coaſt is low, covered with ſpruce, white and yellow pines, and ſome oaks, except near the banks of the many rivers which fall from the mountains, on which a great number of ſaw-mills are erected; and on their banks is plenty of oak, aſh, and maple. There are ſeveral ſafe and convenient harbours along the ſea-coaſt, the principal of which is Caſco-bay. This part of the province is well ſtored with wild game, and from it are exported conſiderable quantities of furs and ſkins.

The other part of the province has a variety of ſoil, it being in ſome places very barren, and in others extremely fertile, producing great quantities of Indian corn, rye, oats, barley, peas, flax, and on the weſtern parts wheat. The ſurface is generally rocky and uneven, except near the rivers, where are ſome pleaſant fields. Several fiſheries are carried on to great advantage from the ſea-coaſts of this province to the banks of Newfoundland, the iſle of Sable, &c. eſpecially from the town of Marblehead, where is the moſt conſiderable fiſhery in New England.

His Britannic majeſty appoints the governor, lieutenant-governor, ſecretary, and officers of the admiralty in this province; and the freeholders elect a houſe of repreſentatives, who chooſe a ſpeaker and council, or upper houſe. However, the governor can put a negative on their choice; yet both he and all the officers in the province, except the comptroller of his majeſty's cuſtoms, receive their ſalaries by a vote of the two houſes, who have never yet been perſuaded to ſettle a ſalary even upon the governor, who has it generally in his inſtructions from the king to inſiſt upon their doing it. They, however, commonly grant him one thouſand pounds ſterling per annum.

The eſtabliſhed religion is that of the Independents; but there are a number of churches of the epiſcopal perſuaſion. Great care is taken of the education of children, free-ſchools being eſtabliſhed and ſupported by law in moſt of their towns, which are generally ſupplied with able maſters; and at Cambridge, about ſix miles from Boſton, is an univerſity, or public ſeminary.

This colony is divided into ſeveral counties: thus in the diviſion ſtiled New Plymouth are the county of Briſtol, the county of Plymouth, and the Barnſtable county. In Maſſachuſet Proper are the counties of Suffolk, Middleſex, and Eſſex; to which muſt be added the county of York, already mentioned, and in each of theſe counties are ſeveral conſiderable towns.

Boſton, the capital of this province, is ſeated in the county of Suffolk, in the province of Maſſachuſet's-Proper, in the forty-ſecond degree twenty-one minutes north latitude, and in the ſeventy-firſt degree weſt longitude, at the bottom of a fine bay in a peninſula about four miles in circumference. At the entrance of this bay are ſeveral rocks, which appear above water, and upwards of a dozen ſmall iſlands, ſome of which are inhabited. There is but one ſafe channel to approach the harbour, and that ſo narrow that two ſhips can ſcarce ſail through a-breaſt; but within the harbour there is room for five hundred ſail to lie at anchor. The entrance is defended by the caſtle of Fort William, one of the fineſt pieces of military architecture in Britiſh America, it being ſurrounded by a covert-way, and joined by two lines of communication from the main guard to a redoubt. The caſtle is defended by a hundred guns, twenty of which lie on a platform level with the water; ſo that it is ſcarce poſſible for an enemy to paſs the caſtle. To prevent ſurprize, they have a guard placed on one of the rocks at about two leagues diſtance, from whence they make ſignals to the caſtle, when any ſhips come near it. There is alſo a battery of great guns at each end of the town, to the fire of which an enemy would be expoſed, if he ſhould be ſo fortunate as to paſs the caſtle. At the bottom of the bay is a pier near two thouſand feet in length, with ware-houſes for the merchants on the north ſide; and to this pier ſhips of the greateſt burthen may come and unload, without the help of boats. The greateſt part of the town lies round the harbour in the form of a creſcent; the country beyond it riſing gradually, and affording a delightful proſpect from the ſea. The town has ſeveral ſtreets little inferior to the beſt in London, the chief of which runs from the pier up to the town-houſe, a handſome building, with walks for the merchants, as in the Royal Exchange in London; and in this edifice are not only the courts of juſtice, but the council-chamber and the houſe of repreſentatives. The town contains between four and five thouſand houſes, which are in general well built; and ſeveral of the public ſtructures are very ſpacious and elegant. It has ſeventeen churches, or places appropriated to Divine worſhip. The epiſcopal church is handſomely built and adorned, and the congregation is ſaid to amount to about a thouſand. The church-furniture, and ſome pieces of plate, were given by king William and queen Mary; it has an organ, and there is a magnificent ſeat for the governor, when he happens to be of the church of England. The governor has alſo a very fine houſe. Among the other buildings is Fanniuel-hall, thus named from Mr. Fanniuel, who was its founder. The ſhipping of this port was ſome years ago computed at between ſix and ſeven hundred. The inhabitants of the town amount to about twenty-five thouſand, and there is ſaid to be two hundred thouſand in the province.

Cambridge, the principal town of the county of Middleſex, in this province, is ſeated on the north branch of Charles river, ſix miles to the north-weſt of Boſton, and has ſeveral fine houſes and good ſtreets. It was originally called New Town, but on founding the univerſity changed its name to Cambridge, and contains two ſpacious colleges, called by the names of Haverford-college and Stoughton-hall, with a public library, ſaid to be the beſt furniſhed with books of any in that part of the world. It conſiſts of a preſident, five fellows, and a treaſurer. The governor of the province, deputy-governor, and all the magiſtrates of the Maſſachuſet's colony, with the miniſters of ſix neighbouring towns for the time being, are viſitors. This univerſity never conferred any degree

above that of master of arts, till it obtained a new charter from king William and queen Mary, by which it had the power of creating doctors of divinity; but has seldom made use of it.

SECT. X.

Of the Province of New Hampshire; its Situation, Extent, Soil, and a particular Description of the White Mountains, and the Rivers that flow from them: its Produce, Government, and a Description of the Town of Portsmouth.

THE province of New Hampshire is bounded on the south by Massachuset's bay, on the west by the province of New York, on the north by Canada, and on the north-east by the county of York, having only thirty miles of sea-coast.

The soil is various, and the northerly parts of it are mountainous and barren. The most considerable mountains in this province, and indeed of all the British dominions near the coast, are called the White Mountains, from their appearing like snow, they being generally supposed to consist of a white flint, from which the reflection of the sun is very brilliant and dazzling. From their prodigious height they are to be seen at a very great distance, and it is not certain that any person was ever on the top of them. Major Rogers says, that he has often been told by the Indians that they have frequently attempted them in vain, on account of the change of air they met with; which, he says, he is inclined to believe, he having ascended them himself till the alteration of air was very perceptible, though he had not advanced half way up, and yet the valleys below were concealed from his view by the clouds. The basis of these mountains is a tract about fifty-five miles square, from which they rise in craggy heads one above another, in an irregular manner all the way to the top. For the first four or five miles as you ascend them you find beech, hemlock, and some white pines; higher up the growth is chiefly black spruce for six or seven miles, then the sides are cloathed with a white moss; and if you advance still farther, you find scarce any thing growing, which alone would render the ascent very difficult, the mountain being extremely steep.

Many streams of water gush out of the sides of these mountains, which run down with great rapidity. Indeed the largest and best rivers in New England rise from some part of them. Saco river rises from the south in several small rivulets, which join in the course of a few miles, and run through the county of York, falling into the sea between Cape Porpoise and Cape Elizabeth. On the banks of this river are some fine meadows and fields, which are annually overflowed when the snows melt, and thereby greatly enriched. The rivulets that break out from the south-west of the mountains, after various windings, fall into a lake called Winnipisiokee, out of which issues the river Merrimac, which, from the waters that join it, soon becomes a considerable stream. Upon it are several vales, overflowed and enriched like the former. This river runs through the province of New Hampshire, and part of the Massachusets, discharging itself into the sea between Salisbury and Newbery. From the north and west parts of these mountains rises Connecticut river, which runs to the southward across the provinces of New Hampshire, the Massachusets, and Connecticut, till, after running a course of at least two hundred miles, it empties itself into the sea, or sound, between Connecticut and Long Island. This river, like the others, annually overflows its banks, and enriches the adjacent fields, which in some places are very extensive, particularly through a tract called the Cohas, in New Hampshire, twenty miles in length, and six in breadth, which for its fertility and beauty may be stiled the garden of New England. The river Kennebec, which is a considerable stream, likewise rises on the east side of these mountains, running through the county of York, and is endowed with the same properties as the former. Another river rising from the north of them runs into the province of Quebec, and falls into the river St. Lawrence. A part of the river Shedoir also rises at these mountains, and joins the river St. Lawrence twelve miles above Quebec.

In the province of New Hampshire are raised great quantities of Indian corn, rye, oats, and peas, it being too cold for wheat. It likewise produces some hemp and flax. It has great plenty and variety of timber, and its forests abound with all kinds of game common to the climate. There are here likewise bred black cattle, horses, sheep, &c. but in no great abundance. Its rivers abound in salmon, shad, trout, eels, &c. Some fisheries are carried on in the sea-ports; but its scanty limits on the sea prevents the inhabitants engaging so considerably in the fishery as their neighbours.

The governor, lieutenant-governor, council, and secretary, with the officers of the admiralty in this province, are appointed by his majesty, who is absolute sovereign of the soil. The several towns and districts choose their representatives; but all the inferior officers of the executive power are appointed by the governor, with the advice of the council.

The religion of this province is the same as in Massachuset's-bay, and there is only one episcopal church erected, which is at Portsmouth.

The town of Portsmouth, the metropolis of the province, contains about seven hundred dwelling-houses, and is pleasantly seated on Piscataqua-bay, having a safe and convenient harbour, where the largest ships may ride securely, and five places of religious worship. Here the courts of justice are held; but as this is the only place where causes are tried in this province, and it is seated on one of its extremities, the inhabitants are sometimes obliged to travel a hundred and fifty or two hundred miles on any trifling occasion. From this port annually sail about two hundred vessels, loaded chiefly with timber, pipe-staves, fish, &c. for the West Indies; which having disposed of, they load there, and proceed from thence to Europe, where they sell both their vessels and cargoes, and the mariners return passengers.

The other principal towns for trade in this province are Hampton, Cochecha, Exeter, and Londonderry, an inland town about thirty-five miles from Portsmouth, which is chiefly peopled with the natives of Ireland, and has a considerable manufacture of linen. The number of inhabitants in this province amounts to about seventy thousand; these have been greatly increased since the entire reduction of Canada, settlements being annually begun and new towns formed where formerly they did not dare to attempt it, for fear of the Indians.

SECT. XI.

Of the Colony of Connecticut; its Situation, Extent, Produce, Trade, and Government.

THE colony of Connecticut contains not only the original colony of the same name, but that of New Haven, they being incorporated into one in 1692, and still retains, by the charter then granted them, all the privileges of their ancient charters; but ever since their union they have kept up two seats of government, namely, at Hartford and New Haven, at which places their general court, or assembly, sits alternately for transacting the affairs of the colony. It is bounded on the north by the Massachusets, on the east by Rhode Island and a part of Massachuset's bay, on the south by the Sound, and on the west by New York, extending in length from Stoniton to Rye, in the borders of New York, about a hundred miles, and in breadth from Saybrook to the borders of New Hampshire about seventy.

The soil of this colony is various, a great deal of it being uneven, rocky, cold, and barren; but in other parts it is fertile and exceeding pleasant, particularly on Connecticut river, where the fields produce all kinds of grain and fruit common to the climate in great abundance, seldom disappointing, and frequently exceeding the hopes of the husbandman. In this colony are bred great numbers of black cattle, horses, and swine; and the inhabitants raise a considerable quantity of flax and hemp. A town called Weathersfield, seated on the river Connecticut, is remarkable for the production of onions,

onions, with which it annually loads ſeveral veſſels to the neighbouring provinces.

The inhabitants of this colony carry on a very inconſiderable trade to foreign parts, they being chiefly ſupplied with foreign commodities from Boſton and New York; in exchange for which they ſend beef, pork, flax-ſeed, onions, &c. In this colony are ſome iron works, which are carried on to great advantage; and they ſhip ſome horſes and lumber to the Weſt Indies, with conſiderable quantities of ſaſſafras to England and Holland.

The inhabitants of this province have the privilege of annually chooſing their own governor, lieutenant-governor, aſſiſtants, and repreſentatives, by whom all executive officers are appointed and authorized. They generally allow their governor a very handſome ſalary, and have good funds for other public exigencies.

The religious perſuaſions here are the ſame as in the other New England governments, but there are more people of the church of England than in all the others. Particular care is here taken in the education of their children; the ſeveral towns being provided with ſchools, ſupplied with able maſters.

This colony has many fine towns, agreeably ſeated on the river Connecticut and along the Sound, the principal of which for trade and commerce are New London, Hartford, and New Haven: the latter is ſeated on New Haven-bay, and is elegantly laid out in regular ſtreets, having a beautiful parade in the center. It contains about two hundred dwelling-houſes, beſides public buildings, among which is a college that makes a very handſome appearance.

The number of inhabitants in this colony is ſuppoſed to amount to no leſs than two hundred and ten thouſand.

SECT. XII.

Of the Colony of Rhode Iſland; its Situation, Soil, Produce, Government, and Trade.

THIS colony contains only Rhode Iſland and Providence, which were united by charter about the ſame time as the colony of Connecticut, and like that the inhabitants retain the rights and privileges at firſt granted them in their ſeparate ſtate, having alſo two ſeats of government at Newport and Providence, where their general court is alternately held. This colony has but a ſmall territory, it lying ſomewhat in the form of a heart, and is bounded on the north and eaſt by Maſſachuſet's-bay, to the ſouthward by the ocean, and to the weſtward by Connecticut.

The climate of Rhode Iſland is much more favourable than that of Boſton, though it only lies about ſixty-five miles to the ſouth of that city: it being much warmer in the winter, and being ſurrounded by the ſea, is leſs affected in the ſummer with hot land breezes than the places on the oppoſite continent.

The ſoil is generally low, rocky, and ſtony; yet, when properly improved, produces Indian corn, rye, oats, peas, hemp, flax, and ſome wheat; with moſt kinds of fruit common to the climate in great perfection, eſpecially on Rhode Iſland, which for its beauty and fertility is much admired, it being exceeded perhaps by no ſpot in New England. They raiſe cattle, ſheep, and horſes in abundance, and the latter is eſteemed the beſt on the continent. They likewiſe make conſiderable quantities of butter and cheeſe.

The form of government is in every reſpect the ſame as in the colony of Connecticut; and the number of the inhabitants are computed to amount to ſeventy thouſand.

Liberty of conſcience is here granted in the fulleſt extent, but the greateſt number of people here are Quakers. Here is ſo little bigotry, that every man is left to think and act for himſelf; and, while he obſerves a good moral conduct, no body give themſelves any trouble about his religious principles, for which he is only accountable to God. There are here alſo a pretty many Jews. The education of children is, however, ſaid to be not much attended to, there being not one free-ſchool in the whole colony.

The principal towns are Newport, which is pleaſantly ſeated on Rhode Iſland, and has a ſafe and good harbour for ſhips of a moderate burthen, with its entrance defended by a fort, on which are planted three hundred guns; and Providence, which is alſo delightfully ſeated on a river of the ſame name, and is a thriving town, with a conſiderable trade.

The chief commodities exported from hence are horſes, ſheep, cheeſe, and the produce they procure from the neighbouring provinces, as lumber and fiſh from the Maſſachuſets and New Hampſhire; beef, pork, and flour from Connecticut, New York, and Philadelphia, which they commonly pay for in rum, ſugar, and molaſſes imported from the Weſt Indies. They are charged with carrying on an illicit trade with our enemies in time of war, by carrying beef, pork, and flour to the French iſlands; but this is no more than has been performed by the merchants of Great Britain.

We ſhall conclude this account of New England with giving a curſory view of the commerce of that province in general, which extends over a great part of America and Europe. From thence our ſugar-colonies are furniſhed with fiſh, cattle, dried beef, bacon, boards, hoops, pipe-ſtaves, bark, ſkins, butter, cheeſe, oil, tobacco, corn, apples, turpentine, &c. and that in ſuch vaſt abundance, that it is computed the iſland of Barbadoes alone takes off to the value of two hundred thouſand pounds every year. They deal with the other ſugar-colonies; ſometimes with the French; largely with the Spaniards, and ſhip off prodigious quantities of fiſh to Italy, Spain, and Portugal. They take from us all kind of mercery goods, linen and woollen cloths, ſtuffs, ſtockings, ſhoes, ſail-cloth, cordage, haberdaſhery-ware, veſſels of tin and copper, hardware, and a vaſt quantity of other things: in return, they build a prodigious number of ſhips for our merchants, and export to England a great deal of iron, and a vaſt quantity of maſts, planks, and yards for the royal navy; and alſo pitch, tar, turpentine, ſkins, furs, oil, whale fins, logwood, ſaſſafras, and other commodities.

SECT. XIII.

Of New York.

Its Situation, Climate, Soil, Produce, and Rivers. A Deſcription of Long Iſland, and ſeveral other Iſlands within this Province; with a conciſe Account of the City of New York, its Trade, Government, and Hiſtory.

NEW York is ſituated between the fortieth and forty-fourth degree of north latitude, and between the ſeventieth and ſeventy-ſixth degree of weſt longitude, it being bounded on the eaſt by New England, on the north by Canada, on the north-weſt and weſt by part of Penſylvania and the lands of the Five Nations, and on the ſouth and ſouth-weſt by the province of New Jerſey and the Atlantic ocean; extending two hundred miles in length from north to ſouth, but not above twenty-five in breadth, particularly between Connecticut colony and Jerſey.

As this country lies to the ſouth of New England, the climate is more temperate; the ſoil is generally pleaſant and fertile, producing in great abundance all ſorts of grain and fruit common to the climate, particularly wheat, one buſhel of which is ſaid to have produced here an hundred. The many fine, large plains on the banks of its extended rivers are remarkably fruitful.

The principal river of New York is Hudſon's river, which riſes within twenty or thirty miles of Lake Champlain, and runs ſouth for about fifty or ſixty miles, croſſing in its way ſome lakes, the moſt conſiderable of which is at Scanderoon; then bends more eaſterly to the Carrying-place, where is Fort Edward, and then ſouthward till it diſcharges itſelf into the ſea at New York, or Sandy-hook. This river is navigable for veſſels of one hundred tons as high as Albany, and ſhallops may go up eight or ten miles higher.

The next conſiderable river of this province is the Mohawk river, which riſes in the Mohawk country, and

is navigable, except where there are ſome falls, for large boats, upwards of an hundred miles: it runs eaſterly, and has on its banks many fine plains, particularly that called the German-flats, from its being ſettled by the Germans, and extends along the river fifty miles in length, and about two in breadth. This tract is exceeded by none in America, it being eaſily cultivated, and producing, in the greateſt abundance, wheat, barley, peas, hemp, and flax. This river diſcharges itſelf by ſeveral mouths, called the Spouts, into Hudſon's river, about eight miles above Albany; and about two miles above its confluence with that river it has a cataract, where the whole ſtream falls perpendicularly about ſeventy feet. This part of the province abounds with ſaw-mills, it having plenty of timber.

Theſe rivers abound in great plenty of fiſh; and in this part of the province are ſeveral excellent iron works, ſome of which are ſaid to manufacture the beſt iron in America.

There are very fine lands upon the Eaſt river, or Sound, though it is very rocky, as indeed are moſt of the high lands of this province on the continent; theſe being mountainous, and at preſent hard to cultivate, but afterwards they richly reward the labour of the huſbandman. There are likewiſe ſeveral pleaſant and fruitful iſlands belonging to this province, among which Long Iſland is the moſt worthy of notice.

Long Iſland is about a hundred and fifty miles in length, and in ſome places twenty, but generally about twelve miles broad; the middle of it is indeed ſomewhat barren, but both ends have moſt excellent ſoil, which perhaps is improved to as great advantage as any lands in America; producing corn and fruit to great perfection, and abounding in horſes, cows, ſheep, and ſwine, more than any other part of the province. It is even ſaid that the produce of ſome ſingle acres at the weſt end, which is conveniently ſituated for the market of New York, annually amounts to near a hundred pounds ſterling. In the midſt of the iſland is a celebrated plain ſixteen miles long, and four broad, to which they have given the name of Saliſbury-plain, from its having as fine turf as that of Saliſbury-plain in England. As there is an excellent breed of horſes in the iſland, they have races here every ſeaſon, to which the gentlemen of New England and New York reſort, as people do here to Newmarket.

There are indeed ſeveral other iſlands belonging to the province not at all inferior to this in pleaſantneſs and fertility of ſoil, though they are of much leſs extent, as Staten, or Streighten Iſland, which is oppoſite to the weſt end of Long Iſland, and forms the narrows or ſtreights through which ſhips paſs that are bound to or from the ſea to New York: Fiſher's Iſland lies in the Sound between Long Iſland and the colony of Connecticut; and Manahattan, upon which the city of New York is built: there are ſeveral others both in the bay and Sound, one of which, called Barn Iſland, about twenty-five miles from New York, has lately obtained a charter for erecting a city.

This province is divided into ten counties, which, proceeding from north to ſouth down Hudſon's river, lie in the following order, Albany, Ulſter, Dutcheſs, Orange, King's-county, Cheſter, New York, Queen's-county, Suffolk, and Richmond counties, which abound in farms, but have not many great towns: the principal are the city of New York, Schenecteda, Albany, and Weſt Cheſter.

New York is extremely well ſituated for trade, it having a ſafe and commodious harbour, acceſſible three different ways for ſhips of common burthen, namely, by way of the Sound, by the ſtreights between Long Iſland and Staten Iſland, which is the moſt uſual and eaſy entrance, and between Staten Iſland and the ſhore of Jerſey. There are alſo eaſy conveyances to it by water from the rivers and lakes, except a few carrying-places, both to Montreal and Quebec on the northward, and to the lakes Erie and Ontario on the weſtward, for ſix hundred miles; and upon the ſea it has not only the advantage of its coaſts, but alſo of Connecticut and the Jerſeys, their trade in a great meaſure centering here, where they exchange their ſeveral commodities for foreign goods.

This city is ſeated in the fortieth degree forty minute north latitude, and the forty-ſeventh degree four minutes weſt longitude, at the ſouth end of York county, in an iſland at the mouth of Hudſon's river, about fourteen miles long, and three broad. It ſtands upon an eminence, and contains between two and three thouſand houſes, generally pretty well built with brick and ſtone; but the ſtreets are very irregular, defended by a wall and fort, which are formed ſo as to anſwer the purpoſes both of ornament and defence. It has ſeveral ſpacious public buildings, among which the college, the court-houſe, and the governor's houſe within the fort, are the moſt conſiderable. Hence there is ſcarce any town in North America that makes a better appearance. Public worſhip is every Sunday performed in different churches in the Engliſh, the German, the Dutch, and French languages. There are two handſome churches belonging to thoſe of the church of England, with others belonging to the Swedes of the Lutheran perſuaſion, to the Dutch Calviniſts, to the French refugees, and the Engliſh diſſenters; the Jews have alſo a ſynagogue.

The city is governed by a mayor and aldermen, and abounds with wealthy merchants, who trade very largely to foreign parts, and are obſerved to deal very much upon honour. The trade from New York to the ſugar iſlands is very conſiderable, and conſiſts in corn, flour, beef, pork, bacon, ſmoked beef, peas, apples, onions, ſtaves, plank; and to England flax-ſeed, pig and bar iron, with ſome copper. Of late great encouragement is given to ſeveral manufactories, eſpecially that of hemp, the raiſing of which is encouraged by a bounty given by the province; and in the city of New York a ſociety is formed to conſult methods for promoting the various branches of trade and huſbandry, and the manufacturing of iron, wool, linen, &c. conſiderable premiums being allowed to ſuch as excel in theſe branches, which has doubtleſs a tendency to preſerve the credit of this province, to enrich the inhabitants by increaſing their exports, and to render them leſs dependent on other countries.

The next conſiderable place in this province is Albany, which is ſeated on the weſt ſide of Hudſon's river, a hundred and fifty miles to the north of New York city, and has a fort erected for its defence. It contains near four hundred houſes, and here the chiefs of the Five Nations uſed to meet the governors of the northern colonies.

The number of inhabitants in the whole province amounts to about a hundred and fifty thouſand.

His majeſty is abſolute ſovereign of the ſoil of this province, and appoints the governor, lieutenant-governor, ſecretary, and council; but the freeholders of the ſeveral counties elect their own repreſentatives, in order to form a legiſlative body with the others. The cities of New York and Albany have likewiſe by their charters the privilege of making bye-laws for themſelves, provided they are neither inconſiſtent with the laws of the province, nor of thoſe of England. Theſe bye-laws are enacted by the mayor, aldermen, and common-council of the reſpective cities, annually elected by the freemen of each; theſe alſo form a court of judicature, called the mayor's court.

The religious perſuaſions in this province are pretty numerous, there being Epiſcopalians, Lutherans, Baptiſts, Preſbyterians, Moravians, Quakers, and Jews, who perform religious worſhip here in different languages. Learning has lately been much encouraged in this province, in which is eſtabliſhed a college under the government of a preſident, profeſſors, and tutors. It has alſo a good library, and both the city and country in general are well furniſhed with ſchools.

The Engliſh have a double right to this province by diſcovery and conqueſt. The coaſt was firſt viewed by Sebaſtian Cabot, and in the reign of queen Elizabeth it was conſidered as a part of the province of Virginia. Afterwards, in 1608, that famous navigator Hudſon diſcovered the river that bears his name, with the adjacent country, which he afterwards, without any legal authority, ſold to the Dutch, who found ſome Swedes ſettled here; and being reinforced from Holland, ſoon became the ſtrongeſt party, and obliged the Swedes to acknowledge them as the ſole proprietors of the country, paying

no regard to the claim of the Engliſh, who had not only diſcovered, but traded to it before. They were, however, ſoon after diſpoſſeſſed by captain Argall, who was ſent for that purpoſe with a proper force by the Virginia company. Upon this the Dutch Weſt India company begged permiſſion of king James I. for ſome of their people to ſettle in the country, pretending it's being convenient for their ſhips to call at for refreſhment in their paſſage to and from the Braſils, which then belonged to them.

The king granted their requeſt, upon condition that the people who ſettled there ſhould acknowledge themſelves ſubjects of the king of England. This they did for ſome years; but taking advantage of the troubles that aroſe in the reign of king Charles I. the ſtates of Holland gave their Weſt India company a formal grant of the country, and under this grant they appointed governors, erected forts, and called it Nova Belgia, or the New Netherlands, and afterwards refuſed to pay to king Charles II. the ſum they had paid to his father and grandfather for leave to fiſh on the coaſt of Great Britain. This did not occaſion an immediate rupture; but ſoon after king Charles II. made a grant of what is now the province of New York, New Jerſey, and Penſylvania, to his brother James, duke of York, who, in 1664, ſent a fleet under the command of Sir Robert Carr, with a ſufficient number of land-forces, to take poſſeſſion of the country, who ſoon reduced the forts the Dutch had erected there, and obliged them either to become Britiſh ſubjects, or to leave the country. The people gladly accepted of the former, and hence many of the beſt families in New York appear by their names to be of Dutch extraction. Hence New Amſterdam, which was made the metropolis, had its name changed to that of New York, in honour of the proprietor's title; and from the name of the city the whole province received the ſame appellation. Orange-fort alſo received the name of Albany from the duke's other title.

Sir Robert having thus ſubdued the country, took with him the greateſt part of the land-forces, leaving colonel Nichols governor; and as the States General ſeemed to give up all pretences to it, many people removed thither from England; whence it ſoon became a very flouriſhing colony, Mr. Nichols making it one of his firſt ſtudies to enter into a treaty of peace with the Five Nations of the Indians, who have ever ſince continued faithful allies, and been of great ſervice to this province.

In the year 1673, when a war broke out between England and the States General, the Dutch ſending a fleet, reduced this colony to their obedience; but they kept poſſeſſion of it only a ſhort time, for it was ceded to the crown of Great Britain by the treaty concluded the next year. Ever ſince that time it has been under the Engliſh government, and the people have ſhewed themſelves peaceable and obedient ſubjects, ready upon all occaſions to exert themſelves in defence of the rights of Great Britain, particularly in oppoſing and repelling the encroachments of the French ſettled in Canada, with whom they have had various engagements, in which they were always aſſiſted by the Mohawks, with three hundred of whom, and the ſame number of Engliſh, colonel Schyler, in the reign of William III. obtained a complete victory, near the river St. Lawrence, over ſeven hundred French regulars, and an equal number of Huron Indians, commanded by the governor of Quebec. The ſame brave officer repulſed them again in 1716, and deſtroyed a fort they had erected near the lake of Onondago, in order to cut off their communication with Lake Ontario. Soon after our fort at Oſwego was erected, where has ſince been carried on the greateſt Indian trade of any in America.

SECT. XIV.

Of New Jersey.

Its Situation, Extent, Produce, and Exports; its Sub-diviſions; a particular Deſcription of Perth Amboy, and Burlington; and a conciſe Hiſtory of the Province.

THE entire province containing the two Jerſeys, is ſeated between New York and Penſylvania, in a triangular form; it being bounded on the north by Hudſon's river, which ſeparates it from the province of New York; on the eaſt by the Atlantic ocean, which waſhes its coaſt, from the mouth of Hudſon's river to the mouth of Delaware river; and on the ſouthward and weſtward by Penſylvania. It lies between the thirty-ninth and fortieth degree north latitude, extending in length, on the ſea-coaſt and alſo along Hudſon's river, above an hundred and twenty miles, and ſixty in breadth from eaſt to weſt.

The ſoil of this province is very uniform, and produces wheat and all other kinds of Engliſh corn: it likewiſe abounds in all ſorts of fruit proper to the climate, and is ſaid to produce the beſt cyder of any place on the continent. The timber is tall, and the oaks are eſteemed for ſhip-building. It abounds in ſtreams of water, which afford great convenience for mills, furnaces, and any other kind of water-works; and as it affords great quantities of iron, it has ſeveral furnaces and iron-works, beſides one ſlitting-mill. This province is alſo ſuppoſed to be rich in ſilver and copper ore, ſome of both kinds having been found in ſeveral parts; and one copper-mine in particular is worked to great advantage, ſeveral fine eſtates having been obtained from it.

The lands in this province are chiefly taken up and improved; ſo that they have but little wild game of any kind.

There are no remarkable rivers that extend far into the province; that named Paſſaick, which diſcharges itſelf into the ſea to the northward of it, has a remarkable cataract about twenty miles from its mouth, where the river falls, like the cataract on Hudſon's river, from a perpendicular rock about ſeventy or eighty feet.

This province has a conſiderable diſadvantage, which prevents the inhabitants thriving ſo much as might be expected from the goodneſs and fertility of its ſoil, and their making thoſe improvements of which the country is capable. This is the great uncertainty of their titles, and the continual diſputes and law-ſuits which on this account ariſe among the inhabitants; hence it is ſaid, that no people here grow rich ſo faſt as the gentlemen of the law. Beſides, the inhabitants ſuffer the ſame fate from Philadelphia and New York, that thoſe of the colony of Connecticut do from New York and Boſton; for as they have no conſiderable foreign trade of their own, they exchange their commodities at thoſe two places for foreign gooods, and conſequently give them the profit which they might enjoy among themſelves.

The principal exports of the Jerſeys are wheat, flour, timber, copper ore, pig and bar iron, and black cattle, which they drive in great numbers to Philadelphia, on whoſe rich paſtures they are generally grazed for ſome time, before they are ſent to market and killed.

This province has the ſame form of government as that of New York, and the religious perſuaſions are no leſs numerous. Here is likewiſe a college founded at Prince-town, about thirty miles from the city of Philadelphia, much reſorted to by the young gentlemen of this and the neighbouring provinces.

This province contains Eaſt and Weſt Jerſey; the former of which is the largeſt and beſt inhabited, and is divided into Bergen-county, Eſſex, and Middleſex, on the ſouth ſide of the river Raritan, and Monmouth-county on the ſouth. Weſt Jerſey contains the ſame number of counties, which are Burlington, Glouceſter, Salem, and Cape Mary. Theſe were originally two provinces, and in the hands of different proprietors; but, on the twenty-ſecond of April, 1702, the proprietors made an aſſignment of their rights to the crown.

The chief towns in the Jerſeys are,

Perth Amboy, the capital of the county of Middleſex, in Eaſt Jerſey, which is pleaſantly ſeated at the mouth of the river Raritan, and is ſo commodiouſly ſituated for trade, that ſhips of three hundred tons may come up in one tide and lie before the merchants doors.

Burlington, the capital of the county of the ſame name, and of all Weſt Jerſey, is ſeated on an iſland in the middle of the river Delaware, to the northward of Philadelphia, in Penſylvania. The houſes are handſomely built with brick, and laid out into ſpacious ſtreets, with

with commodious quays and wharfs, to which ships of two or three hundred tons may come up. It has likewise a handsome market-place, a town-house where the courts of justice were formerly held, and two good bridges over the river, one called London-bridge, and the other York-bridge. It has likewise an easy communication both with Philadelphia and the ocean, by means of the river Salem, which falls into Delaware-bay; but though these places have the privileges of a city, they are neither remarkable for the number of their inhabitants nor the greatness of their trade.

This province, like that of New York, was first settled by the Swedes, who had three towns here, named Christina, Elsinburg, and Gottenburg: they, however, made but little progress in their plantations; while the Dutch, who had settled in the northern part, had greatly the advantage, for this country they included under the name of Nova Belgia. It was also contained in the grant made by king Charles to his brother James in 1663, who the following year made a grant of that part now called New Jersey to lord Berkley and Sir George Carteret. These two proprietors sent Philip Carteret, Esq; as governor; and the lands being granted to the settlers for six or seven years free of quit-rents, induced many of the Dissenters of England to settle in the country: thus the inhabitants being a mixture of Swedes, Dutch, and English, were far from agreeing about the form of government, but continued to behave within some bounds, while they were excused paying quit-rents; but when that indulgence was no longer allowed them, and they became considerably in arrears, the proprietors no sooner insisted on their payment than they broke into open rebellion, deposed the governor, and set up a kind of government of their own, under which they continued till the year 1673, when they were attacked aad conquered by the Dutch; but the country being again restored to the crown of England by the treaty concluded the following year, Mr. Carteret returned to his government; and the proprietors making some concessions, the inhabitants continued pretty quiet for some time. Lord Berkley soon after assigned over his right to Mr. William Penn, and three other assignees, with whom Sir George Carteret agreed to divide the country into two equal parts, by running a line from the south-east point of Little Egg-harbour almost due north. The easternmost part of this division was allotted to Sir George, whose family was of the isle of Jersey, and from this circumstance was called East New Jersey; while the other part, which was allotted to Mr. Penn and the other proprietors, was then distinguished and still retains the name of West New Jersey: and thus they became for some time two separate and distinct governments. After Sir George's death his trustees sold his right to Mr. Penn and eleven other purchasers, and they not long after sold a part of theirs to the earl of Perth and eleven others. These divisions and sub-divisions caused the land to be branched out into so many shares, that the respective owners thought them so inconsiderable that they took little or no concern about them; and no proper care being taken to settle and fix the boundaries of their estates, it became difficult, if not impossible, to ascertain their respective rights; which caused great uncertainty of property, the people rose in frequent mobs, till the proprietors being quite wearied out, surrendered the entire government of both the Jerseys to the crown, only reserving to themselves their other rights and privileges, and stipulating for some privileges in favour of the people, which were to be given in charge to the governors appointed by the crown as part of their instructions.

Upon this surrender the crown annexed the government of the two Jerseys to that of New York, in which state they continued till the year 1736, when they became one government, and Lewis Morris, Esq; was appointed their first governor; but they still retain a seat of government in each division, at which their assembly and supreme court of judicature sit alternately, namely, at Burlington in West Jersey, and at Perth Amboy in East Jersey.

SECT. XV.

Of Pensylvania.

Its Situation, Extent, Climate, Vegetables, Animals, and Rivers. The Divisions of the Country; with a Description of Philadelphia, the other Towns in this Province, and a concise Account of its Commerce.

Pensylvania was also esteemed by the Dutch a part of Nova Belgia, and as such was supposed to be included in king Charles the Second's grant to his brother James, duke of York, in the year 1663. It is seated between the thirty-ninth and forty-second degree north latitude, and between the seventy-second and seventy-eighth degree west longitude; it being bounded on the north-east by the Jerseys, on the south by Maryland, on the west by the Apalachian mountains, and on the north by the lands of the Five Nations; extending in length about three hundred and thirty miles, and two hundred in breadth.

The air is here sweet, serene, and clear. Autumn begins about the twentieth of October, and lasts till the beginning of December; after which frosty weather is very common, and sometimes the river Delaware, notwithstanding its breadth, is frozen over; but in such seasons the air is dry, clear, and agreeable. The spring lasts from March till June, during which the weather is more inconstant. In the summer months, July, August, and September, the heats are very great, but are alleviated by cool breezes that render them very tolerable. During this season the wind is south-west; but in spring, autumn, and winter, it is generally north-west. The earth is extremely fertile, and easy to be cleared, as the roots of the trees lie near the surface of the earth.

Pensylvania produces almost all sorts of trees, which are in some respect different from the European, though they are called oaks, beech, walnut, red, white, and black ash, Spanish chesnut, cypress, and red and white cedar; but the most durable are gum-wood, hickery, sassafras, and poplar. They have also apples, pears, pines, cherries, grapes, cranberries, musk-melons, and several other fruits; with all sorts of corn, as wheat, barley, oats, rye, peas, beans, Indian corn, and likewise hemp and flax, with snake-root, sarsaparilla, and many other medicinal woods and roots. There are here also a great variety of garden plants, and of those proper for the kitchen.

Among the animals they have such plenty of horses, cows, and sheep, that it is common for farmers to have four or five hundred of the latter in a flock; they have moose deer, rabbits, racoons, beavers, and a great number of other wild beasts. Among the reptiles are snakes of several kinds; and among the fowl they have fine bustards of forty or fifty pounds weight, pheasants, heath-cocks, partridges, swans, geese, teal, snipe, braindes, pigeons, dunghill fowls, ducks, and a great variety of small birds distinguished by their beautiful plumage. The fish are sturgeons, herrings, perch, eels, smelts, &c. with oysters, cockles, muscles, and other shell-fish. In short, no province on the continent is less dependent on its neighbours for either the necessaries, conveniences, or luxuries of life.

The largest river in this province is the Delaware, which rises in the country of the Five Nations, and flows into the sea at Delaware-bay. It is navigable for near a hundred and fifty miles up, after which it has some falls; the settlements upon this river extend a hundred and fifty miles from the city of Philadelphia. The lands on its banks are excellent, and generally reward the labour of the husbandman with great profusion. Its course is nearly south-east, and it affords great plenty of all such fish as are common to the climate, especially sturgeon, which are here cured and sent abroad in greater abundance than in any other part of America.

The Susquahanah rises in the same country, at the distance of about ninety miles from the Apalachian mountains, and runs nearly parallel to the Delaware, till it discharges itself into Chesapeak-bay in Maryland. This

river

river is likewiſe navigable a great way up the interior country, and, if poſſible, exceeds the other in the pleaſantneſs and fertility of the ſoil on its banks, which produces in great abundance all ſorts of corn, eſpecially wheat. This extraordinary plenty is not confined to the plains near the banks of the rivers, for the intermediate lands are generally fruitful and extremely well improved; they being divided among the farmers in ſuch proportions as they are able to manage to advantage, for which they pay an annual quit-rent to the proprietor.

But we ought not to omit to mention the river Schoolkill, or Schulkill, which has alſo its ſource in the ſame country, running almoſt parallel to the two other rivers, till at length it falls into the Delaware, near the city of Philadelphia, above which it is navigable for boats at leaſt a hundred miles higher up the country.

Theſe rivers, with the numerous bays and creeks in Delaware-bay, capable of containing the largeſt fleets, render this province admirably ſuited to carry on a foreign trade. The country alſo abounds in ſtreams fit for mills, and all other kinds of works invented to eaſe the labour of man; hence there is here manufactured the greateſt quantity of iron of any province on the continent.

This famous ſettlement is divided into three upper and three lower counties. The three upper are thoſe of Buckingham, Philadelphia, and Cheſter; and the lower counties are Newcaſtle, Kent, and Suſſex. The three firſt are thoſe Mr. Penn obtained by a grant from king Charles II. and the three laſt by a grant from James duke of York.

Philadelphia, the capital of this province, is ſeated in the county of the ſame name, in the fortieth degree fifty minutes north latitude, and in the ſeventy-fourth degree weſt longitude. It is built upon one of the fineſt plans that ever was formed, it being laid out by Mr. Penn himſelf, and far excels any other city belonging to Great Britain in North America. It is ſeated between two navigable rivers, the Delaware on the north, and the Schoolkill on the ſouth, which join each other a few miles below, and is near a hundred miles above the bay, into which the river diſcharges itſelf. It is an oblong of near two miles in length, extending nearly to each of thoſe rivers, where the front facing each is a mile in length. The ſtreets are wide and ſpacious, with a dry defended walk on each ſide, and are exactly ſtraight and parallel to each other: the houſes are in general well built, and make a handſome appearance, eſpecially ſeveral of the public buildings, which are not exceeded by any in the country. The High-ſtreet, which runs the whole length of the city, is a hundred feet wide, parallel to which run eight ſtreets that are croſſed by twenty more at right angles, all of them thirty feet wide. Every owner of a thouſand acres has his houſe in one of the two fronts facing the rivers, or in the High-ſtreet, running from the middle of one front to the middle of the other. In the center of the city is a ſquare of ten acres, encompaſſed by the town-houſe and other public buildings, and in each quarter of the city is a ſquare of eight acres. Several canals are let into the town from each river, which add to the beauty and convenience of the place. It has noble barracks for the reception of the king's troops, and the fineſt market of any on the continent, it being of a prodigious extent, well built, and as well regulated and ſupplied. Its quay is two hundred feet ſquare, to which ſhips of four or five hundred tons may come up, and lay their broad-ſides cloſe to it; with wet and dry docks for building and repairing of ſhips, beſides magazines, warehouſes, and all other conveniences for exporting and importing of merchandize. The proprietor's ſeat, which is the uſual place of the governor's reſidence, and is about a mile above the town, exceeds any private building in Britiſh America, both in its magnificence and the pleaſantneſs of its ſituation. In ſhort, ſcarce any thing can appear more beautiful than the city and the adjacent country, which for ſome miles may be compared to a fine and flouriſhing garden. The city contains about four thouſand houſes, and about twenty thouſand inhabitants, among whom are many very wealthy merchants, who carry on a conſiderable trade with the Engliſh, French, Spaniſh, and Dutch colonies in America; with the Azores, the Canaries, and the Madeira iſlands; alſo with Great Britain and Ireland, Spain, Portugal, and Holland.

The other principal towns in the county of Philadelphia are German-Town and Oxford; the former a thriving and populous place, chiefly inhabited by the Germans, who there ſpeak and tranſact their buſineſs in their own language. In the ſame county is likewiſe the city of Radnor on the ſouth-ſide of School-kill river, which is the capital of a large diſtrict planted by the Welſh. To the ſouth of the county of Philadelphia, lies that of Cheſter, the capital of which is the town of Cheſter, ſeated on the river Delaware; and to the ſouthward of Cheſter lies the town of Chicheſter. At either of theſe two laſt towns are ports ſufficient to receive and ſecure the largeſt fleets from ſtorms. The county of Newcaſtle lies ſouth of that of Cheſter; its capital of the ſame name is remarkable for the briſkneſs of its trade, and has alſo an iron-mine in its neighbourhood. The town of Aquoquinemimk is ſeated on the river Delaware, ſouth of Newcaſtle, and has a good trade. Kent lies ſouth of the laſt-mentioned county, and Dover, its chief town, has a very commodious port. The moſt ſouthern county is that of Suſſex, the capital of which is Lewes; this town has a ſecure harbour, and alſo carries on a conſiderable trade. On the other ſide of the province, Lancaſter, which is about ſixty or ſeventy miles from Philadelphia, on the road to Pittſburg, may juſtly be reckoned the ſecond town in Penſylvania, it being near as large as the city of New-York.

The number of inhabitants in the whole province of Penſylvania amounts to upwards of three hundred and fifty thouſand.

The trade of this province is extenſive, large, and valuable, no leſs than three hundred ſail annually clearing out from Philadelphia alone to Europe, the Weſt-Indies, &c. Their trade into the interior country with the Indians is likewiſe very extenſive and lucrative; of them they take the ſkins and furs of wild beaſts; while the Indians in return receive ſhirts, blankets, arms, ammunition, rum, and other ſpirits. Their commerce to Europe and the Weſt-Indies chiefly conſiſts in their exporting all ſorts of grain, as wheat, rye, Indian corn, barley, oats, peaſe, and beans; beef, pork, ſalted and barrelled fiſh, horſes, furs and ſkins, with pig and bar-iron, hogſheads, pipe-ſtaves, hoops, and flax-ſeed. In return for which they import from the iſlands and other places, ſilver and gold, ſugar, rum, molaſſes, ſalt, wine, &c. and from Great Britain cloathing of all kinds, hard-ware, tools, toys, furniture, &c.

SECT. XVI.

A Hiſtory of the firſt Settlement of Penſylvania, and its Government.

WE ſhall now give a conciſe account of the ſettlement of this province, which was the beſt projected, and is the moſt flouriſhing of all our colonies. But it is neceſſary juſt to obſerve, that the Dutch were the firſt planters here as well as at New York, and living near the bay in the neighbourhood of that province, applied themſelves chiefly to trade. Afterwards ſome of the inhabitants of Finland ſettled near the Freſhes of Delaware, the country being ſo called above and below the falls of that river for a conſiderable length; there they applied themſeves to huſbandry, and had a governor appointed them by the king of Sweden, their own ſovereign. Between theſe two neighbouring ſettlements there happened frequent diſputes, till the Dutch becoming too powerful for the Swedes, the latter ſubmitted to their ſtronger neighbours, and the Swediſh governor made a formal ſurrender of the country to the governor, for the States General; after which this province continued ſubject to that republic till the Engliſh drove the Dutch out of New York.

Admiral Penn, who, in conjunction with colonel Venables, conquered the iſland of Jamaica, and was afterwards knighted, being in high credit with king Charles II.

II. and the duke of York had the promiſe of a grant of this country from that king as a reward for his paſt ſervices; and ſome years after his death, his ſon ſtrenuouſly ſolicited the promiſed grant; which, as the king owed conſiderable ſums to his father, he obtained in the year 1679, and the original patent was dated the fourth of March, 1680. Mr. Penn afterwards, as hath been already intimated, obtained part of Nova Belgia, or New York, which was added to the country he had acquired by the firſt grant, and both together, from his own name, he called Penſylvania, or Penn's country.

Mr. Penn, who had turned Quaker during the lifetime of his father, had the more earneſtly ſolicited the above grant on account of the perſecution of the Diſſenters; and particularly of his friends the Quakers, who were harraſſed all over England by the ſpiritual courts, he himſelf being many times thrown into priſon both for preaching, and for being only preſent at their aſſemblies. There were at this time a few Engliſh in Penſylvania, over whom he placed as governor, colonel William Markham, his nephew, to whom both the Dutch and Swedes ſubmitted. Mr. Penn, being continually under the hand of perſecution, reſolved now to put himſelf at the head of as many as would go with him, and remove to this country; but firſt ſent over a body of ſettlers from London, Liverpool, and Briſtol, who purchaſed conſiderable quantities of land at the rate of twenty pounds for one thouſand acres, and paying a ſmall quit-rent. The male and female ſervants were to have fifty acres when their time was out; and the owners of land fifty acres per head for as many ſervants as they carried over. In order to ſecure the new planters from being moleſted by the Indians, he appointed commiſſioners to confer with them about the land, and to confirm a league of peace: by theſe firſt adventurers, he alſo ſent a very affectionate and friendly letter to the native Indians, and the ſame year went to Penſylvania himſelf, taking with him a great number of people, who, with thoſe he had ſent before, and that immediately followed him, amounted to two thouſand perſons.

As ſoon as he arrived, he took the government into his own hands; entered into a treaty of peace with the Indian chiefs; and, inſtead of immediately taking advantage of his patent, purchaſed of them the lands he had obtained by his grant, judging that the original property and eldeſt right was veſted in them; and at the ſame time engaged the ſeveral nations of Indians, inhabiting or claiming this territory, to promiſe that they would not ſell or diſpoſe of any of their lands but to him, or ſuch as ſhould be authoriſed by him to purchaſe them; giving orders to his agents not to take poſſeſſion, or ſuffer any perſon to take poſſeſſion of any lands, till they had firſt made a fair purchaſe of them from the Indians. This generous behaviour not only recommended him ſtrongly to the natives, who conceived a very high opinion of his honour and integrity, but laid a foundation for a laſting peace with them, and effectually prevented many of thoſe tragical calamities which ſeveral of the American provinces ſuffered in their infant ſtate.

He then ſettled the conſtitution and laws of the country by the conſent of the inhabitants, who unanimouſly agreed to the fundamental conſtitution of Penſylvania, which he himſelf had drawn up and publiſhed in England, That none who believe in the exiſtence of a God, and live peaceably, ſhall be moleſted on account of their religious ſentiments, or be compelled to frequent or ſupport any religious worſhip contrary to their declared opinion; and that all perſons who profeſs to believe in Jeſus Chriſt, ſhall not be incapable of ſerving the government in any capacity, on account of any particularities in their religious opinions, they ſolemnly promiſing, when required, allegiance to the crown of Great-Britain, and fidelity to the proprietor and governor of the province.

He likewiſe determined that no laws ſhould be made there, nor money raiſed but by the conſent of the inhabitants, who were empowered to enact what laws they pleaſed for the proſperity and ſecurity of the province. He eſtabliſhed courts of juſtice in every county, with proper officers to prevent law-ſuits and contentions, and that three peace-makers ſhould be choſen by every county-court in the nature of common arbitrators, to hear and put an end to all the differences that aroſe between man and man: he alſo ordained, that every ſpring and autumn an orphan's court ſhould be held in each county, to inſpect and regulate the affairs of the widows and orphans.

Mr. William Penn ſtaid there two years till he had ſettled every thing to his own and the people's ſatisfaction, during which he behaved in ſuch a manner to the Indians, that he inſpired them with the moſt extraordinary love and eſteem both for him and his people. Their deſcendants received from them the ſame ſentiments of this benevolent man, and ſtill ſpeak of him with the greateſt gratitude and affection; and whenever they would expreſs an extraordinary regard for any Engliſhman, they ſay, "We eſteem and love you as if you were that good "man William Penn himſelf."

"What crowned all," ſays an ingenious author, on ſpeaking of the inhabitants who formed this ſettlement, "was the noble charter of privileges by which he "made them as free as any people in the world, and "which has ſince drawn ſuch vaſt numbers of ſo many "different perſuaſions, and ſuch various countries, to "put themſelves under the protection of his laws. He "made the moſt perfect freedom, both religious and civil, "the baſis of this eſtabliſhment; and this has done "more towards the ſettling of the province, and towards ſettling it in a ſtrong and permanent manner, "than the wiſeſt regulations could have done upon any "other plan."

The unbounded latitude given to liberty of conſcience in this country, has occaſioned its being inhabited by people of almoſt every religious ſentiment in Europe. Here you ſee Quakers, people of the church of England, Lutherans, Catholics, Preſbyterians, Independents, Baptiſts, Moravians, and the Dumplers, a ſort of German ſect, who live in common, forming a kind of religious ſociety, wearing long beards, and a habit reſembling that of friars; but marry and live in a peaceable manner by cultivating the earth: in ſhort, the diverſity of the people, religions, nations, and languages, is here prodigious, and the harmony in which they live together no leſs edifying. When there is far from being an union of ſentiment, nothing can be more amiable than an union of affection: it affords a beautiful proſpect to ſee men take and give an equal liberty; to ſee them live, if not as belonging to the ſame church, yet to the ſame Chriſtian religion; and if not to the ſame religion, yet to the ſame fraternity of mankind.

We have already mentioned the terms upon which Mr. Penn ſettled this plantation; namely, twenty pounds for a thouſand acres, reſerving only a ſhilling quit-rent for every hundred acres, and this in ſome of the beſt ſituated parts of the province; but it is neceſſary to add, before we conclude this article, that now at a great diſtance from navigation, land is granted at twelve pounds the hundred acres, with a quit-rent of four ſhillings reſerved; and the cleared lands near Philadelphia rent for twenty ſhillings an acre. In many places, even at the diſtance of ſeveral miles from that city, land that has been cultivated ſells for twenty years purchaſe.

SECT. XVII.

Of MARYLAND.

Its Situation, Extent, Climate, Face of the Country, Soil, Produce, and Rivers. Of the Trade of this Province, with an Account of its Trade and Settlement.

THIS province is bounded on the north by Penſylvania and Delaware bay; on the eaſt by the Atlantic ocean; on the ſouth by Virginia; and on the weſt by the Apalachian mountains. It is ſituated between the thirty-eighth and fortieth deg. north lat. and between the forty-fourth and forty-eighth deg. weſt long. extending in length from north to ſouth about one hundred and forty miles; but its breadth is not ſo conſiderable. This country is divided into the eaſtern and weſtern diviſions by the great bay of Cheſapeak.

Though the air in ſummer is exceſſive hot, and in winter

winter very cold, when the north wind blows, yet their heats are ſeldom very troubleſome, and only in a perfect calm, which ſeldom happens above two or three days in the year, and then but a few hours at a time; when this inconvenience is rendered very tolerable, by their cool ſhades, their open and airy rooms, arbours, and grottoes. In ſpring and autumn the weather is as pleaſant as can be wiſhed; even the winters do not laſt above three or four months, and in theſe they have ſeldom one month's bad weather. During all the reſt they have a clear air and a bright ſun, and are ſcarce ever troubled with fogs. They have indeed ſometimes hard froſts, but they laſt no longer than while the wind blows from the north and north-weſt points, which is ſeldom more than three or four days; and at other times they have no froſt at all. Their rains, except in the depth of winter, are pleaſant and refreſhing, and in ſummer continue but a few hours. However, theſe ſummer ſhowers are very heavy for the time they laſt. That part of the country which lies on the bays of the ſea, and the mouths of the rivers, is certainly hot and moiſt, but higher up in the country the air is more agreeable, eſpecially ſince their lands have been cleared of wood. In the heat of ſummer they have however dreadful thunder, but as it cools and refreſhes the air, the people rather wiſh for it than fear it.

The face of the country may be divided into the low lands next the ſea, the hilly country towards the heads of the rivers, and the Apalachian or Allegany mountains, which are exceedingly high, and extend from the north-eaſt to the ſouth-weſt, parallel to the Atlantic ocean.

The low lands formerly conſiſted of ſwamps covered with woods, and were in a manner a continued foreſt, till the Engliſh cleared part of it, either to make room for their plantations, in building of ſhips and houſes, or the making of tobacco-caſks and pipe-ſtaves for exportation. All theſe have, at length, made ſuch havock among the woods, that the people begin to want timber; eſpecially near their forts and rivers, towards the heads of which is a mixture of hills and valleys covered with a variety of timber and fruit-trees; and where theſe are wanting are large ſavannahs, or meadows, where the graſs grows to a ſurpriſing height.

The ſoil is here as fruitful as in any other country, the principal part being a large plain interſperſed with hills of ſo eaſy an aſcent, and of ſuch a moderate height, that they rather ſeem an artificial than a natural ornament. An abundance of rivers and brooks diffuſes fertility throughout the country, and there is no tree, plant, or grain that grows in Virginia but thrives as well here; and as the animals and every thing elſe are the ſame in both countries, we ſhall avoid repetition, and refer our readers for theſe particulars to the deſcription of Virginia.

This country is watered by innumerable ſprings, and many fine rivers; the principal of theſe are Potowmac, which, riſing in the mountains on the north-weſt, runs to the ſouth-eaſt, ſeparating Maryland from Virginia, and then falls into the middle of Cheſapeak-bay. Potowmac, which iſſues near the ocean, runs directly ſouth, till turning to the weſt, it falls into Cheſapeak-bay, near Watkins's point. The river Patuxent riſes in Arundel county, and running to the ſouth-eaſt, falls into Cheſapeak-bay, about twenty miles to the northward of the river Potowmac. The Severn riſes on the north-weſt, and running ſouth-eaſt falls into the upper part of the ſame bay. Saſſafras-river riſes in the north-eaſt, and running almoſt due weſt, diſcharges itſelf into the north of the ſame bay. Wicomo-river riſes on the eaſtern ſhore, runs to the ſouth-weſt, and falls into the ſame bay, almoſt oppoſite the mouth of Potowmac river.

There are many other rivers capable of receiving large ſhips, which with the numerous bays and creeks wherewith the land is on every ſide indented, affords the advantage of bringing veſſels to the very doors of the planters.

Maryland is divided into ten counties, of which the four following are on the eaſt ſide of the bay, Somerſet, Dorcheſter, Talbot, and Cecil county. Thoſe on the weſt ſide of the bay are St. Mary's county, Charles-county, Prince George-county, Anne Arundel-county, and Baltimore-county.

The capital of the province is Annapolis, which is ſituated on the Severn; but though the governor reſides there, and the courts of juſtice, with the general aſſemblies, are held in the town, it does not much exceed a hundred houſes; for, throughout the whole colony of Maryland, the Engliſh live in their ſeveral plantations, which are almoſt all ſituated upon ſome navigable creek or river with which the province abounds, by which means the planters have the convenience of ſhipping their own produce to England and other parts, and of being ſupplied from thence with foreign commodities. Hence all the towns are extremely ſmall; indeed, every plantation is a little town of itſelf provided with proviſions and neceſſaries, a conſiderable planter's warehouſe being a kind of ſhop, where he not only ſupplies his own family, but inferior planters, ſervants, and labourers, and has commodities to barter for tobacco and other goods, there being but little money in the province, and but little occaſion for it, tobacco anſwering all the uſes of gold and ſilver; and indeed there are but few ſhopkeepers who live entirely by buying and ſelling. The tobacco of this province called Oroonoko, is ſold to great advantage, and the planters of Maryland find ſo good vent for it in foreign markets, that ſeveral hundred ſail of ſhips are annually employed in the commerce between Great Britain and this country. The number of inhabitants amount to about eighty-five thouſand whites, and twenty-five thouſand negro ſlaves.

Maryland was eſteemed a part of Virginia till the year 1632, when king Charles I. made a grant of all the country not then planted on the north of Potowmac river to lord Baltimore, a Roman-catholic nobleman, and his heirs; and the country was called Maryland in honour to queen Mary, conſort to king Charles. His lordſhip ſent Leonard Calvert, Eſq; with ſome popiſh gentlemen and other adventurers, to the number of two hundred, to take poſſeſſion of the country; who, ſailing from England in November 1633, arrived at the mouth of Potowmac river in March following, and having fixed on a proper place for beginning a ſettlement, purchaſed the land of the natives. The place they choſe was near a ſmall bay at the mouth of the above river, and was a town belonging to the Yoamaco Indians, who, having been defeated by the Suſquahana Indians, had reſolved to leave the town and retire farther into the country. The Engliſh arriving at this happy juncture, and fulfilling their agreement, were immediately put into poſſeſſion of one half of the town.

The Engliſh having thus by purchaſe become maſters of a ſpot of cleared ground, they not only began to build a town, which they called St. Mary's, but to plant corn; they alſo purchaſed all the corn they could of the Indians, by which means they had very ſoon a plentiful ſupply; and as they prudently took care to cultivate a friendſhip with the Indians, they avoided the diſtreſſes to which the neighbouring colony of Virginia had often been reduced. While they were cultivating the ground, and raiſing large quantities of Indian corn, the natives went every day into the woods to hunt for game, bringing veniſon and turkies to the Engliſh colony in great plenty, for which they received knives, tools, and toys.

Thus both nations lived in the greateſt friendſhip, doing mutual good offices for each other, till ſome of the Engliſh in Virginia envying the happineſs of this thriving colony, had the baſeneſs to ſuggeſt to the Indians, that theſe ſtrangers were not really Engliſh, as they pretended, but Spaniards, and would enſlave them, as they had done many of their countrymen. Having thus ſowed the ſeeds of ſuſpicion and enmity in the minds of theſe inoffenſive people, who now made preparations to attack them, the new planters prepared to defend themſelves, built a good fort with all expedition, and took every other neceſſary precaution for their defence; but continued to treat the Indians with ſuch kindneſs, that partly by the effect this had upon them, and partly by the awe of their arms, the ill deſigns of their enemies were defeated.

Being thus happy in the enjoyment of peace and plenty, they ſoon received reinforcements from England, many popiſh families of rank and fortune retiring thither to avoid the penal laws which were at that time made againſt them in England. After the king's death, Cromwell deprived the proprietor of his rights, and Maryland remained under the governors appointed by the parliament and Cromwell, till the Reſtoration, when lord Baltimore was reinſtated in his former poſſeſſions, which he cultivated with his uſual wiſdom, care, and moderation. No people could live in greater eaſe and ſecurity; and his lordſhip, willing that as many as poſſible ſhould enjoy the benefits of his mild and equitable adminiſtration, gave his conſent to an act of aſſembly, which he had before promoted in this province, for allowing a free and unlimited toleration for all who profeſſed the Chriſtian religion, of whatever denomination. This liberty, which was never violated, encouraged a great number, not only of the church of England, but of all kinds of diſſenters, to ſettle in Maryland, which before that time was almoſt wholly in the hands of Roman catholics.

Though this nobleman was guilty of no mal-adminiſtration in his government, though he was a zealous Roman catholic, and firmly attached to the cauſe of king James II. this could not prevent his charter being queſtioned in that arbitrary reign, and a ſuit being commenced to deprive him of the property and juriſdiction of a province granted by the royal favour, and peopled by himſelf at a vaſt expence: but it was the error of that weak reign neither to know its friends nor its enemies. Upon the Revolution the lord Baltimore had no reaſon to expect any favour, yet he met with more than king James himſelf had intended him: he was indeed deprived of his juriſdiction, but was allowed the profits of his province, which were far from being inconſiderable; and when his deſcendants conformed to the church of England, they were reſtored to all their rights. At preſent but a ſmall part of the province is veſted in lord Baltimore, he having conveyed to others the greateſt part of it.

This colony and Penſylvania were for a long time free from being harraſſed by the calamity of any war, offenſive or defenſive, with their Indian neighbours, with whom they always lived in the moſt exemplary harmony. Indeed in a war which the Indians made upon the colony of Virginia, they by miſtake made an incurſion into the bounds of Maryland; but they were ſoon ſenſible of their error, and atoned for it. The late war, however, changed every thing; for the Indians were then taught by the French to laugh at all their ancient alliances.

CHAP. III.

Of the Southern Part of the Britiſh Colonies on the Continent of AMERICA, particularly of VIRGINIA, CAROLINA, GEORGIA, and FLORIDA.

SECT. I.

Of VIRGINIA.

Its Situation, Extent, Climate, and Face of the Country. Of Cheſapeak-bay, with the Rivers and Soil of Virginia. Of the Vegetables, containing a Deſcription of the Tobacco Plant and its Preparation; of the Flowers; the Myrtle-berry, and the Candles made of the Wax extracted from them; the wild Fruits, their Kitchen-Gardens, and a general View of the Beauties of the Country.

VIRGINIA contains a very extenſive territory, it being ſeated between the thirty-ſixth and thirty-ninth degree north latitude, and between the ſeventy-fourth and eightieth of weſt longitude; it extending about two hundred and forty miles in length from north to ſouth, and about a hundred and twenty miles in breadth from eaſt to weſt. It is bounded on the north by the river Potowmac, on the eaſt by the bay of Cheſapeak, on the ſouth by Carolina, and on the weſt by the Allegany mountains.

With reſpect to the climate, the heat and cold both here and in Maryland are governed by the winds; the north and north-weſt winds are commonly cold and clear; but the ſouth-eaſt moiſt, hazy, and very hot. In winter the air is dry and clear; and though the ſnow falls in great quantities, it ſeldom lies above a day or two: the froſts are quick and ſharp, freezing the river over, though three miles acroſs; but do not continue long. Their ſpring is ſomewhat earlier than ours; in April they have frequent rains: May and June are very pleaſant months, the heat being greatly tempered by cooling breezes; but July and Auguſt are generally very ſultry, the air ſometimes growing in a manner ſtagnant, which produces dreadful thunder and lightning; but even then the heat is rendered tolerable by the refreſhing ſea-breezes; and in September and October the rains fall, when the inhabitants become liable to agues and intermitting fevers. The weather is changeable, and the changes ſudden and violent. Their winter froſts come on without the leaſt warning: thus, after a warm day, towards the ſetting in of winter, ſo intenſe a cold often ſucceeds, as to freeze the rivers in one night; but theſe froſts, as well as their rains, are rather violent than of long continuance.

The whole face of the country is ſo extremely low towards the ſea, that when you come within fifteen fathom ſoundings, you can hardly diſtinguiſh land from the maſt-head. All this coaſt of America has one uſeful particularity, that you know your diſtance exactly by the ſoundings, which uniformly and gradually diminiſh as you approach the land. The trees appear firſt as if they aroſe out of the water, and afford the ſtranger a very uncommon and not diſagreeable view. In ſailing to Virginia, or Maryland, you paſs a ſtreight between two points of land called the Capes of Virginia, which opens a paſſage into the bay of Cheſapeak, one of the largeſt and ſafeſt bays perhaps in the world; for it enters the country near three hundred miles from the ſouth to the north, having the eaſtern ſide of Maryland, and a ſmall part of Virginia on the ſame peninſula, to cover it from the Atlantic ocean. This bay is almoſt eighteen miles broad for a conſiderable way, and ſeven where it is narroweſt, the water in moſt places being nine fathoms deep. Through its whole extent it receives both on the eaſtern and weſtern ſide a vaſt number of fine navigable rivers; for, beſides thoſe of Maryland from the ſide of Virginia, it receives James-river, York-river, the Rappahannoc, and the Potowmac.

Theſe, in the order they are here mentioned, diſcharge themſelves, with ſeveral ſmaller ones, into the bay of Cheſapeak; and are not only navigable themſelves for very large veſſels a prodigious way into the country, but have ſo many creeks, and receive ſuch a number of ſmaller navigable rivers, as renders the communication of all parts of this country infinitely more eaſy than that of any other country. The Potowmac is navigable for near two hundred miles; it is nine miles broad at its mouth, and for a vaſt way not leſs than ſeven. The other three are navigable upwards of eighty; and in the windings of their ſeveral courſes approach one another ſo nearly, that the diſtance between them is in ſome parts not more than ten,

ten, and ſometimes not above five miles; while in others there is fifty miles between each of theſe rivers. The planters, as in Maryland, load and unload veſſels of great burthen each at his own door; which, as their commodities are of ſmall value in proportion to their bulk, is a very fortunate circumſtance.

The ſoil in the low grounds of Virginia is a dark fat mould, which for many years, without any manure, yields plentifully whatever is committed to it. The ſoil as you leave the rivers becomes light and ſandy, but, though ſooner exhauſted than the low country, yields corn and tobacco extremely well. The land higher up the rivers, throughout the whole country, is generally a level ground, with ſhallow valleys, which abound with ſprings and ſtreams of clear water, there being interſperſed ſome ſmall hills and extenſive vales. The lands next the rivers are ſtored with large oaks, walnut-trees, hickeries, aſh, beech, poplar, and many other ſorts of timber of a ſurprizing ſize. Towards the mouth of the rivers the land has a moiſt and fat mould, for the moſt part well ſtored with oaks, poplars, pines, cedars, cypreſs, and ſweet gums; the trunks are often thirty, forty, and ſome ſixty or ſeventy feet high, without a branch or limb. It likewiſe produces great variety of evergreens, as the holly, ſweet myrtle, and many others. The heads of the rivers afford a mixture of hills, valleys, and plains, adorned with fruit and timber trees.

There are alſo found great variety of earths, as antimony, talc, yellow and red ochre, fuller's earth, and tobacco-pipe clay. In theſe upper parts are likewiſe coal, ſlate, flat paving-ſtones in vaſt quantities, and likewiſe pebbles, though ſome travellers have ſaid there is not a ſtone in the country; beſides, near the falls of the rivers are vaſt quantities of ſtone fit for all uſes.

There is no better wheat than what is produced in this province and in Maryland; it alſo produces other ſorts of Engliſh grain, as barley, oats, rye, peas, &c. but the cultivation of tobacco employs all their attention, and almoſt all their hands; ſo that they ſcarcely raiſe corn enough for their own conſumption.

As the great produce of this country is tobacco, and as Virginia is celebrated for producing the beſt, it will be proper here to give a particular account of the management of this plant ſo well known in England. This plant at its full height is as tall as a common ſized man; the ſtalk is ſtraight, hairy, and clammy; the leaves alternately of a faded yellowiſh green, and towards the lower part of the plant of a great ſize. The tobacco ſeeds are firſt ſown in beds, where having remained a month, the young ſprouts are in the firſt rainy weather tranſplanted, and the earth raiſed about them: within the ſpace of another month they grow near a foot high; after which the people top them and prune off the bottom leaves, leaving only ſeven or eight on the ſtalk, that they may be the better fed; after which theſe leaves in ſix weeks time come to their full growth. The planters prune off the ſuckers, and clear them of the hornworm twice a week, which is called worming and ſuckering. This laſt work laſts three weeks or a month, by which time the leaf, from being green, begins to turn browniſh, and to ſpot and thicken, which is the ſign of its ripening. They cut the plants down as faſt as they ripen, heap them up, and let them lie a night to ſweat. The next day they carry them to the tobacco-houſe, where every plant is hung up at a convenient diſtance from each other, for about a month or ſix weeks: they take them down in moiſt weather, elſe they will crumble to duſt. After this they are laid upon ſticks, and covered up cloſe in the tobacco-houſe for a week or a fortnight to ſweat; and then opening the bulk in a wet day, they are ſtripped and ſorted, the top leaves being the beſt, and the bottom the worſt tobacco. The laſt work is to pack it in hogſheads, or to bundle it up, which is alſo done in a wet ſeaſon; for in the curing of tobacco, wet ſeaſons are as neceſſary as dry to render the leaf pliant.

There is no commodity of ſuch advantage to the revenue as this, for while it produces a vaſt ſum, it ſeems to lay but a very inconſiderable burthen upon the people in England, all the weight in reality falling upon the planter. Near three hundred thouſand pounds ſterling per annum is received by the government for the duty on this article only; and the exported tobacco, the far greater part of the profits of which come to the Britiſh merchant, brings almoſt as great a ſum annually to the kingdom.

The country is all over interſperſed with a ſurprizing variety of curious plants and flowers. They have a ſort of briar growing ſomewhat like the ſarſaparilla; the berry of which is as big as a pea, and of a bright crimſon colour, very hard and finely poliſhed. The flowers grow ſpontaneouſly in a ſurpriſing variety: among theſe is a moſt beautiful crown imperial; the cardinal flower, which is of a beautiful ſcarlet; the moccaſin flower, and a thouſand others; for almoſt all the year round the levels and vales are beautified with flowers of one colour or another, which render the woods as fragrant as a garden. From theſe materials the wild bees make vaſt quantities of honey; but their magazines are often rifled by bears, racoons, and the like. There is alſo found the fine tulip-bearing laurel-tree, which has the pleaſanteſt ſmell in the world, and keeps bloſſoming and ſeeding ſeveral months together: it delights much in the gravelly banks of the brooks, and perfumes the very woods with its odour; as does alſo the large tulip-tree; the locuſt, which reſembles the jeſſamine; and the perfuming crab-tree, during this ſeaſon. With one ſort or other of theſe, and by many other ſweet flowering-trees not mentioned, the woods are almoſt every where adorned.

At the mouth of the rivers, and all along upon the banks of the ſea and bay, and likewiſe near many of the creeks and ſwamps, grows the myrtle, which bears a berry of which the inhabitants make a hard brittle wax of a beautiful green colour, which by refining becomes almoſt tranſparent. Of this they make candles, which are never greaſy to the touch, nor melt with lying in the hotteſt weather; nor does the ſnuff ever offend the ſmell, like that of a tallow candle; but inſtead of being diſagreeable, if a candle be put out it yields a pleaſant fragrance, which is diffuſed all over the room; ſo that nice people frequently put them out on purpoſe to ſmell the incenſe of the expiring ſnuff.

The melting of theſe berries is ſaid to have firſt been diſcovered by a ſurgeon, who performed wonderful things with a ſalve made of them. The method of managing theſe berries is by boiling them in water, by which all of them diſſolve, except the ſtone or ſeed in the middle, which amounts to about half the bulk of the berry, the biggeſt of which is ſomething leſs than a pepper-corn. Cedar berries have been found to yield the ſame ſort of wax; but their berries are as much larger than pepper, as thoſe of the myrtle are leſs.

The fruits natural to the country are in great abundance, the ſeveral ſpecies of which are produced according to the difference of the ſoil, and the various ſituation of the country.

Peaches, nectarines, and apricots, that grow upon ſtandard trees thrive here extremely; and of the two firſt there are finer ſorts than in England. The beſt ſort of theſe cling to the ſtone, and will not come off clear; are they call plum-nectarines and plum-peaches. Some of theſe are twelve or thirteen inches in compaſs. Theſe ſorts of fruits are raiſed ſo eaſily there, that ſome good huſbands who live at a diſtance from the woods, plant large orchards of them purpoſely for their hogs; and others make a drink of them, which they call mobby, and either drink it like cyder, or make brandy of it by diſtillation, it making the beſt ſpirit next to grapes.

Of the cherries which grow wild in the woods there are at leaſt three ſorts, two of which grow upon trees as large as the common Engliſh oak; the fruit of one of them grows in bunches like grapes. Both theſe ſorts are black without, and but one of them red within: this laſt is more palatable than the Engliſh black cherry, it not having its bitterneſs. The other, which hangs on the branches like grapes, is water-coloured within, of a faintiſh ſweet, and is greedily devoured by the ſmall birds. The third ſort, which is called the Indian cherry, grows higher up the country, and is commonly found by the ſides of rivers growing on ſmall ſlender trees that are ſcarce able to ſupport them; but this is the moſt delicious cherry in the world: it is of a dark purple when ripe, and grows upon a ſingle ſtalk like the Engliſh cherry;

cherry; but is very ſmall. They are, however, ſo greedily devoured by the ſmall birds, that they ſeldom remain long enough on the tree to ripen.

The plums which grow wild are of two ſorts, the black and the murrey-plum, both which are ſmall, and have much the ſame reliſh with the damſin.

The perſimmon is a kind of Indian plum of ſeveral ſizes, between the bigneſs of a damſin and a Burgamot pear; but, till they are fully ripe, the taſte of them are ſo very rough as not to be endured: however, they are pleaſant fruit when fully ripe. Theſe, like moſt other fruits, grow as thick upon the trees as ropes of onions; ſo that the branches are often broke down by them.

An incredible variety and plenty of grapes grow wild, ſome of which are very ſweet and pleaſant to the taſte, and others very harſh and rough. There are two ſorts of them as large as the Dutch gooſeberry, which are very fine eating: one ſpecies of them is white, the other purple, but both of them are much alike in flavour.

We ought not here to omit the honey and ſugar-trees, which grow near the heads of the rivers. The honey-tree bears a thick ſwelling pod full of honey, appearing at a diſtance like the bending pod of a bean or pea. The ſugar-tree yields a kind of ſap, or juice, which by boiling is made into ſugar. The juice is drawn off by making an inciſion in the trunk of the tree, and placing a receiver under it. The Indians make one pound of ſugar out of eight pounds of the liquor. This ſugar has a large full grain, and its ſweetneſs reſembles that of good muſcovado.

They have muſk-melons, water-melons, pompions, cuſhaws, macoas, and gourds. The muſk-melons here reſemble the large Indian kind, and generally fill four or five quarts. The water-melons are much larger, and of ſeveral kinds, diſtinguiſhed by the colour of their meat and ſeed; ſome of them are exceeding pleaſant to the taſte, and very beautiful. One ſort has the rind of a lively green, ſtreaked and watered, the meat of a carnation colour, and the ſeed black and ſhining. Their pompions are much larger and finer than thoſe in England. Their cuſhaws are a kind of pompion of a bluiſh green, ſtreaked with white when fit for uſe, and larger than the pompion. The macoas are a ſmaller ſort of pompion, of which there are many ſorts, all of which are here called by the Indians by this name; but by the more northern Indians they are called the ſquaſh. Theſe being boiled whole when young and the ſhell tender, and melted butter or cream poured over them, are very good with all ſorts of butcher's meat.

There are here great variety of berries, all very good in their kind. They have three ſorts of mulberries, two black and one white, of which the long black ſort are the beſt; theſe being about the ſize of a boy's thumb. The other two kinds are of the ſhape of the Engliſh mulberry, but are of a faintiſh ſweet, without any tartneſs.

There grow naturally two ſorts of currants, one red and the other black; but theſe are far more pleaſant than thoſe of the ſame colours in England.

The wild ſtrawberries are as delicious as any in the world, and grow almoſt every where in the woods and fields, where they are ſo plentiful, that few perſons take care to tranſplant them. Here are alſo wild raſberries, cranberries, and hurts, with various kinds of nuts. Beſides theſe they have all the other fruits common in England.

A kitchen-garden thrives no where better or faſter; they have all the culinary plants that grow in England, in far greater perfection, with many others that will not grow there. Beſides theſe they have many medicinal plants, roots, and wood fit for medicine and dying. The ſnake-root here is a great antidote in all peſtilential diſtempers; the rattle-ſnake-root is the moſt admirable remedy ever diſcovered for curing the bite of that reptile, which has ſometimes been mortal in two minutes. If this medicine be early applied it preſently removes the infection, and in two or three hours reſtores the patient to as perfect health as if he had never been hurt.

An author born in Virginia, after ſhewing that the unhealthineſs of the climate attributed to this country is ſolely owing to the folly and indiſcretion of thoſe who on their firſt arrival from Europe over-heat themſelves, and then take a ſurfeit with greedily eating their delicious fruits, by drinking cold water or new cyder, adds, "Here the people enjoy all the benefits of a warm ſun, "and by the ſhady groves are protected from its inconvenience. Here all their ſenſes are entertained with "an endleſs ſucceſſion of native pleaſures. Their eyes "are raviſhed with the beauties of nature: their ears are "ſerenaded with the perpetual murmur of brooks, and "the through-baſs which the wind plays when it wantons through the trees; the merry birds too join their "pleaſing notes to this rural concert, eſpecially the "mock-birds, who love ſociety ſo well, that whenever "they ſee mankind they will perch upon a twig very "near them, and ſing the ſweeteſt wild airs in the world: "but what is moſt remarkable in theſe melodious animals, they will frequently fly at ſmall diſtances before "a traveller, warbling out their notes ſeveral miles an end, "and by their muſic make a man forget the fatigues of "his journey. Their taſte is regaled with the moſt delicious fruits, which, without art, they have in great "variety and perfection. And then their ſmell is refreſhed with an eternal fragrancy of flowers and ſweets, "with which nature perfumes and adorns the woods almoſt the whole year round.

"Have you pleaſure in a garden? all things thrive in "it moſt ſurpriſingly; you cannot walk by a bed of "flowers, but, beſides the entertainment of their beauty, "your eyes will be ſaluted with the charming colours of "the humming-bird, which revels among the flowers, "and ſucks off the dew and honey from their tender "leaves, on which it only feeds. Its ſize is not half "ſo large as an Engliſh wren, and its colour is a glorious ſhining mixture of ſcarlet, green, and gold. "Colonel Bird, in his garden, which is the fineſt in that "country, has a ſummer-houſe ſet round with Indian "honeyſuckles, which all the ſummer is continually "full of ſweet flowers, in which theſe birds delight exceedingly. Upon theſe flowers I have ſeen ten or a "dozen of theſe beautiful creatures together, ſport about me ſo familiarly, that with their little wings they "often fanned my face."

SECT. II.

Of the Quadrupeds of Virginia, particularly the Panther, the Bear, the Elk, the Racoon, the Opoſſum, and the Flying-Squirrel. Of the Birds, with a particular Deſcription of the Humming-Bird and the Fiſhing-Hawk. Of the Reptiles and Inſects, with a very particular Account of the Rattle-Snake. Of the Fiſhes of Virginia.

IT has been already obſerved, that there were neither horſes, cows, ſheep, nor hogs in America before they were carried thither by the Europeans; but now they are multiplied ſo extremely, that many of them here run wild. The hogs in particular are very numerous, and in general find their own ſupport in the woods, without any care of their owner, and it is well if the proprietor can find and catch the pigs, or any part of a farrow, when they are young, in order to mark them; for if there be any marked in the herd, they determine the property of the reſt, becauſe they ſeldom miſs their gangs; for as they are bred in company, ſo they continue to the end.

There are alſo many horſes foaled in the woods of the uplands, and are as ſhy as any wild creature. The young men take great delight in hunting theſe wild horſes, which they purſue ſometimes with dogs, and ſometimes without; for as they have no mark upon them, they belong to the firſt who take them; but they are ſo ſwift, that it is very difficult to come up with them.

Among the animals originally found in Virginia are panthers, bears, wolves, elks, red and fallow deer, racoons, wild-cats, the opoſſum, &c.

The panther of North America is of the cat kind, near as large as the tyger, and much of the ſame ſhape. It is of a pale reddiſh colour, finely mottled with ſmall round black ſpots, and the hair is ſhort. The eyes of theſe animals are large and of a greyiſh colour, very fierce and ſparkling. Their tails are exceeding long; and they are very ſtrong limbed. They pur like a cat, and will climb

trees with the greateſt agility imaginable; but are ſo wild, that they cannot be tamed even when taken young. They devour ſwine, deer, or any other creature they can maſter; but ſeldom attack mankind, except they are enraged by being wounded: it is even ſaid that a ſmall dog will make them take to a tree, where they generally remain till they are ſhot by the huntſmen. The fleſh looks as well as any ſhambles meat, and is much admired.

The bears are not very large, but, though they ſeem ſo clumſy, they climb trees very nimbly, and in coming down always go with the tail foremoſt. They are alſo very dexterous and expert in fiſhing. It is remarkable that the female never appears abroad when with young. Bear-hunting is a common diverſion both with the Chriſtians and Indians, the former having a breed of dogs fit for that ſport, who bark and ſnap at him till he mounts a tree; when, by the noiſe of the dogs, the huntſmen repair to the place, and generally ſhoot one after another till they kill him; for though the bears are not naturally fierce, they will fight moſt deſperately when wounded. Their fleſh is good, nouriſhing, and not inferior in taſte to the fineſt pork; the paws are accounted the beſt eating. The young cubs are a moſt delicious diſh; the planters prefer the fleſh to that of any other meat; it looks as well as it eats, their fat being as white as ſnow, and the ſweeteſt of any creature in the world.

The elk is a ſtrong and ſwift beaſt, bigger than a horſe, and exactly like a deer. They have two large horns, which weigh twelve or fourteen pounds. Their neck is ſhort and thick; but the ears and back are very long. In colour they reſemble a hart; but their fleſh is not near ſo ſweet as that of the fallow deer.

The racoon is of a dark grey colour, and in ſhape and ſize partly reſembles a fox; but has large black eyes, with great whiſkers like a cat; the noſe reſembles that of a pig, and the feet are formed like thoſe of a monkey. The tail is round, and encircled with annular ſtripes like that of a cat. It makes uſe of its fore-feet in the manner of hands, and will run up a tree to the very end of the boughs. This animal is very fond of crabs, and it is ſaid that when he wants to catch them, he will ſtand by the ſide of the water and let his tail hang in, which the crab taking for a bait faſtens his claws in it; upon which the racoon ſprings forward a conſiderable way upon the land, dragging the crab along with him, which no ſooner finds itſelf out of its element than it lets go its hold, and the racoon ſeizing it croſſwiſe in his mouth, devours it.

The opoſſum is a very extraordinary animal of the ſize of a cat, it being almoſt eighteen inches in length; the head reſembles that of a fox; the eyes are little, round, clear, and lively; and the ears long, broad, ſmooth, thin, tranſparent, and placed erect. The fore-legs are ſhort, and no more than three inches long; but thoſe behind are more than four, and the feet reſemble hands. Its back is covered with long hair; but on the head, neck, under the belly, and legs, it is pretty ſhort. The tail is round, and a foot long, with which it lays hold of the branches of trees, and thus ſuſpends itſelf. It is hairy from the root to the length of four inches; but the other part is naked, and ſcaled like a ſnake, which it nearly reſembles. The whole back, the ſides, and the upper part of the tail, are chiefly black; but under the neck, belly, and tail, it is of a yellowiſh colour. This animal has one peculiar property which diſtinguiſhes it from all others in the world, the female having a falſe belly, or bag, hanging below under the other belly, with a pretty large aperture at the end, towards the hinder-legs. Within this bag, on the uſual parts of the common belly, are eight teats, and, what is very extraordinary, upon theſe when the female conceives the young are formed, and there hang like fruit upon the ſtalk, with all their members complete, till they grow in bulk and weight to their appointed ſize; and then dropping off, are received in the falſe belly, from which they go out at pleaſure, and in which they take refuge when any danger threatens. The falſe belly is hairy within, and the aperture, which is big enough to admit a large orange, ſhuts up pretty cloſe, and cannot be well opened without violence. Improbable as this method of propagation may appear, yet this account is confirmed by a conſiderable number of authors, and particularly by that great naturaliſt Mr. Ray, who diſſected one of theſe animals himſelf, and informs us, that this falſe belly is the only uterus the animal has, no other being to be found. Theſe animals are ſo hard to kill, that when their ſkulls are maſhed and broken to pieces, and they ſeem to be quite dead, yet in a few hours they will recover and creep about again.

There are here two ſorts of ſquirrels, one grey and commonly larger than a rabbit, but ſmall like a fox; yet are good to eat. It is commonly of a grey colour, yet ſome are pyed, and ſome white, red, and black.

The flying-ſquirrel is of a grey or light dun colour, and is leſs than the Engliſh. It has a fine thin ſkin on each ſide, covered with hair like the reſt of the body, and extending from the fore-feet to the hinder-feet, which buoys them up as they ſpring from one tree to another, and enables them to take a much more extenſive leap than any other ſquirrel; this is termed flying.

They have all our ſorts of wild and tame fowl in equal perfection with us, and ſome which we have not, with a vaſt number of birds of various kinds valuable for their beauty or their note. The white-owl of Virginia is much larger than thoſe of England, and is all over of a bright ſilver-coloured plumage, except one black ſpot upon his breaſt. The Virginian nightingale is a beautiful bird, whoſe colours are crimſon and blue. The mocking-bird is ſuppoſed to excel all others in the fineneſs of its note, and is remarkable for imitating the notes of all others. The rock-bird is very ſociable, and his ſociety very agreeable by the ſweetneſs of his muſic.

The humming-bird is the leaſt of all the birds yet known, and has this remarkable peculiarity, that though it is feathered like a bird, it gets its living like the bee by ſucking honey from the flowers. Theſe birds are of different colours; but the cocks are more beautiful than the hens, and are finely tinged with red, green, and gold, as hath been already obſerved, which being expoſed to the ſun-beams ſhine with wonderful luſtre. They have long bills and tails, conſidering their ſize, and in ſome of the larger flowers they often bury themſelves, and are quite covered while ſucking to the bottom of them, by which means they are often caught by children. They fly very nimbly, but more like inſects than birds, from flower to flower, making a humming noiſe ſomewhat like that of a bee. They breed during the heat of ſummer; but what becomes of them in the winter is not known. Their neſts are a great curioſity, and may be ſaid to be one of the fineſt pieces of workmanſhip the whole ſpecies of winged animals can ſhew; for it commonly hangs on a ſingle briar, and is moſt artificially woven like a round ball, with a ſmall hole to go in and out. Within it the hen lays and hatches her eggs, which are oval, and no bigger than a ſmall pea.

There are here ſeveral ſorts of eagles and hawks. The fiſhing-hawks are very eager in catching of fiſh at their firſt coming in the ſpring; and the bald eagle no ſooner perceives a hawk that has taken his prey, but he immediately purſues and ſtrives to get above him in the air; which if he can once attain, the hawk, for fear of being torn by him, lets the fiſh drop, and thus compounds for his own ſafety; for the fiſh is no ſooner looſe from the hawk's talons, than the eagle ſhoots with ſuch inconceivable ſwiftneſs, that he catches it in the air. It is ſaid that the fiſhing-hawks in more plentiful ſeaſons will catch a fiſh and loiter about with it in the air, in order to have a chace with an eagle; and when he does not appear ſoon enough, will make a noiſe as inſolently defying him. This is ſaid to have been frequently ſeen.

The troubleſome reptiles and vermin of this country are frogs, ſnakes, muſkettos, chinches, ſeed-ticks, or red-worms. The marſhes, fens, and watery grounds are full of frogs, which make a diſagreeable croaking noiſe. In the ſwamps and running ſtreams are frogs of an incredible ſize, which are called bull-frogs, from their bellowing noiſe. Theſe are ſaid to be frequently ſix times as large as thoſe in Europe; but there are no toads in the country.

The rattle-ſnake uſually fills ſtrangers with terror, who are under great apprehenſions of being bit by this formidable reptile; but it is here very rarely ſeen, and then

then never does the leaſt miſchief, unleſs you offer to diſturb it, and by that means provoke it to bite in its own defence; and even then it never fails to give fair warning, by making a noiſe with its rattle, which may be heard at a conſiderable diſtance.

The rattle-ſnake is ſo called from the rattles at the ends of their tails, which is a connection of joints within a thin covering of a horny nature. The number of joints, or rattles, are uncertain, being more or leſs according to the age of the ſnake; ſome authors aſſerting, that every year there is the addition of a new rattle, and that theſe do not begin to grow till they are three years old. Mr. Brickell informs us, that he has ſeen one with thirty rattles. M. Derham and others have obſerved, that Providence has wiſely given theſe rattles to this poiſonous ſerpent, that the noiſe might be a warning to man and beaſt to avoid the approaching danger. Some of theſe reptiles grow to the length of ſix or ſeven feet, and they are about the thickneſs of the ſmall of a man's leg. Their ſkins are all over covered with thin ſcales, with a ridge through the middle of them, of an orange tawny; the reſt of their back are generally of a blackiſh colour beautifully mottled, and the belly of an aſh colour, inclining to lead. The top of the head is flat as in the viper, and by the protuberance of the jaws ſomewhat reſembles a bearded arrow; it has two noſtrils, and its eyes are round and very bright and ſhining. The mouth is very large; its tongue in all reſpects like that of a viper, which it darts out and retracts again with great agility. The male is eaſily diſtinguiſhed from the female by a ſpot on the head reſembling a patch of black velvet, and his head is ſmaller and longer. They ſeldom or never bite except they are provoked, and this they cannot do till they gather themſelves into a coil, and then will ſpring at a good diſtance to bite whatever provokes or injures them; otherwiſe they are moſt peaceable creatures, and never attack or moleſt any one. They have ſeveral ſmall teeth in each jaw, which ſerve them for catching and retaining their food, which they always ſwallow whole; and beſides theſe are the poiſonous fangs, which are placed without the upper jaw, towards the fore part of the mouth. Theſe fangs uſually lie under a ſtrong membrane, or ſheath; but are erected upon occaſion, and there are only two on each ſide of their upper jaw. Theſe are hooked, but in all of them is a hole, ſo ſmall that you can but juſt get in the point of a ſmall needle; towards the point is a plain ſlit, and cloſe to the jaw a bag filled with venom, which iſſues out of the hole when this ſerpent bites. The venom, which is of a water-colour tinged with yellow, is not always of the ſame force, it being moſt poiſonous in the hotteſt weather. Thoſe who have been bit ſay, that it ſeems as if a flaſh of fire ran through their whole bodies: but the Indians have happily a remedy, by which they eaſily cure themſelves if bitten by accident, which is by chewing a bit of the rattle-ſnake root, ſwallowing ſome part of the juice, and applying the reſt to the wound, which perfectly cures thoſe who are bit in a few minutes.

Dr. Brickell obſerves, that the Indians frequently pull out theſe poiſonous fangs, which is eaſily done by tying a bit of red woollen cloth to the upper end of a long hollow cane, provoking the rattle-ſnake to bite, and then ſuddenly ſnatching it away, by which means the teeth are found ſticking faſt in the cloth.

Their common food is frogs, ground-mice, crickets, graſhoppers, and other inſects; and the rattle-ſnakes themſelves ſerve for food to bears, and even hogs will eat them without harm. They are viviparous, and generally bring forth about twelve young ones.

We ſhall now conſider the effects of the rattle-ſnake's poiſon, of which we have ſome extraordinary inſtances given us by captain Hall, who being in South Carolina, where perhaps the venom may be ſomewhat more violent than in this province, and where they are at leaſt more numerous, procured a fine healthful rattle ſnake, and, with one Mr. Kidwell, a ſurgeon, and three or four other gentlemen, made ſeveral experiments. They got three cur-dogs, the largeſt no bigger than a common harrier; and the ſnake being tied and pinned down to a graſs-plat, they took the largeſt of the dogs, and having tied a cord round his neck, ſo as not to ſtrangle him, the captain held one end, and another perſon the other; when pulling the dog over the ſnake, the latter raiſed himſelf near two feet, and bit the dog as he was jumping. The dog yelped, by which the captain perceived he was bitten; and pulling the dog to him as faſt as he could, he found his eyes fixed, his tongue between his teeth, and, in ſhort, he was quite dead in a quarter of a minute: but as they could neither perceive the bite, nor any blood, they ordered ſome hot water, and ſcalding off the hair, diſcovered only one puncture, with a bluiſh green colour appearing a little round it, between his fore legs and breaſt.

Half an hour after they took a ſecond dog, that was ſomewhat ſmaller, and brought him in like manner over the ſnake, which bit his ear, ſo that all the company ſaw it. The dog yelped much, reeled and ſtaggered about for ſome time, then fell down and ſtruggled as if convulſed, and two or three times got up, and wagging his tail, though ſlowly, endeavoured to follow a negro boy, who uſed to make much of him. They put him into a cloſet, and ordered the boy to look after him, who two hours after brought word that the dog was dead.

About an hour after the ſecond dog was bitten, they took the third in like manner, which the ſnake bit on the right ſide of the belly, ſo that he drew blood. The dog for about a minute did not ſeem to be hurt; but was dead the next morning.

Four days after they got two dogs, as big as common bull-dogs; and the firſt which the ſnake bit, on the inſide of his left thigh, died exactly in half a minute, according to the watches of two gentlemen preſent, though no blood was drawn. The ſecond was bit about an hour after, on the outſide of the thigh, where they perceived blood at two places, and he died in four minutes. As they imagined the venom was not quite ſpent, they got a cat, which he bit an hour after; ſhe was very ſick, and was found dead the next morning.

The laſt experiment the captain made with this ſnake was to try if his poiſon would not prove mortal to the reptile himſelf. In order to this, he hanged him in ſuch a manner that he was not above half his length on the ground, and then ſo irritated him by pricking and ſcratching him with two needles faſtened to the end of a ſtick, that he ſoon bit himſelf, after having ſeveral times attempted to bite the ſtick. He then let him down, and he was quite dead in eight or ten minutes. The ſnake was then cut into five pieces, and given to a hog, the head-part firſt, in the ſight of ſeveral people. The hog eat up all the ſnake, and ten or twelve days afterwards the captain ſaw the hog alive and healthful.

But beſides the effect of the poiſon, there are others attributed to the eyes of this ſerpent, that appear much more ſurprizing; and we have many accounts that ſeem to prove that the rattle-ſnake, by fixing its eyes on any ſmall animal, as a bird or ſquirrel, though ſitting on the branch of a tree, can ſo diſorder their animal ſpirits, that they have not the power to fly but fall down, and are ſwallowed by that dreadful reptile. The following inſtance given by colonel Beverly cannot fail of being highly agreeable to the reader.

The above gentleman, with two other perſons in company, ſtopping at an orchard by the ſide of a road, one of the company ſearching for the beſt cherries eſpied a hare, better than half grown, ſitting; and though he went cloſe by her ſhe did not move, till he, not ſuſpecting the occaſion of her tameneſs, gave her a laſh with his whip; upon which ſhe ran three or four yards, and ſat down again. The gentleman not finding the fruit ripe, immediately returned the ſame way; and near the place where he ſtruck the hare obſerved a rattle-ſnake. Not ſuſpecting the charm, he went back about twenty yards to a hedge to get a ſtick to kill the ſnake, and at his return found it removed and coiled in the ſame place from whence he had removed the hare. This made him look about for her, and he ſoon eſpied her about ten feet diſtant from the ſnake in the place to which ſhe had ſtarted when he whipped her. She was now lying down, but would ſometimes raiſe herſelf on her fore-feet, ſtruggling as it were for life to get away; but could never raiſe her hinder parts from the ground; and then ſhe would fall flat on her ſide again, panting vehemently. The hare and ſnake were in this condition when our author was called, who ſays, that though all three went within five yards of the

ſnake to have a full view of the whole, the ſnake did not ſo much as give a glance towards them. There they ſtood at leaſt half an hour, the ſnake not altering one jot; but the hare often ſtruggled to get up, and fell again on its ſide; till at laſt ſhe lay ſtill as if dead. The ſnake then moved out of his coil, and ſlid gently and ſmoothly towards the hare, his colours at that inſtant ſhining ten times more bright than at other times. As the ſnake moved along the hare happened to make another ſtruggle, upon which the ſnake made a ſtop, lying at his length till ſhe was quiet, and then advanced till he came up to the hare's hinder parts, which in all this proceſs had been towards the ſnake. There he ſurveyed the hare all over, raiſing part of his body above it; then turning off, he went to the noſe, and after that to the ears, which he took into his mouth one after another, working them as a man does a wafer to moiſten it. He then returned to the noſe, and took the face into his mouth, ſtraining and gathering his lips ſometimes on one ſide ſometimes on the other. At the ſhoulders he was a long time puzzled, often pulling and ſtretching the hare out at length, till at laſt he got the whole body into his throat. The ſpectators then advanced, and our author taking the twiſt-band off his hat made a nooſe, aud threw it about the ſnake's neck. This made him very furious; but having ſecured him, they put him into one end of a wallet, and carried him on horſeback five miles to the houſe where they lodged that night, and killing him the next morning, took the hare out of his belly. The head began to be digeſted, and the hair to fall off, having laid in the ſnake's belly about eighteen hours.

Sir Hans Sloane endeavours to ſolve the myſtery, by ſuppoſing that when ſuch animals as are the prey of theſe ſnakes, as ſmall quadrupeds, birds, &c. are ſurprized by them, they give them a bite, and the poiſon allows them time to run a little way, or a bird to fly into the next tree; where the ſnakes watch them with great earneſtneſs till they fall down, and then licking them over with their ſpawl ſwallow them; but this does not ſeem fully to explain the difficulty, ſince among the ſquirrels, birds, and other animals frequently found in their bellies, it does not appear that any of them were wounded: nor could they have an opportunity of ever biting them, if it be true that they never bite with their poiſonous fangs without firſt giving warning by rattling their tails.

They have ſeveral other ſnakes which are more frequently ſeen, ſome of which have very little or no hurt in them, as the black-ſnake, the water-ſnake, and the corn-ſnake. However, the black-viper-ſnake and the copper-bellied-ſnake are ſaid to be extremely venomous. Theſe three poiſonous ſnakes bring forth their young alive, while the other three lay eggs, which are hatched afterwards. There is here alſo the horn-ſnake, which is ſo called from a ſharp horn in its tail, with which it aſſaults any thing that offends it with ſuch force, that it will ſtrike its tail into the butt-end of a muſket ſo far as to be unable to diſengage it.

The muſkettos are leſs dangerous, but more troubleſome, on account of their being more frequent. They are a kind of long-tailed gnat, and are only found in the low grounds and marſhes.

The chinch is a kind of flat bug, that lurks in the bedſteads and bedding, and is very troubleſome in the night; but every neat houſe-wife contrives to keep the beds clear of theſe vermin, by ſearching for them early in the ſpring. Seed ticks and red-worms are ſmall inſects that are very troubleſome by day, as muſkettos and chinches are by night. The ſeed-ticks are no where to be found but in the track of cattle, upon which the great ticks faſten, and fill their ſkins ſo full of blood that they drop off; and wherever they happen to fall, produce a kind of egg, which lies about a fortnight before the ſeedlings are hatched. They then run in ſwarms up the next blade of graſs, and the firſt thing that bruſhes the graſs gathers off moſt of theſe vermin, which ſtick like burs upon any thing that touches them. Red-worms lie only in old dead trees and rotten logs, and without ſitting down upon them in the midſt of ſummer, no perſon ever meets with them; but a little warm water immediately brings off both the ſeed-ticks and red-worms, though they be ever ſo thick upon any part of the body, and are ſo ſmall that they can ſcarcely be perceived; but if nothing be done to remove them, the itching they occaſion goes away in two days time.

No place abounds with ſea and river-fiſh more than Virginia. In February, March, April, and May, ſhoals of herrings come up into the very brooks, ſome of the ſize of ours; but moſt of them are much larger. There are alſo plenty of cod, and ſtingraſs, a fiſh peculiar to this country, ſo called from its having a ſting in its tail; it is, however, eſteemed good food. In the rivers are ſturgeon, old-wife, the ſheep's-head, an excellent fiſh; trouts, and green-fiſh in great plenty; alſo plaice, flounders, whitings, carp, pike, mullets, and perch; and for ſhell-fiſh they have crabs, oyſters, cockles, and ſhrimps. Of thoſe that are not eaten, here they have in the ſeas whale and dog-fiſh. Here is alſo a fiſh called the toad-fiſh, from its ſwelling monſtrouſly when taken out of the water; and likewiſe the rock-fiſh, ſome ſpecies of which are poiſonous, though others, which are not eaſily diſtinguiſhed from them, are very wholeſome food.

Annually in the month of June there are here vaſt numbers of worms, which enter the bottoms of ſhips, ſloops, and boats, wherever they find the coat of pitch, tar, and lime worn off the timber, and by degrees eat the planks into cells like thoſe of an honeycomb. Theſe worms continue upon the ſurface of the water from their riſe in June till the firſt great rains, after the middle of July; but after that do no great damage till the next ſummer ſeaſon, and never penetrate farther than the plank upon which they firſt fix. The damage occaſioned by theſe worms may be prevented ſeveral ways, as by keeping the coat of pitch, lime, and tallow whole upon the bottom of the ſhip, or veſſel; by anchoring the large veſſels in the ſtrength of the tide, during the worm ſeaſon, and hauling the ſmaller on ſhore: by running up into the freſhes with the ſhip or veſſel; for they never do any damage in freſh water: and by burning and cleaning immediately after the worm-ſeaſon is over; for then they have but juſt ſtuck into the plank, and have not buried themſelves in it.

SECT. III.

Of the Diviſions, Number of Inhabitants, and Towns of Virginia: A Character of the People: The Form of Government, and Trade.

VIRGINIA is divided into twenty-five counties, namely, James county, which is ſeated on both ſides the river James, Prince George county, Henrico county, Charles County, Surrey, Iſle of Wight, Nanſamond, Norfolk, Princeſs Anne, York, Warwick, Elizabeth, New Kent, King William, and Queen, Glouceſter, Middleſex, Eſſex, Richmond, Stafford, Weſtmoreland, Lancaſter, Northumberland, Northampton, and Acomat counties.

The number of inhabitants in this province is about two hundred thouſand whites, and it is ſuppoſed there are half that number of ſlaves; yet there are only two towns in the whole country built by the Engliſh; theſe are Jamestown and Williamſburg.

James-town, which before the building of Williamſburg was eſteemed the capital, is ſeated on a peninſula formed by James river, about forty miles from its mouth, in the ſeventy-ſixth degree weſt longitude, and the thirty-ſeventh degree thirty minutes north latitude, and contains only about eighty or a hundred houſes, the greateſt part of which are taverns or public-houſes for the entertainment of mariners. Its ſituation is naturally ſtrong, but the fortifications are neglected, the inhabitants thinking themſelves perfectly ſecure from enemies ſo far up the river.

Williamſburg, now the capital of Virginia, is ſeated ſeven miles from the above town, between James river and York river, in the thirty-ſeventh degree twenty minutes north latitude, and the ſeventy-ſixth degree thirty minutes weſt longitude; but though it is the ſeat of the government, where the general aſſembly or parliament meet,

meet, it ſcarce contains ſixty houſes. It has a town-houſe, and a handſome college erected for the education of the Indians, and alſo ſome works raiſed for its defence. The above college conſiſts of a preſident, ſix profeſſors, and one hundred ſtudents; and for endowing it king William not only gave two thouſand pounds, but granted twenty thouſand acres of land, and one penny per pound on all tobacco exported. It has likewiſe received ſeveral other valuable donations, and is upon the whole one of the richeſt colleges in America.

The inhabitants of Virginia are a chearful hoſpitable people, and many of them genteel, vain, and oſtentatious; they live luxurioufly, and generally leave all kinds of labour to their ſlaves. But though there are not many rich planters in this province, there is ſcarce a man ſo poor as to be reduced to a ſtate of beggary; but if any one happens to be diſabled by age or ſickneſs from working, he is quartered upon ſome ſubſtantial planter, where he is plentifully provided for at the public expence.

The conſtitution of the Virginian government reſembles that of Great Britain. The governor repreſents the king, by whom he is choſen; the council anſwers to the houſe of peers; and the repreſentatives of the people, elected by the freemen of every county, are their houſe of commons.

There are only three public officers beſides the governor, who have their commiſſion immediately from his majeſty, namely, the auditor of the revenue, the receiver-general, and the ſecretary, in whoſe office is kept the public records, and all deeds and other writings are there proved. The treaſurer of the province is choſen by the general aſſembly, and receives the money raiſed by the acts of that aſſembly.

No other forces are kept in Virginia but militia, of which the governor is by his commiſſion lieutenant-general, and appoints in each county a colonel, lieutenant-colonel, and all other commiſſioned officers. All freemen between the ages of ſixteen and ſixty, not otherwiſe excuſed, are obliged to bear arms and attend a general muſter once a year in the county where they dwell, and four times a year in ſmaller parties or ſingle companies.

The public revenues are a rent reſerved by the crown of all lands granted by patent: a duty of two ſhillings a hogſhead on all tobacco exported: a duty of ſix-pence a head for every paſſenger brought into the country: fines and forfeitures: duties on ſlaves and ſervants imported, and on foreign liquors: money raiſed by acts paſſed in the aſſembly, and the heavy duties laid on tobacco when exported to Great Britain.

Their county courts have the power of cenſuring and puniſhing all maſters that do not provide their ſervants good and wholeſome diet, cloathing, and lodging; and theſe courts have power to redreſs any grievance ſervants may have reaſon to complain of.

The eſtabliſhed religion is that of the church of England: every pariſh has its miniſter, who has a houſe and glebe, with about the value of eighty pounds per annum paid him in tobacco, which the church-wardens collect for him. The eccleſiaſtical affairs are under the inſpection of a commiſſary authorized by the biſhop of London, who preſides over all the colonies in religious matters. But though full liberty of conſcience is allowed to people of all perſuaſions, there are few diſſenters from the eſtabliſhed church.

The chief exports from this province are iron, beef, pork, pipe-ſtaves, and other lumber: but, as hath been already obſerved, all the other commodities of this country are ſwallowed up in tobacco. It is computed that generally one year with another two hundred large ſhips are freighted with that commodity, and that a hundred thouſand hogſheads are annually exported, each weighing four hundred weight, out of which it is ſuppoſed that forty thouſand hogſheads are conſumed at home, and the other ſixty thouſand exported from Great Britain to foreign markets, after moſt of it is manufactured at home.

SECT. IV.

A conciſe Hiſtory of the Settlement of Virginia.

VIRGINIA, which was diſcovered by Cabot, is the moſt ancient of our colonies; though the firſt attempts to ſettle a colony were not, ſtrictly ſpeaking, made in Virginia, but in that part of North Carolina which immediately borders upon it. The great Sir Walter Raleigh, when this country was firſt made known to the Engliſh, ſaw how advantageous it might be made to this kingdom. He was the firſt man in England who had a right conception of the advantages of ſettlements abroad, the only perſon who had a thorough inſight into trade, and who ſaw clearly the proper methods of promoting it. He applied to court, and formed a company, compoſed of ſeveral perſons of diſtinction and ſome eminent merchants, who agreed to ſettle a colony in that part of the world, which, in honour of queen Elizabeth, he named Virginia. The ill ſucceſs that attended the firſt attempts ſeemed to give little hopes of their ever being completed: near half of the firſt colony was deſtroyed by the Indians, and the reſt, conſumed and worn out by fatigue and famine, returned home to their native country: the ſecond colony was cut off to a man in a manner unknown; but was ſuppoſed to be deſtroyed by the Indians: the third had the ſame unhappy fate; and the fourth quarrelling among themſelves, neglected agriculture to hunt for gold, and exaſperating the Indians by their inſolent behaviour, loſt ſeveral of their people, and the poor remains of them were returning in a famiſhing condition to England, when juſt in the mouth of Cheſapeak-bay they met the lord Delaware with a ſquadron loaded with proviſions, and with every thing neceſſary for their relief and defence, who perſuaded them to return.

This nobleman endeavoured with the utmoſt zeal and aſſiduity to cheriſh and ſupport the froward infancy of this unpromiſing colony. After he had prevailed on the people to return, he comforted them under their misfortunes, pointed out their cauſes, and uniting the tenderneſs of a father with the ſteady ſeverity of a magiſtrate, healed their diviſions, and reconciled them to authority and government, by making them feel by his conduct what a bleſſing it could be made. Having ſettled the colony within itſelf, his next care was to put them upon a proper footing with regard to the Indians, who had been too often treated ill, and whom he now found very haughty and aſſuming on account of the miſerable ſtate to which the Engliſh had been reduced; but by ſome well-timed and vigorous, though cruel, ſteps, awed them into very peaceable diſpoſitions; and having ſettled his colony in a very thriving condition, retired home for the benefit of his health, which, by his conſtant attention to buſineſs, and the air of an uncultivated country, had been impaired; but left his ſon, who had his father's ſpirit, as his deputy, and Sir Thomas Gates, Sir George Summers, the honourable George Piercy, Sir Ferdinand Wenman, and Mr. Newport, for his council.

Lord Delaware on his return to England did not forget the colony. For eight years together he was indefatigable in doing every thing that could tend to the peopling, the ſupport, and the good government of this ſettlement; and died in the purſuit of the ſame object in his voyage to Virginia, with a large ſupply of people, cloathing, and goods.

The colony of Virginia took ſuch vaſt root under the care of lord Delaware, that it was enabled to ſtand two terrible ſtorms, in which the injured Indians had nearly cut off that colony, and to ſubdue them ſo as to put it entirely out of their power to give the Engliſh the leaſt diſturbance for many years. After the death of Charles I. Sir William Berkley held out for the crown, till the province was reduced by the parliament.

Soon after the Reſtoration a rebellion aroſe in the province, from miſmanagement in the government, the decay of trade, and exorbitant grants, which included the ſettled property of many people; theſe grievances raiſed a general diſcontent among the planters, which was made to blaze out into an actual war, by a young gentleman named Bacon: he had a graceful preſence and winning behaviour: he had been bred to the law, had a lively and fluent expreſſion fit to ſet off a popular cauſe, and to influence men who were ready to hear all that could be ſaid to colour, in a proper manner, whatever was already ſtrongly drawn by their own feelings. By a ſpecious, or perhaps a real, regard for the public good, finding the governor ſlow in his preparations againſt the Indians, who

were then ravaging the frontiers of the province, he took up arms without any commiſſion to act againſt the enemy. When he had ſufficient force for this purpoſe, he found himſelf in a condition not only to make head againſt the Indians, but to give law to the governor, and to force him to give a ſanction by his authority to thoſe proceedings, with which he intended to deſtroy it.

Bacon at length, armed with the commiſſion of a general, marched againſt the Indians, followed by the whole force of the colony; when Sir William Berkley, the governor, being freed from the immediate terror of his forces, proclaimed him a traitor, and iſſued a reward for apprehending him. Upon this the people were univerſally inflamed, and adhered to Bacon, while the governor, who was unwilling to temporize, or yield to the ſtorm, retired over the river Potowmac, proclaimed all Bacon's adherents traitors, put himſelf at the head of a ſmall body of troops, which he raiſed in Maryland, and of ſuch Virginians as were faithful to him, and wrote to England for ſupplies.

Mean while Bacon marching to the capital, called an aſſembly, and for ſix months together diſpoſed of every thing according to his own pleaſure. Things were now brought to a criſis, and haſtening to a civil war; when ſuddenly the public tranquility was reſtored by Bacon's dying a natural death; for the people being unable to act without a head, propoſed terms of accommodation, and peace was reſtored not ſo much by the removal of the grievances complained of, as by the arrival of a regiment from England, which remained a long time in the country: and it muſt be obſerved, in honour of the moderation of the government, that no perſon ſuffered in his life or eſtate for this rebellion, which was the more extraordinary, as many people were then very earneſtly ſoliciting grants of land in this country.

SECT. V.

Of NORTH *and* SOUTH CAROLINA.

Their Situation, Extent, Climate, Soil, and Face of the Country. The many Species of Corn, Plants, and Trees.

THE provinces of North and South Carolina, lying between the thirty-firſt and thiry-ſixth degrees of latitude, are upwards of four hundred miles in length, and in breadth to the Indian nations near three hundred. North Carolina is bounded on the eaſt by the Atlantic ocean, on the ſouth by South Carolina, on the weſt by the Apalachian mountains, and on the north by Virginia. The coaſts are extremely broken by bays, creeks, and rivers, in the openings of which are many bars and ſhoals, which render the navigation difficult to ſtrangers: there are, however, ſeveral ſafe and good harbours.

The climate and ſoil of both Carolinas are not very different from thoſe in Virginia; but where they differ it is much to the advantage of Carolina, which, upon the whole, may be conſidered as one of the fineſt climates in the world. Indeed the heat in ſummer is very great, but it exceeds little that in Virginia, and has the advantage of having the winters milder and ſhorter. However, the weather, though in general ſerene, and the air healthy; yet, like all American weather, makes ſuch quick changes as obliges the inhabitants to obſerve more caution in their dreſs and diet than we are obliged to uſe in Europe. Thunder and lightning is very frequent, and theſe, with the ſouthern colonies, are the only ones we have on the continent that are ſubject to hurricanes; but they are here very rare, and not near ſo violent as thoſe of the Weſt Indies. Part of the month of March, all April and May, and the greateſt part of June, are here inexpreſſibly temperate and agreeable; but in July, Auguſt, and for almoſt the whole of September, the heat is very intenſe; and though the winters are ſharp, eſpecially when the north-weſt wind prevails, yet the cold is ſeldom ſevere enough to freeze any conſiderable body of water. It is chiefly felt in the mornings and evenings; for the froſt has never ſufficient ſtrength to reſiſt the noon-day's ſun; ſo that many tender plants, which do not ſtand the winter of Virginia, flouriſh in Carolina.

The whole country, where it is not cleared by our planters, is in a manner one foreſt. The trees are almoſt the ſame in every reſpect with thoſe produced in Virginia; and by the different ſpecies of theſe the quality of the ſoil is eaſily known: thus the ground which bears the oak, the walnut, and the hickery, are extremely fertile; it is of a dark ſand, intermixed with loam; and as all the land abounds with nitre, it is long before it is exhauſted; for here they never uſe manure. What is called the pine-barren is the worſt, it conſiſting of a white ſand, yet naturally bears the pine-tree and other uſeful plants; thoſe trees yield good profit in pitch, tar, and turpentine: when this land is cleared, it produces for two or three years together tolerable crops of Indian corn and peas; and when it lies low, and is flooded, anſwers well for rice; but what is of greateſt advantage to this province is, that the worſt ſpecies of its land is favourable to a ſpecies of one of the kinds of indigo, the moſt valuable of all its products. There is another ſort of ground which lies low and wet on the banks of ſome of the rivers, and is in ſome places uſeleſs; but in others is far the richeſt of all their grounds, it conſiſting of a black fat earth that bears their great ſtaple rice, which requires a rich moiſt ſoil.

The country near the ſea, and at the mouths of the navigable rivers is much the worſt; for moſt of the land there is a pale, light, ſandy coloured ground; but the country on your advancing farther into it continually improves; and at a hundred miles diſtance from Charles Town, where it begins to grow hilly, the ſoil is extremely fertile, the air pure and wholeſome, and the ſummer heats much more temperate than in the flat country; for Carolina is for eighty miles from the ſea an even plain, in which is no hill, no rock, and ſcarce even a pebble to be found. Whence, from this ſameneſs, it muſt want the fine effect which its beautiful products would have by a more variegated and advantageous diſpoſition; but nothing can be imagined more delightful than the back country, and its fruitfulneſs is almoſt incredible. Wheat grows extremely well there, and yields a prodigious increaſe. In the other parts of Carolina they raiſe but little wheat, it being apt to mildew, and ſpend itſelf in ſtraw; evils which the planters take very little care to redreſs, as they turn their whole attention to the culture of rice, which is more profitable, and in which they are unrivalled, they being ſupplied with what wheat they want, in exchange for this grain from Penſylvania and New York.

The land in Carolina is every where eaſily cleared, as there are little or no under-wood. The foreſts moſtly conſiſt of large trees at a conſiderable diſtance from each other; ſo that they can clear in Carolina more land in a week, than they can do in the foreſts of Europe in a month. Their method is to cut them about a foot from the ground, and then ſaw them into boards, or convert them into heading, ſtaves, or other ſpecies of lumber, according to the nature of the wood, or the demands of the market. The roots ſoon decay, and before that happens, they find no inconvenience from them, where they have ſuch plenty of land.

In the two provinces of which Carolina is compoſed is ten navigable rivers, that have a very long courſe, and a great number of ſmaller ones that fall into them, all abounding in fiſh: but in moſt of the great rivers there are falls fifty or ſixty miles from the ſea, and as you approach their ſources theſe become more frequent.

We ſhall now, after dwelling ſo long on the ſoil, begin with the produce of this province, and firſt with the corn.

The wheat, particularly of North Carolina, is very good, and the flour extremely white; rye thrives very well, but they ſow very little of it; barley grows much better than might be expected from the manner in which it is managed here; oats alſo do very well, but the vaſt plenty of other grain prevents its being propagated in many places.

Here are ſeveral ſorts of rice, ſome bearded and others not, beſides the white and the red; but the white is the beſt. The rice of Carolina is eſteemed as good as any brought to Europe, and increaſes ſo prodigiouſly, that one

one meaſure ſown yields from eight hundred to a thouſand. It grows beſt in the wet and wild land, that has never been cultivated or broken up before. This anciently formed the ſtaple of this province; but while the rigour of the act of navigation obliged the planters to ſend all their rice directly to England, to be re-ſhipped for the markets of Spain and Portugal; the charges incident to this regulation lay ſo heavy upon the trade, that the cultivation of rice, eſpecially in time of war, when theſe charges were greatly increaſed by the riſe of the freight and inſurance, hardly anſwered the charges of the planter; but now the legiſlature permits the inhabitants of Carolina to ſend their rice directly to any place to the ſouthward of Cape Finiſterre; this has revived the rice-trade, and this branch alone of their commerce is at the loweſt eſtimation worth a hundred and fifty thouſand pounds ſterling a year.

Indian corn, or maize, proves a moſt uſeful grain in theſe parts, it being in great plenty all over the province. Millet alſo does very well here, eſpecially in light and looſe ground: they ſow it in April and May, and it proſpers beſt in moiſt and rainy weather; but the plenty of other grain prevents there being much of it ſown, it being only uſed in Carolina for fattening their poultry. Guinea wheat likewiſe thrives very well here, and ſerves for the ſame uſe as the former.

There are ſeveral ſorts of pulſe in this province, as the buſhel-bean, ſo called from one bean producing a buſhel; the miraculous-pea, which is ſo called from its long pods and prodigious increaſe; the bonavis, calivances, nanticoacs, and ſeveral other kinds, all of which are excellent food. There are likewiſe kidney-beans, and the large European bean; but this laſt degenerates: yet there are ſeveral ſorts of European peas, which come to as great perfection as in moſt parts of Europe.

Here are likewiſe a great variety of garden-roots, pot-herbs, and ſallads; with pompions, caſhaws, ſquaſhes, and many others.

Among the medicinal plants are aſarabacca, carduus benedictus, ipecacuhana, ſarſaparilla, baſtard china-root, and a great number of others: with the valuable indigo plant, and others uſed in dying.

The fields and woods are adorned like thoſe of Virginia, with a vaſt variety of flowers, among which are many of thoſe raiſed with great care in our gardens, and others peculiar to America.

The foreſt-trees are likewiſe very numerous; among theſe are many kinds of oak, the aſh, ſycamore, the elm, the beech, four ſorts of pine, the ſervice-tree, the maple, horn-beam, and the cypreſs. This laſt is not an evergreen in Carolina, the leaves turning red in winter, and not recovering their verdure till the ſpring. They are the talleſt and thickeſt of any trees in this part of the world, ſome of them being above thirty-ſix feet in circumference: the nuts they bear yield an odoriferous balſam uſed as a cure in all new green wounds, gonorrhœas, and old gleets; and, being drank with Alicant, ſtop all kinds of fluxes. The planters and Indians commonly make their periaguas and canoes of this wood, and ſome of theſe periaguas are ſo large that they will carry thirty or forty barrels of pitch or tar in them, though formed of one entire piece of timber. Of theſe trees are likewiſe made curious pleaſure boats.

Here are alſo in the foreſts the mulberry, the hickery, which is of the walnut kind, and is of three ſorts, the white, the red, and the flying-barked hickery, ſo called from its brittle and ſcaly bark; the black walnut-tree, the cheſnut-tree, the honey-tree, and the ſugar-tree.

The palmeto-tree, when at its full growth, is forty or fifty feet in height, and about two feet in diameter. The leaves grow only in great cluſters on the top, and are exactly in the form of a fan.

The ſweet gum-tree receives its name from a fragrant gum it yields in ſpring, by making an inciſion in the bark and wood. This gum is uſed internally as a ſovereign remedy for ſeveral internal diſorders, and outwardly for cutaneous complaints.

The black gum-tree bears a well-taſted black berry, and the white gum-tree has flowers in bunches, and its wood beautifully veined, whence ſeveral kinds of curious furniture are made of it.

The cedar-tree is here of two ſorts, the red and white. The red cedar is encompaſſed with a vaſt number of branches, which gradually ſhortening as they approach the top of the tree, form an exact pyramid. The leaves are ſmall and round, like thoſe of the pine, but ſhorter and not ſo ſharp-pointed; it bears berries all the year, which are ſweet and pleaſant to the taſte. Of this wood tables and other furniture are made, rooms are wainſcotted with it, and of it are made coffins for the dead. It is admired for its fragrant ſmell, and its durableneſs, for no worms will touch it.

The tulip-tree grows here to ſo large a ſize, that the trunk is ſometimes above twenty feet in circumference. Some of theſe trees bear white tulips, and others thoſe that are party-coloured. The wood makes handſome tables, &c.

The bay-tree, and the bay-tulip-tree, are beautiful ever-greens.

The ſaſſafras is very common, and the trunk is ſometimes two feet in diameter. The wood, which is light and durable, is, notwithſtanding its medicinal virtues, made into bowls, poſts, and other things made to ſtand in the ground.

The ſumach-tree grows about nine or ten feet high, with ſoft and hairy leaves, indented on the edges, and a red ridge running through the midſt of them. The flowers which come forth in July are of a greeniſh yellow, and grow with the leaves in long red ſtalks in cluſters, after which follow ſmall reddiſh ſeeds in bunches like grapes. This tree is of great uſe in Europe in dreſſing ſkins, and eſpecially Spaniſh leather.

Many of the fruits of Great Britain grow wild in the woods, and of theſe are all the kinds we have mentioned in treating of Virginia; with a number of other American fruits, of which we ſhall only mention the following:

The papau-tree is only about eight or ten inches in diameter, but has the broadeſt leaves of any of the trees in the woods of Carolina. It bears a fruit about the bigneſs of a hen's egg, which reſembles an apple, but contains a large ſtone within it. When it is ripe it is of a beautiful yellow, and as ſoft and ſweet as any fruit can be; of it the planters make puddings, tarts, and many other diſhes.

The Indian-fig, commonly called the prickly-pear, is an admirable plant, which grows in great plenty, and ſeems to be nothing but a multitude of leaves, or a tree made of leaves, without trunk or boughs; for a leaf ſet in the ground takes root and produces other leaves, growing one above another till they are pretty tall like a tree, the leaves ſpreading out like boughs. Theſe leaves are long, broad, thicker than a man's hand, of a deep green, and ſet full of long, ſharp, and ſlender prickles. From the tops of the leaves riſe long yellow flowers, reſembling thoſe of the pomegranate-tree, after which is produced a fruit which reſembles the common fig; but within is full of red pulp of a blood colour, very ſweet and luſcious, but occaſions ſuch a tincture in the urine of thoſe who eat it, that it ſeems like pure blood, and yet is perfectly innocent. The tops of theſe figs are encircled with ſcaly leaves like a crown, in which are contained ſmall grains that are the ſeeds, which being ſown bring forth plants with round bodies like the trunk of other trees, with the leaves growing on them like the former; but if theſe leaves are plucked off and planted in the ground, they bring forth trees of only leaves. Upon this plant grow certain excreſcences, from which are ſaid to proceed the cochineal inſect, ſo much valued for dying the richeſt ſcarlet.

SECT. VI.

Of the Cattle of Carolina, and the Manner in which they are managed by the Planters. Of the wild Beaſts, and Inſects. A Deſcription of ſeveral remarkable Birds; and of the Fiſhes on the Coaſt and in the Rivers.

HORNED cattle, horſes, and ſwine multiply ſurprizingly, there being as great numbers here of each ſpecies, as in any province poſſeſſed by the Engliſh in America. The veal is very good and white; but they gene-

generally preſerve their calves to a larger growth, and therefore kill few for the market. The planters make folds adjacent to their habitations, in which they milk their cows every morning and evening; after which they turn them into the woods, where they feed all day. When they return at night, they carefully ſhut up their calves with a few of the cows in thoſe folds, to protect them from the wolves, and other voracious wild beaſts. The calves generally ſuck the dams all the time they are milking, otherwiſe the cows would not ſuffer any one to touch them. Their method of killing the black cattle is generally to ſhoot them in the fields or in the folds; they then cut off the head and feet, and take out the entrails, which they throw away as uſeleſs, except the fat. If the cattle be ſuffered to live to a proper age, the beef proves as large and as fat as any in the neighbouring colonies. They kill a great number of horned cattle in October and the other cool months, eſpecially when they intend them for ſalting and exportation; for they are then in their prime of fleſh. The exportation of ſalt beef is one of the great branches of trade of North Carolina.

It is ſurpriſing that they have ſuch ſtocks of cattle, while there are ſuch numbers of wolves, tygers, and panthers; but theſe are far from being ſo ravenous as thoſe beaſts in Africa; and it muſt be obſerved, that they very ſeldom dare to attempt to kill either calves or foals, for fear of their dams, who vigorouſly defend them. When a cow ſees a wolf or any other ravenous beaſt near, ſhe gives a ſignal by bellowing, upon which all the black cattle within her hearing come to her aſſiſtance. There are great numbers of horned cattle and horſes that breed in the woods, and you may ſee great droves feeding promiſcuouſly in the ſavannas among the deer, fifty or ſixty miles diſtant from any habitation.

The horſes are well-ſhaped, ſwift, and generally about thirteen or fourteen hands high; they will travel incredible journies, though they are never ſhod, on account of the ſoftneſs of the ground, which is covered over with graſs without any gravel or ſtones, yet the planters generally uſe them very ill; and ſeldom allow them corn after long journies. They frequently tie them to a tree for hours together, and ſometimes for a day or two without thinking of giving them any ſubſiſtence, on which account they ſometimes break looſe, and run into the woods, where they remain for weeks together with the ſaddles on their backs. The horſes which they keep in the incloſures, and ſometimes feed with Indian corn, are very ſerviceable in journies and hunting.

When the planters hunt the wild horſes in the woods, they go two or three together on horſeback, and as ſoon as they eſpy a wild horſe, purſue him; and indeed their horſes are ſo well trained, that they will neither hurt themſelves nor their riders againſt a tree, and will go full ſpeed for hours together till the wild horſe ſtands ſtill, when one of the hunters alights, claps the bit into his mouth, and a ſaddle on his back, and rides him to his own, or the next plantation, where he is fed with Indian corn and ſalt, which in a little time renders him as tame as any in the plantation, and fit to purſue his wild ſpecies in the woods at the next hunting-match, or for any other uſe.

The ſheep have generally two or three lambs at a time, and are never ſuffered, like the other cattle, to ramble in the woods; but are kept in incloſures in the plantations, from whence they come every evening to the planters houſes, and at night are put into their folds to defend them from wild beaſts. The mutton is generally exceeding fat, and as well-reliſhed as any in Europe. Their wool is fine, and eſteemed a good commodity.

There are but few goats in Carolina, they being ſo miſchievous to gardens, orchards and other trees, that the planters are not fond of keeping many of them, though they are as fat, and their fleſh as well reliſhed as any in Europe.

The ſwine are exceeding numerous, and the pork is ſaid to excel in goodneſs any in Europe. The plenty of acorns, nuts, ſtrawberries, and other fruit with which the woods naturally abound, gives a moſt agreeable taſte to their fleſh. The planters export vaſt quantities of pork to the Weſt-Indies, and ſeveral other places where proviſions are ſcarce.

Among the wild beaſts are buffaloes, elks, ſtags, fallow-deer, bears, and jackalls, panthers, and tygers.

The American tyger is ſaid to be the fierceſt animal of this country; his ſkin is of a ſallow colour, moſt beautifully mottled with ſeveral kinds of ſpots, and larger than a greyhound. Theſe animals are large, ſtrong, and ſwift; they are never to be met with in the ſettlements; but more to the weſtward. The American tyger has a great reſemblance to a cat; the tail is very long, and ends in a point: its eyes are bright; and when hungry it will fear neither man nor beaſt.

The other animals are the mountain-cat, the wild cat, the pole-cat, the minx, the wolf, the racoon, the opoſſum, beavers, otters, rabbits, ſquirrels of ſeveral kinds, muſk-rats, &c. ſeveral kinds of mice, alligators, tortoiſes, or turtle, ſeveral ſorts of lizards, the rattle-ſnake, horn-ſnake, water-ſnake, and many others of the ſerpent kind.

Among the inſects are plenty of bees, not only in hives but in hollow trees in the woods, wherein are frequently found vaſt quantities of honey and wax.

The fire-fly lives in the open air, and is ſo called from its appearing at night, like a ſhining ſpark of fire. Theſe are as long as the drones among the bees, but much thicker, and of a browniſh colour. Their light is under their wings, and at firſt ſight appears frightful to ſtrangers, though they have no manner of harm in them. Dr. Brickell ſays, that he has frequently taken them, and breaking off their wings, placed them on a book in a dark room, and whatever way they went, he could plainly ſee the letters. They appear in May, and remain moſt part of the ſummer, when they are ſometimes ſo numerous that the woods ſeem covered with ſparks of fire. They are never ſeen in the day, but fly all night.

The ſpider is here a poiſonous inſect, which hurts by ſtinging. Of theſe there are many ſpecies; but the moſt remarkable is the mountain-ſpider, which is ſeldom found any-where but in the woods near the mountains. Several ſorts of theſe ſpiders make their webs ſo ſtrong, that they often entangle ſmall birds; thoſe perſons who have the misfortune to be ſtung by them are afflicted with different diſorders, according to the nature of ſpiders, that have communicated their poiſon. Some have violent pains at the heart; others ſhortneſs of breath; others trembling, cold ſweats, and vomiting; others laughing, ſinging, with a number of other ſymptoms that frequently end in death.

The birds of Carolina, are the bald, the black, and the grey eagle; the fiſhing-hawk, the ſparrow-hawk, the ring-tailed hawk, the goſs-hawk, and the herring-tailed hawk, ſo called from its beautiful forked tail; this laſt is alſo named the ſnake-hawk, from its feeding on ſnakes, it managing with great dexterity, the largeſt in theſe parts. It is of the ſize of a falcon, and is a much longer bird, of a fine aurora colour, with the pinions of the wings and end of the tail of a jet black. They never appear here but in ſummer, and are very familiar. They will fly for hours together near the place where the ſnakes are, till they have an opportunity of killing ſome of them. They ſeize it in their talons near the head, and fly and drag it ſome diſtance before they tear it in pieces, and then devour it. On account of their deſtroying theſe pernicious reptiles, the planters will not ſuffer them to be killed.

The parakeeto, or parakeet of this province, is a ſpecies of the parrot, generally about the ſize of a ſmall pigeon; it is for the moſt part of a fine green, only the head and part of the wings are of a beautiful orange colour, and they have thick beaks exactly reſembling thoſe of a hawk. They build their neſts in hollow trees, in low ſwampy ground; but never appear abroad in winter. They are very miſchievous to orchards, and peck the apples, to eat the kernels; they are very fat in mulberry and other fruit-time, and are excellent food, far preferable to any pigeon. They are often taken alive with traps, and bird-lime, and in two or three days become tame and familiar; but are not ſo apt to learn to ſpeak as a parrot.

There

There are here falcons, various ſorts of owls, the cuckow, the rail, jackdaw, wood-pecker, and magpye, rooks, crows, ſwallows, bats much larger than thoſe in Europe, martins, nightingales, wrens, larks, gold-finches, wood-peckers, and almoſt all the ſmall birds common in England.

There are great plenty of wild turkeys, ſome of which weigh about forty pounds. There are two ſorts of ſwans, the largeſt of which are called trumpeters, from the noiſe they make. They come in winter, and remain till February, in ſuch flocks that each ſide of the freſh water rivers and creeks ſeem at a diſtance like land covered with ſnow. About Chriſtmas they are frequently ſo fat as to be ſcarce able to fly; they are larger than thoſe in Europe, and very good meat. In ſpring they go to the northern lakes to breed. The ſecond ſort are called hoopers, from the noiſe they make. There are likewiſe three ſorts of wild ducks.

Here are pheaſants, woodcocks, ſnipes, curlew, the green plover, the grey, or whiſtling plover, partridges, turtle-doves, wild pigeons, the will-whillet, which is ſo called from its cry, and reſembles the curlew; the cat-bird, thus named from making a noiſe like a young cat. The mocking bird, which receive their name from imitating the notes of other birds, is one of the fineſt ſinging birds in the world. There are two ſorts of them, one has feathers much of the colour of our green plover, with white in the wings, like thoſe of a magpye. This has a more melodious and ſoft note than the other, and is generally of the ſize of our thruſh. They are fond of the dwellings of men, and frequently reſort thither; but though they are bold and briſk, yet they are of a tender conſtitution; for they neither ſing in winter, nor in the midſt of ſummer, and it is with great difficulty that any of them that are brought over, will live in England. They may be bred up tame, and will ſing in cages, yet the planters ſeldom take them, except it be to ſell to thoſe trading to Europe. They commonly make their neſts, and breed in orchards, and other places near the dwelling-houſes, feeding on mulberries, and ſeveral other berries and fruit. The other ſort is called the ground-mocking bird, and is of a light cinnamon colour; it ſings exceeding well; but does not reſort to the houſes, it delighting to live among the myrtle trees, where it breeds its young.

There are two ſorts of red-birds; the cocks of both are of a pure ſcarlet, and the hens of a duſky red; but one ſort has a fine tuft of ſcarlet feathers on the head, and the other has none. They have ſtrong and thick bills, and are near as large as our black-birds; they whiſtle and ſing like a thruſh, but more melodiouſly. They feed on Indian corn, and ſeveral ſorts of berries and ſeeds produced in the country, and, when taken, may be eaſily rendered tame; but it is ſaid that when they are ſhut up in cages for ſome years, they become milk-white, and ſo ſtupid that they ſcarce know how to feed themſelves, which is never known to happen while they are in the woods.

Here are alſo the fieldfare, the throſtle, the whipoo-will, ſo called from its frequently repeating thoſe words; the yellow-wing, whoſe wings reſemble gold; the crane, the ſtork, the king's-fiſher, the pelican, the cormorant, and many others.

Among the fiſh are ſeveral ſpecies of the whale, the porpoiſe, the ſword-fiſh, the ſhark, the pilot-fiſh, the devil-fiſh, ſo called from a large pair of horns, and being of a monſtrous ſize and ſtrength, the boneto, the drum-fiſh, of which there are two ſpecies, rock-fiſh, mullets, plaice, ſoals, ſhad, ſkate, thornbacks, eels of ſeveral ſorts, ſmelts, herrings, ſturgeon, trout, gudgeons, perch, carp, dace, &c. with many ſorts of ſhell-fiſh.

SECT. VII.

Of the Perſons, Manners, and Cuſtoms of the Inhabitants of Carolina; their Diſeaſes, Way of Life, Houſes, Diverſions, and Trade; their Method of preparing Indigo, Turpentine, Roſin, Pitch, and Tar; with the Goods they import from England.

THE deſcendants of the Europeans in Carolina are a ſtraight, tall, well-limbed, and active people, whoſe children are ſeldom troubled with rickets, or with the many other diſtempers with which the Europeans are afflicted. The men who frequent the woods, and labour out of doors, have a brown complexion; but as for the women, who do not expoſe themſelves to the weather, they are frequently very fair, and well-featured; they have bright ſparkling eyes, and are as finely ſhaped as any women in the world. Red-haired people of either ſex are ſeldom born in the country.

The women generally marry very young, ſome at thirteen or fourteen, and thoſe that continue unmarried till they are twenty, are reckoned old maids, which is here a very indifferent character. The women are very fruitful, moſt of the houſes having a number of ſmall children; and many women from other places, who have been long married without having the bleſſing of children, have ſoon after their removal to Carolina become joyful mothers. They ſeldom miſcarry, and have very eaſy labours.

The children at nine months old are generally able to walk and run about the houſe, and are as apt to learn as any children in Europe. The girls are, for the moſt part, handſome and well-featured; they are uſually more forward than the boys; and are not only bred to the needle and ſpinning, but to the dairy and domeſtic affairs, which many of them, though very young, manage with a great deal of prudence. Both ſexes are very dexterous in the management of the canoe, to which they are bred from their infancy.

The planters, from the richneſs of the ſoil, live in the moſt eaſy and pleaſant manner, and you ſhall ſeldom hear them repine at any misfortune, except the loſs of their friends, there being here plenty of all the neceſſaries of life. Poverty is here an entire ſtranger; the planters, who live well, are the moſt hoſpitable people that are to be met with, to all ſtrangers, to thoſe who by any misfortune have loſt the uſe of their limbs, or become unable to work, and to ſuch as have no viſible way to ſupport themſelves. To ſuch objects the country allows fifty pounds a year for their ſupport; ſo that there are no beggars or vagabonds in the country.

The men are very ingenious in building their canoes and houſes; but, for the moſt part, live in an indolent and luxurious manner, which occaſions many diſeaſes among them.

The principal diſeaſes are agues, the cachexy, the cramp, white and bloody-flux, the venereal diſeaſe, the yaws, which is of the venereal kind, ſaid to be brought here by the negroes from Guinea, and communicated to ſeveral of the Europeans, by cohabiting with the blacks, by which means it is hereditary in many families. The colic, or dry belly-ach, which is often attended with ſuch violent convulſions that the limbs, eſpecially the hands, are ſo contracted, that they have continued in this condition all their lives. The prickly heat, which ſometimes comes in the extremity of the hot weather that ſuddenly follows the cold, and is attended with extreme itchings all over the body, eſpecially the legs, which if ſcratched immediately become inflamed, and turn to ſores and ulcers.

The eſtabliſhed religion is that of the church of England; beſides which there are Preſbyterians, Baptiſts, and Roman-catholics, liberty of conſcience being fully allowed. Hence the planters live in the greateſt harmony imaginable; no diſputes now ever ariſe about their religious principles, they treat each other with friendſhip and hoſpitality: yet, with reſpect to morals, they have in other reſpects their ſhare of the corruptions of the age; for as they live in the greateſt eaſe and plenty, luxury of conſequence predominates, which is ſeldom without its attendant vices.

Their houſes are built after two different manners: the moſt ſubſtantial planters generally uſe brick and lime made of oyſter-ſhells, there being no ſtone fit for that purpoſe at a diſtance from the mountains. The meaner ſort erect theirs with timber, and the outſide with clap-boards. The roofs of both ſorts of houſes are covered with ſhingles. They have generally ſaſh windows, and large decent rooms, with good cloſets, and are fond of having a beautiful proſpect by ſome noble creek or river. Their furniture, as with us, conſiſts of tables, chairs, pewter, braſs, &c. imported from England; and thoſe in affluent circumſtances have tolerable quantities of plate, with other ornaments and valuable furniture.

The cloathing uſed by the men conſiſts of Engliſh cloth, druggets, durois, green linen, &c. The women have ſilks, calicoes, printed linen, calamancoes, and all kinds of ſtuffs, ſome of which are manufactured in the province.

Their diet, as with us, conſiſts of beef, mutton, pork, veniſon in abundance, wild and tame fowl, fiſh of ſeveral delicate ſorts, fruit, ſeveral kinds of ſallads, good bread, butter, milk, cheeſe, rice, and roots. Their liquors are principally rum, brandy, malt liquor, which they import, cyder, perſimon-beer, made of the fruit of that tree, and cedar-beer, made of cedar-berries; they alſo make beer of the green ſtalks of Indian corn; but the common table-beer is made of molaſſes. They alſo drink chocolate, tea, and coffee.

The principal diverſions are fiſhing, fowling, and hunting wild beaſts, as deer, bears, racoons, hares, wild turkeys, with ſeveral other animals. They are very fond of horſe-racing, which is performed in a very odd manner; for near each town, and in many parts of the country, they have what is called race-paths, which ſeldom exceed a quarter of a mile in length, and only two horſes ſtart at a time. They are alſo very fond of gaming, eſpecially cards and dice, at which they play very high. They greatly admire cock-fighting, and procure cocks from England and Ireland. They are alſo very fond of dancing, at which they will ſpend many hours together.

They have an annual feaſt at the wheat-harveſt, which is celebrated in the beginning of June, when the planters let each other know that they deſign to reap that grain on a certain day; ſome ſend their negroes to aſſiſt, and others go only to partake of the feaſt; and it is not unuſual for people to come twenty or thirty miles on this occaſion. The entertainments are grand, and the whole ſcene pleaſant and diverting. This annual revelling is very expenſive to the planters; but as it is cuſtomary few omit it, nor have they ever theſe public diverſions at reaping any other grain but the European wheat.

The produce of this country for exportation to Europe and the iſlands are rice, indigo, pitch, tar, turpentine, roſin, tobacco, peas, beef, pork, tallow, hides, deer-ſkins, furs, cotton, horſes, wheat, Indian corn, potatoes, honey, bees-wax, myrtle wax, ſeveral ſorts of gums, ſnake-root, maſts for ſhips, planks, and boards of moſt ſorts of timber.

We ſhall now give an account of the principal manufactures carried on in Carolina, and ſhall begin with indigo, a dye made from a plant of the ſame name, which was probably ſo called from India, where it was firſt cultivated, and from whence we had for a conſiderable time the whole of what was conſumed in Europe. This plant when grown reſembles the fern, and when young is hardly diſtinguiſhable from lucern-graſs. Indigo is generally planted after the firſt rains ſucceeding the vernal equinox; the ſeed is put into the ground in ſmall ſtraight trenches, about eighteen or twenty inches aſunder, and is fit for cutting the beginning of July. It is cut again towards the end of Auguſt, and if they have a mild autumn there is a third cutting at Michaelmas. The indigo land muſt be weeded every day, and the plants cleanſed from worms. Each acre yields ſixty or ſeventy pounds weight of indigo, which at a medium is worth fifty pounds.

The indigo when cut is firſt laid in a vat about twelve or fourteen feet long, and four deep, to the height of about fourteen inches, to macerate and digeſt. Then this veſſel, which is called the ſteeper, is filled with water: the whole having lain about twelve or ſixteen hours, according to the weather, begins to ferment, ſwell, riſe, and grow inſenſibly warm; at this time ſpars of wood are run acroſs to prevent its riſing too much, and a pin is then ſet to mark the higheſt point of its aſcent; when it falls below this mark they judge that the fermentation has attained its due pitch, and begins to abate; upon which the manager opens a cock, and lets off the water into another vat, which is called the beater; and the groſs matter that remains in the firſt vat is carried off to manure the ground.

When the water ſtrongly impregnated with the particles of the indigo has run into the ſecond vat, they agitate it till it heats, froths, ferments, and riſes above the rim of the veſſel in which it is contained: to allay this violent fermentation oil is thrown in as the froth riſes, which inſtantly ſinks it. When this beating has continued twenty, thirty, or thirty-five minutes, a ſmall muddy grain begins to be formed; for the ſalts and other particles of the plant before diſſolved in the water are now re-united, and begin to granulate. When this is compleated they let in ſome lime water from an adjacent veſſel, gently ſtirring the whole. The indigo now granulates more fully, the liquor aſſumes a purpliſh colour, and the whole is troubled and muddy; it is now ſuffered to ſettle; then the clearer part is permitted to run off into a ſucceſſion of veſſels, from whence the water is conveyed away as faſt as it clears at the top, till nothing remains but a thick mud, which is put into bags of coarſe linen. Theſe are hung up and left for ſome time, till the moiſture is drained off, and to finiſh the drying this mud is turned out of the bags, and worked upon boards of a porous timber with a wooden ſpatula. It is alſo frequently expoſed to the morning and evening ſun, but for a ſhort time only, and then put into boxes or frames, where it is again expoſed to the ſun in the ſame cautious manner, till with great labour and attention the operation is finiſhed, and that valuable drug called indigo fitted for the market. The greateſt ſkill and care is required in every part of the proceſs, without which there is great danger of ſpoiling the whole.

In all parts of Carolina, but eſpecially North Carolina, the people make great quantities of turpentine, roſin, tar, and pitch, which are all produced from the pine. Turpentine is drawn by merely cutting inciſions in the tree, forming ſeveral channels which meet at the bottom in a point, where a receiver is placed. Theſe channels are cut as high as a perſon can reach with an ax, and the bark is peeled off from thoſe parts of the trunk that are expoſed to the ſun, that its heat may the more eaſily force out the turpentine, which flows into the receiver. This turpentine being boiled in kettles becomes roſin.

Tar is made by preparing a circular floor of clay, declining towards the center, from which is laid ſloping a wooden pipe, which reaches about ten feet without the circumference. Under the end the earth is dug away, and barrels placed to receive the tar as it runs. Upon the floor is built a pile of dry pine wood ſplit in pieces, and ſurrounded with a wall of earth, or clay, which covers it all over, except a little at the top, where the fire is at firſt kindled. When the fire begins to burn they cover this opening likewiſe, to prevent there being any flame, and to leave only ſufficient heat to force the tar downwards into the pipe in the center of the floor. The heat they temper as they pleaſe by thruſting a ſtick through the earth and letting in the air, in as many places as they think proper. Pitch is made by boiling tar in large iron kettles ſet in furnaces, or by burning it in round clay holes made in the earth.

The commodities they receive from Europe, in exchange for all the above articles, are linens of all ſorts, particularly blues, brown and ſtamped linens, Oſnabrugs, men and women's apparel ready made, broad cloth, blue and red ſtuffs, calimancoes, druggets, kerſies, camblets, all light ſtuffs for men and women's ſummer wear, haberdaſhers goods, ſtockings of all ſorts, a few gloves, thin wigs, linen caps, tobacco-pipes, glaſs for ſaſh-windows, looking-glaſſes; all ſorts of hard-ware, as knives, forks, ſciſſars, ſaws, hatchets, chiſſels, bills, hoes, ſhovels, wedges, nails; and all manner of tools for carpenters, ſhoe-makers, and coopers; locks of many different kinds, traps of all ſorts, grindſtones; all manner of whetſtones, guns, powder, ball, ſhot, flints, paper, ink, ſaddles, bridles, fiſh-hooks of all ſorts, fans, necklaces, beads, ribbons, thimbles, ſhoe-buckles, buttons, &c.

SECT. VIII.

Of the Diviſions of Carolina, and its Towns; the public Roads; Regulations relating to Debtors, the tranſported Felons, and Slaves.

THIS province, as we have already obſerved, is divided into North and South Carolina; the former extends about three hundred miles along the ſea-coaſt,

and is ſeparated from South Carolina by an imaginary line drawn in the thirty-fourth degree from the Atlantic ocean to the Apalachian mountains. It is ſubdivided into fourteen townſhips. The principal rivers are Ronoac, or Albemarle river, the river Neuſe, and Clarendon river, upon which are ſeated the principal towns in the province, namely, Wilmington, on Clarendon river, which is the largeſt town in the province, and has much the greateſt trade; Neuborn on the Neuſe, and Edenton on the river Albemarle; at which three places the general aſſembly of North Carolina ſit alternately for making laws; but the planters being diſperſed over the country, none of theſe towns are worth mentioning. The number of inhabitants are computed to be about ſeventy thouſand whites, and twenty thouſand negroes.

The bounds of South Carolina are much reduced from their original extent, Georgia being taken off to the ſouthward, as far as the river Savanna, which runs in a curve round the ſouth and weſt part of the province, out of North Carolina. The extent of the province upon the Atlantic ocean to the eaſt is upwards of a hundred miles, and weſt from the ſea upwards of two hundred. There is no doubt but that the ſilk-worm might be employed here to great advantage, here being his natural food in great plenty: indeed ſome attempts that way have been made with good ſucceſs.

The only town in either of the Carolinas worthy of notice is Charles Town, one of the fineſt in North America for ſize, beauty, and trade. This is the metropolis of South Carolina: it is ſeated between two navigable rivers, Aſhley on the weſt and ſouth, and Cowper river on the eaſt, in the thirty-ſecond degree thirty minutes north latitude. The ſtreets are wide and ſtraight, interſecting each other at right angles; thoſe running eaſt and weſt extend about a mile from one river to the other. Its harbour is good in every reſpect but that of a bar, which hinders veſſels of more than two hundred tons burthen from entering. The town is regularly and pretty ſtrongly fortified by art and nature. Here are two very handſome churches built with brick, beſides ſeveral other edifices for public worſhip belonging to different ſects of diſſenters. Near the center of the town is a neat market-houſe, and at a ſmall diſtance is the ſtate-houſe, a handſome and commodious brick building. In the neighbourhood of the town are convenient barracks ſufficient for a thouſand men. Charles Town contains about a thouſand dwelling-houſes, four thouſand male inhabitants, and ſix thouſand negro ſlaves: it is the ſeat of the governor, and the place of meeting of the aſſembly. Several handſome equipages are kept here; for the planters and merchants are rich and well bred, the people expenſive in their dreſs and way of living, and every thing conſpires to render this the livelieſt and politeſt place in North America. However, great part of the town was burnt down on the twenty-firſt of February, 1741, by which much valuable merchandize was entirely deſtroyed. It has alſo frequently ſuffered by inundations and unhealthy ſeaſons.

The town of Beaufort is ſeated on the iſland of Port Royal, on the borders of Georgia, in the thirty-firſt degree forty minutes north latitude, and a hundred miles ſouth of Charles Town; the iſland and continent forming a fine capacious harbour of ſuch depth, that it is capable of containing the whole royal navy of England. The iſland on which the town is ſeated conſiſts of near a thouſand acres, and is navigable all round for boats and periaguas, and one-half of it for ſhipping, where large veſſels may load and unload from the ſhore. The town, however, is not yet conſiderable, but bids fair in time for becoming the firſt trading town in this part of America.

The number of inhabitants in the whole province of South Carolina amounts to about ſixty thouſand whites, and above double that number of blacks.

The roads are as good as in moſt parts of the world, and travelling as pleaſant, being made broad and convenient for all ſorts of carriages, as coaches, chaiſes, waggons, and carts, eſpecially for horſemen, the lands generally lying level, and the beautiful and delightful proſpects affording a high entertainment to the traveller. It is a general rule throughout all North America, that wherever you come to any of theſe roads, with the trees marked or notched on each ſide, it is a ſure ſign that it is a public road from one Chriſtian town to another.

We ſhall now give ſome account of ſeveral regulations relating to Carolina in general, and more particularly to North Carolina.

In this country few or no debtors are confined in priſon above twenty-four hours; for the ſheriff generally takes them home to his houſe, or takes their word for their appearance at the next court, to be held in any of the precincts or baronies, where they ſentence him to become a ſervant to the creditor for as long a time as they imagine the debt deſerves; but if the perſon has been a planter, and has contracted debts which his misfortunes have rendered him unable to pay, or is in years, they frequently make a collection among themſelves, by which means they diſcharge the debt, or ſatisfy the creditor; and by theſe means none are barbarouſly kept in confinement, and rendered a uſeleſs burthen to the public.

To prevent people's ſpending their time idly in a public-houſe, it is enacted by the laws of the country, that no perſon ſhall be liable to pay above forty ſhillings for liquor drank in any public-houſe.

No vagabond or inferior perſon is ſuffered to travel through the country without a paſs from the governor, or ſome of the juſtices of the peace; a regulation that is in ſome meaſure neceſſary, to prevent the tranſports from Europe running away from their maſters.

The convicts tranſported to theſe parts from Europe are indentured for a limited time, during which they ſerve as ſervants, and are more or leſs regarded according to their behaviour and the reaſon of their being tranſported. As ſoon as they have fulfilled the obligation of their indenture, their maſters are obliged to give each man-ſervant a new ſuit of cloaths, a gun, powder, ſhot, ball, and ten buſhels of Indian corn; and by the laws of the country they are intitled to fifty acres of land, which they ſeldom take up, but diſpoſe of for trifles. Thoſe who have acted with prudence, care, and good conduct while they were ſervants, if their maſters have no employment for them, recommend them to others. Their buſineſs is then to mark all the calves, foals, and young pigs with the planter's brand; and this being his chief buſineſs, he is allowed for his ſervice every ſeventh calf, every ſeventh foal, and half of the young pigs bred during his ſtewardſhip; and likewiſe the ſeventh part of all ſorts of grain and tobacco produced on the maſter's plantation; and whatever quantity of corn, rice, or tobacco he plants by his own induſtry at his leiſure hours, is all his own property. Thus, in three or four years time, with good management, he may have a ſufficient ſtock of cattle, grain, money, and all other neceſſaries to enable him to turn planter. But this is the caſe of very few of thoſe tranſported hither for their crimes, they being moſtly a diſſolute, debauched, and indolent people; and if they run away from their maſters, they are obliged to ſerve double the time they are abſent after the expiration of their indentures.

Few maſters of ſhips will venture to carry any on board their veſſels without obtaining a ſufficient ſecurity that they are freemen and not in debt, and therefore oblige them to publiſh an advertiſement, ſome time before their departure, requiring all perſons to whom they are indebted to come and receive what is due to them, which is fixed on the court-houſe door, for all perſons to peruſe; but if the maſter of a ſhip takes away a perſon bound, or in debt, without firſt taking theſe precautions, his perſon and ſhip are liable to be ſeized, and he is obliged to pay whatever the creditors can make appear to be due to them, or any other loſſes they have ſuſtained, by his taking them away. Notwithſtanding the ſeverity of theſe laws, ſome of the tranſports run away; but if they are taken they have neck-yokes put on them, like thoſe worn by the negroes, which they conſtantly wear till they have given ſufficient teſtimonies of their good behaviour.

There are a great number of negro ſlaves born in the country, who prove more induſtrious and tractable than thoſe brought from the coaſt of Africa; at leaſt being born in ſlavery, they have never imbibed that love of liberty which is apt to make men reſtive and ſtubborn under the galling yoke of oppreſſion. "I have frequently ſeen them whipped, ſays our author, to that degree, "that

" that large pieces of their ſkin have been hanging down " their backs ; yet I never obſerved one of them ſhed a " tear, which plainly ſhews them to be a people of very " harſh and ſtubborn diſpoſitions :" but might he not rather ſay, that it ſhews them to be poſſeſſed of invincible courage and magnanimity? The laws againſt theſe unhappy beings of our own ſpecies are extremely rigorous; ſo that if a negro cut or give the ſlighteſt wound to his maſter, or any other Chriſtian, with an unlawful weapon, as a ſword, ſcymetar, or even a knife, and there is blood ſhed, if it be known among the planters, they immediately meet and order him to be hanged, which is always performed by another negro ; and generally the planters bring moſt of their blacks with them to behold their fellow-negro die ; and it is not even in the power of the maſter to ſave him. Indeed he ſuffers nothing by the loſs of his ſlave, for the province is obliged to pay him the full value of what the unhappy wretch is judged to be worth.

There are ſome Chriſtians ſo charitable as to have the negroes born in the country baptized, and inſtructed in the Chriſtian faith in their infancy ; but this does not in the leaſt exempt them from ſervitude, and they are afterwards as far from being at their own liberty, as they would have been had they never been entitled to the name of Chriſtians ; nor does it appear that they afterwards take much care about their being an ornament to that profeſſion.

Their marriages are generally performed with little ceremony ; for the man makes the woman a preſent of a braſs ring, or ſome other toy, which if ſhe acccepts of, ſhe becomes his wife ; but upon any diſguſt, ſhe returns his preſent, and then the marriage is diſſolved. If after cohabiting with each other for a year or two, a woman has no children by the firſt huſband, the planters oblige them to take a ſecond, third, fourth, or fifth ; a fruitful woman being much valued by the planters. All the children go with the mother, and are the property of the planter to whom ſhe belongs.

Their children are carefully brought up, and provided for by the planters till they are able to work in the plantations, where they have convenient houſes built for them, and they are allowed to plant a ſufficient quantity of tobacco for their own uſe, a part of which they ſell ; and on Sundays they uſually gather the ſnake-root ; with this and the tobacco they buy hats and neceſſaries, as linen, bracelets, ribbons, and other toys for their wives and miſtreſſes.

The children of both ſexes wear little or no cloaths, except in the winter, and many of the young men and women work naked in the plantations in hot weather, except having a piece of cloth about their waiſt, and therefore the planters are at no great expence for their cloathing.

Several blacks born in the country can read and write ; others are bred to trades, and prove good artiſts ; and others are very induſtrious in improving the plantations, planting rice, corn, and tobacco, and making vaſt quantities of turpentine, tar, and pitch, they being better able to undergo fatigues, in the ſultry heats of ſummer, than the Europeans. The planters at their death uſed to make ſome of their negroes free ; but it is now an eſtabliſhed law in ſome of the provinces, that if they do not quit the country in about eleven days after they have thus obtained their freedom, they become the property of the firſt perſon who ſeizes them. Hence, before the expiration of that ſhort term, they generally either leave the country, or voluntarily become ſubject to a new maſter. But it would certainly be more conſiſtent with juſtice, with the laws of humanity, and with the ſpirit of the Chriſtian religion, to ſuffer theſe negroes, who have from their good behaviour, and the benevolence of their maſters, obtained their freedom, to become planters; to become united to the Chriſtians by the bands of friendſhip, and by mutual good offices; and to be allowed all the advantages of freemen. The proſpect of ſuch a reward might have a happy effect on the ſlaves, by making obedience and fidelity the guides to liberty, wealth, and honour; and the ſtrongeſt defence of the whites, by having a number of the blacks firmly united in the ſame intereſt with them.

SECT. IX.

A Conciſe Hiſtory of Carolina, and of its Settlement, and Progreſs.

THE extenſive territory of the two Carolinas and Georgia are a part of the diſcovery made by Cabot in 1497; but no advantage having been taken by the Engliſh in conſequence of this diſcovery, the Spaniards in 1512 attempted a ſettlement; but not ſucceeding, abandoned the country, which lay neglected by the Europeans. Chatillon, the celebrated leader of the Proteſtants in France, who was not only a great admiral, but an able ſtateſman, procured two veſſels to be fitted out for diſcoveries upon that coaſt ; probably intending to retire thither, with thoſe of his perſuaſion, ſhould his brave endeavours to preſerve their liberties fail. Theſe ſhips ſailed in the year 1565, under the command of M. Ribaut, and in two months arrived on the coaſt of Florida, as all this country was then called, from its abounding in flowers.

Ribaut landed in ſeveral places to the north of Altamaha river, taking poſſeſſion of the country in the name of his maſter, and calling it Carolina in honour of his ſovereign Charles IX. He at laſt ſettled at the mouth of Albemarle river, and giving the Indians to underſtand in the beſt manner he was able, that he and thoſe that were with him were all enemies to the Spaniards, this ſecured them a friendly reception, and the good offices of the inhabitants ; and he there erected a fort, to which he gave the name of Charles-fort. But ſoon after a civil war breaking out in France, he was obliged for the want of ſupplies, to abandon the ſettlement; and had he not been ſo happy as to meet with an Engliſh ſhip from which he procured proviſion, both he and his people would probably have periſhed by famine.

The admiral, not diſcouraged, was ſo well ſatisfied with the account they gave him of the country, that in 1564 he fitted out five or ſix ſhips, in order to make another attempt to ſettle a colony. This was accordingly done at the place of their landing in the firſt expedition. The Spaniards, who had intelligence of their proceedings, diſpatched a conſiderable force to attack the colony, who, not ſatisfied with reducing it, barbarouſly put all the people to the ſword, after having given them quarter. Not content with this they committed great outrages upon the natives, by both which they paved the way for the vengeance that ſoon after fell upon them for theſe unneceſſary and unprovoked acts of cruelty : for notwithſtanding the admiral and his party were by this time deſtroyed in the dreadful maſſacre of St. Bartholomew, and though the deſign of a colony died with him, one M. de Gorgues, a private gentleman, fitted out ſome ſhips, and ſailed to that coaſt merely to revenge the murder of his countrymen and friends. The Indians gladly embraced the opportunity of joining in the puniſhment of the common enemy. The French and they had laid ſiege to two or three forts the Spaniards had erected there, took them, and, without mercy, put the whole garriſon in each to the ſword. The adventurers, ſatisfied with this action, returned, and happily for us, the French court, blinded by their bigotry, did not underſtand the advantages that might have been obtained from giving America to the Proteſtants. Had they taken this ſtep, we ſhould probably have had either no ſettlements in America, or they muſt have been ſmall in extent, and precarious in their tenure.

After the French expedition, Carolina remained unnoticed by the Spaniards, French, and Engliſh, till Sir Walter Raleigh projected an eſtabliſhment there, which was afterwards fixed in Virginia, and it was not till the year 1663, that any ſettled reſolution was taken for fixing a colony here. In that year the earl of Clarendon lord high chancellor of England, the duke of Albemarle, the lord Craven, the lord Berkeley, lord Aſhley afterwards earl of Shafteſbury, Sir George Carteret, Sir William Berkeley, and Sir George Colleton, obtained a charter from king Charles II. for the property and juriſdiction of that country from the thirty-firſt degree of north latitude to the thirty-ſixth, and being inveſted with full power to ſettle and govern

govern the country, they had the model of a conſtitution framed, and a body of fundamental laws compiled by the celebrated Mr. Locke.

On this plan the lords proprietors themſelves ſtood in the place of the king, and gave their aſſent or diſſent, as they thought proper, to all laws, appointed all officers, and beſtowed all titles of dignity; and each lord in turn acted for the reſt. In the province they appointed two other branches, which in a great meaſure reſembled the legiſlature in England. They conſtituted three claſſes of nobility: the loweſt compoſed of thoſe to whom they had made grants of twelve thouſand acres of land, whom they ſtiled barons: the next order had twenty-four thouſand acres, or two baronies, with the title of caſſiques, who were to anſwer our earls: the third had two caſſiqueſhips, or forty-eight thouſand acres, and were called landgraves, a title analogous to a duke. This body formed the upper houſe. The lower houſe was formed as it is in the other colonies, of repreſentatives from the ſeveral counties and towns, and the whole was called not an aſſembly, but a parliament.

Their firſt ſettlement was at a point of land toward the ſouthward, between two navigable rivers, called Aſhly and Cowper rivers, where they laid the foundation of a city called Charles Town, the preſent capital of the province. They expended about twelve thouſand pounds in the firſt ſettlement; and the lords proprietors obſerving what advantages the other colonies derived from opening a harbour for refugees, and influenced by the humane diſpoſition of that excellent man who formed the model of their government, gave an unlimited toleration to the people of all religious perſuaſions. This induced a great number of diſſenters, whom the government, contrary to juſtice and all the laws of policy, treated with a very ſevere hand, to remove with their fortunes and families into Carolina; and hence they ſoon became, at leaſt, as numerous as the church-men. But they could not preſerve themſelves from the jealouſy and hatred of thoſe of the church of England, who had brought a perſecuting ſpirit with them from their native country, and having a majority in one of their aſſemblies, attempted to exclude all diſſenters from a right of ſitting there. This produced daily diſſenſions, tumults, and riots, which for many years hindered the colony from making that progreſs which might be expected from the fineneſs of the country. The people alſo fell into diſputes with the lords proprietors, and provoking the Indians by a ſeries of unjuſt and violent actions, gave occaſion to two wars, in which, however, they were victorious, and ſubdued almoſt all the Indian nations within their own bounds on this ſide the Apalachian mountains.

Theſe inteſtine diſtractions and wars kept the colony ſo low, that an act of parliament was made to prevent the ruinous conſequences of theſe diviſions by putting the province under the immediate care of the crown, and the lords proprietors accepted a recompence of about twenty-four thouſand pounds, both for the property and juriſdiction; except earl Grenville, who kept his eighth part of the property, which comprehends near half of North Carolina, on that part which borders on Virginia. Their conſtitution, where it differed from that of the other colonies, was altered; and the country, for the more commodious adminiſtration of affairs, was divided into two diſtinct independent governments, called North and South Carolina. This happened in 1728. Soon after a firm peace was eſtabliſhed with all the neighbouring Indian nations, the province began to breathe and obtain ſtrength on the return of peace and tranquility, and its trade has annually advanced ſince that time with a rapid progreſs.

SECT. X.

Of GEORGIA.

Its Situation, Extent, Climate, Produce, principal Towns, and Number of the Inhabitants.

GEORGIA received its name from his late majeſty George II. It lies to the ſouthward of Carolina, from which it is ſeparated on the north by the river Savanna; it has the Atlantic ocean on the eaſt; the river of St. John, which divides it from Eaſt Florida, on the ſouth; and on the weſt it is bounded by Louiſiana lately ceded by the French.

What has been ſaid of the heat, thunder, and lightning of Carolina, may be ſaid with propriety of them here, Georgia lying ſtill more to the ſouthward. The planters ſometimes ſuffer by thunder and lightning deſtroying their timber and houſes, and its killing their ſlaves and cattle.

The land lying low near the coaſt is woody, but at the diſtance of twenty-five miles begins to riſe into hills, which at length terminate in the Apalachian or Alegany mountains. From the foot of theſe mountains to the coaſt the country is level. The river Savanna is of ſuch a length, that canoes may ſail up it ſix hundred miles, and boats half that way. The coaſt of Georgia is defended from the fury of the Atlantic ocean by being lined all along with a range of iſlands, and both theſe and the continent being thick ſet with trees, render the intermediate channel very pleaſant. About ſeventy miles from the ſhore of Georgia are ſand-banks, and the water ſhoaling gradually till within ſix miles of land, the banks become ſo ſhallow as to be impaſſable, except in the channels between the bars, which were formerly thought a ſufficient ſecurity from any attempts of an enemy's fleet, till the Spaniards paſſed theſe channels in 1742, and landed in the iſland of St. Simon, which would have inevitably fallen into their hands, had not their ſcheme been fruſtrated by general Oglethorpe.

After paſſing the bars, ſhips find a ſecure and commodious harbour in the mouth of the river Savanna, and ſouth of it is a ſtill more capacious road, named Teky-Sund, where a large fleet may ride in between ten and fourteen fathom water, being land-locked, and having ſafe entrance over the bar. The flood-tide on this coaſt moſtly riſes ſeven feet.

This province abounds in cattle, and with a multitude of wild beaſts, birds, and poiſonous reptiles, which are in general the ſame as in Carolina.

Rice is ſaid to grow here rather better than in Carolina, which, with corn and indigo, may be eſteemed its principal commodities. They have made ſome beginnings towards cultivating the vine; and great expectations have been long raiſed, of their producing large quantities of ſilk; this was one of the principal views of the truſtees at the firſt ſettlement of this province; indeed both theſe branches may hereafter become conſiderable, the climate and ſoil being proper for them, as hath been ſufficiently proved by a variety of experiments.

The principal towns in Georgia are Savanna, the capital, ſeated in the thirty-firſt degree fifty-eight minutes north latitude. The houſes and ware-houſes are built at a diſtance from each other, to prevent the ſpreading of fire, and form ſeveral ſpacious ſquares and wide ſtreets. The town is extremely well ſituated for trade, as the navigation of the river Savanna on which it ſtands, and from which it takes its name, is very ſecure, and ſhips of three hundred tons burthen may lie within ſix yards of the town, where the worm does not eat into them. In the town is a church, a meeting-houſe, a wharf, and ſome other public buildings; and near it the orphan-houſe, founded by Mr. Whitfield, which is converted into a college for the education of young men for the miniſtry.

About four miles within land from the river are the villages of Highgate and Hampſtead, which lie about a mile diſtant from each other. The inhabitants ſettled there apply themſelves chiefly to gardening, and ſupply the town of Savanna with greens and roots.

Two hundred miles farther up the river, which is navigable ſo far for large boats, is Auguſta; which ſtands upon a ſpot of ground of the greateſt fertility, and is ſo commodiouſly ſeated for the Indian trade, that from the firſt eſtabliſhment of the colony it has been in a very flouriſhing condition, and very early maintained ſix hundred whites in that trade only: for their trade with the Creeks, the Chickeſaws, and the Cherokees is very conſiderable for ſkins: they alſo deal with them for a few furs; but theſe are of an inferior ſort; it being obſerved, that, by a wiſe diſpoſition of Providence, the animals

that bear fur have it more thick, and of a ſofter and finer kind, in proportion as you approach to the northward; for the greater the cold, the better they are cloathed.

The inhabitants of this province, who are a mixture of Epiſcopalians and Diſſenters, amount at preſent to about eight thouſand whites, and twenty thouſand negroes.

The governor is appointed by his majeſty, and the form of government is the ſame as in the other royal governments, and particularly the two Carolinas, Virginia, New Jerſey, and New York.

SECT. XI.

A Hiſtory of the Settlement of the Province of Georgia.

THE province of Georgia was divided from South Carolina and a ſettlement begun there in 1732, in conſequence of a repreſentation made to his late majeſty George II. by ſome generous and compaſſionate noblemen and gentlemen, who obſerving that a conſiderable number of people in theſe kingdoms were, by a variety of misfortunes, rendered incapable of ſubſiſting in ſuch a way as to be uſeful to themſelves and the community, formed the deſign of ſettling that part of America which properly formed our frontier towards the Spaniards and French; and though within the bounds of the province of South Carolina, was in reality no part of it, as not being at all ſettled, and therefore rather a burthen than an advantage to the province to which it belonged. They therefore applied to the crown for ſufficient power to ſet this undertaking on foot, and meeting with all the encouragement they could expect or deſire, eaſily obtained a very extenſive charter. Their next care was to raiſe a fund ſufficient to ſend over a conſiderable number of people, and provide them with all kinds of neceſſaries, towards which they ſubſcribed liberally themſelves, obtained conſiderable ſums by way of collection, and had a grant from the parliament of ten thouſand pounds.

In forming the plan of this frontier ſettlement, it was reſolved to conſider each ſettler in the double capacity of a planter and a ſoldier, and not only to provide them tools for the cultivation of the land, but arms for their defence, and to have them taught the uſe of both. It was alſo reſolved, that upon the firſt ſettling of their colony, towns ſhould be laid out, and lands allotted all the men for their ſupport, as near thoſe towns as poſſible. It was agreed that every lot of land ſhould conſiſt of fifty acres, and that it ſhould be granted them in tail male, as the propereſt tenure for the colony in its infancy; and, with reſpect to any hardſhips that might ariſe from this tenure, they determined to remedy them occaſionally, till ſuch time as the condition of the colony ſhould render an alteration neceſſary. They alſo reſolved to prohibit the uſe of negroes, which they conſidered as abſolutely inconſiſtent with the deſign of forming a frontier colony, and in many reſpects both inconvenient and dangerous.

Having concluded on theſe diſpoſitions, it was reſolved to ſend over a hundred and fourteen perſons, men, women, and children, out of ſuch as were in low circumſtances, and on that account unable to follow any buſineſs in England, and who if in debt had leave from their creditors to go; and of ſuch as were recommended by the miniſter, church-wardens, and overſeers of their reſpective pariſhes; and James Oglethorpe, Eſq; one of the truſtees, generouſly offered to go and form the ſettlement at his own expence. At length the people being examined whether any of them had any objections to the terms and conditions propoſed, they declared they were fully ſatisfied with them, and executed articles under their hands and ſeals, teſtifying their conſent. But four of them deſiring their daughters might inherit as well as their ſons, and that their widows dower might be conſidered, the truſtees reſolved, that all who ſhould deſire it ſhould have the privilege of naming a ſucceſſor to the lands granted them, who, in caſe the poſſeſſor ſhould die without iſſue male, ſhould hold the ſame to them and their heirs for ever; and that the widows ſhould have their thirds as in England; this reſolution was immediately communicated to all the people, who now expreſſed themſelves fully ſatisfied. The truſtees then prepared a form of government, and eſtabliſhed under their ſeal a court of judicature for trying cauſes, as well criminal as civil, in the town of Savanna, the name given to the firſt town to be raiſed: they alſo appointed a bailiff, a recorder, two conſtables, and two tythingmen out of ſuch of the ſettlers as appeared moſt diſcreet and prudent.

Mr. Oglethorpe ſet out from Graveſend with the colony, and arrived at Carolina on the fifteenth of January, 1733. That gentleman choſe a pleaſant, convenient, and healthful ſpot ten miles up the Savanna river. While the town was building he kept a ſtrict diſcipline, allowing none of the people to ſwear or get drunk; they were debarred the uſe of ſpirituous liquors, and inſtead of rum had Engliſh beer. In the mean time ſome of the land was ploughed up, and part of it ſowed with wheat. Two or three gardens were alſo ſowed with pot-herbs, &c. and fruit-trees planted. The limits of the town were paliſadoed, and every thing went on with the utmoſt regularity.

Things being in ſome forwardneſs, and every man being appointed his proper ſtation and employment, Mr. Oglethorpe went to Charles Town to ſolicit ſuccours for his colony, where both the aſſembly and people in general contributed largely to the aſſiſtance of the newcomers. Five hundred pounds of this money he laid out in cattle, and having given directions for whatever his people might want at Charles Town, returned to Savanna.

On his arrival he found that the chiefs of the Lower Creek Indians were come to treat of an alliance with the new colony. He received them in one of the new houſes, and in the moſt amicable and friendly manner concluded a treaty of alliance and trade with them.

This treaty being concluded, Mr. Oglethorpe returned to England, taking with him a number of the Indian chiefs and principal warriors, who were preſented to his majeſty, and afterwards took a tour through the kingdom. They here deſired the truſtees that the weights, meaſures, prices, and qualities of goods to be purchaſed by them with ſkins, might be ſettled: that no body might be allowed to trade with them without a licence from the truſtees, that if they were injured they might know where to complain; and that there might be but one ſtore-houſe in each Indian town for ſupplying them with the goods they might want to purchaſe; and that in each the traders ſhould be obliged to furniſh them at the fixed prices, alledging that the traders had often, in an arbitrary manner, raiſed the price of goods, and defrauded them in their weights and meaſures, which had frequently created animoſities between the Engliſh and Indians. In compliance with this requeſt the truſtees procured ſeveral acts of parliament, among which was one for maintaining peace with theſe Indians, and another to prevent the importation and uſe of ſpirituous liquors in Georgia.

Things being thus ſettled, two embarkations were made the ſame year, chiefly of Saltzburghers, who, with others that went before, built and ſettled a town called Ebenezer, upon the river Savanna. The next year the colony of South Carolina ſending over a memorial relating their danger from the French and Spaniards, the parliament granted the truſtees an extraordinary ſupply of twenty-ſix thouſand pounds, and very conſiderable benefactions were made both in Great Britain and Carolina; on which account great numbers of people were ſent, chiefly conſiſting of perſecuted German Proteſtants, and others from the north of Scotland.

Some Highlanders arrived in Georgia in 1735, ſettled on the river Alatamahar, about ſixeeen miles from the iſland of St. Simon, which is ſeated at the mouth of that river, and there built a town called Darien, which name they afterwards changed to that of New Inverneſs.

On the ſixth of February following arrived four hundred and ſeventy perſons, under the direction of Mr. Oglethorpe, and were ſettled upon the iſland of St. Simon, which is about forty miles in extent, has a rich and fruitful ſoil, and is full of oak and hickery trees, intermixed with meadows. The Creek Indians upon this occaſion came down, and claiming a right to the land, were treated with and prevailed upon to agree, that the

Engliſh

Engliſh ſhould poſſeſs it, and all the adjacent iſlands; which ſtep being taken, the Engliſh built there the town of Frederica, ſo called from prince Frederic, his preſent majeſty's father. And this being then the ſouthern barrier, a regular fortreſs was built there, ſtrengthened with four baſtions and a ſtrong battery; other fortifications were alſo raiſed in different places. The colony now became ſo conſiderable, as to excite the jealouſy of the Spaniards. However, the governor of St. Auguſtine concluded an amicable agreement with Mr. Oglethorpe and the Engliſh colony, upon very ſafe and advantageous terms; but it ſoon appeared that this governor was not in the ſecret of the court of Spain; for the Spaniſh miniſtry diſapproved of the treaty, and prepared to attack Georgia; on which a regiment of ſix hundred men was ſent over for the defence and protection of the place, and as an encouragement to theſe ſoldiers the truſtees allowed each of them five acres of land, and after being ſeven years in the ſervice they ſhould have a regular diſcharge, and be entitled to a grant of twenty acres.

In the beginning of the year 1737, the parliament granted the truſtees twenty thouſand pounds more for the farther ſettling and ſecuring the colony, on which the truſtees made another embarkation of perſecuted German Proteſtants, and all the towns laid out in Georgia received great ſupplies.

In the mean time the truſtees, by their letters and inſtructions to the magiſtrates, had conſtantly exhorted and encouraged the people to cultivate their lands; but in 1738, finding that many continued in idleneſs, they gave orders that none who neglected to cultivate their lands ſhould receive ſupplies from the ſtores. Soon after a part of the people ſent over a memorial, complaining of the want of a fee ſimple in their lands, and of their not being permitted the uſe of negroes. But thoſe who were ſettled on the frontier, and were conſequently moſt expoſed to the Spaniards, having by their induſtry improved their plantations ſo as to draw from them a comfortable ſubſiſtence, ſent over a counter memorial, in which they repreſented the diſadvantages and dangers that would ariſe from the permiſſion of negroes. However, an almoſt general ſpirit of diſcontent ſoon prevailed; and tho' ſuch great ſums had been expended, and ſuch prudent regulations taken in the ſettlement of this colony, its progreſs was far from anſwering the expectations of the truſtees and merchants. The prohibition of rum, tho' ſpecious in appearance, had a very bad effect, the ſettlers wanting ſomething to ſupport their ſtrength and ſpirits under the extraordinary and unuſual heat of the climate, and where its dampneſs in ſeveral places expoſed them to agues and fevers. But what was worſe, this prohibition in a manner deprived them of the vent they had for the only commodities they could ſend to market, lumber and corn, which could ſell no where but in the ſugar iſlands; and with this reſtriction of rum they could take very little from them in return. They were obliged to work themſelves, while the natives of Virginia and Carolina were in a much eaſier ſituation, and had their labour performed by their ſlaves. Indeed Virginia and Carolina were originally ſettled without the help of negroes; but this they did not conſider, and they were unwilling to ſubmit to extraordinary hardſhips, while they found their neighbours in a much more eaſy ſituation. Many quitted the laborious life of planters to reſide more at their eaſe at Savanna, by the exerciſe of their ſeveral trades and profeſſions. In ſhort, horſe-races and other diverſions were ſoon ſet on foot, and ſuch a ſpirit of idleneſs began to prevail as eaſily accounted for their eagerneſs in deſiring the uſe of negroes.

At length a ſpirit of diſcontent almoſt generally prevailed; they quarrelled with one another and with their magiſtrates; they complained; they remonſtrated; and obtaining no ſatisfaction, many of them left Georgia, and diſperſed themſelves among the other colonies; ſo that of above two thouſand people, who had been carried thither at a great expence from Europe, in a little time 'tis ſaid that not above ſeven or eight hundred were to be found in this province: upon which the truſtees, in 1752, ſurrendered their charter to the crown, and the government took the country under their own care; annulled all the particular regulations that had been made; allowed them the unlimited uſe of negroes, with the importation of rum, and left Georgia exactly on the ſame footing with Carolina; ſince which time it has been gradually, but ſlowly, encreaſing in the number of its inhabitants.

SECT. XII.

Of FLORIDA.

Its Situation, Extent, Climate, Soil, and Produce; with a particular Deſcription of the Cabbage-tree, and a conciſe Account of the tame and wild Animals.

THE country to which the Spaniards have given the name of Florida, and which, by the late treaty, was ceded to Great Britain, was firſt diſcovered by Sebaſtian Cabot, in 1496, eighteen years before it was known to the Spaniards. That nation gave it a very great extent, including under the name of Florida all the country from the twenty-fifth degree ſix minutes to the thirty-ninth degree thirty-eight minutes north latitude, including Virginia, Carolina, and Georgia; but what is properly called the peninſula of Florida is bounded by Georgia on the north, by the Miſſiſſippi and the gulph of Mexico on the weſt, by that of Florida on the ſouth, and by the channel of Bahama and the Atlantic ocean on the eaſt; extending from Georgia to Cape Florida, between the twenty-fifth degree ſix minutes and the thirtieth degree fifty-eight minutes north latitude, and its moſt eaſtern coaſt lies in about the eighty-firſt degree thirty minutes weſt longitude from London.

The air, though hot, is pure and wholeſome, and the ſoil remarkably rich and fruitful, frequently producing two or three crops of Indian corn in a year, and, with proper cultivation, might be made to bear every ſort of grain, &c. It abounds with all kinds of timber, particularly oak, cypreſs, palms, cedar, pines, and cheſnut-trees; but above all ſaſſafras is found in the greateſt plenty: excellent limes, mulberries, oranges, peaches, cocoas, and plums, alſo grow here in great abundance, with many other fruits of a delicious flavour; olives and vines likewiſe of various ſorts are the natural produce of the country, and the land is thought to be as proper for the cultivation of the grape as the warm countries of Europe. Cotton alſo grows wild here in great abundance; hemp and flax are alſo very common.

One of the moſt ſingular trees in this or any other country is the cabbage-tree, by ſome authors called the palmeto royal; "and well, ſays the reverend and learned "Mr. Hughes, may it be called royal, from its great "height, majeſtic appearance, and beauty of its waving "foliage: neither the tall cedar of Lebanon, nor any of "the trees of the foreſt, are equal to it in height, beauty, "and proportion." The trunk bulges out a little near the ground, which gives it the becoming appearance of a ſubſtantial baſis to ſupport its towering height. It is generally as ſtraight as an arrow; and ſcarce can a pillar of the niceſt order in architecture be more regular, eſpecially when it is of about thirty years growth. It riſes above a hundred feet in height, and the trunk near the earth is then about ſix or ſeven feet in circumference, the whole body growing tapering to the top. The colour of the bark reſembles that of an aſh-tree, and is faintly clouded at about the diſtance of every four or five inches with the veſtigia of the fallen-off branches: this colour of the bark continues till within about twenty-five or thirty feet of the extremity, where it alters at once from an aſh-colour to a beautiful deep ſea-green, and thus continues to the top. About five feet above the beginning of the green part, the trunk is encircled with its numerous branches; all the lowermoſt ſpreading horizontally with great regularity, and the extremeties of many of the higher branches bend wavering downwards, like ſo many plumes of feathers. Theſe branches, when full grown, are about twenty feet long, and are thick ſet on the trunk, riſing gradually ſuperior one to another, and the top is terminated by a beautiful upright green conic ſpire. Theſe branches are decorated with a very great number of green pointed leaves, ſome of them near three feet long, and an inch and a half broad, growing narrower towards their points, as well as gradually decreaſing

creaſing in length towards the extremities of the branches. It is obſerved that the lowermoſt branch drops monthly from the tree, carrying with it an exfoliated circular lamen of the green part of the tree from the ſetting on of the branches to the aſh-colour part. This, and the branch to which it is always fixed, fall together. When the loſs of this lower branch happens, the green conic ſpire, which iſſues from the center of the uppermoſt branches, and riſes ſuperior to all, burſts, and throws from its ſide a young branch, which continues the uppermoſt, till another of the lowermoſt branches drops off: then the ſpire ſends forth again another branch ſuperior in ſituation to the laſt. Thus the loſs of the branches below is ſupplied by thoſe above.

The inſide texture of the leaves appears to be ſo many longitudinal thread-like filaments, which, being ſpun, are uſed in making cordage of every kind, as well as fiſhing-nets. What is called the cabbage lies in many thin, white, brittle flakes, which have ſomething of the taſte of almonds, and when boiled has ſomewhat the taſte of a cabbage; but is ſweeter and more agreeable.

The ſea-coaſt is very flat, ſandy, and full of ſhoals; and on the level ſhore are a prodigious number of oyſters adhering to the mangrove trees, with which the ſouthern coaſt is covered. Among the more precious productions may be reckoned cochineal, of which there is both the wild and the cultivated; but the latter is by far the moſt valuable. The indigo plant grows very plentifully in many of the ſouthern parts of the province. Ambergriſe is likewiſe frequently to be met with on the coaſt, from the moſt ſouthern cape of Florida as far as Mexico.

Animal food is here in great plenty, and very good in its kind, particularly beef, veal, and mutton. The country alſo feeds a multitude of ſwine, the fleſh of which is very good, there being no want of acorns, cheſnuts, and ſuch food as is proper for their nouriſhment. Horſes are alſo bred here fit for the ſaddle and draught, and ſo cheap, that they may be purchaſed for any trifle brought from Europe.

The wild beaſts found in the country are the panther, bear, catamountain, buffalo, deer, hare, goats, rabbits, beavers, otters, foxes, racoons, flying ſquirrels, the armadillo, warre, opoſſum, guano, and ſeveral kinds of ſnakes.

Fowl are here in great plenty, as cranes, wild geeſe and ducks, herons, turtle-doves, partridges, thruſhes, jays, hawks, and crows; the curoſoe, the maccaw, the humming-bird, and an almoſt infinite number of others, ſome of which have their plumage elegantly variegated. The rivers abound with fiſh, and alſo with that deſtructive animal the alligator.

SECT. XIII.

Eaſt and Weſt Florida ſeparately conſidered. The Situation, Advantages, and Diſadvantages of each.

THE country of Florida is now divided into two diſtinct governments, under the names of Eaſt and Weſt Florida, and we ſhall begin with the former, on account of its being contiguous to Georgia.

Eaſt Florida is bounded on the north by Georgia, from which it is ſeparated by the river St. John; on the eaſt by the Atlantic ocean and the gulph of Florida, which laſt ſeparates it from the Bahama iſlands; on the ſouth by the gulph of Florida, which there ſeparates it from the iſland of Cuba; and on the weſt by the gulph of Mexico and Weſt Florida.

The eaſtern and ſouthern part of Eaſt Florida conſiſts of about twenty-four iſlands of pretty large extent, and a ſtill greater number of ſmaller ones, all formed by narrow ſtreights and bays, which run in from the weſt and join others from the ſouth and the eaſt. Theſe ſtreights are improperly called rios, or rivers. One of the principal of the bays is named Laguna del Eſpiritu Santo, or the lake of the Holy Ghoſt, which extends from north to ſouth about twenty-ſeven leagues, and is near eight leagues wide: it has ſeveral communications with the bays on the weſt ſide of the peninſula, as well as with the gulph of Florida.

Bahia de Carlos, or Charles's-bay, is ſeated on the weſt coaſt, extending about fourteen leagues almoſt ſouth-eaſt from its entrance, and is about five leagues over in the broadeſt part; but has only three fathoms water. It has ſeveral openings between the iſlands, the chief of which communicates with the Laguna del Eſpiritu Santo, juſt deſcribed.

The Bahia del Eſpiritu Santo is about four leagues to the north-eaſt of the Bahia de Carlos, on the weſtern coaſt, and is a large and noble bay extending above twenty leagues in length, and ſix in breadth, where broadeſt, having from five to ſeven fathoms water, except at the outlet that goes into the Laguna del Eſpiritu Santo, where it is no more than two fathoms. This bay, which lies from ſouth to eaſt, is in about twenty-ſeven degrees thirty minutes north latitude, and is capable of receiving the largeſt fleet that ever was collected in this part of the world; and may, in caſe of any rupture, be of great importance to the crown of Great Britain; for the galleons in their paſſage from Vera Cruz to the Havanna, are obliged, by reaſon of their north-eaſt trade-winds, to ſtretch away to the northward, and generally keep as near the coaſt of Florida as poſſible.

On the ſouth-eaſt of Florida is a large chain of iſlands and rocks, called Cayos de los Martyres, which extend in a circular form, in twenty-four degrees forty minutes north latitude, at the diſtance of thirteen leagues from Punta Florida, the moſt ſouthern point. In 1733 a fleet of fourteen galleons, on their return through the gulph of Florida for Old Spain, ran foul of theſe rocks, occaſioned by the ignorance of the admiral, Don Roderigo de Torres. One of the captains diſobeying the admiral's ſignals, by that means avoided the danger, and ſaved his ſhip; but the other thirteen were entirely loſt, with great part of their treaſure: and for many years after theſe rocks were much frequented by the Spaniſh and Indian divers, who were often ſo ſucceſsful as to recover great quantities of dollars.

The ſoil of Eaſt Florida in general is not ſo good as that in Georgia; but the north part of it adjacent to Georgia is much like it, and may be improved to the ſame purpoſes as Georgia, for raiſing of corn, rice, indigo, and ſilk; and in the weſt part of this province is ſome very good land, capable of being improved to great advantage. However, great part of the coaſt, both of the continent and the prodigious cluſter of iſlands included in Eaſt Florida, is very ſandy and barren; but farther within land it is ſaid to be very fertile.

There are ſome good ſettlements begun in this province under the direction of colonel Grant, the preſent governor: there is a proſpect of its ſoon becoming a flouriſhing province, and as inhabitants are at this time flocking to it from ſeveral countries in Europe, it will doubtleſs be in a ſhort time a place of conſiderable conſequence.

St. Auguſtine, the principal town in this province, is ſeated near the borders of Georgia, in the twenty-ninth degree fifty minutes north latitude, and was built by the Spaniards, who ſurrendered it at the late peace. The city runs along the ſhore at the foot of a pleaſant hill, adorned with trees, and is of an oblong form, divided by four regular ſtreets, croſſing each other at right angles. Down by the ſea-ſide, about three quarters of a mile ſouth of the town, ſtands the church and monaſtery of St. Auguſtine. The beſt built part of the town is on the north ſide leading to the caſtle, which is called Fort St. John. This is a ſquare building of ſoft ſtone, fortified with whole baſtions, a rampart twenty feet high, with a parapet nine feet thick, and is cazemated. The town is likewiſe fortified with baſtions, and incloſed with a ditch: the whole well furniſhed with cannon. The harbour is formed by the north end of Santa Anaſtaſia, an iſland nine leagues in length, and a long point of land divided from the continent by the river St. Mark, which falls into the ſea a little above the caſtle. At the entrance of this harbour are the north and ſouth breakers, which form two channels, whoſe bars have from eight to nine feet water over them at low tide. On the north and ſouth are two Indian towns without the city walls.

The exports at preſent from Eaſt Florida are but ſmall, the produce of their trade with the Indians being the chief

chief they have to ſpare; for as the country was four years ago almoſt entirely uncultivated, and there are but few inhabitants, no great improvements can yet be expected.

Weſt Florida is bounded on the eaſtward by Eaſt Florida, on the ſouth by the gulph of Mexico, on the weſt by the river Miſſiſſippi, and on the north by the country of the Chicketaws; and is a narrow ſlip extending from eaſt to weſt along the coaſt of the bay of Mexico. It was ſeized upon by the French, who begun a ſettlement at Penſacola in 1720, and enjoyed it till the treaty of Fontainbleau in 1763, when it was ceded to his Britannic majeſty, who formed it into a diſtinct government.

Captain Robinſon, who took a view of this country ſo lately as the year 1763, ſays, "the country all round is "wonderfully delightful and fertile, and about Penſa- "cola abounds with various herbs, ſhrubs, evergreens, "and meadows well ſtocked with cattle. From Penſa- "cola, he adds, I coaſted eaſtward for two hundred miles, "in a brigantine, to St. Mark d' Apalaché, ſcarcely ever "loſing ſight of land. We were becalmed ſo cloſe to "the ſhore as to be able to pitch a biſcuit upon it, near "forty miles eaſt of Penſacola, the firmament being "very ſerene. In this ſtate I ſtood contemplating on the "rich and bountiful hand of nature: looking which "way I pleaſed, I was equally attracted with a view of "the moſt raviſhing proſpects. The ſhore level, riſing "gradually into eminences, cloathed with the fineſt "verdure and ſpontaneous productions, interſperſed pro- "miſcuouſly, as mulberries, cedar, coco, vanilla, moho, "cabbage-trees, &c. the laſt towering their round tops "above the reſt, as if conſcious of their ſovereign dignity. "About ſixty miles farther eaſt we were again impeded "in our voyage by the ſame cauſe, cloſe to the pleaſant "little town of Santa Joſeph. We made no ſtay here, "by reaſon the wind was up very ſoon, but the face of "the country is as before deſcribed, only a few miles "round St. Joſeph it is ſomewhat more mountainous. "Soon after we arrived at St. Mark d' Apalaché, the "ſecond town in Florida, on the northern extreme of "Apalachy-bay. In ſailing along to the above place, "the coaſt was much the ſame as already mentioned. "This town is exceedingly beautiful and pleaſant, "ſtanding on the ſlope of a hill, and tolerably regular "built of ſtone, except ſome few baracas. Here are "two convents, one of Jeſuits, and the other of Fran- "ciſcans: the exterior parts of the town are fortified in "the Spaniſh mode, rather as a defence, I ſuppoſe, a- "gainſt the natives, than the Europeans. From the "excellent and central poſition of this fine port, it car- "ries on a good trade in its own river, and the interior "parts as far as the Apalachian mountains. It is looked "upon to carry on more commerce than all the other "ſettlements in Florida put together.

"Curioſity induced me one day to take a journey of "eight or nine miles into the country. I found abun- "dance of extreme fine mulberry-trees, larger than any "I ever ſaw in Italy: the leaves are well known to be "the food of the ſilk-worm, the climate and all other "neceſſaries being adapted for their nouriſhment: never- "theleſs, it remained unregarded by the Spaniards, "though it has produced, ten years ago, ſilk as good "as any in Europe. On my return to the town of St. "Mark d' Apalaché, I met with exquiſite grapes inter- "ſperſed up and down, exceeding the muſcadine in "bulk, and with ſomething of their flavour."

There are at preſent in this province about ſix thouſand inhabitants; but their number is increaſing very faſt, it being more healthy and inviting than Eaſt Florida, eſpecially in the weſtern parts near the bank of the Miſſiſſippi; and it is not to be doubted but that in a few years this will be a rich and flouriſhing province.

The principal town in Weſt Florida is Penſacola juſt mentioned, ſeated on the iſland of Santa Roſa, which is thirty-three miles in length, and ſeparated from the main land by a channel half a league over, but only navigable for ſmall boats. The landing-place is within the bay in very ſhallow water, the town being ſeated on a ſandy ſhore as white as ſnow, that can only be approached by ſmall veſſels. The road is, however, one of the beſt in all the gulph of Mexico, in which veſſels may lie in ſafety againſt every kind of wind. The bottom affords excellent anchorage; and the ſea, which is never agitated, on account of its being ſurrounded by the land on every ſide, is capable of containing a great number of ſhips. Penſacola was lately defended by a ſmall fort ſurrounded by ſtoccadoes, and the principal houſe is the governor's, which is a very handſome building, adorned with turrets on the top. As many of the French who inhabited this town before the treaty have choſen to become Britiſh ſubjects for the ſake of keeping their eſtates, this will contribute to the ſpeedy peopling this province, where there are ſeveral other ſmall towns; the inhabitants already carry on a conſiderable trade with the Indians, and export great quantities of ſkins; the French inhabitants alſo raiſe a great deal of rice.

SECT. XIV.

The Perſons, Dreſs, Manners, and Cuſtoms of the Indians of Florida.

THE Indians of Florida are of an olive complexion; their bodies are robuſt, and finely proportioned; but both ſexes go naked, except having a deer ſkin round their waiſt. They ſtain their ſkin with the juice of plants; and have black and long hair, which they have a method of twiſting and binding upon the head ſo as to render it very becoming. The women, who are handſome and well ſhaped, are ſo active that they will climb with ſurprizing ſwiftneſs to the tops of the higheſt trees, and ſwim acroſs broad rivers with their children on their backs. The men make uſe of bows and arrows, which they manage with great dexterity; the ſtrings of their bows are made of the ſinews of ſtags, and they arm the end of their arrows with ſharp ſtones or the teeth of fiſhes.

With reſpect to their religion, they worſhip the ſun and moon, and have an extreme averſion to all Chriſtians, which is the leſs to be wondered at, as the horrid cruelties exerciſed by the Spaniards on the natives of the adjacent iſland of Cuba, and other places, could not fail of exciting the utmoſt abhorrence and dread in their minds. The Spaniards, according to their uſual cuſtom, charge them with many vices, in order to caſt as fair a colour as they can over their inhuman behaviour to the Indians, both of this and other countries, whom they firſt butchered, and then repreſented as ſavage barbarians, in order to palliate the crime, and in ſome degree apologize for ſuch cruel proceedings.

Their œconomy, with regard to the management and diſtribution of their corn, which is accounted the common ſtock of the public, is worthy of notice. The crop, which is calculated to ſerve only half the year, is collected into granaries appointed for that purpoſe, and afterwards regularly delivered out to every family, in proportion to the number of perſons it contains. The ſoil is indeed capable of affording much more corn than they are able to conſume, but they chooſe to ſow no more than will ſerve them for that term, retiring for the remainder of the year into the deep receſſes of the foreſts, where they build huts of palm-trees, and live upon roots, wild-fowl, and fiſh. They are alſo very fond of the fleſh of alligators, the young of which are delicious, but have a ſtrong muſky ſmell. Their meat is dreſſed in the ſmoke upon a gridiron made of ſticks, and water ſerves them for their common drink.

The people are in general ſatisfied with one wife; but the chiefs are indulged with more, though the children of only one of them ſucceed to the father's dignity.

The government of the Floridans is in the hands of many chiefs, who are called caſſiques: they are generally at variance and at war with each other; but this is far from being carried on in an open manner; on the contrary, they uſually make uſe of ſurprize, or ſtratagem, exerciſing great cruelty upon ſuch as they take priſoners, yet ſpare the women and children, whom they carry off and ſettle among them. When they have obtained a victory, they at their return home aſſemble all their friends, and feaſt three days and nights, ſpending the time in ſinging and dancing. In their war-like expeditions they carry with them honey and maize, and ſome-

times

times fish dried in the sun. The chief marches at their head, carrying a club in one hand and a bow and arrows in the other; his quiver hangs at his back, and the rest follow tumultuously with the same arms. They make their attacks with a horrible noise, not unlike the war-whoop of the Indians of the Six Nations.

They, however, attempt nothing rashly; but previously hold a consultation, having a sort of council, which consists of twelve or fourteen chosen members, who have remarkably distinguished themselves by their bravery in war, and have a considerable influence upon that account. They assemble daily at the hut of the chief, who has a higher seat than the rest, entering according to seniority, and with their hands thrown above their heads each sing their *Ha he ya*, while the rest join with *Ha ha*; after which they all take their seats. If the matter in debate be of great moment, their priests, who are also a kind of conjurers and physicians, with all who are distinguished by their great age, are called in, and their opinions particularly asked. Then the cassique carries round a kind of liquor like our tea, made by the infusion of the leaves of a certain tree.

The burial of a deceased cassique is celebrated among them with great solemnity: they place upon his tomb the bowl out of which he was accustomed to drink, and stick innumerable arrows in the earth around him, bewailing his death for three days with fasting and loud lamentations: the generality of them also cut off their hair, as a singular testimony of their sorrow. Their chieftains also set fire to and consume all the arms and household-furniture, together with the hut that belonged to the deceased; after which some old women are deputed, who every day, during the space of half a year, at morning, noon, and evening, bewail him with dreadful howlings: a custom that has been formerly practised among some of the most civilized nations, particularly among the Romans, who frequently hired women to weep at the funerals of their friends and relations.

SECT. XV.

Of the Country in the back Settlements on the Banks of the Mississippi, the Misauris, and the Ohio.

THE river Mississippi rises on the southermost part of the Central Mountains already described, and has a course of three thousand miles before it enters the gulph of Mexico. It rises from a lake of a considerable size, opposite to which is an opening in the mountain, from which a large stream flows to the lake, carrying with it a red sulphureous substance, by which the water is tinged, and on this account it is called the Red Lake. This lake has on its south and south-east sides a fine fertile country.

The Mississippi runs nearly south-west from this lake for upwards of two hundred miles, where it is joined by a small stream from the westward; and then turning nearly south-east for above three hundred miles, is joined by the Muddy River, and before that by another not so large, flowing to it from the north-east. The Muddy River rises from the south of the Central Mountains out of a large bog, and runs south, inclining to the west, till it meets the Mississippi, which, after its junction, is near two miles wide. The current from the head to this place is generally pretty rapid, and has frequent and large falls; but the country on both sides of the river, and of the branches that flow into it, is exceeding fine and fertile: the timber lofty, but thin, and the trees scattered at a distance from each other: the plains large and beautiful: the air and climate, even quite to the head, moderate and agreeable: the winters short and rarely severe; though farther eastward, in the same latitude, they are quite the reverse; and the farther you travel to the westward, the more mild and temperate it grows, and the country is more agreeable and fertile. The lakes and the rivers here abound with fish, and the wild oats, or rice, grow here in great plenty. On the wide extended plains are a multitude of wild cattle, and great plenty of deer, elks, and buffaloes, with some beavers, hares, and panthers. Here are wild-fowl in abundance, especially turkies, and another kind of wild-fowl, much larger and nearly as tall as a man: they run very swift, but cannot fly, except it be from some eminence, and a small distance at a time.

This fertile country is at present inhabited by a nation called the White Indians, from their having a much fairer complexion than any other of the original inhabitants of the continent. This nation is so numerous as to be able to raise between twenty and thirty thousand men. They use no weapon but bows and arrows, tomahawks, and a kind of wooden pikes; on which account they frequently suffer greatly in battle, when attacked by the eastern Indians, who have the use of fire-arms, and frequently make excursions against them, killing and taking prisoners great numbers of them. These Indians dwell together in large towns, and have commodious houses; they raise Indian corn, tame the wild cows, and use both their milk and flesh; they keep a great number of dogs, and are very expert in hunting; but have little or no commerce with any other nation known to the Europeans.

The Mississippi, from the place where it is joined by the Muddy River, runs near two hundred miles to the south, with a strong and in some places a rapid current: it is then joined by a large river from the west, which rises four hundred miles from the Central Mountains; its waters chiefly rise from the north and north-easterly part of the Misauri ridge, a double chain of mountains so called, that extend towards the isthmus of Darien. This is named by the Indians the Bloody River, on account of the long and bloody wars that have happened between the Indians here and those to the eastward. Four hundred miles farther down, another river flows in from the north-west, that rises near the Bloody River. The two last rivers are both inhabited by the Illinois Indians, who likewise possess the western banks of the Mississippi for several hundred miles, till you come to a river that flows into it from the east, and rises near the Green-bay, having but a short carrying-place to the stream that discharges itself into that bay, and to another that falls into Lake Meshigan, near Fort St. Joseph. The country near this branch of the Mississippi was once inhabited by the Illinois, but they are now mostly retired to the west side of the Mississippi, only a few still remain at the mouth of the above river, where the French had likewise begun a settlement, which extended fifty miles along the Mississippi, and a considerable way up the river Illinois. There they raised excellent tobacco, and carried on a large trade with the Indians up the Mississippi and on the lakes. They likewise raised excellent wheat, barley, and other corn; and had formerly a good fort here, well garrisoned for their protection. Since this place was ceded to the crown of Great Britain, the French settled a garrison on the other side of the river, where the greatest part of the inhabitants have retired; but as there were a considerable number of Germans among them, they chose to stay on this side, and become British subjects. Near this fort is a village of Indians, but their largest settlement is on the west side, some miles above this, where they have a town, in which are contained near eight thousand men. They have also many large towns on the branches that fall into the river from the west.

These Indians live very comfortably, have pretty good houses, and make great use of horses; their country also abounds with buffaloes, deer, elks, &c. The soil and air are agreeable and pleasant: in some parts the trees are tall and handsome, and in other parts, for several hundred miles, there is scarce any timber to be found.

About a hundred and fifty miles below where the Mississippi is joined by the Illinois on the east side, the Misauris falls into it on the west. This last river rises from the east and south-east of the above Misauri ridge of mountains, in many different streams, for near a thousand miles on this side, which unite with each other at different places, and, after an easterly and south-easterly course of near two thousand miles, flow into the Mississippi.

It is perhaps impossible to find a finer country in any part of the earth, than that which is extended on each side of the Misauris, with respect to the salubrity of the air or the fertility of the soil. There are in this country

near

near a thouſand Indian towns, the inhabitants of which are called the Miſauri Indians, and are able to raiſe a great number of fighting men; theſe people have nearly the ſame manners and cuſtoms as the Illinois, who are alſo very numerous. The goodneſs of the country they both inhabit, muſt render life eaſy and agreeable to perſons who, like them, are content with gratifying the demands of nature, without endeavouring to encreaſe theſe demands, by ſtudied refinements in dreſs, equipage, or the modes of living. Health, joy, peace, and plenty, ſeem here to take up their abode; while care, anxiety, ambition, and the love of gold ſeem baniſhed from this happy region.

The Miſſiſſippi, after being joined by the Miſauris, is about ſix miles wide, and continues its courſe ſoutherly, no conſiderable ſtream falling into it after this, for between two and three hundred miles, when it is joined by the Ohio. The country on each ſide the Miſſiſſippi to this place is exceeding fine, nearly reſembling that juſt deſcribed; but it enjoys a ſomewhat warmer climate. It is claimed by the Tweeghtwees, or Yeahtanees, on the eaſt ſide down to the Ohio, and eaſtwardly from the Miſſiſſippi as far as the Wabach.

The Ohio riſes in ſeveral branches, one of which is near Preſque Iſle, within ſix miles of the Lake Ontario. About ten miles down this branch ſtood Fort Du Beauf, from which place it is navigable for canoes and ſmall boats quite to the mouth. The courſe of this branch is ſouthерly for ſeventy or eighty miles below the laſt-mentioned fort, where was another fort called Venango; but both this fort, with that of Preſque Iſle and Fort Du Beauf, were all deſtroyed by the Indians in 1763. About twenty miles above this laſt fort are ſeveral little towns of the Mingos, who now belong to the Five Nations. Oppoſite to Venango fort this branch is joined by another large one from the north-eaſt, which riſes in the country of the Five Nations; and about half way from thence to Fort Pitt is another, which joins it from the north-eaſt, and after their meeting it is called the Ohio, till you come to Fort Pitt, where it is joined by the Monongahela, which riſes from the weſt ſide of the Allegany mountains in a great number of ſmall ſtreams, that ſoon unite and form this river.

Fort Pitt ſtands upon a point of land between the rivers Monongahela and Ohio, and is a regular well-built fortreſs, kept in good order, and well garriſoned: it is a very neceſſary poſt for the protection of our frontiers; and indeed there are none in this country more ſo, except Niagara and Detroit. Near Fort Pitt is a good coal-mine, made uſe of by the garriſon for fuel; but what is a ſtill greater advantage, the country is extremely well watered by ſprings and rivulets, and has an eaſy communication with the ſea down the Miſſiſſippi, and with great part of the interior country of North America by its ſeveral branches, the Wabach, Miſauris, Yeahtanees, the Ohio, &c. and with the great lakes by the way of Preſque Iſle, where, at a ſmall expence, the waters of the lake might be turned into the Ohio; and even at preſent the carrying-place extends but a ſmall diſtance.

From Fort Pitt the general courſe of the Ohio inclines to the ſouth for near a thouſand miles, according to the courſe of the river. At Fort Pitt it is a mile wide, but grows much wider before its junction with the Miſſiſſippi, it being joined by ſeveral ſtreams in its courſe thither.

The country between the lakes and the junction of the Ohio and Miſſiſſippi for ſeveral hundred miles, and all the country between Fort St. Joſeph and the Green-bay, and between Detroit and the Illinois, and even much farther north than Detroit, is level, and has excellent ſoil; the climate is healthy and agreeable, and the winters ſhort and moderate: its natural productions are numerous and valuable: it is ſufficiently, but not too much, covered with trees, which are tall, beautiful, and fit for building; and, in ſhort, no country in the world is capable of richer improvements.

Below the river Ohio on the eaſt ſide of the Miſſiſſippi, down to its mouth, the country is poſſeſſed for near two hundred miles to the eaſtward by the Chicketaws, a nation that can raiſe ten thouſand fighting men. This country is indeed ſandy, and inferior to that juſt deſcribed; but it produces rice and indigo in great perfection, of which the French have made ſufficient proof.

The Chicketaws generally dwell in large towns near the banks of the Ohio, on the ſtreams that fall into that river on the eaſt. Their houſes, though not very handſome, are pretty compact, in order to ſecure them againſt the Muſketoes, which at ſome ſeaſons of the year are very troubleſome. They keep cows, hogs, and horſes; and the latter in great abundance. They likewiſe raiſe plenty of corn, beans, and potatoes; but have little game, except deer.

The Cherokees dwell at the ſouth-weſt end of the Apalachian mountains, from the head of the river Taneſee, which flows into the Ohio, about a hundred miles before its confluence with the Miſſiſſippi. Their country extends in length about four hundred miles from the north-eaſt to the ſouth-weſt, and is about two hundred miles wide. It is very mountainous and difficult of acceſs every way. They live in as good order as any Indians on the continent, building their houſes with wood, and covering them with clay mixed with ſtraw, in ſuch a manner as to render them cloſe, warm, and comfortable. They have many ſmall towns diſperſed among the mountains on the branches of the rivers Taneſee and Savanna. They have great plenty of horſes, ſome black cattle, and many ſwine. Theſe people raiſe a great deal of corn, and fence in their fields, which is practiſed by no other Indians. They have alſo orchards of peach-trees, and keep poultry. They attend to gardening, and are likewiſe very famous for hunting, their country abounding with deer, elks, and bears; and they have plenty of turkies in the vallies between the mountains. The Cherokees can raiſe about two thouſand fighting men.

The river Taneſee is entirely uninhabited below the mountains as far as its confluence with the Ohio; yet the country is claimed by the Chickeſaws, a brave warlike people, who have only one town, which is ſeated on a plain, by a ſmall creek that riſes about thirty miles to the ſouth of the Taneſee. Their town is picqueted in, and defended by a fort. Their houſes are built in much the ſame form as thoſe of the Chicketaws. Theſe people raiſe a great deal of corn, have ſome black cattle and ſwine, and a conſiderable number of horſes; but can only raiſe five hundred fighting men.

To the ſouth-weſt of the Cherokees live the Creek Indians, who are ſeated partly between them, the Chicketaws, and Georgia, in a level country. They can raiſe about two thouſand fighting men, and live in the ſame manner and have the ſame commodities as the Cherokees and Chicketaws. All the country of the Creeks are infeſted with alligators and ſnakes of a very large ſize; and at certain ſeaſons of the year they are much plagued with the muſketoes.

The ſoil is good from the Miſauris down to the weſt ſide of the Miſſiſſippi, till you come near its mouth. The French had lately a ſettlement a little above its confluence with the Ohio on the weſt ſide: about a hundred miles farther down another ſcattered ſettlement of theirs begun, and was continued for near a hundred miles, from whence to New Orleans it is better ſettled. The produce of this country is rice, Indian corn, and ſome wheat. The iſle of Orleans is a very beautiful and fertile ſpot, on which the French had, if they have not ſtill, a conſiderable town; and their number in this province is ſaid to amount, at the time of the late peace, to about a hundred thouſand perſons. The negroes are alſo very numerous, and the ſoil towards the ſouth proper for producing rice and indigo, and towards the north for raiſing wheat.

Having now deſcribed the provinces of North America ſubject to Great Britain, we ſhall proceed to the Weſt Indies; but ſhall firſt give a Deſcription of Bermudas, or the Summer Iſlands.

CHAP.

CHAP. IV.

Of the BERMUDAS, with a Deſcription of the WEST INDIAN Iſlands belonging to GREAT BRITAIN.

SECT. I.

Of the BERMUDAS, *or* SUMMER ISLANDS.

Their Name, Situation, Number, Extent, and Climate; a particular Deſcription of the Soil, Vegetables, and Animals, particularly of the Iſland of St. George; with the Manners of the Inhabitants.

THE Bermudas, or Summer Iſlands, received their firſt name from their being diſcovered by John Bermudes, a Spaniard, in the year 1503, after which they were frequently touched at by his countrymen in their paſſage to the Weſt Indies. They received their ſecond name from Sir George Sommers, who was ſhipwrecked upon them, with Sir Thomas Gates, in 1609, in their paſſage to Virginia. Theſe iſlands are very numerous, but lie pretty contiguous to each other, and are ſuppoſed to amount to about four hundred; but moſt of them ſo ſmall and barren as not to be habitable. They lie in the thirty-ſecond degree twenty minutes north latitude, and, according to the moſt accurate obſervations, in the ſixty-fourth degree forty-eight minutes weſt longitude. Their greateſt extent, which is from the north-eaſt to the ſouth-weſt, is computed at about twenty miles, and their greateſt breadth about five: however, ſcarce an eighth part is inhabited. Their diſtance from the Land's-end is computed between fifteen and ſixteen hundred leagues, from the Madeiras about eleven or twelve hundred, and three hundred from Cape Hateras in Carolina, which is the neareſt land to them. All theſe iſlands, except St. George's, St. David's, and Cooper's, have only a few houſes ſcattered up and down.

St. George's, the largeſt of theſe iſlands, is only about ſixteen miles in length, and not a league over in the broadeſt part: but is fortified with rocks every way, extending far into the ſea. To its natural ſtrength the inhabitants have added ſeveral good forts, with batteries and other out-works, eſpecially towards the eaſt, where it lies moſt uncovered, ſo well diſpoſed, that they command the ſeveral channels and inlets on that ſide. There are only two places at which ſhips can ſafely enter, and the rocks lie ſo thick that, without a good pilot from the ſhore, a veſſel of ten tons burthen could not find the way into theſe harbours, which being once known the largeſt ſhips in the world may enter: but they are ſo well fortified, that ſhould an enemy, aſſiſted by the moſt ſkilful pilots, attempt either of them, they might be eaſily kept out. Indeed all the iſlands in general are ſo environed with rugged and dreadful rocks, that they ſeem to threaten all the ſhips that venture near the coaſt with preſent deſtruction; and ſo many have been wrecked upon them, that the Spaniards gave them the name of Los Diabolos, or the Devils.

The air of theſe iſlands has been always eſteemed extremely healthful, and the appearance of every thing in St. George's iſland, and the other fertile ones, is perfectly delightful, whence people have been accuſtomed to remove thither from the other colonies, in order to repair their broken conſtitutions. The heat in ſummer is very ſupportable, and with reſpect to winter it is here unknown; ſome even affirm, that there is but one ſeaſon, and that there is here a perpetual ſpring, in which the trees never loſe their verdure; for though the leaves at one time of the year fall off, others have firſt budded out: but, notwithſtanding the fineneſs of the climate, theſe iſlands are ſubject to ſtorms of thunder and lightning.

The country is moſtly mountainous, but has ſome fertile plains. The earth is of various colours, but the brown is eſteemed the richeſt; the whitiſh, or ſandy, is reckoned the next; and the reddiſh the worſt. Upon the whole, the ſoil, though thin and very ſtony, is rich and fruitful; but their water is generally brackiſh, except what falls from the clouds, and is preſerved in ciſterns.

Maize, which is the principal ſupport of the people, is twice reaped; for what they ſow in March, they reap in July: in a fortnight after they ſow again, and reap in December. They alſo raiſe ſome tobacco. The cedars of theſe iſlands are ſaid to exceed all thoſe of the other parts of America, particularly in their fragrancy, durableneſs, beauty, and the hardneſs of the wood; and they are here in ſuch plenty, that this wood anſwers in all reſpects our oak timber; for they not only build their beſt ſloops, brigantines, and other veſſels with it, but ſome of their houſes, churches, and other public buildings. Their palmeto, which is a kind of wild palm, is no leſs uſeful and common. Its fruit, which in colour, ſhape, and ſize reſembles our damſin, is very delicious; the wood is ſerviceable for building and fewel, and the leaves, which are generally between eight and ten feet long, ſerve to make a very good covering for their houſes. The date, or palm-tree, likewiſe yields a fine fruit, and their foreſts abound with variety of odoriferous and medicinal woods, ſome black, others yellow, and ſome red. The berries of theſe laſt trees have the ſtyptic quality of a ſloe, and are much uſed by the Engliſh to cure the flux, which they frequently get by eating the luſcious palm-berries, and other rich fruits. All European and American trees are ſaid to grow here in great perfection, eſpecially the mulberry, olive, laurel, Barbary pear, and orange-trees, which are peculiarly excellent; the fruit, in point of ſize, ſcent, and flavour, far exceed thoſe either in the Eaſt or Weſt Indies. They have alſo a very ſingular plant called the Summer Iſland red-wood, the berry of which is as red as the prickly-pear, and gives the ſame kind of tincture; out of it come worms, which turn into flies, that are ſomewhat larger than the cochineal fly, and have a medicinal virtue much exceeding it. They have alſo a plant called the poiſonous-weed, that grows much in the ſame manner as our ivy; but this is the only noxious thing in any of theſe iſlands.

With reſpect to quadrupeds, there were none in the Bermudas but hogs, when Sir George Sommers was ſhipwrecked there, and theſe he found by ſending out two or three of his own to feed, which rambling home, a huge wild boar followed them, and being killed, was found excellent meat. The hogs they afterwards killed were all black, whence it is concluded that the Spaniards left them there to breed, they being of the ſame kind with thoſe they carried to the continent of America. They have alſo all the other ſpecies of European cattle, but they are not very numerous.

Theſe iſlands abound with a prodigious variety of fowl, as ſwans, widgeons, herons, ducks, ſnipe, teal, moor-hens, bitterns, oſprays, baldcoots, cormorants, and hawks of all ſorts; bats, owls, and other birds of the night are alſo very common, and there are multitudes of ſmall birds. The Engliſh at their firſt coming found a kind of water-fowl peculiar to thoſe iſlands, called cowkees; they breed in the holes of the rocks, and in burrows like rabbits. This bird is of the ſize of a ſea-mew, and being of ſo gentle a nature as to be eaſily caught, and being alſo very good to eat, ſuch numbers have been taken of them that they now are become ſcarce. Here are likewiſe found the trumpet-bird and the pemlico, the laſt of which is ſeldom ſeen in the day-time.

The inſects in theſe iſlands are generally the ſame as in our other plantations, except the ſpider, which is thought to be larger here than in any other country in

the world; but the beautiful colour with which they are adorned takes off very much from that diſtaſte which otherwiſe the ſight of creatures of this kind, and of ſo enormous a ſize, would naturally occaſion.

It has been already obſerved, that the number of theſe iſlands is uncertain: the principal of them are St. George, St. David, Ireland, Somerſet, Long-iſland, Bird-iſland, Cooper, and Nonſuch. We have alſo obſerved that the firſt of theſe is the moſt conſiderable; it is therefore here proper to add, that it is divided into nine diſtricts, called by the inhabitants tribes; namely, St. George's tribe, Hamilton's tribe, Smith's tribe, Devonſhire's tribe, Pembroke's tribe, Paget's tribe, Warwick's tribe, Southampton's tribe, and Sandy's tribe. All the inhabitants of the leſſer iſlands are ranged under one or other of theſe eight tribes, and the number of people in all the iſlands is computed at about ten thouſand.

St. George, the capital town, is ſeated at the bottom of a haven in the iſland of the ſame name, and is defended by ſeven or eight forts mounted with about ſeventy pieces of cannon. The town has a handſome church, together with a fine library, with a noble ſtate-houſe for the meeting of the governor, council, and aſſembly, and about one thouſand houſes more very neatly built.

The government is like that of Virginia, Carolina, Florida, &c. the crown appointing the governor and council, and the repreſentatives of the people compoſing the aſſembly. They are ſaid to have fewer bye-laws than any of our ſettlements, which may be imputed to the ſmallneſs of their trade; for this country produces no conſiderable commodity by which the inhabitants can obtain riches; for their commerce chiefly conſiſts in timber and proviſions, in building ſhips, and ſending ſome tobacco to England.

The people of the Summer-iſlands ſeem to content themſelves with the plenty and pleaſure of their country, and with enjoying a ſafe and quiet retreat from the troubles and cares of the reſt of the world. Indeed the inhabitants have conſtantly maintained an excellent reputation, and the Bermudas have been equally remarkable for the beauty of the country, and the integrity, ſimplicity, and honeſty of the people. The beauty and the healthfulneſs of theſe iſlands, and the amiable characters of the inhabitants, induced the learned dean Berkeley, afterwards biſhop of Cloyne, to erect an academy at the Bermudas for promoting uſeful learning and true religion in the Weſt Indies, and the Society for the Propagation of the Goſpel aſſiſted him in procuring a patent from king George I. for erecting a college there. That gentleman and three fellows of Trinity-college in Dublin, with ſeveral of the Doctor's relations, embarked on this undertaking; but were driven by a ſtorm to Long-iſland, in the province of New York, from whence the Doctor, with his companions, went to Boſton and ſeveral other towns in New England, where they preached; but the deſign of erecting a college being laid aſide, they returned home, and ſoon after doctor Berkeley was promoted to the ſee of Cloyne in Ireland.

SECT. II.

A conciſe Hiſtory of the Settlement of the Bermudas.

WE have already obſerved, that Sir George Sommers was wrecked on theſe iſlands; but he here cauſed a veſſel to be built in which he purſued his intended voyage to Virginia, but left two men who had committed ſome crime for which they would have been put to death, had they been brought to England. Theſe were there when he afterwards returned to the iſlands, they having lived on the productions of the place, and built them a hut on St. George's iſland. Theſe men, whoſe names were Chriſtopher Carter and Edward Waters, alſo ſtaid behind Sir George's ſecond company, and even perſuaded one Edward Chard to remain with them; and now Carter, Waters, and Chard, though the ſole lords of the country, ſoon quarrelled, when Carter, tho' he hated both, not liking to be alone, prevented their fighting, by threatening to declare againſt the man who ſtruck firſt. At laſt neceſſity made them friends, and they joined together in making diſcoveries. In one of their expeditions they found a large piece of ambergriſe among the rocks that weighed eighty pounds, beſides other ſmaller pieces. This treaſure made them almoſt beſide themſelves, and in order to obtain an opportunity of making uſe of it, they reſolved on the moſt deſperate attempt that men could form; which was to build a boat after the beſt manner they could, and to ſail either to Virginia or Newfoundland, juſt as the wind happened to blow; but before they could put their project in execution, they were prevented by the arrival of a ſhip from England; for captain Matthew Sommers, Sir George's brother, had promiſed to come to them, or to ſend a veſſel to their relief. This ſhip had ſixty perſons on board, ſent by the new-formed Bermudas company to make a ſettlement, of which Mr. Moore was governor. That gentleman pitched upon a plain in St. George's iſland, and there built a cabin of palmeto leaves, large enough for his wife and family; and the reſt of the adventurers following his example, it ſoon grew into a town of conſiderable extent. This is now St. George's town, juſt deſcribed. Mr. Moore proved an excellent governor, and in 1614, diſappointed the Spaniards in an attempt to conquer theſe iſlands.

This gentleman was ſucceeded in the government by captain Daniel Tucker, who having a better education, and greater experience, eſtabliſhed a regular polity, traced out plantations, and obliged every man to build uniformly in the town, and to lay out regular plantations in the country; by which means the iſlands were much improved, and the exportations to England increaſed. He likewiſe eſtabliſhed a militia, and placed the iſlands in ſuch a poſture of defence as to put it out of the power of any of their enemies to hurt the colony.

However, the ſeverity of captain Tucker's government gave great diſguſt to the licentious, and five of them executed as deſperate a deſign to eſcape, as Waters and his two companions had propoſed. They were ſenſible that the governor would not give them leave to return to England, and therefore hearing that he had a great deſire to go a fiſhing out at ſea, but was afraid of doing it becauſe ſeveral fiſhing-boats had been driven off by the weather, they propoſed to build a boat of two or three tons burthen, with a deck, and ſo fitted, that ſhe ſhould live in all weathers. The governor conſenting to this, they began to build in a private place, under the pretence of its being convenient for getting timber and launching the boat. One of theſe five was a gentleman, another had contrived the deſign, another was a ſhip-carpenter who undertook to build this little veſſel, and the other was a common ſailor who promiſed to navigate it. They finiſhed the boat ſooner than was expected, and the governor ſending for it, in order to go on board a ſhip that was ready to ſail to England, the men on coming to the place could neither find the boat nor the builders, and all that they could hear of them was, that the boat being finiſhed the night before, thoſe who built it went off to ſea in order to try how it would ſail; but at laſt they found, by ſome letters they left behind, that they had ſet ſail for England.

Theſe raſh adventurers had, on ſome pretence, borrowed a compaſs-dial of a neighbour, and then going on board the ſhip bound for England, exchanged ſuch things as they could ſpare for proviſions; and one of them, at parting, told the mariners, that though they were forbidden to go with them, they hoped to be in England before them, at which the maſter of the ſhip laughed, and away theſe fearleſs adventurers ſailed with a fair wind and weather that laſted twenty-one days. They then met with a ſtorm, which continued forty-eight hours, and drove them a little out of their courſe to the weſtward; but the wind coming fair again, and continuing ten days, they went on chearfully. In that time they met with a French privateer, and went on board to beg ſome relief; but, inſtead of aſſiſtance, were plundered of all the little they had; the French had even the inhumanity to take away their compaſs, and then cruelly turned them adrift. In this miſerable condition they ſailed on, growing every day weaker and weaker. Their proviſions were almoſt ſpent, their fire-wood quite gone, not a drop of freſh

water left, nor food for above a day, when at length, to their unſpeakable joy, they made land, which proved to be Ireland; where going on ſhore in the county of Cork, they were nobly entertained by the earl of Thomond, to whom they related their extraordinary voyage, which laſted forty-two days.

But to return, in 1619 Mr. Tucker reſigned to captain Butler, who arrived with four ſhips, in which he brought five hundred paſſengers, and there being as many Engliſh before on the iſland, the colony began to make a conſiderable figure. This governor divided the iſlands into diſtricts; and now the government, by a governor, council, and aſſembly, was eſtabliſhed, it before conſiſting only of the governor and council; and the laws of the country were ſettled as much like thoſe of England as the circumſtances of the place would admit.

SECT. III.

Of the BAHAMA, *or* LUCAYAN *Iſlands.*

Whence the Weſt Indies obtained that Name. The Situation and Extent of the Bahama Iſlands, with a conciſe Account of Bahama and Providence Iſlands, and an Account of their Settlement and Revolutions.

WE now return from the Bermudas to the Britiſh iſlands near the middle of the continent of America, where all the iſlands have obtained the name of Weſt-Indies, from the opinion the great Columbus had entertained, that by ſailing to the weſt he ſhould diſcover India, and be able to bring from thence the rich ſpices, which for a conſiderable time had been brought by the way of the Red Sea, carried by land through Egypt, and there ſold to the Venetians and other maritime republics in the Mediterranean, who obtained immenſe wealth by ſupplying all the reſt of Europe with theſe articles of luxury. Columbus was right in his general idea; but theſe iſlands, which he imagined lay near the coaſt of India, were ſome thouſand leagues to the weſt of them; nor was he prepared for ſuch a voyage. It was with difficulty and great danger that he reached theſe; the mariners, at that time never accuſtomed to ſail far out of ſight of land, were frequently in deſpair, and dreading leſt they ſhould periſh in the boundleſs ocean into which he had carried them, frequently, in the midſt of their terror, intreated him to return; and at length reſolved to throw him over-board, and then endeavour to ſail back to Spain. But Columbus, bold and undaunted, raiſed their hopes, by ſhewing them at one time, weeds floating in the ſea; at another ſmall birds, which he obſerved could not fly far from land; and at laſt a cane, with a ſtaff, which had been evidently cut; and at length they landed in one of the Bahama iſlands we are now going to deſcribe, where the mariners no ſooner got on ſhore, than they fell proſtrate, and in a tranſport of joy kiſſed the earth.

The Bahama iſlands are ſeated to the eaſt and ſouth-eaſt of Florida, and the north of Cuba, ſtretching from the north-eaſt to the ſouth-weſt between the twenty-firſt and twenty-eighth degree of north latitude, and between the ſeventy-ſecond and eighty-firſt of weſt longitude. Theſe iſlands are very numerous; but there are only twelve worthy of notice. Between them and the continent of Florida is the gulph of Bahama or Florida, through which the Spaniſh galleons ſail in their paſſage to Europe.

Bahama, from which the reſt of theſe iſlands take their name, is ſeated in the twenty-ſixth degree forty-five minutes north latitude, at the diſtance of fifteen or twenty leagues to the eaſt of Florida, and eight or ten to the weſt of the iſland of Lucaya, from which it is divided by a channel, which, notwithſtanding its great breadth, is very dangerous from its being full of rocks and ſands. Bahama is about fifty miles in length; but ſcarce anywhere ſixteen miles in breadth, and in many places not half ſo broad. It is however very pleaſant and fruitful, the air ſerene and temperate, and the ſoil remarkably rich, it being watered by a multitude of ſprings and brooks of freſh water. It formerly produced plenty of guaiacum, ſaſſafras, ſarſaparilla, and red-wood; but theſe were all deſtroyed by the Spaniards; ſo that its chief produce at preſent is Indian wheat, fowl, and a particular ſort of rabbit; the reſt of their proviſions and other neceſſaries they obtained from Carolina and Florida, and the people both here and in the iſland of Providence are able to aſſiſt the ſhips that are driven upon their coaſt by the boiſterous winds and impetuous currents, which are here very violent.

Providence iſland is ſeated in the center of ſome hundreds of theſe iſlands, ſome of them many miles in length, and others are only ſmall rocks riſing above the water; ſo that it is extremely dangerous for ſhips to be forced in among them by a tempeſt. This iſland lies in the twenty-fourth degree thirty minutes north latitude, and is about twenty-eight miles long and eleven broad, where it is wideſt. It is a beautiful little iſland, abounding with trees, plants, fowl, and fiſh. The moſt conſiderable profit formerly made by the planters aroſe from the misfortunes of ſuch as were ſhipwrecked, and whom they relieved; or from thoſe who in a winter voyage to the continent of America were driven to the Bahama iſlands, and put into Providence for proviſions, where the traders who purchaſed them from Carolina kept ſtore-houſes to ſupply thoſe who wanted, and theſe afforded great relief to the unfortunate mariners. They likewiſe made ſome advantage of the wrecks that were thrown in upon them. The principal produce of the iſland is ſalt and braſiletto-wood, which they carry to Carolina. They alſo ſow peaſe and Indian wheat.

The other iſlands, notwithſtanding ſome authors reckon that they amount to between four and five hundred, are hardly worth deſcribing; at leaſt we have no particulars relating to them that can engage the attention of the curious reader. The moſt conſiderable of them, beſides thoſe juſt mentioned, are Eleuthera, Harbour-Iſland, Lucaya, Androſs, Cigateo, which may be termed of the ſecond magnitude. Thoſe of the third are Cat-Iſland, the firſt land diſcovered by Columbus in America, Yumeta, Samana, Mayaguana, Yuma or Exuma, Ynagua, Caicos, and Triangulo. As to the reſt, they are rather barren rocks than iſlands.

With reſpect to the hiſtory of theſe iſlands, they were the firſt-fruits of the New World diſcovered by Columbus; we have already obſerved that he landed in Cat-iſland, which was then called Guanahani; but was called by Columbus St. Salvador, and it owes its preſent name to the Engliſh inhabitants. The native Indians, a ſimple, harmleſs, inoffenſive people, received the firſt diſcoverers with the utmoſt aſtoniſhment, flocked in crouds to the European veſſels, and admired every thing they ſaw; but though they behaved in a moſt inoffenſive manner, the Spaniards after Columbus's time, not thinking thoſe iſlands worth making a ſettlement upon, to the diſgrace of humanity, extirpated all the natives they found, though they were very numerous; and thus wantonly murdered many thouſands of innocent perſons, without any advantage to themſelves.

Theſe iſlands lying out of the courſe of ſhips bound to the continent of America, it was long before they were known to the Engliſh: but in 1667 captain William Sayle, in a voyage to Carolina, was forced among them in a ſtorm, and had an opportunity of examining them carefully, particularly a large iſland to which he at firſt gave his own name; but being a ſecond time driven upon it, gave it the name of Providence.

On his return to England he let the proprietors of Carolina know the ſituation and circumſtances of theſe iſlands, obſerving, that in caſe they were ſettled, they might not only be a great benefit to this nation, but be a conſtant check on the French and Spaniards, if a breach ſhould happen between either or both of thoſe nations. Theſe reaſons being mentioned to king Charles II. that prince made a grant of the Bahama iſlands to George duke of Albemarle, Anthony lord Aſhley, John lord Berkeley, William lord Craven, Sir George Carteret, and Sir Peter Colleton.

The firſt governor ſent by the proprietors to Providence-Iſland was Mr. Chillingworth, who ſailed thither about the year 1672, when ſeveral people from England and the other colonies went to ſettle there; but living a licentious life, and Mr. Chillingworth endeavouring to bring them to reaſon, they aſſembled in a tumultuous

manner, and having ſeized him ſhipped him off for Jamaica, and then lived as they thought proper. Though a colony ſo unruly afforded little encouragement for any man to put himſelf in their power; yet, ſix or ſeven years after, the proprietors made Mr. Clarke governor, whoſe fate was much worſe than that of his predeceſſor; for, the Spaniards, jealous of every new Engliſh colony towards the ſouth, landed in Providence-Iſland, deſtroyed all the ſtock which the inhabitants could not carry off, and burnt their houſes. But what is ſtill more extraordinary, Mr. Trott, one of Mr. Clarke's ſucceſſors, always aſſerted, that after the Spaniards had killed Mr. Clarke, they roaſted him on a ſpit. This is indeed very improbable; it is however certain that he was killed, and that the people removing to other colonies, the iſland remained uninhabited till about the time of the Revolution, when a number of perſons removed thither from Europe and the continent of America, and the proprietors appointed a new governor.

About ten years after Providence and the adjacent iſlands contained near a thouſand inhabitants, ſome tobacco was planted, a ſugar-mill was ſet up, and other improvements were made; but in 1708 the Spaniards and French landed, ſurprized the fort, took the governor priſoner, plundered and ſtripped the Engliſh, burnt the town of Naſſau, together with the church, ruined the fort, and nailed up the guns; after which they carried off the governor, and about half the blacks, the reſt ſaving themſelves in the woods; but within about a month they returned, and took moſt of the negroes who were left. After this ſecond invaſion the Engliſh inhabitants of the Bahamas thinking it in vain to ſtay any longer, diſperſed, removing to Carolina, Virginia, New England, and other places. Mean while the proprietors appointed one Mr. Birch to go over governor, who landing in Providence, and finding it a deſart, did not give himſelf the trouble to open his commiſſion; but after remaining there two or three months, during which he ſlept in a tent erected in the woods, he returned back, and left the place uninhabited.

The Bahama iſlands at length becoming a receptacle for pirates, the houſe of lords, conſidering that it would be of fatal conſequence ſhould they fall into the hands of an enemy, addreſſed her majeſty queen Anne, that the iſland of Providence might be put into a poſture of defence; but this advice being neglected, their lordſhips four years after addreſſed king George I. on the ſame ſubject, who was pleaſed to give directions for diſlodging the pirates, making ſettlements, and erecting a fortification. Captain Woodes Rogers, who was now appointed governor, ſailed for Providence in 1718, with a naval force for ſubduing the pirates. In the mean while colonel Bennet, governor of the Bermudas, ſent a ſloop to the iſland, ordering them to ſurrender, purſuant to a late proclamation. Thoſe who were on ſhore gladly accepted the mercy offered them, adding, that they did not doubt but their companions who were at ſea would follow their example. Accordingly captain Henry Jennings, and fifteen others, followed the ſloop to the Bermudas, and ſurrendered themſelves. Soon after four other captains, with a hundred and fourteen of their men, likewiſe ſurrendered. But Vane, one of the captains of the pirates, knowing that captain Rogers was coming to reduce thoſe robbers by proclamation, or by force, ſet fire to a French ſhip of twenty-two guns, which he had taken, in order to burn the Roſe frigate, which had juſt arrived at Naſſau: however, the Roſe got off by cutting her cables, and though the governor, with two men of war, then entered the harbour, Vine, and about fifty of his men, made off in a ſloop; and, notwithſtanding the governor ſent a veſſel after them, they made their eſcape.

Mr. Rogers having taken poſſeſſion of the fort, cauſed his majeſty's commiſſion to be read in the preſence of the officers, ſoldiers, and about three hundred people, whom he found there at his arrival, and who had been almoſt daily exerciſed in arms for their defence in caſe of an attack from the French or Spaniards; and the governor brought with him above a hundred ſoldiers, who, with the others, were judged ſufficient to ſecure the iſland. He began to regulate the government, and nominated ſix of the adventurers who came with him to be of the council, to which he added ſix out of ſuch of the inhabitants that had never been pirates. Two hundred more of the pirates ſoon after ſurrendered, and a few years after the number of the inhabitants was computed at fifteen hundred, out of whom were formed three companies of militia, who took their turn every night in the town guard at Naſſau. The face of affairs being thus changed, the town of Naſſau was rebuilt, and plantations laid out. Soon after the neighbouring iſland of Eleuthera was likewiſe ſettled; about ſixty families fixing themſelves there, erected a ſmall fort for their defence. The like was done in Harbour Iſland, where the plantations ſoon grew more conſiderable, and a larger fort was built for the protection of the inhabitants. Cat Iſland was alſo ſettled. Captain Rogers likewiſe defeated the Spaniards, who, after three ſeveral preparations, attacked him with two thouſand men, which force he repulſed, and burnt two of their ſhips of war in their retreat. At length Mr. Rogers returned to England, and was ſucceeded in his government by captain Fitz-Williams; and ever ſince this laſt ſettlement of theſe iſlands they have been continually improving, though they advance but ſlowly.

SECT. IV.

Of JAMAICA.

Its Situation, Extent, Face of the Country, and Climate.

JAMAICA, the largeſt of all the Britiſh iſlands in America, was named by Columbus St. Jago, which it retained while in the poſſeſſion of the Spaniards; but after its being taken by the Engliſh, it obtained its ancient name. It extends from ſeventy-five degrees fifty-ſeven minutes weſt longitude from London to the ſeventy-eighth degree thirty-ſeven minutes weſt longitude, and from the ſeventeenth degree forty-eight minutes to the eighteenth degree fifty minutes north latitude; it being about a hundred and ſixty miles in its greateſt length from Point Negril on the weſt to Point Morant on the eaſt, and ſeventy in its greateſt breadth from the Pitch of Portland on the ſouth to Gallina Point on the north; but grows leſs towards each end. It lies near four thouſand five hundred miles ſouth-weſt of England, a hundred and ſeventy leagues to the northward of Porto Bello and Carthagena, twenty leagues ſouth of Cuba, and twenty-four to the weſt of Hiſpaniola.

The iſland being within the tropic, has the trade wind continually there: it is on the ſouth ſide of the iſland, and is called the ſea-breeze. It comes about eight o'clock in the morning, and increaſes till twelve at noon, and decreaſes as the ſun grows lower, till there is none at four in the afternoon. The land breeze begins about eight in the evening, blowing four leagues into the ſea; it continues increaſing till twelve at night, and decreaſes again till four. Thus, as the land-wind blows at night, and the ſea-breeze during the day, no ſhips can come into port except in the day, nor go out but at break of day, or ſoon after.

The whole iſland is divided into one continued ridge of hills, which run from eaſt to weſt through the middle of it, and are generally called the Blue Mountains, on each ſide of which are hills much lower. The mountainous part is very ſteep, and the higheſt hills on the north and ſouth ſides are ſurrounded by very deep channels made by the violent rains, which almoſt every day fall on the mountains, and firſt wearing a ſmall channel for their paſſage, and afterwards carrying all before them, make their channels extremely deep. Moſt of the ſavannas, or plains, cleared of wood and fit for paſture, lie near the ſouth ſide of the iſland; they reſemble our meadow land, and a perſon may ride ſeveral miles without meeting with the leaſt aſcent: ſome of theſe plains are within land environed with hills; after rain they are very green and fertile; but after a long drought look yellow and parched.

The principal harbours in the iſland are Port Royal, which is fine and capacious; Old Harbour, which lies ſeven or eight miles weſt of St. Jago; Port Morant, at the eaſt end of the iſland; and Port Negril, at the weſt end; beſides which there are ſeveral others on the ſouth

and

and north ſides; but it is dangerous approaching the coaſt without a pilot on account of the coral rocks, with which it is almoſt encompaſſed.

With reſpect to the rivers of Jamaica, they are ſaid to amount to near a hundred, yet none of them are navigable; for riſing in the mountains in the middle of the iſland, they precipitate themſelves down the rocks to the north and ſouth, falling into the ſea before they have run many miles, frequently carrying down with them large trees and great pieces of rocks; and ſeveral of theſe rivers have cataracts fifty or ſixty feet high. However, in dry years water is very ſcarce in the ſavannas at a diſtance from the rivers; ſo that many cattle die with driving to water. It is remarkable that ſome of the rivers in the mountains in ſeveral places riſe above and ſink under ground, and in particular the Rio d' Oro falls and riſes two or three times. Another peculiarity is, that ſome of the ſprings and rivers petrify their channels by encruſting them with a cement which unites the gravel and ſand in their bottoms.

There are alſo ſeveral hot ſprings, and many others that are ſalt and form lakes, particularly Riotto, a lake that receives a great deal of water, and yet has no viſible diſcharge. In theſe, and in ponds formed by ſea-water, great plenty of ſalt is made, by the heat exhaling the moiſture.

The mountains, and indeed the greateſt part of the iſland, are covered with fine woods that never loſe their verdure, but look for ever green, and are gay in every ſeaſon. The beauties of December equal the bloom of April: you ſee a thouſand various kinds of trees adorning the brow of every hill, irregularly mixing their different branches, appearing in a gay kind of confuſion, forming groves and cool retreats: the cedar, the mahogany, the lignum vitæ, and unnumbered others mingling their boughs; ſome rearing their lofty heads, and others thriving under their friendly ſhade. Nor are the beauties of the better cultivated valleys inferior to theſe; they too wear the verdant robe of nature, and pleaſe no leſs when they are laid out with the niceſt art and care, and produce the richeſt plants, as the ſugar cane, the ginger, pimento, and others, which are more valuable to their owners than a ſhare in the mines of Potoſi or Peru. They likewiſe boaſt of the fineſt orange and lemon-trees in great plenty. Fruit is ſo common that few regard them; on the way ſides you may pick the citron, the ſtar-apple, the guava, and the mamee; and every thing reſembles a kind of paradiſe. But theſe advantages are balanced by many diſagreeable circumſtances: the rivers contain the dreadful alligator, the fens and marſhes the guana and galliwaſp, with numberleſs ſnakes and noxious animals. You are expoſed during great part of the year to the ſcorching heat of the ſultry ſun, and the warm climate renders the iſland ſickly.

The longeſt day in ſummer is about thirteen hours, and the ſhorteſt in winter about eleven. At nine in the forenoon the air grows intolerably hot, and could ſcarce be endured were it not for the ſea-breeze already mentioned. Indeed the hot and moiſt temperament of the air would ſoon bring on peſtilential diſeaſes, that would in a ſhort time turn all to a deſart, had not the wiſe Contriver of all things prepared thoſe friendly gales, the ſea and land breezes, to temper the air and render it ſo refreſhing, that none need be afraid of going about their lawful employments.

The nights are ſometimes pretty cool, and the dews are ſo great within land, that in a morning the water drops from the leaves of the trees, as if it had rained; and a man riding in the night will find his cloaths and hair very wet in a ſhort time. Theſe cold and piercing dews, which happen every night after the pores have been opened by the extraordinary heat of the day, are juſtly reckoned extremely unwholeſome, and new-comers who expoſe themſelves to their influence ſeldom eſcape without a ſevere ſickneſs.

Inſtead of dividing the year into ſpring, ſummer, autumn, and winter, its only diviſions are the dry and wet ſeaſons; nor are theſe regular, but vary in many parts of the iſland. Thus about the Blue Mountain valley, and ſeveral hilly places, they have more or leſs rain every day in the year, and plant the ſugar-cane at the ſame time they are cutting others for uſe. On the north ſide the ſeaſons are pretty regular; they begin to plant in Auguſt, and continue till Chriſtmas, all which time they are ſure of rain; after that till the end of March they have none; but then it begins again, and continues during the months of April and May. Several parts of the iſland, which were once the choiceſt and richeſt ſpots, and had fine ſugar-works, which uſed annually to produce many hundred hogſheads of that valuable commodity, are now only fit for grazing cattle, they being dry for almoſt nine months in the year. This is aſcribed to the cutting down of the woods; for the trees gathered and retained great quantities of vapours, which were diffuſed in rain. The months of July, Auguſt, and September, are called the hurricane months, becauſe then they have been obſerved to happen moſt frequently.

It lightens almoſt every night, but without much thunder, which when it happens is very terrible; it roars with aſtoniſhing loudneſs, and the lightning in theſe violent ſtorms frequently does a great deal of damage. In February or March they expect earthquakes, which have ſometimes been as dreadful as any recorded in hiſtory; theſe we ſhall hereafter have occaſion to mention. Indeed the innabitants obſerve ſeveral days in the year in a ſolemn manner on account of ſtorms and earthquakes.

According to the beſt obſervations, there is not one-third of the country inhabited; there are indeed plantations round the iſland, but none at any great diſtance from the ſea; and even theſe are ſo far from being cultivated, that the greateſt part of the ground is not cleared, but is overgrown with wood; for a gentleman who has a patent for three or four thouſand acres, has perhaps five hundred of them well laid out and improved, and the reſt is uſeleſs: yet the ſoil is in ſome places ſo exceeding fertile, that one acre has been known to yield ſeveral hogſheads of ſugar.

SECT. V.

Of the Vegetables of Jamaica, with a particular Deſcription of the Sugar Plant, its Culture, and the Manner of making Sugar; the Pimento Tree, the Cacao or Chocolate Tree, the wild Cinnamon Coffee Tree, and Ginger; with a conciſe Account of the Beaſts, Birds, Inſects, and Fiſhes.

NO ſorts of European grain grow here; they have only maize, or Indian corn, Guinea corn, peaſe of various kinds, but none of them reſembling ours, with variety of roots. Fruit, as hath been already obſerved, grow in great plenty, citrons, Seville and China oranges, common and ſweet lemons, limes, ſhadocks, pomegranates, mamees, ſourſops, papas, pine-apples, cuſtard-apples, ſtar-apples, prickly pears, allicada pears, melons, pompions, guavas, tamarinds, and ſeveral kinds of berries, which are every where to be found in the roads.

The ſugar-plant grows in a long ſtalk, or cane, divided by joints, two, three, four, or five inches aſunder, and about ſix feet high; the ſprouts and leaves at the top riſing ſo as to make it near eight feet in all. The body of the cane ſeldom exceeds an inch in diameter, the colour of its tops is a pure graſs-green; but the cane itſelf when ripe, yellowiſh. It is covered with a thin ſkin or bark, and is of a white ſpongy ſubſtance full of juice, which the ſervants and others ſuck; and nothing is pleaſanter and more nouriſhing when it is ripe, and taken with moderation. Upon this occaſion, they cut the rind, and put the ſpongy part into the mouth, when the juice will come more freely than the honey out of the comb. This ſweetneſs is extremely agreeable, and far from being furfeiting; the juice is a little thicker than that of an apple, and without the leaſt ill taſte. Of this juice are made ſugar, rum, and molaſſes.

The ſeaſon for planting ſugar canes is from Auguſt to the beginning of December, and they do not arrive to maturity, till they have been a year and a half in the ground. Their manner of growing is in ſprouts, three, four, or five from one root. The cane-tops make very good food for horſes and black cattle; but the ſolid canes are carried to the mill.

They

They are planted by digging long trenches in the earth, about ſix inches deep, and as many broad, laying a double row of canes along in the trench, one by another, then the earth is thrown in, and another trench dug at about two feet diſtance, till all the land is planted by laying the canes along. Thus they produce the greateſt number of ſprouts; for this way a branch ſhoots out of every joint of the cane. The firſt planters uſed to thruſt a piece of cane perpendicularly into a hole, at certain diſtances, which yielded no ſhoot but from the top, and having three or four ſprouts whoſe whole weight depended on one root, when they grew tall and heavy, the ſtorms looſened the roots; but by this new way of planting the root is ſecured, and the produce increaſed. They come up ſoon after they are planted, and in about twelve weeks they grow two feet high.

The next care of the planter is to weed the canes, and to dung them; but this laſt is done either when they are planted or when they are grown two feet high, and this is the greateſt trouble and expence the planter is at; for was it not for this dunging, a third part of the negroes would do his buſineſs.

When the canes are ripe they are cut down, ſtripped of their leaves and tops, bundled up in faggots, and carried to the mill by mules, or in carts drawn by horſes. The mills are turned by oxen or horſes; and ſome ſubſtantial planters have erected wind-mills: there the juice is preſſed out by wooden rollers caſed with iron, and at the bottom of the mill is a hollow place which receives the juice, from whence it is conveyed by leaden pipes into a ciſtern near the boiling-houſe, where it muſt not remain above one day, for fear it ſhould grow ſour. From thence it is conveyed through a gutter fixed to the walls of the boiling-houſe to the clarifying-copper, or boiler, and there boiled till all the groſs matter riſing to the top is ſkimmed off. It is then carried into a ſecond, and ſo into a third, fourth, fifth, ſixth, and ſeventh; and is continually kept ſtirring and boiling till it comes to a conſiſtency; and yet all this boiling would only reduce it to a thick clammy ſubſtance; but to turn it to grain they pour in ſome lime-water, on which the ſugar begins to riſe up with a turbulent and ungovernable fury, occaſioned by the fermentation of the liquor from the lime-water and the vehement heat of the fire; when, to prevent its running over, they throw in a ſmall piece of tallow no bigger than a nut, which ſoon makes it fall. The liquor is at length emptied into a cooler, where it remains till it is fit to be potted. The pots are wide at the top, they taper downwards, and a hole is left for the molaſſes to drain. In refining the ſugar, the firſt degree of pureneſs is permitting the molaſſes to drain away with the top of the pot open, by which means the air hardens the ſugar, before it has time to refine by ſeparation. The ſecond degree is procured by covering the pots at the top with clay; the firſt requires but one month to refine, and the other four.

We ſhall now deſcribe the principal trees, and ſhall begin with the pimento, which produces Jamaica pepper, or allſpice. It is as thick as a man's thigh, and riſes ſtraight above thirty feet, covered with a very ſmooth ſkin of a grey colour: it is branched out on every hand, having the end of its twigs ſet with leaves of ſeveral ſizes, the largeſt being four or five inches long, and two or three broad in the middle, whence it decreaſes in both extremes ending in a point. The ends of the twigs are branched into bunches of flowers, each ſtalk ſuſtaining a flower bending back, within which bend are many ſtamina of a pale green colour; theſe flowers have a branch of crowned berries, the crown being made up of four ſmall leaves, at firſt greeniſh; but when ripe is black, ſmooth, and ſhining, containing in a moiſt green aromatic pulp two large ſeeds ſeparated by a membrane. This tree grows in all the hilly parts of the iſland; but chiefly on the north ſide. It flowers in June, July, and Auguſt, and the fruit ſoon ripens. There is no difficulty in curing the pimento, or Jamaica pepper: they climb the trees, and pull the green unripe fruit, which they expoſe to the ſun till it becomes of a brown colour, and is fit for the market. According to Sir Hans Sloane, this is the beſt, the moſt temperate, mild, and innocent of all ſpices.

The body of the cacao, or chocolate-nut tree, is commonly about four inches in diameter, and it is about twelve from the ground to the top of the tree; the chocolate-nuts grow in pods, or long ſhells, ſhaped like a cucumber, each having three, four, or five kernels of about the ſize of cheſnuts, ſeparated from each other by a pleaſant refreſhing white ſubſtance, nearly of the conſiſtence of the pulp of a roaſted apple, moderately ſharp and ſweet. A bearing tree generally yields from two to eight pounds of nuts a year. The manner of curing them is to cut them down when ripe, and lay them in a heap to ſweat three or four days in the pods; after this the pods are cut, the nuts taken out, put in a trough, and covered with plantain leaves, where they ſweat again about ſixteen or twenty days. After this they are put to dry three or four weeks in the ſun, and then they become of a reddiſh dark colour. The pods grow only out of the body, or great limbs and boughs, and at the ſame time there are bloſſoms, with young and ripe fruit on the ſame tree.

The wild cinnamon is about twenty or thirty feet high, having many branches and twigs hanging downward, which form a very handſome top. The bark conſiſts of two parts, one outward and another inward; the outward is thin, of a whitiſh grey colour, and of an aromatic taſte: the inward bark is much thicker than cinnamon, paler, and of a much more biting and aromatic taſte, ſomething like that of cloves. The leaves ſhoot out near the ends of the twigs without any order, ſtanding on foot ſtalks, each of them two inches in length, and one in breadth. They are of a yelloviſh green colour, and are ſmooth and ſhining, without any inciſures about their edges. The ends of the twigs are branched into bunches of ſcarlet or purple flowers, which falling off, are ſucceeded by cluſters of roughiſh green berries, of the ſize of a large pea, that contain a pale green thin pulp, and four black ſhining ſeeds of an irregular figure. All the parts of this tree, when freſh, are very hot and aromatic; but the inward bark of the tree is what is chiefly in uſe both in the Engliſh plantations in the Weſt Indies and in Europe, and it is eaſily cured by only cutting off the bark, and letting it dry in the ſhade. The ordinary ſort of people in the Weſt Indies uſe it inſtead of all other ſpices, it being thought very good to conſume the immoderate humidity of the ſtomach, to help digeſtion, and expel wind. Rum loſes its diſagreeable ſmell if mixed with this bark.

Coffee is now much cultivated here: it is a large ſhrub, with leaves of a dark green; the berries grow in great cluſters, and one buſh will produce ſeveral pounds. The berry is incloſed in a fine ſcarlet pulp, which is too luſcious to be palatable; however, many eat it. When it is ripe it turns black, and then they gather the fruit, ſeparate the berries from the huſk, and expoſe them to the ſun till they are well cured and fit for the market.

Here are alſo the cabbage-tree, the cedar, and the maſtic tree, which grow to a great height; the mahogony tree, the cotton tree, the manchineel, and a great number of others. The iſland likewiſe abounds in abundance of dyers woods, as fuſtic, red-wood, logwood, and others.

Among the drugs and medicinal herbs are guaiacum, china root, ſarſaparilla, caſſia, vanilloes, ginger, &c. Ginger ſhoots forth blades from its root not unlike thoſe of wheat. The ſtalk ſeldom exceeds eighteen inches in height; from its ſides grow ſharp-pointed leaves about five inches long, the extremity of the ſtalk ending in a ſoft pointed ſpire. When the plant is dug up, the roots are races of ginger, which are ſcraped clean, and dried in the ſun. The uſual time of planting this root is in May and June, and of digging it up in February and March.

Among the animals are the land and ſea-turtle, and the alligator. Here are all ſorts of fowl wild and tame, and in particular more parrots than in any of the other iſlands; beſides parrokeets, pelicans, ſnipes, teal, Guinea hens, geeſe, ducks, and turkies; the humming-bird, and a great variety of others. The rivers and bays abound with fiſh.

With respect to the reptiles and insects, the mountains breed numberless adders and other noxious animals, as the fens and marshes do the guana and galliwasp; but these last are not venomous. Among the insects are the ciron, or chegoe, which eats into the nervous and membranous parts of the flesh of the negroes, and the white people are sometimes plagued with them. They get into the toes and eat the flesh to the very bone. These insects get into any part of the body, but chiefly the legs and feet, where they breed in great numbers, and shut themselves up in a bag. As soon as ever a person feels them, which is not perhaps till a week after they have been in the body, they pick them out with a needle or the point of a penknife, taking care to destroy the bag entirely, that none of the breed, which are like nits, may be left behind.

SECT. VI.

The Food, Dress, Buildings, Learning, Coin, Distempers, Manners, and Customs of the Inhabitants of Jamaica; their Treatment of their Servants, and their Cruelty to their Slaves.

THE common bread here is plantain, yams, and cassava; the first is of an oblong form, grows in clusters on the tree, and when pulled green and roasted eats very deliciously. The yams are a kind of potatoe, but of a much larger size, some of them weighing several pounds. Cassava is the root of a shrub taken and squeezed, the juice being a mortal poison, though when properly prepared it is very wholesome and agreeable food; when dry it is grated and put in water, where it stands a considerable time; the water being poured off, and the flour dried, it is made into cakes, and baked on a griddle over the fire. These cakes are white and crisp, and are preferred by the Creoles to any other bread whatever. These several kinds of food are not peculiar to this island, since they are eaten in most of the other islands and on the continent of North America. They do not want flour, for this they obtain from New England and other of our northern colonies. In every house they have an oven, and bake as they find occasion.

There are such plenty of hogs, that many plantations have several hundreds of them, and their flesh is exceeding sweet and delicate. Their beef, however, is tough and lean; but the mutton and lamb are tolerable; however, the cattle bred on the island are but very few. The sheep have their wool resembling the hair of a goat, and they seem to be of a larger size than ours. They have variety of wild-fowl, as well as common poultry; and the tortoise, or turtle caught on the coast are much admired. They have also salt cod from Newfoundland, and a great deal of salt beef from Ireland and the plantations on the continent, for the servants are seldom allowed fresh provisions.

The common drink for persons in affluent circumstances is Madeira wine mixed with water; while those of inferior rank drink rum punch, which being frequently drank to excess, has obtained the name of kill-devil; for thousands lose their lives by it, especially those who are just come to the island; for they cannot drink it to excess without exposing themselves to imminent danger; as by heating the blood, it brings on fevers, which in a few hours send them to the grave. They have also ale and claret, but they are extravagantly dear.

With respect to dress, the heat renders many cloaths insupportable, and therefore the men generally wear only thread stockings, linen drawers, a vest, a handkerchief tied round the head, and a hat upon it. Wigs are never used but on Sundays, or in court time, and then gentlemen appear very gay in coats of silk, and vests trimmed with silver. The servants wear a coarse linen frock, which buttons at the neck and hands, long trowsers of the same, a checked shirt, and no stockings. The negroes generally go naked, except those who attend gentlemen, who take care to have them dressed in their own livery.

The ladies make as gay an appearance as any-where in Europe; they dress as rich, and appear with as good a grace. Their morning habit is a loose night-gown, carelessly wrapped about them; before dinner they put off their dishabille, and show themselves in all the advantage of a rich, neat, and becoming dress. The servant-maids have generally a cotton or striped Holland gown, and plain head-cloaths. Many of the negro women in the country go quite naked; for they do not know what shame is, and are surprized at an European's bashfulness; but in the towns they are obliged to wear a kind of petticoat, and some of them are neatly dressed.

The gentlemen's houses are generally built low of one story, and consist of five or six handsome apartments beautifully lined and floored with mahogany; they have generally a piazza, to which is an ascent by several steps, and this serves as a screen against the heat. In the towns are several houses two stories high; but this is disapproved of, because they are seldom known to stand the shock of an earthquake, or the fury of a storm. The negroes have nothing but a parcel of poor miserable huts built with reeds.

There are few gardens that deserve notice; the chief curiosities they produce are English peas, cabbages, some kinds of European fruits, and others peculiar to the climate. The apple tree seldom comes to any perfection, and bears but a very few years; the same may also be said of other fruits that thrive with us: indeed the plants and fruits which flourish there would alone be sufficient to render them more delightful than can be imagined; but they despise the orange, the lemon, the cacao, and pomegranate; and prefer to the fine shade and fragrance of these a number of shrubs that are of no manner of use.

Learning is here at a low ebb: there are indeed a few gentlemen well versed in literature; but the generality seem to have a greater affection for gaming than for useful learning. Indeed those whose fortunes can allow it, frequently send their children to Great Britain, where they have the advantage of a polite and liberal education; but in general a boy, till he is seven or eight years of age, spends his time with the servants and negroes, acquires their broken way of talking, and their manner of behaviour. He then, perhaps, goes to school; but young master must not be corrected; if he learns it is well, if not it cannot be helped. After learning to read he goes to the dancing-school, commences beau, and then visits and rakes with his equals. Some of the ladies read; they are all fond of dancing, but take little care to improve their minds.

The current coin is entirely Spanish, and English money is seldom seen, except in the cabinets of the curious. There is no place perhaps where silver is so plentiful; they use no copper, and the lowest piece is a ryal, which here passes for seven-pence halfpenny; but a half-penny in Britain will go farther. You cannot dine for less than a piece of eight, and the common rate of boarding is three pounds a week. The difference between their money and British is twenty-five per cent. thus seventy-five pounds sterling make one hundred pounds Jamaica currency.

The common distempers here are high fevers and the belly-ach. The fevers are generally extremely violent, and a few hours wil carry off the person afflicted by this disorder. Few miss it on their first arrival, and for this reason many die as soon as they come to Jamaica. The belly-ach, or dry-gripes, is perhaps the severest pain that can be endured; it frequently takes away the use of their limbs, which are never recovered. The common remedies for this disease are gentle doses of physic and clysters. After they are somewhat recovered, the cold bath proves of great use in restoring them to their former vigour. The physicians here generally make fine estates, and Jamaica has had several of them who have made a considerable figure in the learned world.

This island contains three sorts of inhabitants, masters, servants, and slaves. Some of the gentlemen are extremely polite, and use their inferiors with a great deal of good nature. However, most of them have a haughty disposition, and require great submission; but a stranger, who knows how to apply to their humour, generally gets into good business; yet, those who are so unfortunate as to mistake it, may look for business in another place.

The ſervants who behave well are reſpected and encouraged; thoſe who are found honeſt, and worthy of their truſt, ſometimes not only dine on the ſame proviſions with their maſters, but wear as good cloaths, are allowed a horſe when they go abroad, and a negro boy to attend them. But others, who are either ſtupid or roguiſh, are hardly uſed, often put in the ſtocks, and beat very ſeverely: their ſalt proviſions are weighed out, and they have nothing but what the law obliges the maſter to give. The ſervants labour is not very hard, it being much leſs than that of the day-labourers in Great Britain. Thoſe who have no trade, by which they can be of ſervice to their maſter, are only employed in looking after the negroes at work, or in overſeeing the boiling of the ſugar.

The condition of the blacks is indeed much worſe, their ſervitude being perpetual, and they are obliged to toil for the benefit of others without the leaſt advantage to themſelves, and the moſt trivial error is puniſhed with a terrible whipping. "I am inclined to touch the hard-"ſhips which theſe poor creatures ſuffer in the tendereſt "manner, (ſays our author, who ſeems to be a perſon "of judgment and candor) from a particular regard which "I owe to many of their maſters; but I cannot conceal "their ſad circumſtances entirely. I have ſeen ſome of "them ſcourged in the moſt cruel manner for no other "reaſon, but to ſatisfy the brutiſh pleaſure of an over-"ſeer, who has their puniſhment moſtly at his diſcretion. "I have ſeen their bodies all in a gore of blood, the ſkin "torn off their backs with a cruel whip, beaten pepper "and ſalt rubbed in the wounds, and a large ſtick of "ſealing-wax dropped leiſurely on them. It is no won-"der if the horrid pain of ſuch inhuman tortures incline "them to rebel. At the ſame time it muſt be confeſſed, "that they are generally perverſe, which is owing to "the many diſadvantages they lie under, and the bad "example they daily ſee." We could wiſh that it was poſſible to diſprove this account. There are no doubt many perſons of humanity in Jamaica; but when the laſh is committed to abandoned wretches inſenſible to humanity, and who have been tranſported from England for their crimes, it cannot be wondered at, that wretches like theſe, when raiſed to power, ſhould prove ſavage and inhuman tyrants.

They, however, are not the only perſons guilty: the laws themſelves are in the extremeſt degree inhuman, and no countty in the world exceeds them in the cruel methods by which they put theſe unhappy negroes to death. A rebellious black, or he that twice ſtrikes a white man, is condemned to the flames: he is carried to the place of execution, and chained flat on his belly, with his legs and arms extended; then fire is ſet to his feet, and he is burnt gradually up. Others they ſtarve to death, with a loaf hanging before their mouths. "I have ſeen theſe "unfortunate wretches, ſays our author, gnaw the fleſh "off their ſhoulders, and expire in all the frightful "agonies of one under the moſt horrid tortures. Per-"haps indeed, he adds, ſuch ſeverities may be in ſome "ſort excuſed, when we conſider the ſtate of the coun-"try, and how impoſſible it would be to live amidſt ſuch "numbers of ſlaves, without watching their conduct "with the greateſt ſtrictneſs, and puniſhing their faults "with the utmoſt ſeverity." *A new Hiſtory of Jamaica in thirteen Letters to a Friend.*

But ſurely ſuch inhumanity can be in no caſe neceſſary. We cannot here help borrowing the words of the judicious author of a work lately publiſhed, entitled, *An Account of the European Settlements*, who, after obſerving, that, notwithſtanding the great care taken to make them propagate, the ill treatment they receive ſo ſhortens their lives, that inſtead of encreaſing by the courſe of nature, many thouſands are annually imported to ſupply the place of thoſe who die by the hardſhips they receive, then adds, "I know "that they are ſtubborn and untractable for the moſt "part, and that they muſt be ruled with a rod of iron. "I would have them ruled, but not cruſhed with it. I "would have a humanity exerciſed which is conſiſtent "with ſteadineſs. And I think it clear, from the whole "courſe of hiſtory, that thoſe nations which have be-"haved with the greateſt humanity to their ſlaves, were "always beſt ſerved, and ran the leaſt hazard from their "rebellions. And I am the more convinced of the ne-"ceſſity of theſe indulgencies, as ſlaves cannot go through "ſo much work as freemen. The mind goes a great way "in every thing; and when a man knows that his labour "is for himſelf, and that the more he labours the more "he is to acquire, this conſciouſneſs carries him through, "and ſupports him beneath the fatigues under which he "would have otherwiſe ſunk.

"The principal time I would have reſerved for the "indulgence I propoſe to be granted to the ſlaves is Sun-"day, a day which is profaned in a manner altogether "ſcandalous in our colonies. On this day I would have "them regularly attend at church; I would have them, "particularly the children, carefully inſtructed in the "principles of religion and virtue, and eſpecially in the "humility, ſubmiſſion, and honeſty which become their "condition. The reſt of the day might be devoted to in-"nocent recreation. To theſe days of relaxation, and "with the ſame exerciſes, ſhould be added ſome days in "the grand feſtivals of Chriſtmas, Eaſter, and Whitſun-"tide; and perhaps four or five days in the year beſides. "Such methods would by degrees habituate their maſters "not to think them a ſort of beaſts, and without ſouls, "as ſome of them do at preſent, who treat them accord-"ingly; and the ſlaves would of courſe grow more ho-"neſt, tractable, and leſs of eye-ſervants; unleſs the "ſanction of religion, the precepts of morality, and all "the habits of an early inſtitution, be of no advantage "to mankind.

SECT. VII.

The Manners and Cuſtoms of the Negroes.

THE owners of theſe ſlaves ſet aſide for each a ſmall parcel of ground, and allow them the Sundays to cultivate it: in it they generally plant maize, Guinea corn, plantains, yams, cocoas, potatoes, &c. This is the food which ſupports them, unleſs ſome of them, who are more induſtrious than others, raiſe a ſtock of fowls, which they carry to market on the Sundays, the only market-day in Jamaica, and ſell for a little money, with which they purchaſe ſalt beef, fiſh, or pork, to make a diſh which they call pepper-pot.

Theſe ſlaves, on their firſt arrival from the coaſt of Guinea, are expoſed naked to ſale: they are then generally very ſimple and innocent creatures, but they ſoon become roguiſh enough; and when they come to be whipped, excuſe their faults by the example of the whites.

Their notions of religion are very inconſiſtent, and vary according to the different countries from which they come; but they join without diſtinction in their ſolemn ſacrifices and gambols. They generally believe that there are two gods, a good and a bad one: the good god they tell you lives in the clouds, and is very kind and favourable to mankind; for it was he that taught their fathers to till the ground, and to hunt for their ſubſiſtence: while the evil god ſends ſtorms, earthquakes, and all kinds of miſchief. Hence they love the former, and fear the latter. They have no idea of heaven, farther than the pleaſure of returning to their native country, whither they believe every negro goes after death. This thought is ſo agreeable, that it cheers the poor creatures, and renders the burthen of life eaſy, which would otherwiſe be quite intolerable. They look on death as a bleſſing, and it is ſurprizing to ſee with what courage and intrepidity ſome of them meet it; they are quite tranſported to think their ſlavery is near an end, that they ſhall reviſit their happy native ſhores, and ſee their old friends and acquaintance. When a negro is about to expire, his fellow-ſlaves kiſs him, wiſh him a good journey, and ſend their hearty good wiſhes to their relations in Guinea. They make no lamentations; but with a great deal of joy inter his body, firmly believing he is gone home and happy.

When any thing about a plantation is miſſing, they have a ſolemn kind of oath, which the eldeſt negro always adminiſters, and is by them accounted extremely ſacred; but this they never take without the expreſs command of their maſter or overſeer. They then range themſelves

ſelves in the ſpot of ground appropriated for the burying-place of the negroes, and one of them opens a grave, when he who acts the prieſt takes a little of the earth, and puts it into every one of their mouths, and they imagine that if any has been guilty their belly will ſwell and occaſion their death.

None of them are allowed to touch any arms, unleſs by their maſter's command; or to go out of the bounds of the plantation to which they belong, without a ſpecial permit ſigned by their owner or the chief overſeer. They are kept in ſuch awe, that they are afraid to let even the leaſt thought of liberty appear; and when they ſee the whites muſter and exerciſe, they are ſtruck with terror. This indeed is not the caſe with the Creolian negroes, who all of them ſpeak Engliſh, and are ſo far from fearing a muſter, that they are very familiar with it, and can exerciſe extremely well.

SECT. VIII.

The Diviſions and principal Towns of Jamaica, its Government, and Trade; with a particular Account of the Log-wood Cutters in the Bay of Honduras, and the Trade carried on with the Spaniards in America.

THE whole iſland is divided into nineteen diſtricts, or pariſhes, each of which ſends two members to the aſſembly, and allows a competent maintenance to a miniſter. Anciently Port Royal was the capital of the iſland; it ſtood upon the very point of a long narrow neck of land, which towards the ſea formed part of the border of a very noble harbour of its own name. In this harbour above a thouſand ſail of the largeſt ſhips could anchor with the greateſt convenience and ſafety; and the water was ſo deep at the quay of Port Royal, that veſſels of the greateſt burthen could lay their broad-ſides to the wharfs, and load and unload at very little expence or trouble. This convenience weighed ſo much with the inhabitants, that they choſe this ſpot for their capital, though the place was a hot dry ſand, that did not produce one of the neceſſaries of life, and not even freſh water. However, this advantageous ſituation rendered it a conſiderable place, and it contained two thouſand houſes very handſomely built, and that were lett at as high a rent as thoſe of London. It grew to all this in about thirty years time, and there were few places in the world which for the ſize could be compared to this town for trade, wealth, and an entire corruption of manners.

However, on the ninth of June, 1692, an earthquake, which ſhook the whole iſland to its foundations, overwhelmed this city, and buried nine-tenths of it eight fathoms under water. This earthquake not only demoliſhed the city, but made a terrible devaſtation all over the iſland, and was followed by a contagious diſeaſe which was near giving the finiſhing hand to its deſtruction.

The city was rebuilt after the earthquake, but it was again deſtroyed; for ten years after a terrible fire laid it in aſhes: yet the extraordinary convenience of the harbour induced the inhabitants to rebuild it once more. But in 1722 one of the moſt dreadful hurricanes on record reduced it a third time to a heap of rubbiſh. Warned by theſe extraordinary calamities, the cuſtom-houſe and public offices were removed from thence, and the principal inhabitants ſettled on the oppoſite ſide of the bay at the town of Kingſton. Port Royal has, however, three or four handſome ſtreets, ſeveral croſs lanes, a fine church, an hoſpital for ſick and diſabled ſoldiers, and a yard for the king's naval ſtores, with conveniences for the workmen employed about his majeſty's ſhips of war. The harbour is guarded by one of the ſtrongeſt forts in the Weſt Indies, which has a line of near a hundred pieces of cannon, and a garriſon of ſoldiers maintained at the expence of the crown.

Kingſton is commodiouſly ſeated for freſh water, and all manner of accommodations. The ſtreets are broad, perfectly ſtraight, and cut each other at equal diſtances and right angles. It is about a mile long, and contains above a thouſand houſes, many of them handſomely built, though low, with porticos, and every convenience for a comfortable habitation in that climate. Here the inferior courts ſit, and the receiver-general, ſecretary, and ſurveyor, are obliged to keep officers. It has one or two churches, the Jews have two ſynagogues, and the Quakers a meeting-houſe. The fortifications of the harbour were greatly improved by the late governor Knowles.

Not far from Kingſton the river Cobre, a conſiderable but not navigable ſtream, falls into the ſea; and upon its banks ſtands St. Jago de la Vega, or Spaniſh Town, the ſeat of the government, and the place where the courts of juſtice are held, and conſequently the metropolis of Jamaica, though it is inferior in ſize to Kingſton. However, though it has leſs buſineſs, it has more gaiety. Here reſide many perſons of large fortunes, who make a very ſplendid figure. It is ſurprizing to ſee the number of coaches and chariots perpetually plying, beſides thoſe belonging to private perſons. Here is a regular aſſembly, a theatre, in which plays are acted, and it being the reſidence of the governor, and the principal officers of the government, who have very profitable places, all conſpire with the genius of the inhabitants, which inclines them to an oſtentatious and expenſive way of life, to render it a very ſplendid and agreeable place.

We ſhall now proceed to give a ſummary account of the government of Jamaica. The king of Great Britain, as in all the other royal governments, appoints the governor and council, while the repreſentatives of the people are choſen by the freeholders. The governor is captain-general, admiral, and chancellor of the iſland; has power to iſſue out all ſorts of commiſſions; to ſummon and diſſolve aſſemblies; to make counſellors; to pardon all crimes, except treaſon or murder, and even for thoſe to grant a reprieve; to place and diſplace all officers who are not by patent: in a word, to act with ſovereign authority under his majeſty; and has a negative voice in all acts of the aſſembly. As he is chancellor, he is impowered to grant adminiſtrations and executorſhips of the eſtates of perſons dying inteſtate; and this laſt brings in a conſiderable profit. His ſtanding ſalary is two thouſand five hundred pounds a year; the aſſembly vote the governor as much more, and this, with the other great profits of his office, make it in the whole little inferior to ten thouſand pounds a year.

The council, who are twelve in number, are generally men of the beſt eſtates and quality in the country, and are appointed by letters of mandamus from the king. On the death or diſmiſſion of any of theſe, the governor nominates others to ſupply their places. It is their duty to adviſe and aſſiſt the governor, and even to be a check upon him, if he exceeds the bounds of his commiſſion. This body forms the upper houſe in the aſſembly, where it has the ſame power as the houſe of peers in England.

The grand court, which takes cognizance of all civil pleas, as well as of crimes that merit corporal puniſhment, ſits four times in the year. Their ſeſſion is limited to twenty-one days, during which they frequently diſpatch a great deal of buſineſs. The chief juſtice has ſix aſſiſtants, who are generally men of the greateſt knowledge, and of the faireſt characters. There are many inferior courts, who decide cauſes of leſs than twenty pounds value, and juſtice is generally impartially diſtributed, and without delay.

The militia is under the direction of officers appointed by the governor, and all from ſixteen to ſixty are obliged to enliſt.

The revenue of the iſland is reckoned to amount to ſeventy thouſand pounds, out of which are paid a great number of public officers, who have very large ſalaries.

The trade of Jamaica principally conſiſts in the following articles: firſt, ſugar, of which they imported in 1753 twenty thouſand three hundred and fifteen hogſheads, ſome ſo large as to be a ton weight; which cannot be worth leſs in England than four hundred twenty-four thouſand ſeven hundred and twenty-five pounds ſterling, moſt of which comes to London and Briſtol; and ſome part of it is ſent to North America, in return for the corn, peas, beef, pork, cheeſe, plank, ſtaves, pitch, and tar, which they obtain from thence. The ſecond is rum, of which they export about four thouſand puncheons. The third is molaſſes, in which they make a great

great part of their returns for New England, where there are great diſtilleries. Theſe are all the produce of their grand ſtaple the ſugar-cane. The fourth is cotton, of which they ſend out two thouſand bags. The fifth are various drugs, as cacao, coffee, a conſiderable quantity of pimento, ginger, ſweetmeats, drugs for dyers and apothecaries, mahogany, and manchaneel plank. Some of the moſt conſiderable articles of their trade are with the continent of New Spain and Terra Firma; for in the former they cut great quantities of logwood, and both in the former and latter carry on an extremely profitable trade in negroes, and all the kinds of European goods carried thither from Spain by the flota.

Both the logwood and contraband trade have been the ſubject of much contention, and even the cauſe of a war between England and Spain. The cutting of logwood in the bay of Honduras on the ſouthern ſide of the peninſula of Jucatan has been long claimed as a right by England, and this privilege was confirmed to his Britannic majeſty's ſubjects in the moſt expreſs terms by the late treaty of peace in 1763.

The logwood cutters are chiefly compoſed of vagabonds and fugitives from all parts of North America, and their way of life is ſuitable. They live in a kind of lawleſs manner, though they elect one among them whom they call their king, and to him pay as much obedience as they think fit. The country is low and extremely marſhy; the air moleſted by muſketoes, and the water dangerous with alligators; yet a life of licentiouſneſs, a plenty of rum, large gains, and a want of thought, have reconciled them both to the hardſhips of their employment and the unwholeſomeneſs of the climate. They go always well armed, and are ſaid to amount to about one thouſand five hundred men. This trade in ſome years employs near ſix tons of ſhipping, finds employment for a number of ſeamen, conſumes a great deal of our manufactures, and the value of returns are ſaid to be about ſixty thouſand pounds ſterling a year. This trade is generally carried on by veſſels from New England, New York, and Penſylvania, who take up the goods they want in Jamaica.

There is ſtill a more profitable trade carried on between this iſland and the Spaniſh continent, which has alſo been the cauſe of much diſpute between the courts of England and Spain. A ſhip from Jamaica having taken in negroes, and a proper aſſortment of goods there, proceeds in time of peace to a harbour called the Grout, about four miles from Porto Bello. A perſon who underſtands Spaniſh is directly ſent aſhore to give the merchants of the town notice of the arrival of the veſſel; the ſame news is likewiſe carried with great ſpeed to Panama, from whence the merchants ſet out diſguiſed like peaſants, carrying jars almoſt filled with ſilver; but the top covered with meal, to deceive the officers of the revenue. Here the ſhip frequently remains trading five or ſix weeks together. The Spaniards uſually come on board, leave their money, and take their negroes, and their goods packed up in parcels fit for one man to carry, after they have been firſt handſomely entertained on board, and received proviſions ſufficient for their journey home. If the whole cargo is not diſpoſed of here they bear off eaſtward to the Brew, a harbour about five miles from Carthagena, where they ſoon find a vent for the reſt. There is no trade more profitable than this; for they are payed in ready money, and the goods ſell higher than at any other market. It is not on this coaſt only but every where upon the Spaniſh main that this trade is carried on; nor is it by the Engliſh only, but the French from Hiſpaniola, the Dutch from Curaſſou, and even the Danes have ſome ſhare in it. However, when the Spaniſh guarda coſtas ſeize upon one of theſe veſſels, they make no ſcruple of confiſcating the cargo, and of treating the crew little better than if they were pirates.

SECT. IX.

A conciſe Hiſtory of Jamaica.

THE iſland of Jamaica was diſcovered by Columbus in his ſecond voyage, in the year 1594; his ſon Diego was the firſt European governor of the iſland, and built the city of St. Jago de la Vega, now Spaniſh Town. On the firſt arrival of the Spaniards the Indians appeared in arms, and bravely reſolved to maintain their liberties againſt theſe bold intruders; and had certainly been ſucceſsful, at leaſt for a while, had not the Spaniards at length taken the advantage of their ſimple natures, and deluded them by ſpecious ſhews of peace and well contrived proteſtations: but they in a ſhort time felt the diſmal effects of giving faith to the Spaniards, who were no ſooner in a condition of putting their bloody deſigns in practice, than they began a horrid maſſacre, murdered, butchered, and deſtroyed, in a few years, to the amount of ſixty thouſand of the natives, and ſcarce left one alive. Some took refuge in the woods, and retired to the caves and faſtneſſes, whither they were purſued and hunted by thoſe ſavage tyrants, and cut to pieces. Before this deſolation, Jamaica was one of the beſt peopled of all the Antilles; but ſuch was the deſtructive ſlaughter which the Spaniards made, that the very name of an Indian was in a few years rooted out, and none left to preſerve the memory of that once flouriſhing people.

This iſland was poſſeſſed by the Spaniards till Oliver Cromwell being ſenſible of the advantages they obtained from their provinces in America, ſent a conſiderable ſquadron of men of war, commanded by the generals Penn and Venables, in 1654, to take the fine iſland of Hiſpaniola. This they attempted, but being repulſed with loſs, the principal commanders fearing to return to England without ſucceſs, wiſely reſolved to try what could be done againſt the iſland of Jamaica, before the inhabitants of that iſland could receive encouragement by the news of their defeat in Hiſpaniola.

The fleet and troops ſoon arriving at Jamaica, they ſeverely puniſhed the officers who had ſhewn an ill example by their cowardice, and iſſued orders, that if any man attempted to run away, the next man to him ſhould put him to death; and if he failed to do it, he ſhould be liable to be tried for his life. Fortified with theſe reſolutions, the troops were no ſooner landed, than advancing towards the fort, they made themſelves maſters of it with little loſs, and the next morning, when the ſun aroſe, marched towards a ſavanna near the town, when ſome Spaniards advancing to meet them, deſired to treat. But this Venables refuſed, unleſs they would ſend his men a conſtant ſupply of proviſions, of which they were in great want. To this the Spaniards conſented, and having performed their promiſe, the following articles were agreed upon: That all the forts arms, ammunition, and neceſſaries of war, with all the ſhipping in the harbours of the iſland, and all wares, merchandize, &c. ſhould be delivered up for the uſe of the protector and the commonwealth of England. That all the inhabitants of the iſland, except ſome that were particularly named, ſhould have their lives granted. That thoſe who choſe it ſhould have leave to ſtay, and the others be carried to New Spain, or ſome other of his Catholic majeſty's American dominions; together with their apparel, books, and papers. That the commiſſion officers alone ſhould be permitted to wear their rapiers and poniards; and that the artificers and meaner ſort of people ſhould be permitted to remain in the iſland, and enjoy their goods, provided they conformed to the laws that ſhould be eſtabliſhed. Thus the whole iſland was reduced, and the conqueſt was confirmed to Great Britain by a ſubſequent treaty. However, many of the Spaniſh negroes retiring to the mountains, maintained their ground there, and being afterwards joined by ſeveral other fugitives from the Engliſh plantations, became very formidable; nor could they be ſubdued, though a body of regular troops were ſent over to the aſſiſtance of the planters. However, governor Trelawny entering into a treaty with them, it was agreed that they ſhould remain an independent ſtate, and be governed by their own magiſtrates, on condition of their harbouring no more fugitives. They are ſaid now to live in a very friendly manner with the Engliſh, and, in caſe of an invaſion, ſome imagine they would contribute greatly to the defence of the iſland; while others ſuppoſe that theſe negroes are not yet to be truſted, and for this reaſon ſome of the beſt lands in the iſland which lie in their neighbourhood are not cultivated.

After the Reſtoration the Spaniards ceded Jamaica to the king of England. Some of the troops employed in its reduction had ſettled there; many of the royaliſts, who had been uneaſy at home, had ſought an aſylum in this iſland, and not a few planters from Barbadoes were invited thither by the extraordinary fertility of the ſoil, and the other advantages which it afforded. The latter taught the former ſettlers the manner of raiſing the ſugar-cane, and making ſugar; for at firſt they had wholly applied themſelves to the raiſing of cacao, as the Spaniards had done before them. It was very happy for them that they fell into this new practice, for the groves of the cacao trees planted by the Spaniards began to fail, and the new plantations did not anſwer.

What gave freſh life to this ſettlement, and at once raiſed it to a ſurprizing pitch of opulence, which it has ſince hardly equalled, was the reſort thither of the pirates called the Buccaneers; men who fought with the moſt deſperate bravery, and ſpent their plunder with the moſt laviſh extravagance, were welcome gueſts in Jamaica. They often brought three or four hundred thouſand pieces of eight at a time, which were immediately ſquandered in exceſſive gaming, wine, and women. Thus vaſt fortunes were made, and the returns of treaſure to England were prodigiouſly great. By this means the inhabitants had raiſed ſuch funds, that when the ſource of this wealth was ſtopped up by the ſuppreſſion of the pirates, they were enabled to turn their induſtry into better channels; and they increaſed ſo faſt, that it was computed there were ſixty thouſand whites and a hundred and twenty thouſand negroes in the iſland.

But while the inhabitants were filled with the gayeſt hopes and wallowing in riches, they ſuffered one of the moſt violent earthquakes that perhaps was ever felt. Of this we have taken notice in treating of the deſtruction of Port Royal, in which city two thouſand whites and blacks periſhed. It will be proper here to add, that the houſes all over the iſland were thrown down, and the ſurviving inhabitants forced to dwell in huts. Two great mountains falling ſtopped the courſe of a river, that was dry from that place for a whole day, by which means vaſt quantities of fiſh were taken up, to the great relief of the diſtreſſed. An high mountain was ſplit, and part of it falling into a level plain, covered ſeveral ſettlements; and almoſt all the ſhips and ſloops were loſt in the harbour: but we have not room to deſcribe the terrors of this dreadful ſcene. A general ſickneſs ſoon followed, which alſo carried off a great number of the inhabitants.

The enemies of Great Britain were not idle ſpectators of ſuch a dreadful event; the French propoſed to make an eaſy conqueſt of a ruined iſland, where poverty, ſickneſs, and every hardſhip now prevailed; ſo much was Jamaica changed. They invaded the iſland with firm hopes of ſucceſs: but though the inhabitants had ſo many difficulties to ſtruggle with, they ſtill retained their priſtine ſpirit and native courage; the invaders were repulſed, and only eighteen of them left to carry the news of their defeat. Theſe loſſes ſeem not yet to have been ſufficiently repaired. It is ſaid that at preſent the white inhabitants ſcarcely exceed twenty-five thouſand ſouls, and yet the blacks are computed to amount to near ninety thouſand, an amazing diſproportion!

SECT. X.

Of the CARIBBEE ISLANDS.

A conciſe Deſcription of Anguilla and Barbuda; their Situation, Extent, and Produce.

WE now proceed to ſuch of the Caribbee Iſlands as are ſubject to Great Britain. This name ſeems to have been given to ſome of theſe iſlands before they became ſubject to the Spaniards; who, to colour over their maſſacring the inhabitants, pretended that the name of Caribbee ſignifies cannibals, and that the inhabitants of all theſe iſlands were eaters of human fleſh: but it does not appear that there ever was a nation either here, or in any part of the American continent, that deſerved to have the odious and horrid name of man-eaters. Eleven of theſe iſlands, with the Granadillos, all of which are ſmall, and ſome of them very inconſiderable, belong to the Engliſh; theſe are Anguilla, Barbuda, St. Chriſtopher's, Nevis, Antego, or Antigua, Montſerrat, Dominica, St. Vincent, Barbadoes, Tobago, Granada, and the Granadines, or Granadillos. The firſt ſix, with Porto Rico, Guadaloupe, &c. are alſo termed Leeward Iſlands; and the laſt, with Martinico, &c. are named Windward Iſlands.

We ſhall begin with Anguilla, or Snake Iſland, a long and narrow tract winding ſomewhat in the manner of a ſnake, whence it received its name. This, which is the moſt northerly of the Caribbee Iſlands poſſeſſed by the Engliſh, is ſeated in the eighteenth degree twenty minutes north latitude, and is ten leagues in length and three in breadth.

This iſland is woody, but perfectly level. Its climate is nearly the ſame with that of Jamaica. It abounds with tame cattle, with which it has been ſtocked by the Europeans; and alſo with the opoſſum, muſk-rat, alligator, and other animals common in the ſame climate. The Engliſh ſettled here in 1650, in a fruitful ſoil, where they applied themſelves to the planting of tobacco, the raiſing of corn, and the breeding of cattle, for which purpoſe they brought a ſtock with them. At preſent they chiefly ſubſiſt by huſbandry, and make a little ſugar. They are far from being remarkable for their induſtry, or their numbers; and have been frequently pillaged by the French, who in 1745 made a deſcent on the iſland, to the number of a thouſand men; when ſix hundred of them marching up to attack a breaſt-work, were ſo well received by the continual fire of a hundred men poſted there to defend it, that they were obliged to return with the loſs of a hundred and fifty men, beſides ſome of their colours and fire-arms.

Barbuda is ſeated in the ſeventeenth degree forty-ſeven minutes north latitude, and in the ſixty-firſt degree forty-five minutes weſt longitude, thirty-five miles to the north of Antigua, fifty-three north-eaſt of St. Chriſtopher's, and ninety ſouth-eaſt of Anguilla. It extends twenty miles in length, and twelve in breadth. The land is low and fertile: on the weſt ſide it has a good road well ſheltered, and clear of rocks; but from the north-weſt and ſouth-weſt points two ſhoals of ſand run above two leagues into the ſea.

This iſland produces citrons, oranges, pomegranates, Indian figs, grapes, pine-apples, the ſenſitive plant, cocoas, cotton, pepper, ginger, cinnamon, caſſia, Braſil wood, and ebony; with tobacco, indigo, maize, potatoes, yams, with other roots and drugs.

Here are plenty of cows, ſheep, goats, and fowl; the breeding of all which is the chief employment of the inhabitants, who make good profit of ſelling them to the other iſlands; the Engliſh here living much after the ſame manner as our farmers, and have no immediate trade with England. Here are likewiſe ſerpents of various kinds, ſome very large and not poiſonous, but are of ſervice in deſtroying rats, toads, and frogs; but the bite of others is incurable, if a remedy be not immediately adminiſtered.

This colony was planted as early as any of the Leeward Iſlands, except St. Chriſtopher's: but was ſo often diſturbed by the Caribbees, that the people were frequently forced to deſert their plantations; for there hardly paſſed a year in which they did not make one or two incurſions, and that generally in the night, for they durſt not attack them by day; ſo that the Engliſh grew weary of dwelling in a place where they were ſo much expoſed to the fury of the natives; and therefore deſerted the iſland: but the Caribbees diminiſhing daily in number, and the Europeans in the other iſlands increaſing, the Engliſh again poſſeſſed themſelves of Barbuda: in a few years the inhabitants amounted to five hundred, and they are now increaſed to about thirteen or fourteen hundred. It is ſubject to a gentleman of the name of Codrington, who chuſes the governor, and enjoys the ſame prerogatives as the other lords proprietors in America.

SECT. XI.

St. Christopher's.

Its Situation, Extent, Air, Soil, and Face of the Country; its Vegetables, and Animals. Its Inhabitants, and the Forts erected for their Defence, with a Deſcription of the Town of Baſſe Terre.

THE iſland of St. Chriſtopher, commonly called by our ſailors St. Kitt's, lies between the ſeventeenth degree ten minutes and the ſeventeenth degree forty minutes north latitude, and the middle of the iſland is in the ſixty-ſecond degree forty minutes weſt longitude from London, it being about ten miles to the north of Nevis, and fourteen leagues from Antigua. It extends twenty-five miles and a half in length; but its greateſt breadth is no more than ſeven.

The air is exceeding hot; but pleaſant, pure, and healthful, and agreeably tempered with cool breezes. The days and nights are almoſt equal during the whole year, and it would ſeem to be conſtant ſummer were it not for the rainy ſeaſon and the hurricanes.

In the thick woods, which are plentifully ſtocked with cabbage-trees, are ſwarms of monkies, who venture out in the night to ſteal potatoes and other proviſions. At the top of the Conorrhee hills, is a plain not three hundred yards wide, ending at the edge of a cavity of a prodigious depth, and about a mile in circumference, containing ſulphur, from which riſe continual clouds of ſteam. A furlong to the ſouth-eaſt is a large rocky hill, called Mount-Miſery, from a raſh man, who attempting to aſcend a precipice, fell backwards, and was killed. This is the higheſt point of land on St. Chriſtopher's, and it is ſaid to riſe about a mile and a half perpendicular from the ſea. In the ſulphureous cavity above-mentioned, are two or three round holes in the earth, vulgarly called the Devil's Coppers. They are two yards aſunder, and each about three feet in diameter. The reverend Mr. Smith ſays, that when he ſaw them, they boiled fiercer than ever he ſaw a ſugar-copper. On this hill, there is a great quantity of pure brimſtone, and on its top is a powder magazine.

St. Chriſtopher's is repreſented by ſome writers as one of the moſt delightful iſlands in the world. Its mountains, notwithſtanding there are dreadful rocks and thick woods between them, riſe one above another, and are adorned by rows of trees that wear a perpetual verdure, intermixed with handſome houſes covered with ſhining ſlate. The ſoil, which is light and ſandy, is not only proper for the cultivation of tobacco, but for that of ſugar, cotton, ginger, and fruit of all ſorts. It is well ſupplied with ſprings, and at the foot of the mountains on the ſouth-weſt part of the iſland has ſome hot ones proper for baths: yet in ſome places the water is ſcarce. The valleys and ſides of the hills are very fertile; but the mountains are leſs ſo; yet for the moſt part are overgrown with palmeto, cotton-trees, lignum-vitæ and other trees. There are no trees in the iſland like ours, except ſuch as originally come from hence. The ſoil abounds with maize, pine apples, prickly pears, with two ſorts of pepper; one that grows in a little red huſk about four inches in length, and the other in ſmall pods. Here are alſo maſtic and locuſt trees, bana, muſk-melons, water-melons, the papa, the manchaneel-tree, and many others. It principally abounds with ſugar-canes, and is ſuppoſed to produce about ten thouſand hogſheads of ſugar one year with another, with a conſiderable quantity of rum. The iſland alſo affords a great deal of ſalt, which is produced in a ſalt lake, ſuppoſed to contain about eighty acres, where the ſun exhaling the water during the hot weather, leaves a cruſt of ſalt at the bottom that exactly reſembles rock-cryſtal.

The animals are generally the ſame as thoſe in the other Caribbee iſlands; but the moſt remarkable of its beaſts is the rocket, a kind of lizard, whoſe ſkin reſembles a withered leaf, with yellow or blue ſpots. It has ſparkling eyes, always holds up its head, and is in perpetual motion. Its tail turns up towards its back in a circle and a half, and when purſued it puts out its tongue.

The moſt noted of the birds, beſides thoſe common to the Caribbees, are the orinoca eagle and the craw-fowl. The feathers of the former are a light grey, curiouſly diverſified with black ſpots, and the ends of the wings and tail are yellow. It attacks only ſuch birds as have crooked beaks and ſharp talons like itſelf, and always ſeizes them flying.

The craw-fowl, which is as big as a large duck, is aſh-coloured, has a great head, ſmall eyes, and a ſhort neck, under which is a craw that will hold two gallons of water. It lives upon fiſh, which it watches from trees on the ſhore, and ſometimes dives in for them above a fathom under water. It is ſo intent on its prey that it is eaſily ſhot; but is not fit for food.

Their other birds are a few ſwans, a ſmall kind of ſcreech-owls, mountain-thruſhes, noddies, ſpoon-bills, pelicans, boobies, and common pigeons, beſides two or three wild ſorts, ground-doves, humming-birds, and ſome batts.

Tho' no bees are hived, either here or in the iſland of Nevis, yet there is a great deal of honey produced by the wild-bees; but it will not make mead, on account of the warmth of the climate.

The inhabitants are computed to amount to about eight thouſand whites and eighteen thouſand negroes. When it was inhabited by the French, they dwelt nearer together than the Engliſh, who live ſcattered up and down the country for the convenience of planting; but have as fine houſes as any in America, they being of cedar, adorned with walks and groves of orange and lemon-trees.

The fortifications of the iſland are a fort erected on Brimſtone-hill, ſaid to be impregnable, and planted with forty-nine pieces of cannon. Charles-fort, which is furniſhed with forty pieces of ordnance, and a ſufficient quantity of ſtores; and Londonderry-fort, on the eaſt-ſide of Baſſe-Terre. There are alſo ſix batteries raiſed at ſo many landing-places, mounted with forty-three cannon in all.

The iſland is divided into the pariſhes of St. John, Chriſt-church, and St. Mary on the north; St. Anne, St. Thomas, and Trinity, on the ſouth-ſides; and in each is a handſome church, wainſcotted and furniſhed with pews, which, as well as the pulpit, are of ebony, cedar, red-wood, brazil, and other precious ſorts of wood, of a beautiful colour, and fragrant ſcent.

Baſſe-Terre, the capital of the iſland, is a fine town built by the French, under the cannon of their fort. The houſes are of good brick, free-ſtone, and timber; and among other buildings, are a town-houſe, an hoſpital, and a large church. They erected their caſtle on the eaſt ſide of a high mountain, ſhaded with lofty ever-green trees, about a mile and a half from the ſea. This caſtle is built of brick and free-ſtone, has very noble halls and apartments, wainſcotted with cedar, and a fine proſpect of delightful plantations of the ſugar-cane and ginger, with a long walk of lemons and orange-trees, leading to a large court before it. This caſtle, which was defended by five ſconces, mounted with cannon, has a chapel on one ſide, and on the other great ſtone ciſterns, into which water is brought by pipes under ground. Between the place and the mountains, is a large and beautiful garden, that produces the moſt delightful flowers and plants of Europe and America, and is adorned with a fountain.

The iſland has a militia conſiſting of one regiment of foot, a troop of horſe, and another of dragoons, amounting in the whole to about one thouſand three hundred and forty men.

SECT. XII.

Of the Settlement and Revolutions that have happened in the Iſland of St. Chriſtopher

ST. Chriſtopher's was diſcovered by Chriſtopher Columbus in his firſt voyage to America, who gave it this name from the figure of its mountains, there being in the upper part of this iſland a very high mountain, bearing on its ſummit another of a ſmaller ſize, as St. Chriſ-

topher

topher is painted like a giant carrying our Saviour on his back. Sir Thomas Warner, an Engliſh adventurer, and M. Deſnambuc, a French gentleman, who commanded for the French in America, arrived at St. Chriſtopher's on the ſame day, and both took poſſeſſion of the iſland in the names of their reſpective maſters. This happened about the year 1623. It was then inhabited by the Caribbees, and the Spaniards uſed to put in there in their Weſt-India voyages, to take in freſh water, they being on ſuch good terms with the Caribbees, that they ſometimes left their ſick on ſhore, of whom the natives took great care.

The above gentlemen leaving ſome of their men on the iſland, returned to their reſpective countries for recruits, when their maſters approving of their conduct, ſent them back in 1626 with ſupplies of men and proviſions, and with commiſſions to the governors of the new ſettlements. M. Deſnambuc arrived there about the month of January, 1627, with about three hundred people, after a long and ſickly voyage. Sir Thomas had as many men, and had proceeded a good way in his ſettlement before the arrival of the French. The two governors, therefore, to prevent any diſputes about the buſineſs of their reſpective territories, ſet boundaries to their ſeveral diviſions, with this particular regulation, that hunting and fiſhing ſhould be equally free to the inhabitants of both nations; that the ſalt-ponds and moſt valuable timber ſhould be in common, together with the mines and havens; they even concluded an offenſive and defenſive league againſt all their enemies, after which they proceeded with great harmony.

The Engliſh, however, receiving ſupplies of men and proviſions from London, throve better than the French; and not only became ſtrong enough to keep what they had, but to ſpare men for ſettling plantations at Nevis, of which Sir Thomas Warner took poſſeſſion, and left a ſettlement there in 1628.

The Spaniards being in the mean time alarmed at the progreſs of the Engliſh and the French, in the Caribbee-iſlands, thought the ſafety of their own plantations required their preventing thoſe nations ſettling in their neighbourhood, and therefore, the next year, ſent Frederic de Toledo with twenty-four ſhips and fifteen frigates to diſpoſſeſs the Engliſh and French of St. Chriſtopher's. Don Frederic ſeized ſome Engliſh ſhips near the iſle of Nevis, and then anchored under the cannon of a fort called Baſſe-Terre, commanded by M. Roſſey. Neither the French nor Engliſh forts were then in a condition to oppoſe ſuch an enemy. Roſſey, after a ſmall oppoſition, abandoned Baſſe-Terre, and retired to Cabes-Terre, another fort commanded by M. Deſnambuc in perſon; but neither could prevail on their men to defend themſelves there, nor to retire to the mountains, where they might have been able to oppoſe a great army; and nothing could ſatisfy them but embarking and leaving the place, and with this Mr. Deſnambuc was obliged to comply. In the mean time the Engliſh, being in great conſternation at hearing the news of Deſnambuc's retiring with his colony, ſome endeavoured to eſcape by ſea, others fled to the mountains, and all who were left, ſent deputies to treat with the Spaniards. Don Frederic, who had them now in his power, commanded all on the iſland inſtantly to depart, on pain of being put to the ſword; and to haſten their going, ſent them the Engliſh ſhips he had taken at Nevis; but theſe ſhips not having room for all the people, with their families, he conſented that thoſe who could not embark, ſhould ſtay till they could be removed. Don Frederic now weighed anchor, taking with him ſix hundred of the Engliſh who were fitteſt for his ſervice. But he was no ſooner gone than the Engliſh who were left, reſolved to go on with the ſettlement; when the French, who had gone no farther than to Antigua and Montſerrat, ſending a ſhip for intelligence to St. Chriſtopher's, and being informed that the Spaniards were gone, and the Engliſh buſy in rebuilding and planting, rejoiced at this happy and unexpected turn, and ſailing back to St. Chriſtopher's, reſumed the poſſeſſion of their former habitations.

The Engliſh now continued carrying on their colony, and encreaſed ſo faſt, that in 1632, they ſpared more men for new ſettlements at Barbuda, Montſerrat, and Antigua, and at the ſame time had good houſes at St. Chriſtopher's, with wives and families; but few of the French married, or took much pains about furniſhing themſelves with many of the accommodations of life. M. Deſnambuc died about the year 1637, and an American company, which he had cauſed to be ſet up in France, continued only till the year 1661, when their ſhare of this and the other iſlands was ſold to the knights of Malta, of whom in 1664, they were bought by the Weſt-India company. Sir Thomas Warner did not long ſurvive the French governor; but, before his death, the colony was greatly encreaſed.

About the time of the Revolution, animoſities aroſe between the two nations, and were carried to a great height. The French, even before war was declared either in England or France, entered the Engliſh pale, and deſtroying all before them with fire and ſword, forced the inhabitants to fly to their forts for ſafety, which, however, for want of timely ſuccours, they were obliged to ſurrender, together with their part of the iſland, on the 29th of July 1689, and could obtain no better terms than being removed to Nevis.

The French, however, had not been above eight months ſole maſters of the iſland, when a moſt dreadful earthquake deſtroyed their poſſeſſions; the earth in many places opened nine feet, deſtroyed their ſugar-mills and houſes, overturned their Jeſuits college, and all the other ſtone-buildings. The next year the Engliſh, under colonel Codrington and Sir Timothy Thornhill, recovered the iſland, and remained ſole maſters of it, after having removed one thouſand eight hundred French-men, with their families, to Hiſpaniola; and tho' the French were reſtored to their part of the iſland by the treaty of Ryſwick, yet in 1702, upon the breaking out of Queen Anne's war, Codrington again attacked the French ſettlements, and drove every man out of the iſland; and the country being yielded to the crown of Great-Britain, by the peace of Utrecht, all the French territory was ſold for the benefit of the public, which muſt have produced a very large ſum, ſince eighty thouſand pounds of the money was in bank till the year 1733, when it was appropriated by parliament for the marriage portion of the princeſs Anne to the prince of Orange.

SECT. XIII.

Of the Iſle of NEVIS.

Its Situation, Extent, Climate, Soil, and Plants; with a Deſcription of the Diddledoo Tree. Of the Cattle, and wild Animals, is deſcribed the Land-Pike, the Soldier-Snail, the Fly-Catcher, the Land-Crab, and others.

THE iſland of Nevis is three or four miles ſouth-eaſt of the ſouth-eaſt point of St. Chriſtopher's, whence they are full in ſight of each other; and from hence may be diſtinctly perceived, in a clear day, the iſlands of Euſtachia, Saba, St. Bartholomew, Antigua, Guadaloupe, Montſerrat, and Redondo. It is only ſix leagues in circumference, and has a high mountain in the middle of it, ſaid to be exactly a mile and a half perpendicular, and is covered with plantations and trees.

The climate is ſaid by ſome to be even hotter than that of Barbadoes, though the latter is much nearer to the line. Fevers are very riſe here, eſpecially in October, when the trade winds veer from the eaſt to the north.

The land is very fertile; Engliſh beans bloſſom in the mountain plantations, but never pod; yet ſamphire, cucumbers, common lettuces, kidney-beans, cellery, and naſturtiums, &c. are excellent. Among the trees is one called the diddledoo, reſembling a codling tree; but with narrow thin leaves. It bears a lovely bloſſom of the fineſt yellow and ſcarlet colours, and is eſteemed a ſovereign remedy againſt the green-ſickneſs.

Though the vallies are fruitful, the riſing ground is ſtony, and the plantations grow worſe in proportion as they riſe towards the ſummit of the mountain. The produce of this is much the ſame as in the other Caribbee Iſlands: they have oranges, limes, and lemons; but ſugar, which is the ſtaple commodity, anſwers all the purpoſes

purpoſes of money, and all the trade of the iſland is managed by it. Their ſugar is for the moſt part muſcovado; tobacco, cotton, and ginger, were formerly much cultivated; but all theſe have been neglected to make way for the ſugar-cane, which produces ſuch plenty of ſugar, that fifty or ſixty ſhips have been laden with it, in this ſmall iſland, within a year for Europe.

As no hay is made here, their ſaddle-horſes are fed with graſs weeded out from among the ſugar-canes, as alſo with the green blades of Indian corn, Guinea corn, and New England oats; but their mill-horſes, aſſes, and mules, are generally fed in paſtures, except during the ſugar harveſt, when they live on the ſugar-cane tops and the ſkimmings of the ſugar coppers. The ſheep of this iſland have neither horns nor wool; but are hairy and ſmooth ſkinned, and have generally ſmall red or black ſpots like thoſe of a fine ſpaniel. They breed twice a year, if not oftener, and have generally two, three, or four lambs at a time, and even ſuckle them all. The rams are of a pale red, with a thick row of long, ſtraight, red hair hanging down from the lower jaw to the breaſt, as far as the fore-legs. Their ſwine, which feed upon Indian corn, Spaniſh potatoes, and the juice of the ſugar-cane, are exceeding ſweet, white, and fat. They have rabbits, and ſome black cattle; but their ſalt beef, hams, pickled ſalmon, ſturgeon, and oyſters, are brought to them from Europe and the northern colonies. The fowls and the turkeys, which are fed with the ſame diet as the ſwine, are excellent food. Some of theſe, together with the geeſe and ducks, are brought from the northern colonies, but they have plenty of Muſcovy ducks of their own breeding. The ground-doves are here about the ſize of a lark, of a chocolate colour ſpotted with dark blue: their heads reſemble thoſe of a robin-red-breaſt, and their eyes and legs are of a fine red.

Here are ſeveral ſorts of lizards, ſome of which are ſo large as to be five feet from the head to the tail, which is of the ſame length.

The land-pike is ſo called from its reſembling the fiſh of that name; but inſtead of fins it has four feet, which are ſo weak that it crawls ſlowly along, and winds its body like a pike freſh taken out of the water. It is about ſixteen inches in length; its ſkin is of a ſilver grey, covered with little ſhining ſcales. In the night they make a noiſe under the rocks more hideous than the croaking of frogs and toads. They are ſeldom ſeen but in the evening, and have been frequently ſold upon pretence of their being ſalamanders.

One of the moſt extraordinary animals is a kind of ſnail called the ſoldier, becauſe having no ſhell of its own, it creeps into the ſhells that are drove to the ſhore, in which it accommodates itſelf like a ſoldier, who takes up his quarters in other people's houſes. As it grows bigger it gets into larger ſhells, which it finds empty, and appears of ſeveral forms and figures, according to the diverſity of the ſhells of which it takes poſſeſſion. For its defence it has ſomething reſembling the claw of a large crab-fiſh, with which it cloſes the entrance of the ſhell, and thus ſecures its whole body, all of which, except the head and claw, is very tender. This claw is jagged within, and takes ſuch firm hold of whatever it faſtens on, that it takes away the piece. This creature marches faſter than the common ſnail, and does not mark its track with any ſlime. When put near the fire it forſakes its quarters; and if its ſhell be preſented to it to enter it again, it goes in backward. M. Rochefort ſays, that when there are many of theſe met together in order to change their quarters, if they find a ſhell which ſeveral would be glad of, they contend for it with great eagerneſs, and an obſtinate engagement enſues, in which they grapple with one another, till the weaker being forced to ſubmit, the victor takes poſſeſſion of the ſhell in diſpute, and peaceably enjoys it in right of conqueſt.

Here is a pretty little flying inſect, with four legs, and of various beautiful colours, called a fly-catcher; for it comes into rooms, and preſently clears it of all the flies and other vermin. It alſo lies down on planks, waiting for the flies, and puts its head into different poſtures on its ſeeing them ſhift their places. It frequently ſtands with its mouth half open, and when it ſees an advantage leaps directly on its prey, which it ſeldom miſſes; and is ſo tame, that it will come on the table when people are eating, and catch the flies that crawl on their hands or cloaths.

There are here land-crabs much ſmaller than our ſea-crabs; theſe make little burrows like rabbits in the woods high up the mountains; but come down every year to the ſea to waſh and ſhed their ſhells, and then are eaſily caught at night by torch-light. Their claws are long and ſlender, which enables them to travel pretty faſt. The only venomous creatures here are centipedes and ſcorpions.

Here are different ſorts of ſhell-fiſh, and in the ponds near the ſea are crabs of a beautiful ſky blue, with a browniſh yellow ſhade all round the edges. They are much leſs than our European ones, but finer ſhaped both in the body and claws; yet the fine colours of their ſhells vaniſh with the life of the creature.

SECT. XIV.

Of the Inhabitants of Nevis; its principal Towns; the Negroes, and the Laws made againſt them. The Government of the Iſland, the Value of Money, and the Revenue of the Clergy.

THOSE of the inhabitants that are deſcended from the Europeans are computed at about three thouſand, and the negroes at three times that number, of whom at leaſt four thouſand are employed in the ſugar trade. The militia is computed at about three hundred men, but there is only one fort in the iſland, which is mounted with nineteen guns.

Though much ſhipping comes to the iſland it has not one good harbour, nor any tolerable anchoring except on the ſouth-weſt ſide, where are ſeveral rocks and ſhoals, between which ſhips ride in ſafety; but in caſe of an hurricane they put out to ſea, and if poſſible run into Antego.

The only town in the iſland is Charles Town, which has large houſes and ſhops well ſtored, and is defended by a fort. The market is kept here every Sunday, from the riſing of the ſun to nine o'clock in the morning. Mr. Smith ſays, the gentlemen both of this iſland and St. Chriſtopher's purchaſe iron-wood and lignum-vitæ from the iſlands of Santa Cruz, St. Bartholomew's, Deſeada, &c. to ſerve as poſts to the ſugar-houſes, mills, &c.

The negroes are here generally fed with ſalt herrings, maize, and Spaniſh potatoes. Some of them are fond of eating graſshoppers, as others are of cane-rats, which they wrap up in banana leaves, and bake in wood embers. During ſugar harveſt they work almoſt inceſſantly night and day, and on Sundays bring to the market Indian corn, yams, and garden-ſtuff of all ſorts. The laws are here no leſs ſevere with reſpect to the negroes than in other parts of the Weſt Indies, they being ſcarce conſidered as men. Hence a negro cannot be evidence againſt a white man. If he ſtrikes one, the law condemns him to loſe the hand he ſtrikes with; and if he ſhould happen to draw blood, he muſt die. If a white man happens to kill a black he is not tried for his life, but the law obliges him to pay thirty pounds Nevis money to his maſter for the loſs of his ſlave.

There are here three public annual faſts, namely, in the firſt weeks of July, Auguſt, and September, to beg that God would preſerve them from the hurricanes that too often come in thoſe months; and if they eſcape, they have a public thankſgiving in October.

The government of Nevis is by a governor, council, and aſſembly, who can make any law that will laſt twelve months; but not longer, unleſs it be confirmed by the king.

This iſland, with St. Chriſtopher's, Antigua, and Montſerrat, are under one governor, who has the title of captain-general and governor in chief of all the Caribbee Iſlands, from Guadaloupe to Porto Rico. His poſt is worth about three thouſand five hundred pounds a year. Under him each iſland has its particular deputy-governor, who has a ſalary of two hundred pounds a year, and a ſeparate independent legiſlature, conſiſting of a council and an aſſembly of the repreſentatives.

The ſalaries of the clergy amount to ſixteen thouſand pounds weight of muſcovado ſugar each; the fees for a funeral ſermon are three pound, or five hundred pounds weight of ſugar; and for every chriſtening, marriage, and burial twelve ſhillings and ſix-pence.

This is the obſervation of the Rev. Mr. Smith, rector of St. John's pariſh in this iſland; but he obſerves, that an Engliſh ſhilling goes here for one ſhilling and ſix-pence; and that the French, Spaniſh, and Portugueſe coin bear near the ſame proportion. He adds, that the king gives twenty pounds out of the Exchequer to every clergyman ſent hither by the biſhop of London to vacant pariſhes, to defray the charges of the voyage.

SECT. XV.

A Hiſtory of the Iſland of Nevis.

THE firſt colony was ſettled here in 1628 by Sir Thomas Warner, who alſo planted St. Chriſtopher's. At firſt there hardly paſſed a year in which the Caribbeans did not make one or two incurſions generally by night; ſo that the colony was ſeveral times obliged to quit the iſland; but, notwithſtanding this, it throve at length to ſuch a degree, that in twenty years they conſiſted of between three and four thouſand men, who lived by the trade they carried on in ſugar; and about the year 1688 it was ſo improved, that it was ſuppoſed to contain ten thouſand whites, of whom near two thouſand were fit to bear arms, beſides twenty thouſand negroes; but the next year half of the men were cut off by a dreadful mortality, and on the ſixth of April, 1690, was a violent earthquake, which inſtantly levelled with the ground all the houſes in Charles Town built either with brick or ſtone: in ſeveral places the earth clove about a foot aſunder, and hot ſtinking water ſpouted out of it to a great height. The ſea left its uſual bounds ſeveral times for above one-third of a mile. The earth was in many places thrown up in great quantities, and thouſands of large trees buried. Some ſpacious ciſterns, of which almoſt every houſe had one for ſaving rain-water, threw it out by the violence of the earthquake eight or ten feet high; and ſo ſtrong was the agitation of the ſea at the ſame time, that ſloops felt it between St. Lucia and Martinico: others paſſing by the iſland of Redondo, fifteen miles north-weſt of Montſerrat, found the earthquake ſo violent there, that great part of it tumbled into the ſea, with a noiſe as loud as that of the diſcharge of cannon, accompanied with a great cloud of duſt aſcending into the air.

In 1706 the French under M. D'Ibberville made a deſcent both on this iſland and St. Chriſtopher's, and having prevailed on the negroes to lay down their arms by giving them hopes of being ſet at liberty, they marched to attack the Engliſh, who being overpowered by numbers fled to the mountains, where they capitulated, and conſented to remain in the iſland as priſoners of war, till a like number of French priſoners were releaſed by way of exchange elſewhere. In the mean time they were to be uſed civilly, and their houſes and ſugar-works preſerved; but the French, with the uſual regard to the faith of their agreements, treated them very ill, burnt their houſes and ſugar-works, and forced ſeveral of them to ſign an agreement, promiſing in ſix months time to ſend a certain number of negroes to Martinico, or money inſtead of them. After this they left the iſland, tempting three or four thouſand negoes to go off with them, on the promiſe of an eaſy life in the French iſlands; but actually carried them to the Spaniſh Weſt Indies, where they ſold them to work in the mines. One of theſe negroes happening to eſcape when they got aſhore, found means to inform his countrymen, who were left behind at Nevis, how baſely the French had uſed them; upon which they took arms, fell on the French who were left in the iſland to ſee the capitulation performed, and cut them to pieces.

The agents at London, both for this iſland and St. Chriſtopher's, now applied to the lords of trade to have a conſideration for their loſſes, which they repreſented as amounting to ſeveral hundred thouſand pounds; and in order to this the commiſſioners ſent one of their clerks to the Leeward Iſlands, to take an exact account of what damage had been ſuſtained by this invaſion. Both colonies alſo ſending an addreſs on this ſubject to queen Anne, it was referred to the houſe of commons, who granted the ſufferers a hundred and three thouſand two hundred and three pounds to enable them to ſettle there again. In the mean time the people of the iſland met with an enemy even more terrible and deſtructive; for in the year 1707 they were reduced to the greateſt diſtreſs by a hurricane, which threw down their houſes, tore up the trees and plants by their roots, and almoſt entirely deſtroyed their ſugar-works.

This colony has not yet recovered from theſe calamities; and it will perhaps be many years before it will be ſo populous and flouriſhing as it was ſixty years after its firſt eſtabliſhment.

SECT. XVI.

Of ANTIGUA, *or* ANTEGO.

Its Situation, Extent, Harbours, Climate, Soil, Produce, Pariſhes, Towns, and Hiſtory.

THE iſland of Antigua is ſeated in the ſeventeenth degree thirty minutes north latitude, and in about the ſixty-firſt degree forty minutes weſt longitude, to the eaſt of Nevis and St. Chriſtopher's, and is ſomewhat of a circular form, about ſix leagues from eaſt to weſt, the ſame diſtance from north to ſouth, and about ſixty miles in circumference. It is more famous for good harbours than all the other Engliſh iſlands in theſe ſeas; yet is ſo encompaſſed with rocks, that it is in many parts of dangerous acceſs, eſpecially to ſuch maſters of ſhips as are not well acquainted with the paſſages between theſe rocks. The principal harbours are Willoughby-bay, near two leagues to the ſouth-eaſt of Green Iſland; Nonſuch harbour, a ſpacious bay at the eaſt end of the iſland; Five Iſland harbour, on the weſt ſide of the iſland, ſo called from five little iſlands that lie to the weſt of it; St. John's harbour, due north from the former, and about two miles from it by land, is a kind of double harbour, which is really the beſt in the iſland, yet a ſandy bar runs acroſs the mouth of it, the deepeſt part of which is at the ſouth-weſt end. This harbour is defended not only by a fort at the mouth of St. John's river, mounted with fourteen guns, but by ſeven other batteries raiſed for the defence of ſo many landing-places. Falmouth harbour is defended by Fort Charles and Monkſhill fort. Here are alſo Engliſh harbour and Carliſle harbour.

The climate is here hotter than that of Barbadoes, and very ſubject to hurricanes. The ſoil is ſandy, and much of it overgrown with wood: the iſland has alſo but few ſprings, and not ſo much as a ſingle brook, ſo that its chief dependance for freſh water is what falls from the clouds, and therefore the inhabitants are ſometimes diſtreſſed for want of it: yet, notwithſtanding all theſe inconveniences, it is a thriving and very conſiderable plantation. It produces much the ſame commodities as the other Caribbee Iſlands, particularly ſugar and tobacco. Their ſugar was, however, at firſt ſo black and coarſe, that being rejected by our ſugar-bakers, it was generally ſhipped off for Holland and Hamburgh, where it fetched only ſixteen ſhillings per hundred, at a time when other muſcovado ſugar fetched eighteen or nineteen ſhillings: but the planters have ſince ſo far improved their art, that as good muſcovado ſugar is made here as in any of the ſugar iſlands, and they have alſo learned the art of claying it.

This iſland contains about ſeventy thouſand acres, and produces, one year with another, ſixteen thouſand hogſheads of ſugar. They plant but little tobacco; but what they do plant is better than what it was formerly.

The iſland has more veniſon than any other of the Caribbee Iſlands, and has a conſiderable number of black cattle and fowl, with moſt of the animals common to the other iſlands.

The iſland is divided into five pariſhes, and has the following ſmall towns; namely, on the north-weſt part is St. John's town, the capital, which is one of the moſt regular towns in the Weſt Indies, and has the moſt commodious

modious harbour of any of the Leeward Iſlands; but conſiſts of only two or three hundred houſes. On the ſouth ſide are Falmouth, Parham, and Bridge town; and in the center of the iſland is St. Peter's. The people here are computed at about ſeven thouſand whites, and thirty thouſand blacks.

This iſland is ſaid to have been firſt diſcovered by the Engliſh in the time of Sir Thomas Warner, already mentioned, and that ſome Engliſh families ſettled upon it in 1636; but the firſt grant of this iſland from the crown appears to have been made by king Charles II. about the year 1663, to William lord Willoughby, of Parham, who planted a colony there about the year 1666; he was made governor of the Caribbee Iſlands, and loſt his life the ſame year in a hurricane near Martinico. But it does not appear that Antego made any conſiderable figure among the Leeward Iſlands till the year 1680, and it ſeems that its improvement ſince has been chiefly owing to the care of colonel Chriſtopher Codrington, the deputy-governor of Barbadoes, who removed hither; and after planting a good part of it, made this iſland the ſeat of his government, when he was captain-general of all the Leeward Iſlands. This rendered Antego populous, rich, and flouriſhing.

In 1681 the inhabitants ſuffered greatly by a terrible hurricane, and alſo by another in 1689, when moſt of the houſes, ſugar-works, and wind-mills were thrown down. The Indians in the neighbouring iſlands, in league with the French, came hither in their periaguas, and landed more than once in general Codrington's time; but after killing a few of the inhabitants, who lived near the ſea, always retired. This colony, in return for theſe viſits from the friends of the French, ſent three hundred men to Marigalante, drove the French inhabitants into the woods, burnt their town, nailed up their guns, demoliſhed their fort, and brought away the plunder they had obtained. This iſland had afterwards frequent quarrels with the governors, and at length, in October 1736, a general ſtop was put to all buſineſs, occaſioned by the diſcovery of a plot by which the negroes intended to murder all the white inhabitants. It was to have been put in execution on the eleventh of that month, the anniverſary of his late majeſty's coronation, when the governor uſually treats the gentlemen and ladies of the whole iſland with a ball, which happening then to be poſtponed to the thirtieth, on account of the death of the governor's ſon at St. Chriſtopher's, proved the preſervation of their lives. The chief negroes in the plot were three perſons named Court, Tomboy, and Hercules, who belonged to three different planters. The firſt of them was to have been king, and the other two his generals. During the intended ball gun-powder was to have been conveyed into the cellar in order to blow up the houſe. At the ſame time Court and his two generals were to head a party of four hundred men each, one from the eaſt end of St. John's Town, and the two others from Otter's and Morgan's paſtures, all armed with cutlaſſes, to fall on all the white people, women and children, in the town, at the ſame time that the houſe blew up, which was to have been a general ſignal to other parts of the iſland, to be conveyed throughout the whole by fires lighted up on certain eminences. The negroes of the ſeveral plantations were then to riſe and deſtroy all the whites in their reſpective diſtricts, and to make themſelves maſters of the whole iſland. But the three negroes above-mentioned being ſuſpected, on account of their former crimes, were taken up, and evidence being daily brought againſt them, were convicted on the nineteenth of October; and on the next day Court and his two generals were carried to the place of execution. Court being ſtretched out on a wheel, after being expoſed an hour and a quarter in that ſituation to the ſun, begged leave to plead, and confeſſing every thing that had been alledged againſt him, he, with his two generals and two others, were all broke on the wheel. Four more of the principal conſpirators were burnt the ſame day, as were ſeven on the next; ſix were hung alive in chains on gibbets and ſtarved to death, one of whom lived eight days and nine nights without ſuſtenance; after which their heads were cut off, fixed on poles, and their bodies burnt. Fifty-eight others were at ſeveral times chained to ſtakes and burnt alive.

SECT. XVII.

Of MONTSERRAT.

Its Situation, Extent, and Produce; with a Deſcription of the Muſk-Herb, and the Tree called Iron-Wood; with a conciſe Hiſtory of the Iſland.

THE iſland of Montſerrat was diſcovered by Columbus in 1493, who gave it this name, from its reſembling a mountain ſo called near Barcelona. It lies twenty-five miles almoſt ſouth-ſouth-eaſt from Nevis, forty north-weſt from Guadaloupe, twenty weſt-ſouth-weſt from Antigua, and two hundred and forty from Barbadoes. It is ſomewhat of an oval form, about nine miles in length, the ſame in breadth, and about eighteen miles in compaſs.

Its mountains are covered with cedars, cypreſs trees, acomas, and the muſk-herb, which grows like brambles without thorns, and bears yellow flowers that afterwards turn to pods full of ſeeds that have the ſmell of muſk.

In the mountains is alſo the tree termed iron-wood, which does not exceed thirty feet in height, and the trunk is, in proportion, ſomewhat ſlender. It is covered with a whitiſh bark, but that upon the upper branches is of a reddiſh grey. The leaves, which are ſmooth, and of a yellowiſh green, are two inches and a half long, and above an inch broad. The flowers are many and white; theſe riſe in groupes upon one common pedicle, and are ſucceeded by ſmall berries half an inch long, whoſe outward tegument, as well as the inward pulp, is of the fineſt red, interſperſed with ſmall ſeeds. This tree has the name of iron-wood from its hardneſs, its great weight, and the cloſeneſs of its grain. It is ſo heavy, that it will ſink in water; it is proof againſt all weathers, and, in ſeveral ages, ſcarce ſuffers any decay.

The valleys of this iſland are well watered and fruitful: climate and ſoil are much the ſame with thoſe of the other iſlands, as are alſo its animals and trade. Its chief produce is indigo, great quantities of which uſed to be exported to Great Britain. The inhabitants likewiſe make ſome ſugar, which is ſaid not to be ſo fine as that of Jamaica and Barbadoes.

This is, in ſhort, a well planted iſland, pretty much frequented by ſhips, though it is ſurrounded with rocks, and has no place that can be properly called a haven; ſo that on the appproach of a hurricane ſuch ſhips that happen to be on the coaſt are obliged to put to ſea, and with all poſſible expedition to ſail to St. Chriſtopher's or Antigua.

No ſettlement was made upon this iſland till the year 1632, when Sir Thomas Warner, the firſt governor of St. Chriſtopher's, ſettled a ſmall colony here. It at firſt flouriſhed more than Antigua; but the latter iſland has ſince got the ſtart of it. It is computed that it has at preſent about four thouſand whites and one thouſand two hundred negroes. They have two pariſh-churches lined with cedar, whoſe pulpits and pews are alſo of that and other ſweet-ſcented kinds of wood.

In 1668, when the French had taken Antego, they attacked this iſland with a conſiderable force under M. de la Barre, and after much loſs took it, together with ſixteen cannon, a great number of negroes and cattle, and took the governor, with above three hundred Engliſh, priſoners of war. The Engliſh had made ſuch a gallant defence, and killed ſuch a number of brave French officers, that the conquerors were ſo exaſperated, that inſtead of admiring and eſteeming them for their courage, they meanly ſet fire to every thing, except what belonged to the Iriſh, who were the firſt that ſubmitted; ſo that above forty ſugar-houſes, and ſeveral ware-houſes filled with rich merchandize, were deſtroyed. M. de la Barre left five hundred Iriſh, who took the oaths to the conqueror, and with their families made up above two thouſand ſouls; and then carried his priſoners and booty to St. Chriſtopher's. This iſland was however afterwards reſtored to the Engliſh.

In the late queen Anne's war, three thouſand five hundred French, under M. Coſſart, landed at Car's bay upon this iſland, and ſoon made themſelves maſters of it, except Dodon fort on an inacceſſible hill, to which the in-

habitants fled with their beſte ffects; but the French, after having ſpent ten days in plundering the iſland at pleaſure, returned to Guadaloupe.

The affairs of this iſland afford nothing remarkable after this, except a dreadful hurricane which happened in 1733, and blew down three fifths of the houſes in the iſland. A cattle mill-houſe, which weighed at leaſt twenty thouſand pounds, was carried ſome diſtance from its ſituation, and broke into ten thouſand ſhivers by the force of the fall; and a large copper that would hold two hundred and forty gallons was carried over a high wall, and the ſides jammed cloſe together by the force of the fall; but the greateſt loſs was the deſtruction of the ſugar-canes, and the whole damage, excluſive of the ſhipping, was computed at no leſs than fifty thouſand pounds of their currency.

SECT. XVIII.

Of DOMINICA, ST. LUCIA, *and* ST. VINCENT.

Their Situation, Extent, Soil, Produce, and Hiſtory.

DOMINICA, which owes its name to its being diſcovered by Columbus on a Sunday, is the laſt of thoſe called the Leeward Caribbee iſlands, according to our maps; but the Spaniards conſider it as the moſt northerly of the Windward iſlands. It is ſeated in the fifteenth degree twenty minutes north latitude, and in the ſixty-firſt degree twenty-four minutes weſt longitude, about half the way between Guadaloupe and Martinico, and fifteen leagues from each. This iſland extends about thirteen leagues in length from the north-weſt to the ſouth-eaſt, and near as much over in its broadeſt part.

Dominica is divided into the Cabes-Terra and Baſſe-Terra; that is, into the high and low-land part. The ſoil is good, and the ſides of the hills bear the fineſt trees in the world; and, according to ſome authors, it is one of the beſt of the Caribbee iſlands, on account of its fruitful vallies, large plains, and fine rivulets. It is watered by ſeveral rivers abounding with fiſh, and produces mandioca, caſſava, bananas, and the fineſt figs. It has alſo potatoes and ignamas, with a great deal of millet and cotton.

Here are great numbers of ringdoves, partridges, and ortolans. The inhabitants breed hogs and poultry; of the former are two ſorts of wild ones deſcended from ſuch as were firſt brought from France and Spain.

The Caribbeans retiring hither for the moſt part on their being driven out of the other iſlands by the Europeans, are therefore moſt numerous here. The French having frequented the iſland more than the Engliſh, are ſaid to be beſt beloved by the natives. The French always oppoſed the attempts of the Engliſh to ſettle here, becauſe it would enable them in time of war to cut off the communication betwen Martinico and Guadaloupe: the Engliſh, however, frequently made uſe of it to wood and water. But this iſland was, however, ceded to the king of Great Britain, in expreſs terms, by the late treaty of peace.

The iſland of St. Lucia received its name from its being diſcovered on the day dedicated to the virgin martyr St. Lucia. It is ſituated in the thirteenth degree forty-five minutes north latitude, and in the ſixty-firſt degree weſt longitude, lying about ſix leagues ſouth of Martinico, and north from St. Vincent, and is twenty-one miles to the north-weſt of Barbadoes, which, it is ſaid, may be ſeen from thence in a clear day. St. Lucia is twenty-three miles in length, and twelve in breadth. It has ſeveral hills, at the foot of which are fine pleaſant valleys, which contain good land, well watered with rivers. In theſe valleys are tall trees that afford excellent timber.

The air is eſteemed ſalubrious, the hills being not ſo high as to intercept the trade-winds, which always fan it to the eaſt, and by theſe the heat of the climate is mitigated. It has alſo ſeveral good bays and harbours, which afford good anchorage for ſhips.

The Engliſh firſt ſettled on this iſland in 1637, and lived here without any diſturbance from the natives or any others, till the year 1639, when they were driven out by the Caribbees, who were exaſperated againſt them; for an Engliſh veſſel being becalmed before Dominica, ſome of the Caribbeans of that iſland, thinking her to be a French ſhip, from her bearing a flag of that nation, went aboard with their fruit, and drinking freely of brandy, the maſter hoiſted his ſails, and the Caribbeans ſuſpecting his deſign, endeavoured to recover their canoes; but being hindered, leaped over-board and ſwam to the iſland, except two, whom the villainous maſter of the veſſel put in irons, and ſold for ſlaves. Thoſe who eſcaped complaining of this treachery to the natives of Martinico and St. Vincent, they maſſacred the Engliſh at Barbadoes, Antigua, and others of the new ſettlements; then coming to St. Lucia in the night-time, ſurprized the Engliſh in their beds, killed the governor and moſt of the inhabitants, plundered their ware-houſes, burnt their habitations, deſtroyed their proviſions, and in ſhort did incredible miſchief, which obliged thoſe who eſcaped to fly to Montſerrat. This affair ſo terrified the Engliſh, that they gave over all thoughts of ſettling again in the iſland.

In 1644 M. de Parquet, governor of Martinico, ſent about forty men from Granada, under M. de Rouſſelan, who took poſſeſſion of the iſland, erected a fort, which they fortified with cannon and pateraroes, encompaſſed it with a paliſado and good ditches, and raiſed a fine habitation near it, where they planted vegetables proper for food, and cured tobacco. As Rouſſelan was well beloved by the natives, on account of his marrying one of their women, the French enjoyed a perfect tranquility till the year 1654, when he died, and was ſucceeded by la Riviere, who expecting to live with the natives upon as good terms as his predeceſſor, erected a fine habitation, where he had not lived long with his family, before the Carribeans formed the barbarous deſign of aſſaſſinating him. That la Riviere might not ſuſpect their deſign, they paid him ſeveral viſits, in order to ſell him fruit; after which they one day came in great numbers to his houſe, where he gave them a friendly reception and plenty of liquor; but, while he ſuſpected nothing, they treacherouſly murdered him, with ten of his men, and, after plundering his houſe, carried off his wife, two of his children, and a negro ſlave.

He was ſucceeded by M. Haquet, who took all proper precautions not to be ſurprized by the Caribbeans, yet could not eſcape the ſnares they laid for him; for in 1656, on the pretence of ſelling him a conſiderable quantity of turtle, which they had left upon a hill not half a mile from the fort, they decoyed him thither, with only three ſoldiers to attend him; and, while they amuſed the ſoldiers, threw him from the hill into the ſea: yet not being much hurt he got ſafe to land, through a ſhower of arrows, and taking out one of his pocket piſtols, they were ſo frighted that they fell on the ground. He ſeized that opportunity to eſcape to the fort, but juſt before he reached it, one of them ſhot him in the flank with an arrow, and he died three days after. M. Parquet, the governor of Martinico, ſent M. le Breton to ſucceed him, who having been formerly his lady's footman, the garriſon reſolved to aſſaſſinate him; and one of them ſhooting at him when he was without the fort, le Breton thought it his beſt way to take ſhelter in the woods, where not being able to find him, they were in fear of being called to an account for their crime, therefore ſtripping the fort and the governor's houſe, ſeized a veſſel in the road, and eſcaped to the Spaniards.

Eleven days after a French veſſel paſſing by and finding the colony gone, but the guns, pateraroes, and apartments in good condition, the captain left four of his ſeamen there, with ammunition and proviſions, to keep the fort; and as he was ſetting ſail M. le Breton made a ſignal to him from an eminence, on which he was received on board his veſſel, and another garriſon was ſoon after ſent.

In 1663 the Engliſh purchaſed this iſland from the natives, by a treaty concluded with the Indians by Mr. Warner, the ſon of Sir Thomas by a Caribbean woman; and the Engliſh ſending a conſiderable force in 1664, had the fort delivered to them without reſiſtance, on condition that the French governor, with the garriſon, cannon, arms, and baggage, ſhould be ſent to Martinico.

Fourteen

Fourteen or fifteen hundred men were now ſettled on the iſland, but they being ſoon after ſeized with the bloody flux, ſix hundred of them died in leſs than three months, among whom was the governor and principal officers; upon which thoſe who ſurvived abandoned the iſland on the ſixth of January 1666, after ſetting fire to the fort, and diſperſed themſelves into the other Engliſh colonies.

Though the iſland was deſerted, it was ſtill conſidered as a part of the Britiſh dominions, and was accordingly included in every commiſſion of the governor of Barbadoes, who ſometimes aſſerted his juriſdiction over it by going thither in perſon with great pomp, diſplaying the king's colours, firing guns, &c. However, in 1719 the French king granted this iſland to the marſhal de Etree, who ſent a colony to poſſeſs, ſettle, and plant it; on which the Engliſh ambaſſador at Paris repreſented the affair with ſuch ſpirit, as a violation of the rights of his Britannic majeſty, that orders were ſent to the marſhal de Etree's colony, to evacuate the iſland; which they accordingly did.

Three years after king George I. granted this iſland and that of St. Vincent to the duke of Montague, who ſettled a colony here; but ſoon after a ſloop arrived from Martinico, the maſter of which brought a copy of a mandate from the king of France, in which it was declared, that neither St. Vincent nor St. Lucia belonged to the king of England: that the firſt of them ought to continue in the poſſeſſion of the Caribbeans, and that the ſecond belonged to the king of France, who had been willing, however, at the requeſt of the king of England, to ſuſpend the ſettlement of that iſland; and that the chevalier de Fouguiere, governor-general of the iſlands, ſhould ſummon them to retire in fifteen days; and if they did not depart, he ſhould compel them to it by force of arms.

Mr. Uring, the governor, took every prudent ſtep to ſecure the colony, by ſending to the governors of the other iſlands, and the captains of the men of war then ſtationed there, to procure their aſſiſtance; but they declining to act in a hoſtile manner againſt the French in time of peace, who ſent between two and three thouſand men againſt him, he was obliged to ſurrender; when it was agreed, that the Engliſh might re-embark all their cannon, ſtores, arms, and baggage, without moleſtation; that the French ſhould alſo evacuate the place; and that the iſland ſhould remain inhabited by neither the French nor Engliſh, till the diſpute between the two crowns relating to it was decided; but that the ſhips of either nation ſhould be at liberty to frequent its ports for wood and water. It was ſoon after determined by both crowns that this iſland, with that of St. Vincent and Dominica, ſhould remain neutral. However, the French before the late war began to ſettle theſe iſlands; but, by the late treaty of peace, reſigned all claim to them to his Britannic majeſty.

The iſland of St. Vincent is ſeated in the thirteenth degree thirty minutes north latitude, and in the ſixty-firſt degree weſt longitude, fifty miles to the north-weſt of Barbadoes, and ten leagues to the ſouth-ſouth-eaſt of St. Lucia. It is about twenty-four miles in length, eighteen in breadth, and ſixty in compaſs.

This iſland has a deep fat ſoil, capable of producing every thing proper for the climate, and has abundance of rivulets and ſprings of excellent water. It has ſeveral mountains with plains at the bottom, which, if cultivated, would be exceeding fruitful. There are here large ſtraight trees of all the kinds produced in America: tobacco has been cultivated here, and is eſteemed excellent; together with mandioca, Turkey wheat, potatoes, ignamas, gourds, and the fineſt large melons; indigo alſo thrives here remarkably.

It is ſaid that the Caribbeans, the original inhabitants of this iſland, people only a part of the iſland, there being alſo a great nnmber of negroes, ſome of whom are deſcended from a ſhip load of Africans either driven or run aſhore here about ninety years ago, and many fugitives from Barbadoes and the other iſlands. Theſe are now numerous, and have many villages, where they are ſaid to live well: both theſe different people are tenacious of their liberties, and jealous of foreigners, though they readily furniſh them with caſſavi bread, fruit, and other proviſions, in exchange for knives, hatchets, and the like.

We ſhall now proceed to Barbadoes, an iſland better known, and of which we are able to give a more accurate and circumſtantial account.

SECT. XIX.

Of BARBADOES.

Its Situation, Extent, Face of the Country, and Climate: of the Land ſliding from the Hills into the Vallies; with a Deſcription of Cole's Cave, the Water, and bituminous Foſſils in the Iſland.

THE iſland of Barbaboes extends from the thirteenth degree ten minutes to the thirteenth degree twenty-three minutes north latitude, and from the fifty-eighth degree forty-nine minutes three quarters to the fifty-ninth degree two minutes and a half weſt longitude from London; ſtretching in its greateſt length from Goulding's-green, in St. Lucy's pariſh, to Ananias-point, in Chriſt-church pariſh, twenty miles three quarters, and its greateſt breadth from Kirtrige's-point, in St. Philip's pariſh, to a point in St. James's pariſh, thirteen miles three quarters, and the circumference of the whole iſland from ſome of the ſurrounding principal points is almoſt fifty-four ſtatute miles.

Its firſt appearance to the ſea eaſtward is ſomewhat hilly, but to the ſouth-weſt and the north-weſt is more level. The ſurface in general appears covered with an agreeable verdure, variegated with lofty trees, and large buildings, affording many beautiful proſpects. The higheſt part of the iſland is a rocky cliff, whoſe perpendicular altitude is nine hundred and fifteen feet above high-water mark.

The atmoſphere is in general ſerene, clear, and ſeldom cloudy; and from the total abſence of hail, froſt, or ſnow, it is never liable to thoſe many and ſudden viciſſitudes ſo common in the climates more to the ſouthward and northward of the tropics. The air is in general very healthy, which is chiefly owing to the regularity of the trade-winds, and to its having neither bogs nor marſhes, in which the ſtagnated waters being exhaled to vapours might prove pernicious; nor large foreſts, which not only obſtruct the paſſage of the winds, but generate a moiſt air, cauſed by the great quantity of vapours which perſpire through the leaves, as well as from the ſhaded moiſt ſoil.

The ſoil in the low deep lands is chiefly black, in ſhallower parts ſomewhat reddiſh, on the hills frequently of a whitiſh, chalky, and marly nature, and near the ſea it is generally ſandy. By this variety Providence has wiſely adapted different ſoils to the different nature of the ſeveral kinds of trees, ſhrubs, and plants. Where the ſoil is black, as it imbibes the rays of the ſun, and reflects few or none, the circumambient air is there not near ſo hot, as where the ſoil is ſandy or gravelly. As the fertility of this, as well as others of the Weſt India iſlands, depends upon ſeaſonable rains, a long chain of hills, interſperſed with deep vallies, are providentally ſituated to the eaſtward of ſome parts of the iſland, to intercept the clouds and vapours. Hence that part of the iſland called The Thickets, in St. Philip's pariſh, being low land, and having no hills nor high cliffs to the eaſtward to make any reſiſtance to theſe clouds, is often ſcorched with drought, when the middle and more hilly parts of the iſland are repleniſhed with rain.

It ſometimes happens that large pieces of ground planted with canes, and even land with plantain and banana trees growing upon it, have ſlid down to the vallies from the ſides of the hills. This happens in very rainy ſeaſons; for as the ſoil upon theſe hills is commonly not above eight or nine inches deep, and of an oozy and ſopy nature underneath, it eaſily ſeparates from the next immediate ſubſtratum, which is of a ſlippery chalk, flat ſtones, or looſe gravel. When the ſoil ſlides in large pieces, its motion is leſs violent than when it is confined in narrow chaſms in the meeting of two hills, eſpecially if the ſituation be very ſteep; for there the collection of water being

conſiderable and heavy, inſtead of gliding ſoftly between the two ſtrata, ir breaks out in different places at once, and then runs down the precipice a mingled torrent of earth and water.

The beautiful proſpects from ſeveral hills over the vales below is quite enchanting; we ought not here to omit Hackleton's cliff, where nature at one view diſplays a great variety of ſurprizing landſcapes. Here the high impending rocks yield a dreary rueful appearance: the ſeveral deep chaſms below, over which they project, are imbrowned with the thick foliage of lofty trees. The adjacent ſteep declivity conſiſts of irregular precipices and broken rocks, the whole view terminating on the ſea, over whoſe craggy ſhores the foaming waves inceſſantly break. The view appears ſolemnly awful, except when the eye is relieved by a glimpſe or ſometimes a full view of the neighbouring plantations. To complete this uncommon contraſt, a deep rapid river runs through the vallies at the bottom of theſe precipices, which though in the dry ſeaſons is almoſt without water, yet in the rainy months of June, July, and Auguſt, it often overflows its higheſt banks.

The iſland abounds with caves, the moſt remarkable of which, called Cole's cave, is ſituated almoſt in the bottom of a melancholy hideous gully, or a deep chaſm made between hills by repeated torrents of rain. This gully is about a hundred and ſixty-five feet deep, from whence you can ſee nothing above you but the tops of high rocks and impending cliffs, through the gloomy branches of lofty trees. The deſcent towards the entrance of this cave is by a ſteep craggy precipice of great height, where your ſecurity from falling depends much upon the good hold you take of the roots of trees and branches of underwood. Having rather ſlid than walked down in this manner a conſiderable way, you are ſuddenly within an incloſure of very high perpendicular rocks, where the light of the ſky is admitted by two holes in the roof. On the weſt ſide of this gloomy apartment lies the mouth of the cave, which is of conſiderable ſize. Upon your firſt entrance into it the light of the day begins to grow weak, and proves but an uncertain guide. Twenty yards farther it appears no ſtronger nor brighter than the glimmering of a ſtar in a dull hazy night, and a few ſteps more envelops you in total darkneſs. "From "hence, with the aſſiſtance of a candle and lanthorn, "ſays the learned and reverend Mr. Hughes, from whom "we have taken this account, I began my ſubterraneous "tour; and, ſoon after my entrance, turned upon my "left hand, to take a view of what is called the Dry "cave. This has the top and roof crowded with "innumerable petrified icicles hanging downwards. "The ſides of the cave were likewiſe in ſeveral places "thick ſet with them, eſpecially where there was a "cavity: there they grow from the upper to the under "ſhelves of the rocks, like ſo many baluſtrades, but "more in number, irregular, and ſometimes in two or "three diviſions. The next thing remarkable in theſe "ſubterraneous apartments is the Wet cave, which, near "its firſt ſeparation from the Dry already deſcribed, is "very ſpacious and lofty; but its bottom much furred, "and torn up by the repeated torrents of rain, which in "wet ſeaſons run through it. Soon after our entering "it, we were agreeably ſurprized with the murmurs "of a diſtant ſtream, which a little farther we found a "conſiderable ſpring of the moſt tranſparent water, iſſu-"ing from a large projected rock, or rather the impend-"ing ſide of the cave. The roof near this place is re-"markably pitted with ſeveral holes, repreſenting ſhallow "cones, of diameters from nine to twenty inches; but "their greateſt depth did not exceed twenty-four inches. "Theſe holes probably owe their origin to large cavous "icicles which formerly hung from them, but were "broken off by ſome convulſions of the earth. The "ſpring here made a ſmall baſon or bathing-place, and "from henceforward the cave gradually leſſened in "height and breadth, and the icicles hanging from the "top and irregular ſides were more in number, but leſs "in magnitude. Here I began to want air, and at laſt "the paſſage became ſo narrow and low, that I was "obliged to ſtoop much, and the icicles were ſo ſmall "that the largeſt of them did not exceed my little finger "in length and diameter. This place, diſtant near a "quarter of a mile from the entrance, was my *ne plus "ultra*, being ſo much fatigued, and wanting air ſo "much, that I durſt not, without preſumption, proceed "farther."

The iſland has ſeveral ſprings, and a few rivulets. The inhabitants of St. Andrew's, and ſome part of St. Joſeph's pariſh, are plentifully ſupplied with freſh water by digging holes in the ſand, from ten inches to three feet deep; and theſe are almoſt inſtantly ſupplied with freſh water percolated through the ſand; but in other parts the inhabitants are obliged to preſerve rain water in reſervoirs, which are generally dug near a deſcent.

Among the foſſils the moſt remarkable are the following: An oily bituminous exudation iſſuing from ſome hills in St. Andrew's and St. Joſeph's pariſhes, of a dirty black, inclining to a green. It is procured by digging a hole or trench in or near the place where it ouſes out of the earth: this by degrees fills with water, having a thick film or cream of this liquid bitumen ſwimming upon the ſurface; from whence it is ſkimmed off, and preſerved in earthen jars or other veſſels. The moſt proper ſeaſon for gathering it is in the month of January, February, and March. It is of ſo inflammable a nature, that it ſerves to burn in lamps. As to its medicinal qualities, it is uſed with great ſucceſs in paralytic and nervous diſorders, and in the cure of cutaneous eruptions.

There is another ſpecies of bitumen of a ſolid ſubſtance, called here munjac. This is dug out of the earth at different depths on the ſides of hills in St. John's and St. Andrew's pariſhes, and nearly reſembles that bitumen found in the Dead Sea. If by accident any of theſe veins take fire, they continue to burn a long time, though in a dull ſlow manner, for the veins being ſurrounded with earth it crumbles, and falling into the flame, ſtifles it.

In St. George's pariſh are often dug up lumps of a tranſparent reſinous ſubſtance reſembling refin, from which it is chiefly diſtinguiſhed by the fragrance of its ſmell, and upon comparing it with the gum of the birch gum tree it appears to be of the ſame ſpecies.

SECT. XX.

Of the Vegetables of Barbadoes; with a particular Deſcription of the Palm-Oil Tree, the Burgamot Tree, the Forbidden-Fruit Tree, the Guava, and the Manchineel Tree. Among the Animals are deſcribed the Surinam Scorpion, and a particular Account of a Battle between a Sailor and a Shark.

THE trees of Barbadoes are vaſtly numerous; that called the palm-oil tree grows about fifty feet high; its branches ſomewhat reſemble thoſe of the cabbage-tree, but are much leſs uniform, ſhorter, and leſs verdant: the middle rib of each leaf is thickly ſtudded with ſharp-pointed prickles, each two inches long. The fruit is incloſed in a pod, which opening expoſes to view many ſmall nuts covered with a huſky tegument of a yellowiſh colour, containing in its many interſtices, when ripe, a conſiderable quantity of fine ſweet oil, which the ſlaves, after the whole fruit is firſt roaſted in the embers, greedily ſuck. When this outward huſky covering is taken off, the nut appears, which is of a ſomewhat blunt conic ſhape, and the inſide filled with a white kernel.

The burgamot-tree reſembles that of the orange, but the fruit is ſomewhat larger; it has, however, very little juice, and what it yields is exceeding ſour: what is moſt valuable is its oil, which is extracted by ſlicing the outward ſkin, and ſqueezing the fruit into a glaſs, on which the oil immediately ſeparates from the juice, and ſwims upon the ſurface. This being carefully drained off and preſerved, is what alone ought to be called the genuine burgamot oil. The Portugueſe have a method of making ſnuff-boxes of the rind, which retain for a long time the grateful fragrance of the oil.

What is here called the forbidden-fruit tree has the trunk, leaves, and flowers like thoſe of the orange. The fruit, when ripe, is ſomething larger and longer than the fineſt

fineſt orange, which it alſo exceeds in its delicious taſte and flavour.

Here are alſo the ſour orange, the Guinea orange, the golden orange, ſo called from its being of a deep yellow within; the ſhaddoe, the citron, the St. Helena lemon, the Spaniſh lemon tree, and the lime; the pomegranate and the guava tree.

The latter is diſtinguiſhed into two ſorts, the white and the red; and theſe, with regard to their ſhape, into the round and the pear-faſhioned, or perfumed guavas. The latter have a thicker rind, and a more delicate taſte than any other. This tree, if carefully cultivated, grows to about eighteen feet in height, has a very ſmooth bark, of a reddiſh grey, with ſharp-pointed leaves and white flowers. The perfumed guava is round, and about the ſize of a large tennis-ball; the rind, or ſkin, is generally of a ruſſet ſtained with red, lined with an apple-like ſubſtance, as thick as a crown-piece. The inſide is full of an agreeable pulp mixed with innumerable ſmall white ſeeds. The rind, when ſtewed, is eaten with milk, and preferred to any other ſtewed fruit. From the ſame part is made marmalade, and from the whole fruit the fineſt jelly perhaps in the world.

Beſides the trees already mentioned there are the pine-apple, and a great variety of other fruits, with many trees admired for the beauty and ſolidity of the wood, particularly lignum vitæ, red wood, iron wood, and many others; we ſhall only add the following, which is one of the moſt remarkable of the American trees, and is found in moſt of the Caribbee Iſlands, as well as Barbadoes.

The manchaneel tree is remarkable for the beauty of the timber, and its juice being one of the ſtrongeſt poiſons yet diſcovered. Hiſtorians have, however, exaggerated the accounts they have given of the poiſonous nature of this tree; for it has been pretended, that the heads of the perſons who ſleep under its ſhade ſwell, and they become blind; that if the leaves but touch the naked ſkin, they raiſe puſtules, which cauſe deadly pains, unleſs helped with water and ſalt, or faſting ſpittle. This, however, is not true, nor is any ill conſequence to be feared from the leaves touching the naked body, unleſs they are bruiſed, and the white milky juice they contain is ſuffered to pervade the pores; which if it does, it raiſes bliſters like thoſe of the confluent kind in the ſmall-pox, cauſing acute pains; but ſimple drops of rain water falling from thoſe leaves upon the ſkin will not have any bad effect, which Mr. Hughes tells us he has experienced upon repeated trials.

This tree is of a very quick growth, and is ſeldom or never found growing to any perfection, but in a looſe and ſandy ſoil, near the ſea or other water. The trunk, when full grown, is generally from two feet and a half to three feet in diameter, branching, moſt commonly, from three to fifteen feet high from the ground. The heart, which is very ſmall, in proportion to the bulk of the tree, is very hard and ſolid, of a pale yellow, with a greeniſh caſt, interſperſed with ſmall blackiſh veins, the grain ſmooth, and the wood durable: the bark is of a ſleek whitiſh grey, the branches many in number, and covered with thick, ſmooth, ſhining leaves, among which are long pendulous catkins. It bears a fruit of the ſame make as the round ſort of crab-apples which we have in England, and is of a beautiful colour and fragrant ſmell. The pulp of theſe manchaneel apples does not exceed one-ſeventh of an inch in depth, the inſide being a hard ſtony kernel, in which are included the ſeeds. The juice of the apple is of the ſame colour and quality as that of the leaves, and yet the reverend gentleman juſt mentioned obſerves, that he has known a woman big with child, who longed for them, to have eaten of them, without any apparent bad effect; but adds, he cannot ſay that the fragrance of the ſmell, or their tempting looks, have induced others to follow her example by ſo dangerous an experiment: yet if ſome of this crude milky juice does but fall upon a horſe, the hair of the part affected ſoon falls off, and the ſkin riſes up in bliſters, which will require a long time to heal. Formerly no one dared to cut down theſe trees, without firſt having made a large fire round them, in order to burn the bark and dry up the ſpry and juices that fly from them in cutting: but now naked negroes venture to cut them down, only uſing the caution of previouſly rubbing their whole bodies with lime-juice, which prevents the ſap from corroding or ulcerating their ſkins. Bruiſing and maſhing the tender leaves and boughs, and then throwing them into fiſh-ponds, has often been practiſed by villains to deſtroy the fiſh, which ſoon after grow ſtupid, float with their bellies upwards on the top of the water, and frequently die. Some ſorts of fiſh that will eat theſe apples, are often found dead in the water, and if taken while alive and eaten often prove poiſonous; even the large white crab that burrows in the ſand is not, if near theſe trees, to be made uſe of for food. We ſhall conclude this account with mentioning a remarkable inſtance of the goodneſs of Providence, that wherever a manchaneel tree grows, there is found either a white wood or a fig tree near it, the juice of either of which is an infallible antidote againſt the poiſon; ſalt water is no leſs efficacious, and as theſe trees grow by the ſea-ſide, this remedy is alſo near at hand.

Among the vegetables of a lower growth are Guinea and Indian corn, and a vaſt variety of plants, the moſt valuable of which is the ſugar-cane, and many medicinal herbs.

With reſpect to the animals, the ſheep bred here are, as in the other Caribbee Iſlands, hairy like goats: for to be covered with wool would be as prejudicial to them in theſe hot climates as it is uſeful in cold countries, for ſhelter and warmth; yet as cloathing is neceſſary, eſpecially in the rainy ſeaſon, to the inhabitants, the want of wool is abundantly ſupplied by the cotton tree, of which there are here ſeveral ſorts which annually ſupply the inhabitants with the fineſt wool in the world.

They have coach-horſes from England, ſaddle-horſes from New England, and others for carts and common uſes from Bonaviſta, the Cape Verd Iſlands, and Curaſou. They have alſo a breed of their own, which is mettleſome, ſwift, and hardy, but not ſtrong enough for much ſervice. The firſt planters brought black cattle from Bonaviſta and the Iſle of May; and a few of their breed ſtill continues. They have aſſes, which are of extraordinary uſe, becauſe they can carry burthens where horſes cannot paſs.

Among the number of animals, either peculiar to or brought to this iſland, there is not one that is mortally venomous; while many of the neighbouring French iſlands are infeſted with vipers, and other poiſonous ſnakes. There are here but three ſpecies of reptiles that can be properly called venomous, the black ſpider, the forty-leg, and the Surinam ſcorpion.

A full grown ſcorpion of the common ſort is about ten inches long, the ſkin ſoft but ſcaly, and of a dull copper colour. The reverend Mr. Hughes obſerves, that the very young ones are ſurpriſingly preſerved from danger; for when this threatens, the parent ſcorpion opens her mouth and ſwallows them, and afterwards voids them when the danger is over.

The Surinam ſcorpion is, however, only three inches in length, from the head to the extremity of the tail. From the fore-part of the neck riſe two claws, about three quarters of an inch long, divided into three joints, each claw near its extremity ending in a long, ſlender, whitiſh forceps. It has two eyes, which are black, ſmall, and ſhining, with four pair of legs, the hindermoſt being the longeſt: each joint of the legs, as well as the back, is marked with ſeveral faint whitiſh liſts, the intermediate ſpace being of a ruſſet colour, mixed with blackiſh ſpots. The tail is divided into ſix joints, and at the extremity of the laſt appear two ſmall horny crooked ſtrings in the form of a wide extended forceps, the upper being double the length of the lowermoſt: the longeſt coming from the upper ſide of the laſt joint of the tail, the other from the lowermoſt part, the intermediate ſpace being fleſhy. When this ſcorpion walks or runs ſhe generally curls up her tail in a ring, and when provoked extends it to its full length, and with a quick motion darts it into her adverſary. Thoſe who have the misfortune to be ſtung by them, endure very acute pain for ſeveral hours, and the fleſh near the wound generally turns livid; but the wound is not mortal. Theſe ſcorpions are chiefly to be found among old boards, old books, or other looſe papers. They never bear any young but once: the female carries her young upon her

back, and as theſe grow in ſtrength the parent decays and dies.

Monkeys are not very numerous in this iſland; they chiefly reſide in inacceſſible gullies, eſpecially where there are many fruit-trees. They do great miſchief to the neighbouring planters, by digging out of the earth their yams and potatoes, and ſometimes breaking and carrying off the ripe ſugar-cane. But as a premium is granted for deſtroying both theſe and the racoons, they rather decreaſe than multiply.

The moſt deſtructive quadrupeds, with reſpect to their ſugar-canes, are the rats, which are ſo numerous that the annual loſs to the inhabitants of the pariſhes of St. Joſeph and St. Andrew alone is computed at no leſs than two or three thouſand pounds.

The birds of this iſland are not very numerous; there are none of them remarkable for their notes, nor for the beauty of their feathers, excepting the humming-bird. The tame fowls are much the ſame as thoſe in England; beſides which they have the Guinea fowl, Muſcovy ducks, and rumpleſs fowls.

The ſhores afford a great variety of ſhell-fiſh, ſome of which are exceeding beautiful, and a variety of other productions. "We are no ſooner, ſays our author, ad-"vanced to the ſhore on the weſt ſide of the iſland, but "we are, eſpecially in calm mornings and evenings, "pleaſed with the ſight of groves of corals, ſea-feathers, "and ſea-rods; the former grow in thick cluſters, yield-"ing an embrowned ſhade, and remain, as ſturdy oaks, "unmoved; the latter, with their numerous pliant "branches, wavingly bend with the undulating ſlow "motion of the water. The interſperſed, vacant, ſandy "ſpaces reſemble ſo many bright lawns, which pleaſe by "a kind of regular confuſion."

Among the more extraordinary kinds of fiſh are the flying-fiſh, the toad-fiſh, the ink-fiſh, which is ſo called from its diſcolouring the water with a black liquid when in danger of being caught, by which means it becomes inviſible to the enemy; the cat of nine-tails, and the ſcuttle-fiſh, both of which, as well as the ink-fiſh, eject a black liquid; the old-man, the old-wife, the dolphin, the mud-fiſh, the ſtar-fiſh, and the ſhark. This laſt fiſh we have already deſcribed in the courſe of this work; but we cannot forbear mentioning a very unequal and hazardous combat with that voracious animal by a common ſailor, which may perhaps be conſidered as heroic an inſtance of diſintereſted friendſhip and perſonal bravery as any recorded in hiſtory. The account we find in the reverend Mr. Hughes's Natural Hiſtory of Barbadoes, and ſhall give it in his own words.

"About the latter end of queen Anne's wars, captain "John Beanis, commander of the York Merchant, ar-"rived at Barbadoes from England. Having diſembark-"ed the laſt part of his lading, which was coals, the "ſailors, who had been employed in that dirty work, "ventured into the ſea to waſh themſelves; there they "had not been long, before a perſon on board eſpyed a "large ſhark making towards them, and gave them no-"tice of their danger; upon which they ſwam back and "reached the boat, all but one; him the monſter over-"took almoſt within reach of the oars, and griping him "by the ſmall of the back, his devouring jaws ſoon cut "him aſunder, and as ſoon ſwallowed the lower part of "his body; the remaining part was taken up and carried "on board, where his comrade was. His friendſhip with "the deceaſed had been long diſtinguiſhed by a reciprocal "diſcharge of all ſuch endearing offices, as implied an "union and ſympathy of ſouls. When he ſaw the ſever-"ed trunk of his friend, it was with an horror and emo-"tion too great for words to paint. During this affect-"ing ſcene the inſatiable ſhark was ſeen traverſing the "bloody ſurface in ſearch after the remainder of his prey; "the reſt of the crew thought themſelves happy in being "on board, he alone unhappy, that he was not within "reach of the deſtroyer. Fired at the ſight, and vowing "that he would make the devourer diſgorge, or be ſwal-"lowed himſelf in the ſame grave, he plunges into the "deep armed with a ſharp-pointed knife. The ſhark "no ſooner ſaw him, but he made furiouſly towards him; "both equally eager, the one of his prey, the other of "revenge. The moment the ſhark opened his rapacious "jaws, his adverſary dexterouſly diving, and graſping "him with his left hand ſomewhat below the upper "fins, ſucceſsfully employs his knife in his right hand, "giving him repeated ſtabs in the belly: the enraged "ſhark, after many unavailing efforts, finding himſelf "overmatched in his own element, endeavours to diſ-"engage himſelf, ſometimes plunging to the bottom, "then mad with pain, rearing his uncouth form, now "ſtained with his own ſtreaming blood, above the foam-"ing waves. The crews of the ſurrounding veſſels ſaw "the unequal combat, uncertain from which of the "combatants the ſtreams of blood iſſued; till at length "the ſhark, much weakened by the loſs of blood, made "towards the ſhore, and with him his conqueror; who, "fluſhed with an aſſurance of victory, puſhes his foe "with redoubled ardour, and, by the help of an ebbing "tide, dragging him on ſhore, rips up his bowels, and "unites and buries the ſevered careaſs of his friend in one "hoſpitable grave."

This ſtory, our author adds, is of ſo extraordinary a nature, that he would not have dared to give it his reader, had he not been authorized by the teſtimony of a very credible gentleman, who was ready to confirm, by oath, the truth of what is here related.

SECT. XXI.

Of the different Inhabitants, the Diviſions of the Iſland, and a particular Deſcription of Bridge Town, the Capital; with the Government and Trade of Barbadoes.

THE inhabitants of Barbadoes conſiſt of the maſters, who are either originally Engliſh, Scots, or Iriſh; with a few Dutch, French, Portugueſe, and Jews: the white ſervants, and the black ſlaves. The maſters, who conſiſt of the merchants and planters, both clergy and laity; lawyers, phyſicians, &c. live very elegantly, having a number of ſervants for their plantations and houſhold, rich equipages, fine liveries, and the moſt wealthy of them have pleaſure-boats in which they make the tour of the iſland.

The white ſervants are either by covenant or purchaſe, and are of two ſorts, ſuch as ſell themſelves in Great Britain or Ireland, for four years or more, and ſuch as are tranſported thither for their crimes. When the term of the covenant-ſervants is out, the Britiſh ſervants have each five pounds, the others but forty ſhillings. Their work is not ſo hard as that of our day-labourers, yet their encouragement is greater; and if they are good for any thing, they may be employed upon their own terms when their time is expired. They are not allowed near ſo much fleſh as thoſe who are employed in our country farms, yet they do not want; for the planters give them Engliſh biſcuit, which the negroes have not; and the chief of them are ſupplied from their maſters tables.

The ſervitude of the blacks is perpetual, and thoſe maſters who are men of humanity have a double intereſt in taking care of them, becauſe if a negro dies the owner loſes forty or fifty pounds; while by the death of a white ſervant he only loſes the wages he pays to another to ſupply his place, during the remainder of his term. The buſineſs of the blacks lies moſtly in the field, except thoſe who are taken into the ſugar-mills, ſtore-houſes, and dwelling-houſes, where the handſomeſt and neateſt maids are made menial ſervants, and the cleverеſt fellows lacquies, coachmen, and grooms: others are frequently employed as coopers, joiners, maſons, and the like. A ſlave who is a good mechanic is worth a hundred and fifty or two hundred pounds, and even much more has been given for a boiler of ſugar. The negroes are purchaſed out of the Guinea ſhips, after being all viewed naked, and are frequently allowed two or three wives, that they may increaſe the planter's ſtock; for their poſterity to all generations are ſlaves, unleſs they are reſtored to liberty. The women are very conſtant to the man who paſſes for their huſband. Their choiceſt fare is plaintanes, which they boil or roaſt; and they have twice or thrice a week either ſalt fiſh, mackarel, or ſalt pork, with ſome bread made of Indian corn of the produce of the country, fetched from Carolina.

Every negro family has a cabbin built with ſticks, withs, and plantane leaves. Theſe ſtand round the planter's houſe, with a garden, where they plant yams, potatoes, caſſava roots, &c. and breed goats, hogs, and fowls, for their own eating or for ſale. The negroes born in Barbadoes are much more uſeful than thoſe brought from Guinea, and thoſe that come children from Africa make much better ſervants when they are grown up, than thoſe that come over at years of maturity; but it is reckoned that a fourth part of the negroes die in ſeaſoning.

Every plantation has a chief overſeer, who is allowed a hundred or one hundred and fifty pounds a year, beſides two or three under him, with accomptants, and other officers. The country being too hot for hunting and hawking, the planters and other gentry are obliged for the moſt part to divert themſelves by playing at cards, dice, tables, quoits, and bowling; likewiſe by reſorting to balls and concerts.

The principal diſeaſes of this iſland are the dry-gripes, ſo called from its affecting that part of the body with great coſtiveneſs and pain; but this dreadful diſeaſe was formerly much more frequent and fatal than it has been of late. There are likewiſe other kinds of colics, the yellow jaundice, hyſteric diſorders, diarrhœas, and dyſenteries; fluxes are alſo very common, eſpecially in the rainy ſeaſons, when by catching cold the perſpiration is interrupted, and what ſhould have been exhaled through the ſkin is thrown upon the bowels; they are alſo cauſed by eating immoderately of fruit. The yellow fever is another fatal diſeaſe, as are alſo the ſmall-pox, the meaſles, the leproſy, and the yaws. The laſt appears in fleſhy knobs as large as a thimble, covering the face, breaſt, arms, and other parts of the body.

The precincts of this iſland, with their reſpective pariſhes, are as follow:

In the ſouth part of the iſland are St. Michael's or Bridge precinct, containing the pariſhes of St. Michael, St. George, and St. John. In St. James's, or the Hole precinct, are the pariſhes of St. Thomas and St. James; and in St. Peter's, or Speight's precinct, is the pariſh of St. Peter, with All Saints chapel.

In the eaſt part is Oſtine's precinct, which contains the pariſhes of Chriſt church and St. Philip's.

In the north is St. Andrew's Overhill, or Scotland precinct, which contain the pariſhes of St. Andrew and St. Joſeph.

In the weſt is only the pariſh of St. Lucy.

Bridge Town, the capital, is reckoned the fineſt and the largeſt in all the Caribbee Iſlands. It is ſeated in the ſouth-weſt part, in the thirteenth degree north latitude, and in the ſixtieth degree weſt longitude, and was at firſt called St. Michael's, from the name of its church; but received its preſent denomination from a bridge erected over the waters, that after rains flow from the neighbouring marſhes. It is ſituated in the innermoſt part of Carliſle-bay, which is large enough to contain five hundred ſhips. The houſes, which are of brick and ſtone, are lofty, and amount to about twelve hundred; they have glazed windows, and many of them are ſaſhed: the ſtreets are broad, and one of them, named Cheapſide, has the rents as dear as thoſe of the houſes of Cheapſide in London. The wharfs and quays are very neat and convenient, defended by ſeveral forts. The firſt to the weſt is James fort, which is mounted with eighteen guns: the next to this is Willoughby's, built on a ſmall neck of land that runs out into the ſea, and is mounted with twenty guns: there are three batteries between this and Needham's fort, which is alſo mounted with twenty guns. Above Needham's, and more within land, is the Royal citadel called St. Anne's. Charles fort is built on Needham's-point, and lies out in the ſea to the windward of the bay and town. From this a platform runs to Ormond's fort. On the eaſt ſide of the town is a ſmall fort of eight guns, and a magazine built of ſtone, where the powder and ſtores of the iſland are kept under a ſtrong guard. In ſhort, this is both the ſtrongeſt and richeſt town in all the Caribbees; the ſtore-houſes and ſhops being generally as well furniſhed as thoſe in London.

The church, which is as large as many of our cathedrals, has a noble organ, a good ring of bells, and a curious clock. In the town are alſo large taverns and eating-houſes, with a poſt-houſe, packet-boats being eſtabliſhed by the government to carry letters monthly to and from this place. This is the ſeat of the governor, council, and aſſembly; and alſo of the court of chancery. The number of militia for this town and St. Michael's precinct is no leſs than twelve hundred men, who are called the Royal regiment of foot guards. There is here a college founded and well endowed by the liberality of that great man colonel Chriſtopher Codrington, who was a native of this iſland, and was diſtinguiſhed by a great number of amiable and uſeful qualities. The town has alſo a convenient free-ſchool, and an alms-houſe of twenty poor widows.

There are ſeveral other towns; but they are ſmall: indeed every part of the iſland is ſtrewed with gentlemen's houſes, encompaſſed by fields of ſugar-canes, and the bloom and fragrance of orange, lemon, lime, and citron trees, guavas, papas, aloes, and a vaſt multitude of other elegant and uſeful plants. Even the negro huts, though mean, contribute to the beauty of the country; for they ſhade them with plantane trees, which give their villages the appearance of ſo many beautiful groves.

The government of this iſland reſembles that of the others, and the inhabitants ſupport the expence of their own eſtabliſhment, which is very conſiderable, with great credit. The governor's place is worth at leaſt five thouſand pounds a year, and the reſt of the officers have conſiderable incomes. The people provide very handſomely for their clergy, who are of the church of England, which is the religion eſtabliſhed here as it is in the other iſlands; and here are very few Diſſenters. There is in general a greater appearance of order and decency than in any other colony in the Weſt Indies; and there is no place comparable to Barbadoes, in the number of the people, the cultivation of the ſoil, and thoſe elegancies and conveniencies which reſult from both.

The iſland can raiſe five thouſand men of its own militia, and has generally a regiment of regular troops, though it is ſeldom complete. It is fortified by nature all along the windward ſhore by the rocks and ſhoals; ſo that near two-thirds are utterly inacceſſible. On the leeward ſide it has good harbours; but the whole coaſt is protected by a line of ſeveral miles in length, defended by twenty-two caſtles and forts, and twenty-ſix batteries. All freemen here are obliged to enter themſelves in the regiment of their own diſtrict, and there is a law here obliging all perſons who deſign to leave the iſland to give notice of it at the ſecretary's office, three weeks before their departure.

The number of inhabitants amounts at preſent to twenty-five thouſand whites, and near eighty thouſand negroes; and there are ſhipped from hence above twenty-five thouſand hogſheads of ſugar, valued at three hundred thouſand pounds; beſides rum, molaſſes, cotton, ginger, and aloes: an immenſe peopling and produce for a country that does not contain above a hundred thouſand acres of land.

The inhabitants of Barbadoes trade with New England, Carolina, Penſylvania, New York, and Virginia for lumber, bread, flour, Indian corn, rice, tobacco, ſalt beef and pork, fiſh, pulſe, and other proviſions; with Guinea for negroes; with Madeira for wine; with Tercera and Fayal for wine and brandy; with the iſles of May and Curaſſou for ſalt; and with Ireland for beef and pork. The other goods which they import from Great Britain and Ireland are Oſnabrugs, which are the chief wear of their ſervants and ſlaves; linen of all ſorts, with broad cloth and kerſeys for the planters, their overſeers, and families; ſilks and ſtuffs for their ladies and houſhold ſervants; red caps for their ſlaves of both ſexes; ſtockings and ſhoes of all ſorts; gloves and hats; millinery-ware and perukes; laces for linen, woollen, and ſilks; ſtrong beer, pale beer, pickles, candles, butter, and cheeſe; iron-ware, as ſaws, files, axes, hatchets, chiſſels, adzes, hoes, mattocks, gouges, planes, augers, nails; lead, powder, and ſhot; braſs and copper-wares; all ſorts of India goods and toys, coals, and pantiles.

The voyage is commonly five or ſix weeks outward-bound, and ſix or ſeven homeward. The planters ſend

to Guinea guns, powder, ball, perpetuanas, hats, and other wearing apparel, which they have from England, and diſpatch ſmall veſſels thither to bring ſlaves for their plantations, which muſt be recruited every year with twenty or thirty negroes to every four or five hundred acres; ſo that, notwithſtanding the means uſed to make the ſlaves propagate, this iſland alone is ſaid to receive a ſupply of a hundred thouſand negroes every thirty years; and yet at the end of that time their number was never found to be increaſed. It cannot be here improper to mention, that upon a parliamentary enquiry in 1728, it appeared, that in three years only the number of negroes ſent to Barbadoes, Jamaica, and Antigua alone amounted to forty-two thouſand.

SECT. XXII.

A conciſe Hiſtory of the Iſland of Barbadoes.

IT is not diſtinctly known when this iſland was firſt diſcovered and ſettled, but it was probably about the year 1625. When the Engliſh firſt landed here they found the country extremely wild, it having not the leaſt appearance of its ever having been peopled even by ſavages. There was no kind of beaſt of paſture, nor any marks of cultivation; yet as the climate was good, and the ſoil appeared fertile, ſome gentlemen of ſmall fortunes in England reſolved to become adventurers. The firſt planters had not only the deſolateneſs of the place and the extreme want of proviſions to ſtruggle with, but the trees were generally ſo large, of a wood ſo hard and ſtubborn, with wide ſpreading tops, that they proceeded in the neceſſary work of clearing the ground with a difficulty that muſt have ſubdued any ordinary patience. And even when they had tolerably cleared a ſmall ſpot, the firſt produce it yielded for their ſubſiſtence, probably for want of ſowing the ſeed in a proper ſoil, was ſo ſmall and ordinary, at the ſame time their ſupplies from England were ſo ſlow and precarious, that nothing but an invincible courage, and a firmneſs that cannot be ſufficiently commended, could have carried them through the diſcouragements they met with in the noble work of cultivating and peopling a deſerted part of the earth. But by degrees things wore a more favourable aſpect; ſome of the trees yielded fuſtic for the dyers; cotton and indigo were found to agree well with the ſoil; tobacco then becoming faſhionable in England, anſwered tolerably; and the country gradually began to ſubmit to culture, and to lay aſide its ſavage appearance.

This happy change, and the ſtorm that ſome time after began to gather in England, encouraged many to go over; but ſtill the colony received no encouragement from the government, which at that time underſtood the advantages of colonies but little; and the court took no other notice of this iſland than to grant it to the earl of Carliſle, which proved of no advantage to the ſettlement. However, as this colony had the hardieſt breeding, and the moſt laborious infancy of any of our ſettlements in this part of America, ſo it was far ſtronger, and grew with greater ſpeed, even to a height that ſeems incredible; for in this ſmall iſland in the year 1650, which was little more than twenty years after its firſt eſtabliſhment, it contained upwards of fifty thouſand whites of all ages and ſexes, with a much greater number of blacks and Indian ſlaves. The former of theſe ſlaves they bought; but the latter they acquired by the moſt baſe and diſhonourable methods; for they ſeized upon thoſe unhappy people, without any pretence, in the neighbouring iſlands, and carried them into ſlavery: a practice which rendered the Caribbee Indians their moſt inveterate enemies.

The ſmall iſland of Barbadoes, peopled by upwards of a hundred thouſand ſouls, was not yet above half of it cultivated, nor was the induſtry of the inhabitants at a ſtand. A little before the period juſt mentioned they learned the art of making ſugar; and this enlarging the ſphere of their trade, they grew prodigiouſly rich and numerous.

The government in England being about this time in the hands of Cromwell, confined the trade of Barbadoes to the mother country; for before it had been entirely managed by the Dutch. The ſeverity with which the royal party were treated, now obliged ſeveral gentlemen of very good families to ſettle in the iſland, which were far from being peopled like ſeveral other colonies by fugitives, and perſons in unhappy circumſtances. After the Reſtoration it continued ſtill advancing by very haſty ſtrides. King Charles II. ſoon after his aſcending the throne, created thirteen baronets from the gentlemen of this iſland, ſome of whom were worth ten thouſand pounds a year, and none ſo little as one thouſand.

On the thirty-firſt of Auguſt, 1675, the iſland was afflicted with a moſt dreadful hurricane, which it is ſaid was not inferior in its deplorable conſequences to the earthquake that happened at Jamaica; for it left never a houſe or tree ſtanding, except the few that were ſheltered by ſome neighbouring hill or cliff. Some hours before the ſtorm began the heavens were overcaſt with thick clouds of a black reddiſh hue; the air calm, but ſultry; and the more it loſt its expanſive force, the cloſer the clouds condenſed, and the blacker they appeared. In the afternoon, when the violence of the ſtorm began, the wind was high, and varying almoſt in an inſtant to every point of the compaſs; but ſettled chiefly at north, being attended with dreadful rain, thunder, and lightning. The ſea, where not guarded with high cliffs, overflowed its banks above an hundred yards, and during the day-light nothing was to be ſeen but one rueful ſpectacle of almoſt univerſal ruin. The night as it came on was uſhered in with a continued rumbling noiſe in the air, with the increaſe of wind, rain, thunder, and lightning; eſpecially the latter, which now with redoubled force darted, not with its uſual ſhort-lived flaſhes, but in rapid flames, ſkimming over the ſurface of the earth, as well as mounting to the upper regions. The next morning, when the ſtorm was abated, the whole iſland, ſays our author, afforded a lively but terrible idea of the tenth Egyptian plague; for there was ſcarce a houſe but lamented one dead in it, or in general ſomething equal or worſe. Several families were entirely buried in the ruins of their houſes, and there were few that eſcaped but with the loſs of ſome relation, friend, or acquaintance.

This dreadful calamity happened in the meridian of this ſettlement, when their whites were computed to be much more than fifty thouſand, and their ſlaves were increaſed to upwards of a hundred thouſand of all kinds. They employed four hundred ſail of ſhips, one with another of a hundred and fifty tons, in their trade. Their annual produce, conſiſting of ſugar, indigo, ginger, exported cotton, &c. amounted to upwards of three hundred and fifty thouſand pounds, and their circulating caſh at home was two hundred thouſand. Perhaps no country in the world was ever peopled in the ſame proportion; nor has land of the ſame dimenſions which produces any thing like the ſame profits. But ſince that time the iſland has been upon the decline. The growth of the French ſugar iſlands, and the ſettlement of Antigua, St. Chriſtopher's, Nevis, and Montſerrat, as well as the greater eſtabliſhment in Jamaica, have drawn away a vaſt number of the people. A terrible contagion attacked the iſland in the year 1692; it raged like a peſtilence; twenty have died in a day in their principal town, and all parts of the iſland ſuffered in proportion. This ſickneſs continued, with ſome abatements, for ſeveral years, and is ſaid to have rendered the climate leſs healthful than it was before. At the ſame time with this diſtemper war raged, and the Barbadians, who raiſed a good number of men, loſt many of them in fruitleſs expeditions againſt the French iſlands. All theſe cauſes contributed to reduce the number and opulence of this celebrated iſland; but it is only in compariſon with itſelf, that it can be conſidered in any other than the moſt flouriſhing condition, even at this day.

SECT. XXIII.

Of TABAGO, *or* TOBAGO.

Its Situation, Extent, Climate, Soil, Produce, particularly its valuable Spices, an Account of its Animals, and a conciſe Hiſtory of its ſeveral Revolutions.

TABAGO, the moſt eaſterly of all the Caribbee Iſlands, is ſeated in the eleventh degree ten minutes

north latitude, about thirty-five leagues to the ſouth-eaſt of St. Vincent, forty leagues eaſt of Grenada, twelve leagues north-eaſt of Trinidad, and between thirty and forty north-eaſt of the Spaniſh Main. It is thirty-two miles in length from the ſouth-eaſt to the north-weſt, and about nine broad from eaſt to weſt, the whole being above ſeventy miles in compaſs; ſo that it is rather larger than Barbadoes, or indeed than any of our Leeward Iſlands. At a ſmall diſtance from the north-eaſt extremity is a ſmall iſland called Little Tabago, which is two miles in length and a mile in breadth.

The climate of Tabago is not ſo hot as might be expected from its being ſeated ſo near the equator; and it is ſaid to enjoy one favourable circumſtance, which is of the greateſt advantage, this is its lying out of the courſe of thoſe hurricanes that have ſometimes proved ſo fatal to the other Weſt India iſlands.

The ſurface of the iſland is agreeably diverſified with hills and vales; its north weſt extremity is mountainous; but no part of it is rugged or impaſſable. Its ſoil is of different kinds; but in general its mould is black, rich, and proper for producing, in the greateſt plenty, whatever is raiſed in other parts of the Weſt Indies. The many ſprings on the iſland contribute to its healthfulneſs, and its bays and creeks are ſo diſpoſed as to be very commodious for all kind of ſhipping: yet its ſituation requires fortifications, eſpecially as the natural richneſs of the iſland ſerves but to render it the more inviting to invaders.

The valuable trees which grow in Tabago are perhaps its richeſt produce; for, beſides its producing the different kinds of wood to be found in the Weſt India iſlands, the Dutch, by whom it was once ſettled, affirm, that both the true nutmeg and the cinnamon tree, with that which produces the real gum copal, grows upon this iſland. The Dutch can indeed be ſcarcely ſuppoſed to be deceived in the natural properties of thoſe valuable trees, which they acknowledge to be, in ſome reſpects, different from thoſe in their plantations in the Eaſt Indies; yet a great doubt remains, whether they are the original productions of Tabago, or whether they had not been imported and planted there from the Eaſt Indies. Tho' the latter is the moſt probable opinion, yet as the fact itſelf, which is undiſputed, evinces that thoſe rich ſpices may be cultivated upon the iſland, it renders it an object highly worthy the attention of the public. This iſland is alſo ſaid to produce five different kinds of pepper, the long, the cod, the bell, the round, and Jamaica pepper, all which we are told grow upon the iſland without culture.

The ſoil naturally produces Indian and Guinea corn; but no Engliſh grain, except peaſe and beans, can be raiſed there. The fig-trees produce as good fruit as thoſe of Spain and Portugal. The pomegranate, the pine-apple, the banana, the prickle-apple, oranges of two ſorts; lemons and limes of both kinds, ſour and ſweet, are found in plenty upon this iſland; and the marmalade made of its guavas is inferior to none. Plantanes grow here of an excellent kind, as do tamarinds, grapes, the cuſtard-apple, the ſour-apple, the papaw-apple, the mammee-apple, and the yellow plum are plentiful here. The cherries that grow upon the iſland are but indifferent. The cocoa-nut, of which we have given a deſcription in treating of Aſia, grows here to ſuch perfection, that the Indians call it God's-tree, as producing both meat, drink, and cloathing. Cucumbers, muſk and water melons, pomkins, and gourds, likewiſe thrive here. The inhabitants have alſo potatoes, yams, caſſava-root, onions, carrots, parſnips, and turnips.

Horſes, cows, aſſes, ſheep, deer, goats, and rabbits, were probably introduced by the Courlanders and Dutch, and their breed are ſtill to be found on the iſland. Here are alſo the pickery, which reſembles a hog, armadilloes, and guanoes.

Its ſhores are ſtored with excellent fiſh, particularly with turtle of every kind, and mullets of a moſt delicious taſte, with other ſorts unknown in England: no iſland, perhaps in the world, can boaſt of ſuch variety of fowl.

We ſhall now give a conciſe hiſtory of this iſland, which was firſt diſcovered by Columbus in 1498; but it does not appear that the Spaniards ever made any ſettlement upon it. At length, in 1628, William, earl of Pembroke, obtained a grant of this iſland from king Charles I. but dying ſoon after, the deſign of peopling it dropped. About the year 1632, ſome Zealanders trading in theſe ſeas, took ſuch a liking to this iſland, that upon their return home, they engaged the company of merchants, to which they belonged, to ſettle it; and it received the name of New Walcheren, from one of the largeſt iſlands in the province of Zealand. The new colony ſoon encreaſed to about two hundred; but being attacked by the Spaniards and Indians, they were all of them exterminated.

Some years after, James duke of Courland ſent a colony of his own ſubjects to this iſland, who ſettled upon what was afterwards called Courland-Bay, and erected a ſmall regular fort, with a town in its neighbourhood. Here they lived ſo inoffenſively, that they remained unmoleſted either by the Caribbees or the Spaniards; and found the ſoil ſo good, that the colony ſoon made an excellent appearance. They were ſupplied from their own country with all kinds of utenſils, and flouriſhed to ſuch a degree as to awaken the jealouſy of the Dutch, who revived their claim. In 1654, Meſſ. Adrian and Cornelius Lampſin of Fluſhing, two Dutch merchants, fitted out ſome ſhips, and landed ſome men on Tobago; but finding the Courlanders too powerful to be oppoſed, took poſſeſſion of a different part of the iſland now called Rockley-Bay, acknowledging themſelves under the protection of the duke of Courland.

But the duke, having given umbrage to Charles Guſtavus of Sweden, had the misfortune to be taken priſoner in 1658, and to be carried to Riga. This news reaching Tobago, the Dutch beſieged and took the Courlanders fort, and thus became maſters of the whole iſland; but promiſed to reſtore the fort as ſoon as the duke ſhould recover his liberty.

The court of France ſoon after inſerting Tabago among the other iſlands granted to the French Weſt-India company; and the Dutch planters, thinking this a favourable opportunity for eſtabliſhing themſelves under ſo powerful a protection, Lampſin, in 1662, applied to the court of France, where he had ſuch intereſt, that he was created baron of Tobago, and becoming ſole proprietor of the iſland, under the crown of France, ſent over M. Hubert de Beveren as governor. The new governor called the town his countrymen had built, Lampſinburg; and gave the ſame name to the harbour, and alſo to a regular fortreſs he erected at the ſame time. He likewiſe built Fort Beveren; and beſides raiſing ſeveral other forts for the ſecurity of the colony, laid the foundation of a new town, which he intended to call New Fluſhing. Mean while the planters proceeded with great ſpirit; they laid out cacao walks, which ſerved equally the purpoſes of beauty and profit; erected indigo-works and ſugar-mills; and Tobago ſeemed as if it would ſoon rival the moſt flouriſhing of the Engliſh Weſt-India ſettlements.

The duke of Courland, being at length reſtored to his liberty by the treaty of Oliva, demanded of the States General the reſtoration of his fort on the iſland of Tobago; but not meeting with any ſucceſs, he applied to Charles II. king of England, who granted to him that iſland, on conſideration of certain ſervices reſerved to the crown of Great Britain; this only ſerved to put the Dutch at Tobago on their guard: but ſoon after, in the firſt Dutch war, the Engliſh privateers deſtroyed the Dutch forts and colony of Tobago; however, in the ſucceeding war carried on by the French and Dutch againſt England, the Engliſh were, in their turn, diſpoſſeſſed of the iſland, and the Dutch reinſtated in it. It afterwards ſerved as a rendezvous for the combined fleets of the two nations, who by this means did prodigious damage to the Engliſh trade; but before the end of the war, Sir John Harman attacked and defeated their joint ſquadrons, and totally deſtroyed the remains of that of France. The Dutch, however, after the defeat of their fleet, and that of their allies, not only kept poſſeſſion of Tobago, but in five years time fortified it with three ſtrong forts, and a numerous artillery; ſo that it was conſidered as impregnable; yet Sir Tobias Bridges, in 1673, made a deſcent upon the iſland, which he not only plundered, but carried away four hundred of the inhabitants priſoners.

The peace which took place the next year between the Engliſh and Dutch, left the latter once more in poſſeſ-

ſion

ſion of this iſland; and they even conquered from the French the iſland of Cayenne. They kept it however but a ſhort time; for the count of D'Etrees, vice-admiral of France, ſoon after reconquered Cayenne, and appeared before Tobago. James Binkes, the admiral of Zealand, was then lying in Great Rockley harbour, with a ſtrong ſquadron of Dutch ſhips, which the count attacked by ſea and land, on the third of March 1677; when, after a deſperate engagement, the Glorieux, the count's ſhip of ſeventy guns, with ſeveral others, being blown up, he was obliged to retire, having firſt deſtroyed in the engagement great part of the Dutch ſquadron. Towards the end of the year the count was reinforced with a ſtronger ſquadron, when landing his men, he regularly inveſted the principal fort in the iſland, which he found ſo ſtrong, that he was obliged to bombard it; but the third bomb that was thrown fell upon a magazine of powder, which blew up the fortreſs, together with admiral Binkes, and the greateſt part of the officers and garriſon. The count then completed the reduction of the iſland, and on the twenty-ſeventh of December the ſame year, entirely deſtroyed the Dutch colony.

After this, the Engliſh publiſhed propoſals for ſettling the iſland; but theſe were never carried into execution: and at the peace of Aix-la-Chapelle, Tobago was one of the four iſlands that were declared neutral. Notwithſtanding this, the marquis de Caylus, governor of the French iſlands, ſent troops and men to fortify and ſettle it; but the Britiſh court warmly remonſtrating to the court of France, againſt ſo manifeſt a violation of the peace, the French diſavowed his proceedings, ordered him home, and the ſettlement to be diſcontinued. In this ſtate it remained till the definitive treaty of Fontainbleau, by which Tobago was ceded to Great Britain; after which the government of it was given by his preſent majeſty to colonel Melvil, and meaſures taken to ſell the land in ſhares, and people the country.

SECT. XXIV.

Of GRANADA, *and the* GRANADILLAS, or GRANADINES.

A Deſcription of Grenada, or Granada, and of the ſmaller Iſlands; their Situation, Extent, Produce, and Hiſtory.

THE chief of theſe iſlands, named Granada, or Grenada, is ſituated in the twelfth degree north latitude, and in the ſixty-firſt degree forty minutes weſt longitude. It is the laſt of the Windward Caribbees, and lies thirty leagues north of New Andaluſia, on the continent. It is ſaid to be about thirty miles in length, in ſome places fifteen in breadth, and about ſixty-ſix in circumference.

Granada and the Granadines produce very fine timber; the latin tree, which grows here, has a tall body, and its leaves, when tied together, ſerve as thatch for houſes; experience has proved, that its ſoil is fit for producing ſugar, tobacco, and indigo; and upon the whole it carries with it all the appearances of becoming as flouriſhing a colony as any in the Weſt Indies of its dimenſions.

A lake on the top of a high hill in the middle of the iſland ſupplies it with ſtreams of freſh water, which render the ſoil extremely fertile, and it abounds with wild game; among the fowl are wood-pigeons, thruſhes, and parrots; and among the fiſh are eels, mullets, and cray-fiſh.

Several bays and harbours lie round the iſland, ſome of which might be fortified to great advantage; ſo that it is very convenient for ſhipping, and has the happineſs of not being ſubject to hurricanes. The chief port, called Lewis, is on the weſt ſide, in the middle of a large bay, with a ſandy botom; and it is ſaid that a thouſand veſſels from three hundred to four hundred tons may ride ſecure from ſtorms, and that a hundred ſhips of a thouſand tons each may be moored in the harbour: beſides, a large round baſon, which is parted from it by a bank of ſand, if cut through would contain a conſiderable number of ſhips. At preſent large ſhips, on account of this ſand-bank, paſs within eighty paces of one of the mountains that lie at the mouth of the harbour; the oppoſite mountain lying at about half a mile diſtance. One of theſe mountains, when the Engliſh reduced the iſland, was ſtrongly fortified, and might have made a good defence, but ſurrendered without firing a gun.

With reſpect to the hiſtory of this iſland, it will be proper to obſerve, that in 1638 the famous M. de Poincy attempting to make a ſettlement here, was driven off by the Caribbees. Afterwards M. Parquet, governor of Martinico, carried over two hundred men from that iſland, furniſhed with preſents to procure the favour of the natives, and with arms to ſubdue them, ſhould they prove untractable. The number of the French are ſaid to have frighted the ſavages into ſubmiſſion; and we are told that their chief not only welcomed the new ſettlers, but, in conſideration of their being preſented with ſome hatchets, knives, ſciſſars, toys, and the like, yielded to Parquet the property of the iſland, only reſerving to themſelves their habitations. The French began with raiſing tobacco, which proved remarkably good; but they had ſcarcely got in one crop, when they began to diſcover that all the ſeeming complaiſance of the natives was diſſembled; who now took every opportunity of cutting off their new gueſts. This produced a war, and the colony having received a reinforcement of three hundred men from Martinico, drove the natives to a mountain, where, having exhauſted all their arrows and other weapons, they rolled down trunks of trees on their enemies. They were ſoon after joined by other ſavages from the neighbouring iſlands, and attacked the French with freſh vigour, but were again defeated; yet were ſo deſperate, that forty of them who had eſcaped the ſword, threw themſelves from a precipice into the ſea. The French then vented their rage on the habitations of the natives, levelled them with the ground, and deſtroyed their proviſions.

Freſh ſupplies of Caribbees however arriving, the war was renewed, and they killed many of their enemies; on which the latter came to a reſolution of exterminating the whole race upon the iſland, and a hundred and fifty attacking them by ſurprize, inhumanly murdered, not only the men, but the women and children; and likewiſe ſet fire to their canoes, to cut off all communication between the ſurvivors and the Caribbees of the neighbouring iſlands. The French were here the ſavages, and not the Caribbees.

Theſe barbarities exaſperated the Caribbees ſtill more againſt the French; they became their irreconcileable enemies, and by their frequent oppoſition at laſt obliged Parquet to deſiſt from his deſign of peopling the iſland, his property in which he ſold to the count de Cerillac in 1657 for thirty thouſand crowns. The count ſent thither as governor a perſon of brutal manners, who by his behaviour made the better ſort of the French abandon it; and ſoon after he was ſhot by thoſe that remained. In 1664 there remained no more than a hundred and fifty planters out of five hundred, who, when the count bought it, were ſettled on the iſland; yet he ſold it to the French Weſt India company for a hundred thouſand crowns: but in 1674 they were obliged to ſurrender all their rights in it to the king.

After this the iſland continued to be inhabited chiefly by the French; but was never fully ſettled. In the laſt war, when Granada was reduced by the Engliſh, the French inhabitants, who were not very numerous, were ſo amazed at the reduction of Guadaloupe and Martinico, that they loſt all ſpirit, and ſurrendered without making the leaſt oppoſition. Afterwards the full property of this iſland, and of the Grenades, which bear nearly the ſame products as Grenada, were confirmed to the crown of Great Britain by the definitive treaty of 1763, and are now in part ſettled by the ſubjects of Great Britain.

We have now concluded our account of the Britiſh dominions in America; an amazing tract of country, much improved, and ſtill capable of immenſe improvements.

CHAP. V.

Of the FRENCH AMERICAN Dominions, particularly LOUISIANA, and the FRENCH WEST INDIAN Iſlands.

SECT. I.

Of LOUISIANA.

Its Situation, Extent, and Produce; with a conciſe Deſcription of New Orleans; and ſome Obſervations with regard to the French Policy, with reſpect to their Colonies.

LOUISIANA was, till lately, conſidered as a much more extenſive country than it is at preſent; M. de Liſle extending it on the north to Canada; on the eaſt to the provinces of New York, Penſylvania, Virginia, Carolina, and Georgia; on the ſouth to the Gulph of Mexico; and on the weſt to New Mexico, New Spain, and unknown countries inhabited by Indians. But by the ſeventh article of the late treaty of peace, a great part of this country, containing all on the eaſt-ſide the river Miſſiſſippi, was ceded to Great Britain; and of this we have already given as accurate an account as it was poſſible for us to obtain.

The country at preſent named Louiſiana, extends from the twenty-ninth to the fortieth degree of north-latitude, and from about the eighty-eighth to the ninety-ſixth or ninety-ſeventh degree weſt-longitude from London. The ſoil is very indifferent near the mouth of the Miſſiſſippi; but the country contains a great deal of excellent land, well ſtocked with a variety of trees, planted by the hand of nature; the ſoil on the ſouth is adapted to the cultivation of indigo, cotton, tobacco, and rice, and the north, to that of wheat; but ſeveral ſpots of great extent, on the eaſtern ſide of the Miſſiſſippi, are no leſs fertile.

With reſpect to the vegetables, and the wild animals, they are, in general, the ſame as thoſe we have deſcribed in treating of Virginia, and the other Britiſh plantations. The Miſſiſſippi, with the many ſmaller rivers that water this country, abound with a variety of fiſh; but their banks are much infeſted with alligators, and ſnakes of a very large ſize; as the air of the low-lands, near the rivers, is with muſketoes.

The iſle of Orleans, at the mouth of the Miſſiſſippi, is a very beautiful and fertile ſpot of ground, on which the French have a conſiderable city, named New Orleans, which is the capital, and indeed the only city of Louiſiana. It is fortified in a regular manner, and according to ſome French authors, has about ſix hundred handſome houſes, and five pariſh churches; with ſtraight and handſome ſtreets, that croſs each other at right angles: but the buildings are chiefly of wood, and not remarkable for their beauty.

The French have ſeveral other ſettlements in the country, and are ſuppoſed by major Rogers, to amount to about one hundred thouſand; the negroes are alſo very numerous; and he obſerves, that as the number of the inhabitants increaſes very faſt, it may in a ſhort time become a very formidable colony.

Before we proceed farther, in the deſcription of the French colonies, it will give ſome ſatisfaction to the reader to know the plan of conduct which France has purſued, with regard to this intereſting and important ſubject. They are ſenſible that as the mother-country is ultimately to receive all the benefits of their labours and acquiſitions, the proſperity of their plantations muſt be derived from the attention with which they are regarded at home: for this reaſon, the plantations are particularly under the care and inſpection of the council of commerce, a board compoſed of twelve of the moſt conſiderable officers of the crown, aſſiſted by the deputies of all the conſiderable trading cities and towns in France, who are choſen out of the richeſt and moſt intelligent of their traders, and paid a handſome ſalary for their attendance at Paris, from the funds of their reſpective cities. This council ſits once a week, when the deputies propoſe plans for redreſſing every grievance in trade; for raiſing the branches that are fallen; for extending new ones; for ſupporting the old; and in fine, for every thing that may improve the working, or promote the vent of their manufactures, according to their own lights, or the inſtructions of their conſtituents. They have a watchful eye upon every article of commerce; and not only propoſe improvements themſelves, but hear the propoſals of others, which are neither diſdainfully rejected, nor raſhly received. They neither render the acceſs to them difficult, by affecting ſtate; nor admit the vexatious practice of fees, and perquiſites, in their inferior officers; nor ſuffer forms and methods to load and incumber that buſineſs they were ſolely intended to advance. They ſummon and examine thoſe who are ſuppoſed to be the moſt competent judges of the matter before them, even the meaneſt artizans; but though they examine theſe men, they are determined by their own opinion. When they are ſatisfied of the uſefulneſs of any regulation, they propoſe it to the royal council, where their report is always received with particular attention. An edict to enforce it accordingly iſſues; and is executed with a punctuality that diſtinguiſhes their government, and which alone can render the wiſeſt regulations any thing better than ſerious mockeries. To this body the care of the plantations is particularly entruſted.

The government of their ſeveral colonies is in a governor, an intendant, and a royal council. The governor is inveſted with a great deal of power; which on the ſide of the crown, is checked by the intendant, who has the care of the king's rights, and whatever relates to the revenue; and on the ſide of the people, it is checked by the royal council, whoſe office it is to ſee that the people are not oppreſſed by the one, nor defrauded by the other; and they are all checked by the conſtant and jealous eye which the government at home keeps over them; the officers of all the ports of France being charged, under the ſevereſt penalties, to interrogate all captains of ſhips coming from the colonies, on the reception they met with at the ports to which they have ſailed? how juſtice was adminiſtered to them? what charges they were made liable to, and of what kinds?

That the colonies may be as little burthened as poſſible, the governor's ſalary is paid by the crown: he has no perquiſites, and is ſtrictly forbidden to carry on any trade, or to have any plantations in the iſlands, or on the continent; or any intereſt whatever in goods or lands within his government, except the houſe he lives in, and a garden for his convenience and recreation. All the other officers are paid by the crown, out of the revenues of the mother country; the fortifications are built and repaired, and the ſoldiers paid out of the ſame funds.

In all the French iſlands judges of the admiralty are appointed, to decide in a ſummary manner all diſputes between merchants, and whatever has any relation to trade. Theſe judges, before they are appointed, are ſtrictly examined as to their ſkill in the marine laws, which have been improved and digeſted in France, with ſuch care and good ſenſe, that all law-ſuits are quickly decided; though in other reſpects, the practice of the law admits of as much chicanery, and has as many, if not more delays, than with us.

That the colonies may be properly repleniſhed with people, every ſhip that ſails from France for America, is obliged to carry a certain number of indented ſervants: thus all veſſels of ſixty tons, or under, are to carry

three; from ſixty to a hundred, four; and from a hundred and upwards, ſix ſervants, of ſound and ſtrong bodies, between the ages of eighteen and forty. Before their departure, they are examined by the officers of the admiralty, to ſee whether they are the perſons required by law; as they are alſo by the commiſſary, on their landing in America, where they are to ſerve three years. The avarice of the planters makes them always prefer negro ſlaves, becauſe they are more in ſubjection than the Europeans, may be more worked, are ſubſiſted with leſs difficulty, and are beſides the entire property of their maſter, which would in time render the ſafety of the colony extremely precarious. The planters are therefore obliged to keep a certain number of white ſervants in proportion to their blacks; and the execution of this law is inforced by the commiſſary, who adjuſts the price, and forces the planters to take the number of ſervants required by the ordinance, who would otherwiſe be a burden upon the maſters of ſhips who brought them.

As to the negroes, they are not left, as with us, with their bodies and ſouls wholly at the diſcretion of the planter. Their maſters are obliged to have them inſtructed in the principles of the Romiſh religion. Methods are alſo taken to protect the ſlaves from the cruelty of the planters, and to preſerve the colony from the ill effects that might ariſe from treating them with a lenity not conſiſtent with their condition. In ſhort, the Code Noir, and other ordinances relative to theſe unhappy beings, ſhew a very juſt and ſenſible mixture of humanity and ſteadineſs. Their planters, however, as well as ours, have the common error of working theſe unhappy creatures in a manner not ſuitable to their conſtitutions, and the nature of the climate.

We ſhall only add, that all debts, though contracted by the planters in France, are levied with great eaſe; for the proceſs being properly authenticated, is tranſmitted to America, where it is admitted as proved, and levied on the planter's eſtate, of whatever kind it be. Care is however taken, that while compulſory methods are uſed to make the planter do juſtice, the ſtate ſhall not loſe the benefit ariſing from the induſtry of an uſeful member of the community; the debt is always levied according to the ſubſtance of the debtor; in ſuch a manner, that one of the parties is not ſacrificed to the other; the creditor is ſatisfied; the debtor is not ruined; and the credit of the colonies is kept up at home, by the ſure methods that are uſed for recovering all demands in the plantations.

Some of theſe regulations, for which we are obliged to a judicious work lately publiſhed, entitled, An Account of the European Settlements in America, would doubtleſs be of great uſe, were they to be introduced into our colonies, eſpecially the iſlands, where proper regulations are much wanted, and where they might be eaſily rendered conformable to the mode of thoſe royal governments.

SECT. II.

Of HISPANIOLA, *or* ST. DOMINGO.

Its Name, Situation, Extent, Climate, and Produce. A conciſe Account of the Buccaneers, and the Manner in which a Part of this Iſland became Subject to the French. Their Trade; the principal Places in the Iſland; with a conciſe Account of St. Lewis, and of the Iſle of Vache, or Cows-Iſland.

WE ſhall now proceed to the iſland of Hiſpaniola, or St. Domingo, which was diſcovered by Columbus in his firſt voyage in 1492, and by him called Hiſpaniola; but afterwards building a city, which he called St. Domingo, in honour of his father Dominic, the name was firſt extended to that quarter, and at length the whole iſland was called St. Domingo, by which name it is as well known as by that of Hiſpaniola.

This iſland, part of which belongs to the Spaniards, is the largeſt of all the Antilles, next to Cuba, it extending from the ſeventeenth degree thirty-ſeven minutes, to the twentieth degree north latitude, and from the ſixty-ſeventh degree thirty-five minutes, to the ſeventy-fourth degree fifteen minutes weſt longitude; it being about four hundred and twenty-ſix miles from eaſt to weſt, and almoſt one hundred and twenty-four where broadeſt, from north to ſouth. It lies in the middle between Cuba and Jamaica, on the north-weſt and ſouth-weſt, and Porto Rico on the eaſt, and is ſeparated from the latter only by a narrow channel.

The climate is extremely hot, but cooled and refreſhed by breezes, yet the air is not reckoned unwholeſome; for ſome of the inhabitants are ſaid to live to above a hundred years of age. Its ſalubrity is ſaid to be owing in a great meaſure to its beautiful variety of hills and vallies, woods and rivers, which every where preſent themſelves to the view.

This iſland is allowed to be the moſt fruitful and the pleaſanteſt in the Weſt Indies; its foreſts contain cabbage-trees, palms, elms, oaks, pines, and other trees, taller and larger, with more beautiful and better taſted fruit than in moſt of the other iſlands, particularly pine-apples, bananas, oranges, lemons, citrons, limes, grapes, dates, and apricots. Here are alſo all the birds common to the Weſt Indies. In the ſavannas, or meadows, are innumerable herds of black cattle, that run wild in the country; horſes enough in the French part of it to ſupply all their neighbouring colonies, beſides wild horſes and wild hogs of the breed brought over by the Spaniards. The hunters ſhoot the beves for their hides, as they do in Cuba; beſides, there is ſcarce a country in the world better watered, either by brooks or navigable rivers, which are all full of fiſh, as the coaſt is with turtle. In the ſands of theſe rivers gold-duſt is found, and it had formerly mines of gold, ſilver, and copper.

The chief commodities of the iſland are hides, ſugar, indigo, cotton, cacao, coffee, ginger, tobacco, ſalt, wax, honey, ambergriſe, and various kinds of drugs and wood for dying; but it produces little corn. The French here are ſaid to equal, if not outnumber, the Spaniards, who both together fall very ſhort of what the extent and fertility of the iſland is capable of ſupporting.

This country was treated with the utmoſt ſeverity by the Spaniards, who in battle and cold blood deſtroyed no leſs than three millions of men, women, and children, and entirely extirpated the inhabitants, by many of whom, at their firſt ſettlement in this iſland, they had been treated with kindneſs.

We have already mentioned the Spaniards attempting to ruin St. Chriſtopher's, when divided between the Engliſh and French; but by this unjuſt act they brought upon themſelves a very ſevere revenge: for ſeveral of the French inhabitants, who were expelled from St. Chriſtopher's, being reduced to great indigence, began to think of deſperate courſes. They betook themſelves to piracy, and uniting with ſome Engliſh, Dutch, and other reſolute fellows, they reſolved to begin a piratical war with the Spaniards. At firſt they ſatisfied themſelves with taking their ſhips, and deſtroying their trade. This they did effectually; but ſoon encouraged, and ſtrengthened by this ſucceſs, they landed upon the continent of New Spain and Terra Firma, burning and plundering the open country. Their number and boldneſs increaſing with their ſucceſs, they aſſembled and took ſome of their ſtrongeſt fortreſſes and opulent cities, particularly Porto Bello, Campeachy, and Maracaibo; they even took the city of Panama by ſtorm, and burnt it, after defeating an army which came to its relief. In all theſe places, and in the others they had taken, they gained an incredible booty, and committed the moſt unheard of cruelties. Another party of theſe pirates paſſing the ſtreights of Magellan, and entering the South Sea, rendered the whole coaſt of Peru, Chili, and the coaſt of Mexico one ſcene of deſolation; while they were every where attended with ſucceſs, becauſe they every where acted with the bravery and conduct that, in a more juſt cauſe, would have merited the higheſt honours.

Theſe pirates, whom we improperly call Buccaneers, the French denominated Flibuſtiers, from the Dutch fly-boats, in which they made their firſt expeditions. The Buccaneers are perſons who hunt wild cattle in America

merica for their hides and tallow: ſome of whom joined the Flibuſtiers in their firſt expeditions, and from them the Engliſh gave the name of Buccaneers to the whole body. Theſe people frequently brought their prizes and plunder to Jamaica, as we have already obſerved, by which they greatly enriched that iſland. Others finding that the Spaniards were ſo weak in Hiſpaniola that they had in a manner deſerted a conſiderable part of the iſland, made it a place of rendezvous. They who hunted the cattle found the deſerts left by the Spaniſh tyranny a proper place for exerciſing their proper profeſſions. To theſe two ſorts of people were added a third, who were ſome of the French in the Leſſer Antilles; who finding how much might be gained by ſupplying men who were laviſh in their expences, and not very exact in their bargains, and perceiving that no part of America afforded a better ſoil, paſſed over to the iſland, and exerciſed the employment of planters and merchants. Theſe three ſorts of people, who were mutually of uſe to each other, lived in very good harmony. Indeed they were ſeveral times diſlodged by the Spaniards; but they ſtill returned with new ſtrength; ſo that it was with difficulty that the Spaniards were able to retain one part of the iſland.

The French court beheld in ſilence the progreſs of theſe people, and whenever complaints were made they diſavowed their proceedings: but when they at length found the French in Hiſpaniola numerous, ſtrong, and wealthy, they owned them as ſubjects, ſent them a governor, and regular forces to defend them in what they had done: the old method of piracy was ſtill connived at, while the trade of ſkins increaſed and the plantations extended. At length the French obtained a legal right by the ceſſion which the Spaniards made them of the north-weſt part of the iſland, by the treaty of Ryſwic in 1697, the beſt and moſt fertile part; and this is the principal ſettlement of the French in the Weſt Indies, and in all America.

This ſettlement begins at a large plain called Bahaia on the north ſide of the iſland, about thirty leagues eaſt of Cape Francois, extending all along the coaſt; from thence to the weſt, reaching on the ſouth ſide as far as Cape Morgon; it being two hundred leagues in circuit, and, including the windings, about a hundred more.

This colony, if it may be ſo called, has ſince met with great encouragement from France, which in 1726 had no leſs than thirty thouſand whites, and a hundred thouſand negroes; they made ſixty thouſand hogſheads of ſugar of five hundred weight each; the indigo was half as much in value as the ſugar; they likewiſe exported large quantities of cotton, and alſo ſent a conſiderable quantity of cacao and ginger to France. Since that time they have raiſed coffee here to a very great amount, and all the other branches of their commercial products have ſince that period increaſed to an aſtoniſhing degree. A Spaniſh writer of great judgment, who was well informed, and who wrote about ſeventeen years ago, reckons the produce of the plantations near Cape Francois, the capital of French Hiſpaniola, and which were exported from that ſingle town, at thirty thouſand tons in ſugar, tobacco, indigo, and coffee, which at the loweſt calculation cannot amount to leſs than ſix hundred thouſand pounds ſterling. If to this be added the exports of the two conſiderable ports of Petit Guaves and Leogane, and the other inferior ones, which are ſuppoſed to ſend out at leaſt as much as the capital, the exported produce of the iſland muſt be annually worth one million two hundred thouſand pounds. There is another branch of trade of extraordinary advantage to the mother-country, which is that they carry on with the Spaniards wholly in the manufactures of France, and for which they receive their returns in ſilver; and this article alone is ſaid to bring annually to France no leſs than two millions of dollars.

The principal places in the iſland are Cape Francois, which is ſituated on the northern part, and is by the French often called the Cape, by way of eminence. It ſtands in the nineteenth degree thirty-five minutes north latitude, and in the ſixty-eighth degree forty-nine minutes weſt longitude, and contains about eight thouſand whites and blacks. In the middle of it is a ſpacious ſquare, about three hundred paces in length and breadth, at which ſeven or eight ſtreets terminate: but this town was deſtroyed in the beginning of the reign of king William by the Engliſh and Spaniards in conjunction. The town is neither walled nor paled in, and is ſaid to have only two batteries, one at the entrance of the harbour, and the other before the town.

Leogane, on the weſt ſide, though inferior in point of ſize, is a good port, a place of conſiderable trade, and the ſeat of the French government, which is in the hands of the governor and an intendant, who are mutually a check upon each other. There are beſides two other towns conſiderable for their trade, Petit Guaves at the weſt end of the iſland, and Port Louis on the ſouth-weſt part.

The capital city belonging to the Spaniards is St. Domingo, ſituated in the eighteenth degree ſeven minutes north latitude, and in the ſixty-ninth degree twenty-ſeven minutes weſt longitude. It is a large well built city, with a good port, and has ſeveral magnificent ſtructures, particularly the houſes of the king of Spain's collectors; with a fine cathedral, ſeven large monaſteries, and two nunneries; beſides a mint, and a college, which has a revenue of four hundred ducats; an univerſity, and an hoſpital endowed with twenty thouſand ducats a year. This city is the ſeat of an archbiſhop, and the reſidence of the governor-general of the Spaniſh Indies and of the judges of the royal courts. The greateſt part of the little trade the Spaniards have in this iſland is carried on from this port, which has fifteen fathoms water at the bar, is large and ſafe, it being defended by ſeveral batteries and a caſtle, with other fortifications. The town is built of ſtone after the Spaniſh manner, and has a large ſquare market-place in the middle of it, about which are the cathedral and other publick buildings; and from this ſquare the principal ſtreets run in a direct line, they being croſſed by others at right angles. The town is almoſt of a quadrangular form, and its ſituation very delightful, between a large navigable river on the weſt, the ocean on the ſouth, and a fine fruitful country on the north and eaſt.

In the French part of Hiſpaniola are the two following iſlands.

St. Louis is about ſix leagues to the north-eaſt of the iſle of Vache, and is ſcarce half a mile long and not a quarter of a mile over; but the French have here a fort. This iſland is juſt high enough not to be over-flown at high water. It is ſeparated from Hiſpaniola by a ſtreight not three quarters of a mile in breadth, where ſmall veſſels ride in deep water cloſe to the ſhore. There is not a drop of freſh water in the iſland, and the rain ſoaks through it immediately as if it were a ſieve; ſo that thoſe who live upon it fetch their water every day from a little river in Hiſpaniola, at the diſtance of a mile and a half. In 1737, an hurricane in this little iſland levelled a town with the ground, except the church and two houſes: ſeveral dwellings about the fort were alſo blown down; the ſhips that were at anchor under it were caſt upon the coaſt, or driven out to ſea; but ſome veſſels and magazines were burnt by lightning, ſeveral perſons were drowned, and all the ſugar-canes and cotton trees in the iſland and its neighbourhood were deſtroyed.

Vache, or Cows-Iſland, is about three leagues from Hiſpaniola, and five or ſix leagues in length. The ſoil is very good, and it has two or three tolerable ports, one of which is able to receive ſhips of three hundred tons burthen. The iſland is conveniently ſeated for a trade with the Spaniſh colonies on the continent of America, and for maintaining an intercourſe with the iſland of Cayenne, the only French ſettlement on the coaſt of South America. It received its name from its being uſed for the grazing of black cattle and hogs, and here the Buccaneers uſed formerly to rendezvous to ſhare the ſpoils they took from the Spaniards.

There are many other ſmall iſlands round Hiſpaniola, moſt of which are uninhabited.

SECT.

SECT. III.

Of ST. BARTHOLOMEW, MARIGALANTE, *and* DESEADA.

Their Situation, Extent, and Produce; with a ſhort View of their Hiſtory.

ST. Bartholomew's is ſituated in the eighteenth degree north latitude, and in the ſixty-ſecond degree thirty minutes weſt longitude, twenty-five miles north of St. Chriſtopher's, and thirty north-eaſt of Saba; it is reckoned only fifteen miles in circumference, but produces tobacco and caſſava, and is covered with trees that give it a delightful appearance, as the ſope tree, the calabaſh tree, the canapia tree, which yields a very pleaſant and ſalutary gum, lignum-vitæ, and iron-wood. On the ſhore are found the fiſh called the ſea-ſtar and the ſea-apple; and has alſo an infinite variety of birds. It has, however, no freſh water, but the rain ſaved by the inhabitants in ciſterns. It is encompaſſed by ſo many rocks, that it is dangerous for ſhips of great burthen to come near it. The harbour is, however, a very good one, and from thence in time of war the French greatly annoy our trade.

This iſland was peopled in 1648, by Poincy the French governor of St. Chriſtopher's; and as the ſoil was thought but indifferent, the French were ſuffered to enjoy it without moleſtation till the year 1689, when Sir Timothy Thornhill landed upon it. The inhabitants had, during their long tranquility, fortified their iſland with batteries and breaſt-works, which extended over two acres of ground, and were double paliſadoed round with ſtakes ſix feet high. Sir Timothy however made himſelf maſter of theſe works, and after ravaging the iſland, carried off about ſeven hundred of the inhabitants with their cattle and effects, ſending the men to Nevis, and the women to St. Chriſtopher's. The Engliſh government thinking this proceeding too ſevere, ſuffered the inhabitants to return to the iſland, but they were to poſſeſs it as Engliſh ſubjects. However, at the peace of Ryſwic it was reſtored to the crown of France. During the firſt war with France, that broke out under George II. this iſland was ſo convenient to the French for privateering, that above fifty Engliſh ſhips were carried into its harbour; and therefore, two privateers from Antigua attacked the French by ſurprize, and reduced the inhabitants before they had time to defend themſelves, making near four hundred white people priſoners, of whom one hundred and forty were fit to bear arms, and alſo three hundred negroes. It was however reſtored to the French, who have retained the poſſeſſion of it ever ſince. Its chief productions for exportation are drugs and lignum vitæ, with lime-ſtone, which the inhabitants ſend to the neighbouring iſlands.

The iſland of Marigalante is ſeated in the ſixty-firſt degree weſt longitude, and in the fifteenth degree forty minutes north latitude, about thirty miles north-eaſt of Dominica, and forty ſouth-eaſt of Guadaloupe: it was diſcovered by Columbus in 1493, who gave it the name of his own ſhip.

This iſland, which is about ſixteen miles from north to ſouth, and four from eaſt to weſt, is full of hills; along the eaſtern ſhore run high rocks, ſo perpendicular, that they ſeem formed by art, and give ſhelter to a prodigious number of tropic birds, they being as full of holes as a pigeon-houſe. On the ſouth-eaſt ſide of the iſland are black rocks; but the weſtern ſhore is plain. The iſland has ſeveral large grottos, with many little ſtreams and ponds of freſh water: it is covered with trees; and particularly abounds with tobacco, and the wild cinnamon tree. Its product is the ſame with the reſt of the Caribbee iſlands, and the plantations are on the ſouth ſide. At the time of its being laſt reduced by the Britiſh arms, it annually produced no more than a thouſand hogſheads of ſugar.

The French began to ſend colonies hither about the year 1647; and, after a long conteſt, remained in poſſeſſion of it; but it was afterwards twice plundered by the Dutch; and in 1691, general Codrington and commodore Wright ſailed thither from the Leeward iſlands, and landing their men, took the town and fort without oppoſition, made the governor and his lieutenant priſoners, and ruined the plantations. Since that time Marigalante could ſcarcely be called an object of military operations, and the Engliſh became twice maſters of it, excluſive of its laſt ſubmiſſion, without reſiſtance, and by the late definitive treaty it was reſtored to France.

Deſeada, or Deſirada, that is, The Deſireable Iſland, received its name from Columbus, it being the firſt of the Caribbee Iſlands he diſcovered in his ſecond voyage in 1493. It is ſituated in the ſixteenth degree twenty minutes north latitude, and in the ſixty-firſt degree twenty minutes weſt longitude; about twenty miles to the north-eaſt of Guadaloupe. It extends ſixteen miles in length, and two in breadth. Some part of it is very fertile, the ſoil being proper for the cultivation of ſugar and cotton, of which laſt it produces the beſt in all the French iſlands. Deſeada was of importance during the late war, on account of the convenient ſhelter its ports afforded to privateers; it was however then taken by the Engliſh; but was reſtored to France by the definitive treaty of 1763.

SECT. IV.

Of GUADALOUPE.

Its Name, Situation, Mountains; with a particular Deſcription of a Volcano, called the Mount of Sulphur. The Climate, Vegetables, and Animals. With a conciſe Account of the little Iſlands called Xaintes, or All Saints. A Hiſtory of Guadaloupe, and an Account of its Trade.

THE iſland of Guardaloupe, or Guadaloupe, was thus called by Columbus, from the reſemblance of its mountains to thoſe of that name in Spain. It is ſituated in the ſixteenth degree ſix minutes north latitude, and in the ſixty-ſecond degree weſt longitude, about thirty leagues to the north-weſt of Martinico, and is the largeſt, as well as the fineſt iſland belonging to the French in thoſe parts, it being about forty-five miles in length, and thirty-eight in breadth; and is divided into two parts by a ſmall arm of the ſea, or rather a narrow channel, through which no ſhip can venture; but the inhabitants paſs it in a ferry-boat. The country on the eaſt ſide, which is called Grand Terra, is deſtitute of freſh water, which abounds in the other diviſion, and is defended by fort Louis, with a redoubt which commands the road. The weſtern part is called Baſſe Terra, and here the metropolis ſtands, which is defended by a citadel and other fortifications.

This iſland is encumbered with many high mountains and precipices, to which the inhabitants uſed to convey their moſt valuable effects in time of danger: here are alſo many beautiful plains watered by brooks and rivers, which fertilize the ſoil, and enable it to produce a great quantity of ſugar, cotton, indigo, tobacco, and caſſia; bananas, pine-apples, rice, maize, ginger, mandioca, and potatoes.

In this iſland is a hill, called the Mountain of Sulphur, which riſes to a great height; the top of it is bare, with nothing upon it but fern, and ſome ſorry ſhrubs laden with moſs; but it affords a fine view of Dominica, Marigalante, Martinico, Montſerrat, Nevis, and the other neighbouring iſlands. Upon the higheſt part is a rugged platform covered with burnt ſtones of all ſizes, and from ſeveral clefts and chinks iſſue ſmoke. On the eaſt ſide are two mouths which open into a pit of ſulphur, one of which is an oval hole of about a hundred feet in its greateſt diameter, out of which alſo frequently riſes thick clouds of black ſmoke, accompanied with ſparks of fire. The negroes who ſell brimſtone fetch it from this mountain. About two hundred paces below the loweſt of theſe mouths are three pools of very hot water, four or five paces from one another; that of the largeſt is very dark coloured, and ſmells like the water in ſmith's forges: the ſecond is whitiſh, and has the taſte of allum: the third is blue, and has a vitriolic taſte. Here are alſo ſeveral ſmall ſprings, which uniting their ſtreams, form ſeveral torrents. The middle and bottom of this burning mountain are extremely different from

from the top of it, they being covered with tall trees and herbage, watered by a number of rivulets, and cultivated with all poſſible care and induſtry.

Near the little iſland of Goyaves are found ſprings that are boiling hot, and are ſaid to contain many medicinal properties, particularly in the cure of dropſies.

In the Grand Terre are ſeveral indentings made by the ſea and the land, capacious enough to ſhelter veſſels from ſtorms, and ſhaded by palmeto trees, to which they may be faſtened. That called the Great Col de Sac affords excellent riding for ſhips of all burthens.

The air is clear and ſalubrious, and among the vegetables are the copau tree, famous for its ſanative balſam or oil: the milk ſhrub, from whoſe fibres are preſt a liquor that reſembles milk; and the corbary tree, which bears fruit covered with a ſhell, within which is a downy pulp of a ſaffron colour, that yields a gum, which being hardened in the ſun becomes very clear and ſolid, ſo that the native Caribbees formerly uſed it for bracelets and other ornaments.

The moſt remarkable bird is one ſaid to be peculiar to this iſland and Dominica, though it is a bird of paſſage. It is called the devil bird, from the blackneſs of its plumage, and is of the ſize of a young pullet. Its wings are long, its legs ſhort, and its feet, which are like thoſe of a duck, have ſtrong claws: its beak is crooked, ſharp, hard, and in length about an inch and a half: its eyes are large, and ſerve to diſtinguiſh fiſh, which it catches at night in the ſea; but it is unable to bear the light in the day-time when flying; ſo that theſe birds often ruſh upon interpoſing objects and fall down. After their fiſhing in the night they repair to the Devil's Mountain, where they lodge by pairs in holes like rabbits. They continue there during the months of October and November, tho' they are ſeen ſingly in other months; but all of them diſappear in May, and are never ſeen again till September. The negroes of the iſland have a peculiar way of hunting theſe birds with dogs and hawks. Their fleſh, when cured of its fiſhy taſte, is good and nouriſhing food, and, during their ſeaſon, the negroes and poor of the iſland ſubſiſt upon them.

The gulphs on the coaſts of Guadaloupe contain turtles, ſharks, land-crabs, and many kinds of fiſh.

The bees of Guadaloupe are entirely different from thoſe of Europe, they being black, ſmaller, and without ſtings. They never hive but in hollow trees, and their wax, which is of a dark purple approaching to black, is too ſoft for candles, and cannot be bleached. Theſe bees, inſtead of making combs, depoſit their honey in bladders of wax, of about the form and ſize of a pigeon's egg: but this honey is ſaid never to harden, nor become of any other conſiſtence than that of olive oil.

The iſland is peſtered with an inſect called a ravet, ſhaped like a May bug, of an offenſive ſmell, and preying upon paper, books, and furniture; and whatever they do not gnaw is diſcoloured by their ordure. Theſe offenſive inſects, which are very numerous and appear chiefly by night, would be intolerable, were it not for a large ſpider which entangles them in its web, and takes all opportunities of ſurprizing them, on which account the inhabitants are very careful not to offer the leaſt injury to theſe ſpiders.

Under the government of Guadaloupe are comprehended Deſeada, juſt deſcribed, and the iſlands of Xaintes, or All Saints. Theſe laſt are three in number, and their ſoil is pretty much the ſame with that of Guadaloupe. The weſtermoſt iſland, which is the beſt, is about nine miles in compaſs; but none of theſe iſlands ſeem ever to have been properly inhabited, on account of their being deſtitute of freſh water, though they produce all the other neceſſaries of life.

We have no account of the hiſtory of this iſland from the time of Columbus to the inſtitution of the French general company of the American iſlands in 1635, who being unable of themſelves to plant or cultivate their iſlands, empowered M. St. Olive, their lieutenant-general of St. Chriſtopher's, and M. du Pleſſis, to contract with ſome merchants of Dieppe for ſettling Guadaloupe. The religious differences in France ſoon produced adventurers, who, beſides the inducement of enjoying liberty of conſcience, were ſtimulated by views of intereſt. Thoſe merchants contracted with four hundred men, who were obliged to ſerve them four years, but many of the proteſtant adventurers were far from imagining that the new ſettlement was under the direction of cardinal Richlieu, who ſent with them four Dominican friars, provided with full powers from pope Urban VIII.

The adventurers happened to make an unfortunate choice of the place on which they landed, for the ſoil was bad: as an addition to this misfortune, D'Olive and Du Pleſſis diſagreed in the partition of their command, and had been guilty of an unpardonable overſight, in not being provided with ſufficient ſtores; for on examining them, they found no more left than could maintain them for two months, on which the two chiefs dividing them, as well as the men and ammunition, agreed to ſeparate.

The natives, ſo far from ſhewing any diſlike to them, aſſiſted them in raiſing their huts, and not only furniſhed them with caſſava bread, but with ſeed for raiſing tobacco, cotton, and peaſe; and taught them to catch turtle and fiſh. The French probably made an ungrateful return for this kindneſs, ſince they were ſoon after afflicted with a dreadful famine, of which many died: others retired to St. Chriſtopher's, and thoſe who remained were reduced to the horrible neceſſity of devouring even the dead bodies of their companions, which they dug from their graves. Mean while a ſhip arriving from Dieppe with one hundred and forty men, landed a month's proviſion; but that being ſpent, the famine and mortality ſtill continued. However, by ſome means or other, ſome of them lived for near five years; but their bodies were reduced to ſuch a ſtate of weakneſs, as to be unable to clear the ground, or raiſe either corn, plants, roots, or fruit.

Amidſt theſe calamities Du Pleſſis died, and the command devolved ſolely on D'Olive, whoſe inſatiable avarice and cruelty equalled the affliction of the famine. D'Olive broke with the natives, numbers of whom he maſſacred, as the readieſt means of procuring ſubſiſtence. They applied to the Caribbees of the neighbouring iſlands, who attacking the French, ſuch numbers were cut off, that thoſe who remained ſcarce deſerved the name of a colony. During this period it appears ſeveral reinforcements were ſent them both from Europe and St. Chriſtopher's; but the French writers tell us, that all their convoys of proviſions miſcarried. Mean while D'Olive's ambition for command would not even ſuffer him to entertain the thoughts of reſigning this miſerable colony; and he ſent over a Dominican, as his agent to the court of France, which was filled with complaints againſt him, to ſolicit ſpeedy ſupplies. The Dominican repreſented the coloniſts as rebellious heretics, and D'Olive was appointed ſole governor of the colony. The governor on receiving his commiſſion, aſſembled his officers to hear it read; but while this ceremony was performing, the Dominican church, with all its rich furniture, was conſumed by fire. D'Olive's repeated applications for freſh ſupplies were now without effect, and the dreadful ſituation he was in affected his brain; and becoming blind, he went to St. Chriſtopher's, where he was put under an arreſt by M. de Poincy, governor-general of the French iſlands. Supplies of men were now ſent to Guadaloupe; but their officers behaved with ſuch tyranny, that the men broke out into rebellion, and M. de Poincy was obliged to ſend over five hundred men from St. Chriſtopher's to reduce them.

The colony after this ſuffered greatly by other bad governors, by hurricanes, and by ſwarms of caterpillars.

It was afterwards under the New Weſt-India Company; but in 1674, was taken into the king's hands, whoſe miniſters adopted a commercial ſyſtem, and it ſoon became the moſt flouriſhing colony ſubject to France. It was fortified with forts and redoubts, which were in ſo good a condition in 1702, when admiral Bembow made a deſcent upon the iſland, with a conſiderable body of land forces, that he did not think proper to attack them; but was ſatisfied with deſtroying many of their plantations and open villages.

However, in 1759 a fleet of ten men of war, beſides frigates and bomb-ketches, under the command of com-

modore Moore, with a body of land forces commanded by general Hopſon, after making an unſucceſsful attack on Martinico, ſailed for Guadaloupe. This ſquadron began to bombard the town and citadel of Baſſe Terre, and notwithſtanding many batteries erected on the ſhore, the houſes and churches were that night every where in flames, and the powder of the magazines blown about the enemies ears. The next day the Engliſh landed, and found both the town and citadel abandoned, but the iſland was far from being taken. The French, with their armed negroes, threw up intrenchments on the mountains, and bravely reſolved to defend themſelves as long as poſſible. Soon after general Hopſon died, and the command devolved upon major general Barrington. The Engliſh were harraſſed by perpetual alarms, and fatigued with conſtant duty; they however gained one paſs after another, and ſtill advanced, alert in the hour of caution, and invincible whenever they attacked. They frequently ſuffered from concealed fires out of the woods, and from lurking parties of armed negroes, that could not be diſcovered. At length the French governor, finding all reſiſtance vain, ſent a flag of truce, by which means Guadaloupe was ſurrendered to the Engliſh.

After the French king took Guadaloupe under his immediate protection, it became incomparably the moſt profitable colony belonging to that crown. Many mercantile writers of great credit, who were upon that iſland, after its being conquered by the Engliſh, confidently affirmed that before that period, it produced more ſugar than all the Britiſh ſugar iſlands put together: ſome have raiſed the quantity annually exported from Guadaloupe, and its dependencies, to the incredible number of one hundred and fifty thouſand hogſheads; but more moderate calculations have fixed them at one hundred thouſand, beſides its coffee, cinnamon, and other commodities.

Since the French by the treaty of 1763, re-entered into poſſeſſion of this iſland, they ſeem more ſenſible than ever of its importance, and have endeavoured to bring it nearly to the conſtitution of a Spaniſh colony, by publiſhing an ordinance that no foreign veſſel ſhould navigate nearer its coaſts than the diſtance of a league, or ſend any boat aſhore, without a written permiſſion from the intendant, on the penalty of the confiſcation of the veſſel and cargo, paying three hundred livres, and ſuffering a year's impriſonment.

SECT. V.

Of MARTINICO.

Its Situation, Extent, Climate, the Face of the Country, and its Produce. Its Government, principal Towns, Trade, and Hiſtory.

MARTINICO is not only the chief, but the largeſt of the French Caribbee Iſlands, and is ſituated between the fourteenth and fifteenth degrees of north latitude, and between the ſixtieth degree thirty-three minutes, and the ſixty-firſt degree ten minutes weſt longitude, about twenty leagues north-weſt of Barbadoes. It is near ſixty miles in length from the north-weſt to ſouth-eaſt; but is of a very unequal breadth, and about one hundred and thirty miles in compaſs.

The air is hotter here than at Guadaloupe, but hurricanes have neither been ſo frequent nor ſo violent as in that and ſome of the other Caribbee iſlands. Though Martinico is generally ſaid to be healthful to the people ſettled upon it, yet it is certain, that the great quantity of water that runs through it, creates an humidity, very noxious to the conſtitutions of the inhabitants. The iſland is likewiſe much ſubject to epidemical diſeaſes, which are chiefly brought over in ſhips from Aſia and Africa.

The country is hilly within the land, and at a diſtance reſembles three diſtinct mountains. Alſo on the north ſide are three rocks, ſo ſituated, that at ſea, they give it the appearance of three ſeparate iſlands.

It is ſaid to have no leſs than forty rivers, ſome of which are navigable a great way up the country. However, beſides the ſtreams, which in the rainy ſeaſon overflow the dales and ſavannas, there are ten rivers that are never dry, which run from the mountains into the ſea, and ſometimes overflowing their banks, carry away trees and houſes. Some of the hills are cultivated, and on their ſteep aſcents grows tobacco, which is better than that in the valleys: other hills are overgrown with trees, that afford ſhelter to wild beaſts, and abundance of ſnakes. The other produce of the iſland is much the ſame with that of Barbadoes, namely, ſugar, cotton, indigo, ginger, aloes, pimento, Indian figs, bananas, pine apples, melons, caſſia, mandiaca, potatoes, and other roots. With reſpect to the firſt, it is computed that here are made, one year with another, ten thouſand hogſheads of ſugar, each weighing about ſix hundred pounds weight. The chief proviſions, beſides hogs, are Guinea pigs, turkies, wood-pigeons, ortolans, frogs, and lizards. The coaſt abounds with commodious bays and harbours, in which are plenty of turtle.

Martinico is not only the chief of the French Caribbee Iſlands, but the reſidence of the governor-general and an intendant. It is likewiſe the ſeat of a ſovereign council, which ſuperintends all their other iſlands, and even their ſettlements in Hiſpaniola. This council conſiſts of the governor-general, the intendant, the governor of the iſland, an attorney-general, the lieutenant-governor for the crown, and twelve counſellors. Their power is very extenſive, for this council judges in the laſt reſort upon all matters brought by way of appeal. The governor-general, if upon the iſland, is preſident of the council, or, during his abſence, the intendant. If both are abſent the eldeſt counſellor then preſent collects the votes, and pronounces the ſentence of the court. The other officers of the iſland are two lieutenant-governors, one for Capes Terre, and another for Baſſe Terre, with a ſecretary of the marine, who has a very extenſive commiſſion. This iſland, before it was ſubdued by the Engliſh, could raiſe ten thouſand white inhabitants fit to bear arms, and above forty thouſand negroes. Beſides this force, ſome companies of regulars were always quartered in the iſland; ſo that the French pretended that it was impregnable.

The principal places in Martinico are St. Peter's and Port Royal.

St. Peter's, the capital of Martinico, was built in 1665, in order to overawe the mutineers of the iſland, who rebelled againſt its proprietors, the ſecond Weſt India company, who were at the ſame time the proprietors of all the French Antilles. The town extends along the ſhore, and a battery, which commands the road, is erected on the weſt ſide, which is waſhed by the river Royolan, or St. Peter. The principal entry to the fort is from the eaſt. Upon the high ground, which overlooks the town, is built a wall, which extends thirty-five fathoms, is well mounted with cannon, and has a large tower at each extremity: this fortification commands the parade and the town. The fort has neither ditch nor covert-way; but the walls are four feet and a half thick, with a parapet and battlements of ſtone; and the gates are defended by ſtrong paliſadoes. The parade is a ſquare which extends each way about three hundred feet, and is ſurrounded on three ſides by houſes, from which run five ſtreets, and on the other ſide is the fort. The town is divided into three wards; the middle, which is properly St. Peter's, begins at the fort, and runs weſtward to the battery of St. Nicholas, which is mounted with eleven guns, and is ſeated on an eminence. Under the walls of the ſecond ward ſhips at anchor ride more ſecurely than under the fort, on which account this ward is called the Anchorage; it extends from the battery of St. Nicholas to that of St. Robert, which bounds the town on the weſt ſide. The third ward, called the Gallery, extends along the ſea-ſide from Fort St. Peter to the Jeſuits river, and is the moſt populous part of the city; but the fortifications, formidable as they appear on paper, made a very inadequate defence againſt the Engliſh when they reduced the iſland. The houſes of St. Peter's ward are neat, commodious, and elegant, particularly thoſe of the governor of the iſland, the intendant, and the other officers. The pariſh-church of St. Peter is a magnificent ſtone building belonging to the Jeſuits, a hundred and twenty feet long, and thirty-ſix wide, with a noble front of the Doric order. The church of the Anchorage, which belongs to the Jacobine

cobine friars, is likewiſe of ſtone, and is ninety feet long by thirty. There are alſo two chapels belonging to each church. Nothing can be more delightful than the walk from the yard in which this laſt church ſtands to the Jacobine convent. It is formed by two rows of fine orange trees, and croſſed by two others half a mile in length. The kitchen-garden of the convent is furniſhed with all kinds of delicious fruit. The Jeſuits cloyſter is built with marble and free-ſtone, and commands a very fine proſpect over a great variety of gardens and vineyards.

Fort Royal, the next place of great conſequence in Martinico, is twenty-one miles diſtance by land, and twenty-ſeven by water from Fort St. Peter, but the road is ſo very inconvenient, that travellers generally chuſe to go by water. This fort is built on an eminence fifteen fathoms above the ſurface of the ſea, by which it is almoſt ſurrounded, there being only a neck of land about fifteen fathoms over; ſo that the fort may be ſaid to be built on an iſthmus. It is of earth, and defended by two ſmall demi-baſtions and a half-moon, a wet ditch, a glacis, and a covert-way paliſadoed. On the flank of one of the demi-baſtions is the harbour, from which a flight of ſteps leads up to a fortified platform. On that ſide the fort is ſhut up by a double wall, and towards the ſea is a parapet with ſome port-holes. The ſoil on which the town is built is a kind of quickſand, but though it contains regular ſtreets and a large church belonging to the Capuchins, it is ſaid to be much inferior to St. Peter's.

Cul de Sac Robert is ſeated in a large bay almoſt two leagues deep, with two ſmall iſlands at its entrance, which, by breaking the force of the waves, render the bay a fine, ſafe, natural harbour; for it will hold many of the largeſt ſhips, and theſe may in ſeveral places reach the ſhore by a plank.

Fort Trinity lies at the bottom of Trinity-bay, and is formed by Point de Caravel on the eaſt ſide, and on the weſt by an iſthmus about two hundred feet broad. The lieutenant governor of Capes Terre has his reſidence in Trinity Town, in which are a conſiderable number of merchants, and, for its convenient ſituation for the European trade, and the ſafety of its port, is become one of the moſt thriving places in the iſland, it having very conſiderable manufactures of cotton, ſugar, cocoa, and other commodities, the produce of the iſland being much the ſame with that of Barbadoes.

In 1637 M. d'Eſnambuc brought from St. Chriſtopher's, which then belonged to the crown of France, a hundred ſoldiers to Martinico, all well provided for forming a colony. He landed at Baſſe Terre, which lies on the weſt and ſouth parts of the iſland, and it is ſaid the inhabitants yielded up all that coaſt, on which he built a fort called St. Peter. The natives retiring to Cape Terre, the new coloniſts applied themſelves to the cultivation of potatoes, cotton, mandiaca, and tobacco; and d'Eſnambuc retiring to St. Chriſtopher's, left du Pont, his lieutenant, governor in Martinico. The French pretend that the inhabitants forming plots againſt them murdered them whenever they had an opportunity, but by their own accounts they were the aggreſſors. Hoſtilities daily multiplying, they gave no quarter to the natives, who ſending to the neighbouring iſlands, were joined by other Caribbees, to the number of fifteen hundred, who landed from their canoes under their fort. The French governor had removed all his men and proviſions within his intrenchments, and the Caribbees, imagining the fort to be abandoned, advanced within piſtol ſhot of the walls. This was what du Pont had foreſeen, and watching his time, he poured upon them a full diſcharge of his cannon and muſketry, which killing one-half of them, the ſurvivors fled to their canoes. This ſecured the French the quiet poſſeſſion of their ſettlements, which they greatly enlarged, and ſoon after the natives ſued for peace.

The French now divided the iſland into five wards, or pariſhes, each containing a church, or chapel, an armoury, ſtore-houſes, dwelling-houſes, and other conveniences. At length they learned from M. Poincy the art of cultivating the ſugar-cane, from which they ſoon reaped great advantages.

About the year 1646 many of the inhabitants refuſed to pay their impoſts to the Weſt India company, which produced an inſurrection that was quelled by the death of the chief ringleaders. About this time the Portugueſe recovering from the Dutch the poſſeſſion of Braſil, the former landed at Martinico with ſome rich Jews who offered to ſettle there, which was ſtrongly oppoſed by the Jeſuits, on the pretence that they would introduce Judaiſm and hereſy into the iſland; but the wealth with which they were poſſeſſed, induced the governor to allow them a ſettlement in a ſeparate quarter. However, the climate not agreeing with them, many of them died, while others removed from the iſland, and the few who ſtaid ſet up public-houſes, by which they acquired fortunes.

At this time the Caribbees took arms, and nothing but the moſt horrid maſſacres enſued: many of the more diſſolute among the French ſpirited up the natives, and Parquet, who was then governor, was beſieged in his own houſe, where he muſt have periſhed had not ſome Dutch ſhips arrived, who ſeeing ſeveral parts of the iſland in flames, landed three hundred men, and defeated the natives. This gave Parquet an opportunity of taking the field, and the original inhabitants, together with the negroes who had joined them, were every where ſlaughtered or obliged to fly to Dominica and St. Vincent, by which means the French became maſters of Capes Terre, and at laſt of the whole iſland.

In 1650, the old Weſt-India company ſold Martinico, St. Lucia, Grenada, and the Grenadines, to Parquet, for fifty thouſand livres; but in 1664, Lewis XIV. obtained the poſſeſſion of this iſland, and granted it to a new Weſt-India company; but ten years after ſuppreſſed that company, and all the above iſlands became part of his domain. After this Martinico was attacked by the famous Dutch admiral De Ruyter; and the Engliſh made many unſucceſsful expeditions againſt this iſland.

In 1700, the French ſettled in Martinico were computed at fifteen hundred, beſides the negroes they employed, and a great number of Caribbees, who were readmitted into the iſland, but were obliged to work as ſlaves, and to live among the French, that they might have no opportunity of forming plots and conſpiracies. In 1727, was a dreadful earthquake, which, with ſhort intervals, laſted eleven hours, and threw down St. Peter's fort. Many people loſt their lives, and beſides churches, convents, and other public buildings, above two hundred ſugar-works were ruined. One mountain was levelled, another cleft in two, and copious ſtreams of water iſſued from the chaſm. However, a few years recovered the iſland, the inhabitants having the Guadaloupe ſugars ſhipped from hence, with many other advantages.

The Engliſh had in vain attempted to take Martinico, but in 1761 the court formed the reſolution of ſending an armament againſt that iſland ſuperior to any that had ever been ſeen in thoſe ſeas. Eleven battalions were drawn from New York, a conſiderable draught was made from the garriſon of Belleiſle, and all the troops that had been cantoned in the Leeward Iſlands were ordered to rendezvous at Barbadoes: general Monckton, who had bravely diſtinguiſhed himſelf at the conqueſt of Quebec, was appointed to command the land forces, while rear admiral Rodney had the command of the fleet.

On the ſeventh of January following the whole armament arrived at St. Anne's-bay in Martinico, where Sir James Douglas, a captain under Mr. Rodney, ſilenced ſome batteries that were raiſed on the ſhore; but in this ſervice the Engliſh loſt the Raiſonable, yet all her men, guns, and ſtores were ſaved. After having found a ſafe landing-place, and having ſilenced all the batteries, the troops landed without oppoſition. Several ſkirmiſhes paſſed after their being on ſhore, to the diſadvantage of the French, and the Engliſh encamped upon the heights above the Cas de Navires; but upon examining the country they found the grounds interſected with gullies and ravines, with rivulets between them, and wherever they were paſſable the French had erected batteries for their defence.

Though the French regulars were not very formidable, yet the militia, the mulattoes, and negroes, all of whom were in arms, were numerous, brave, and well diſciplined. The Engliſh happened to land at a place where there were greater obſtructions than any-where elſe in the iſland.

iſland. The view of the army was bounded by two great eminences, Morne Garnier and Morne Tortenſon, both of them fortified with the utmoſt care, though they ſeemed almoſt inacceſſible by nature. Morne Tortenſon was firſt to be attacked, and batteries were raiſed to defend the Britiſh troops in their paſſing a very wide gulley, lying between them and it. Three diſpoſitions were made for the attack. It was begun by the grenadiers under major Grant; brigadier Rufane, with his diviſion, aſſiſted by a thouſand ſeamen in flat-bottomed boats, fell upon the enemies redoubts along the ſhore; and brigadier Walſh, with his brigade, and the left infantry under colonel Scott, after attacking the left of a plantation, were to endeavour to get round the enemy. All theſe operations were performed with aſtoniſhing impetuoſity and ſucceſs. The attack began at break of day, and by nine in the morning the enemy, having been driven from poſt to poſt, were obliged to abandon Morne Tortenſon to the Engliſh, who were to the laſt degree amazed, upon viewing its ſtrength and ſituation, at the dangers they had ſurmounted, and the numerous redoubts of the French, all of them mounted with cannon. The enemy, after ſuffering ſeverely, fled, part of them to Morne Garnier, and part of them to Fort Royal, the Britiſh grenadiers purſuing them to the bridge of the laſt mentioned place, where they even made ſome priſoners.

General Monckton took poſſeſſion of certain poſts proper for carrying on the attack againſt Morne Garnier, and erected batteries on Morne Tortenſon for carrying on that againſt Fort Royal. Some days after the French preſuming that their enemies were entirely diſcouraged, and wanted only a pretext to make the beſt of their way back to their ſhips, attacked the Britiſh light infantry, and colonel Haviland's brigade, who, with the utmoſt ardour and intrepidity, repelled their enemies, improved their own defenſive ſituation into a moſt vigorous charge, and being well ſupported, purſued the enemy acroſs the ravine, where they ſeized their batteries, and took poſt even in the enemy's redoubt; and happily improving the advantage, Morne Garnier was by nine at night, with all its works, in the poſſeſſion of the Engliſh.

General Monckton now prepared to batter the citadel of Fort Royal, from the eminences he had gained, which the enemy perceiving, on the third of February beat the chamade, and accepted of a capitulation.

The conqueſt of Martinico in a manner cloſed the operations between the Engliſh and French in America, during the late war. It even ſtruck the court of Verſailles with greater conſternation than they had even felt for the loſs of Canada, and the rather becauſe their miniſters at foreign courts had, in no very decent terms, reproached that of London with want of judgment in fitting out an armament againſt an iſland, that might ſecurely bid defiance to all their power, by its artificial, as well as natural ſtrength, and the number, ſpirit, and martial diſpoſition of its inhabitants. The people of Martinico remained with great tranquility under the military government of the Engliſh during the ſhort time they held it, and even ſeemed well pleaſed at their change of maſters. In ſhort, this iſland was reſtored to the French by the definitive treaty of 1763.

We have now finiſhed the deſcription of the French Caribbee Iſlands, only it is neceſſary here to obſerve, that St. Lucia, which, by miſtake, we have placed among the iſlands ceded to Great Britain, was delivered to France by the late treaty of peace, and ought to have been placed here.

St. Croix, or Santa Cruz, another of the Caribbee Iſlands, has, till very lately, been conſidered as belonging to France, and is therefore placed among the iſlands of that nation in Salmon's Grammar, and all the other geographical works in which it is mentioned; but being deſerted by France, it was ſeized by the late king of Denmark.

SECT. VI.

Of CAYENNE, *or* EQUINOCTIAL FRANCE.

Its Situation, Extent, and Produce; with a conciſe Deſcription of the Iſle of Cayenne.

THE country we are now to deſcribe lies on the coaſt of Terra Firma, and conſiſts of a part of the continent, and an iſland called Cayenne.

Equinoctial France is ſeated between the equator and the fifth degree of north latitude, and between the fiftieth and fifty-fifth degree of weſt longitude, extending two hundred and forty miles along the coaſt, and three hundred miles within land; it being bounded on the north by Surinam, on the eaſt by the Atlantic ocean, on the ſouth by Amazonia, and on the weſt by Guiana.

All the coaſt is very low, but within land there are fine hills very proper for ſettlements; the French have, however, not yet extended them ſo far as they might; but they raiſe the ſame commodities which they have from the Caribbee Iſlands, and in no inconſiderable quantities. With reſpect to the climate, vegetables, and animals, we ſhall give a particular account of them when we come to treat of Terra Firma.

The iſle of Cayenne is ſeated at the mouth of a river of the ſame name, in the fifth degree north latitude, and is about forty-five miles in circumference. The anchorage for veſſels is between Cape Caperon in the iſland and that of Corbin in Terra Firma, where above a hundred ſhips may ride ſecurely. The iſland is exceſſively unhealthy, though not ſo bad as formerly. It has ſeveral pleaſant hills, very convenient for ſettlements, and is almoſt cut in two by a river of ſalt water, which affords an eaſy communication between the ſeveral plantations, and facilitates the tranſportation of merchandize. The iſland is alſo watered by ſeveral ſprings proper for drinking, and for turning ſugar mills. The French have a fort oppoſite the road, on a little riſing ground at the point of the iſland; but though it is pretty conveniently ſituated, it wants freſh water, of which they can have none but the rain they ſave in ciſterns. There are in the iſland ſeveral meadows which produce very good graſs. The principal commodities of the iſland are ſugar and roucou, for they have neglected the cultivation of indigo. However, ſince the year 1722, they begun to plant coffee ſhrubs, and the coffee berries are brought to be full as good as thoſe of Arabia. The French who ſettled here about the year 1635, built the fort which they called St. Lewis, and near it is a ſmall town of two or three hundred houſes, inhabited by the ſoldiers of the garriſon and by all ſorts of tradeſmen. About four leagues from the town to the north-eaſt of the fort is a village called Armire, ſeated on a riſing ground, the lower part of which is inhabited by Jews and negroes, and the upper part, which has a chapel, is inhabited by French and negroes. There are ſeveral other plantations of French ſcattered up and down the iſland, with ſome other fortifications beſides the fort already mentioned.

CHAP. VI.

Of the AMERICAN Dominions of the DUTCH and DANES.

SECT. I.

Of ST. EUSTATIA, SABA, *and* ST. MARTIN'S.

Their Situation, Extent, Climate, Face of the Country, Produce, Trade, and Hiſtory.

ST. Euſtatia is ſituated three leagues north-weſt of St. Chriſtopher's, and is only a mountain riſing out of the ſea like a pyramid, but almoſt round. The air is wholeſome, but the iſland is ſubject to terrible ſtorms of thunder, hurricanes, and earthquakes. Its chief produce is tobacco, and the Dutch are ſaid to have here five thouſand white people and fifteen thouſand negroes. Its ſituation renders it the ſtrongeſt of all the Caribbee Iſlands, there being but one good landing-place, which may be eaſily defended by a few men, and the haven is commanded by a fort mounted with guns. It is only the very top of the mountain that is covered with wood; for though it is ſo ſmall, and inconveniently laid out by nature, the induſtry of the Dutch have made it turn out to very good account, and it is fully peopled; the ſides of the mountain are divided and laid out into neat plantations, in which they raiſe ſugar and tobacco. On the ſummit is a pretty large plain, which harbours wild beaſts. In this, as well as in ſeveral of the adjacent iſlands, there are neither rivers nor ſprings of freſh water, but the inhabitants are ſo careful that they never want proper ſupplies of water from their ponds and ciſterns which receive the rain. There are ſeveral ſtore-houſes well ſupplied with all neceſſaries, and particularly with European commodities, which they ſell to their neighbours at a very high price, whenever they are diſappointed with ſupplies from England or France; and they alſo carry on a contraband trade with the Spaniards.

The Dutch took poſſeſſion of this iſland in 1635, and the States granted it to certain merchants of Fluſhing, who ſoon ſettled a colony upon it of about ſix hundred families. In 1665 it was conquered by the Engliſh, but was ſoon after retaken by the united forces of the French and Dutch, after which it had a French garriſon; but it was reſtored to the Dutch by the treaty of Breda. In 1689 it was conquered by the French, from whom it was taken the very next year by the Engliſh, under Sir Timothy Thornhill, who allowed the French only their lives and their baggage, and is ſaid to have had only eight of his own men killed and wounded in the attack, though the fort was mounted by ſixteen great guns, encompaſſed by a ſtrong double paliſado, and defended on one ſide by a deep ditch and a narrow bridge over it to the gate, which admitted only one man at a time. The iſland was again reſtored to the Dutch by the treaty of Ryſwic, and they have ever ſince remained in the quiet poſſeſſion of it.

Saba is a ſmall but pleaſant iſland, thirteen miles north-weſt of Euſtatia, and thirty ſouth-weſt of St. Bartholomew's. It is four or five leagues in compaſs, and is ſaid to have formerly belonged to the Danes. At firſt ſight it ſeems only a rock, but a Dutch colony ſent from St. Euſtatia to manure it, found in it a valley ſufficient to employ and ſubſiſt many families; but it has the misfortune of having no port. The fiſhing about it, eſpecially for the bonetta, is very plentiful, and it is in no want of other neceſſary refreſhments. The ſea on its coaſts is ſo ſhallow, that ſtones may be ſeen at the bottom, and nothing but ſloops can come near, nor even they, but at a ſmall ſand creek on the ſouth ſide of the iſland, to which the inhabitants draw their canoes. There is a road cut from the top of the rock to the bottom; but it is ſo ſteep, that it reſſembles an impregnable fortification, formed by the hand of nature. The inhabitants, for their greater ſecurity, have in many places, by the ſide of the rock piled up heaps of ſtones on ſcaffolds, ſo diſpoſed, that by only pulling a rope the ſcaffolds fall, and inſtantly diſcharge ſuch a ſhower of ſtones, as are enough to cruſh a whole army to pieces. The French Buccaneers ſurpriſed, and thought to have maſtered this iſland in 1688, but miſcarried. Labat ſays, when he was here in 1701, the iſland was divided into two parts, containing no more than about fifty families, who lived in genteel, convenient, and well furniſhed houſes, but traded for the moſt part in ſhoes, by making which, and raiſing indigo and cotton, they purchaſed ſlaves, good furniture, and were in eaſy circumſtances. The inhabitants live in great harmony, and are ſaid to make it a practice to dine at one another's houſes; for there being no ſhambles here, as in the other more conſiderable iſlands, they kill their cattle in turn.

St. Martin's is ſeated in the eighteenth degree fifteen minutes north latitude, between Anguilla on the north-weſt, and St. Bartholomew on the ſouth-eaſt, about fifteen miles from each, and is twenty-one miles in length, twelve in breadth, and forty-two in circumference. It has commodious bays and roads on the north-weſt ſide, with ſome good ſalt pits, and lakes of ſalt water, which run a great way within the land, and abound with good fiſh and turtle; but has no freſh water, except what comes from the clouds, and is ſaved in ciſterns.

In this iſland are ſeveral trees, from whence diſtil various gums; with plenty of the candle-wood-tree, the ſmall ſticks of which when dry, are lighted up inſtead of candles, and yield a very fragrant ſmell, ariſing from the gum contained in the wood: but its tobacco, which is eſteemed the beſt in the Caribbees, is the chief commodity that employs the care of the inhabitants.

Here are great flocks of the birds called flamens, parrots without number, turtle-doves, and many other fowl.

Formerly the Spaniards kept a garriſon here, to prevent other nations ſettling on the iſland; but about the year 1650, they blew up their fort, deſtroyed their ciſterns, burned their houſes, and abandoned the place. Then came the French and Dutch, and ſharing the iſland between them, lived very friendly together, and had their particular churches in their reſpective quarters. The French had that part next Anguilla, which was in every reſpect the beſt half, and the other ſide of the iſland, in which the Spaniſh fort ſtood, remained to the Dutch, by virtue of the partition-treaty made between the two nations: but in 1744 ſome Engliſh, under the deputy-governor of Anguilla, aſſiſted by two privateers from St. Chriſtopher's, drove the French out of their half of the iſland, and took poſſeſſion of it themſelves, ſince which time it has belonged to the Engliſh and Dutch.

SECT. II.

Of CURASSOU, *or* CURACAO.

Its Situation, Extent, Produce, Trade, and the great Advantages the Dutch receive from it. With a conciſe Deſcription of the Iſlands of Bonaire and Aruba.

THE iſland of Curaſſou, or Curaçao, is the only place of importance poſſeſſed by the Dutch in the Weſt-Indies. The northermoſt point is ſettled in the twelfth degree forty-five minutes north latitude, about twenty-five leagues from the continent, and is about thirty miles long,

long, and ten broad. At the eaſt end is a good harbour, called Santa Barbara; but the chief harbour is about three leagues from the ſouth-eaſt end, where the Dutch have a very good town, and a ſtrong fort. Ships bound thither are obliged to keep cloſe to the harbour's mouth, and have a rope ready to ſend one end aſhore at the fort; for there is no anchoring at the entrance of the harbour, and the current always ſets to the weſtward; but being got in, it is a very ſecure port. At the eaſt end are two hills, but the reſt of the land is pretty level.

Though it is naturally barren, it produces a conſiderable quantity both of ſugar and tobacco; and here are alſo very great ſalt-works, which furniſh a good deal for the Engliſh iſlands, and for which there is a conſiderable demand from our colonies on the continent; but the trade for which it is chiefly valued, is the contraband, conſtantly carried on between the inhabitants and the Spaniards, and that carried on between them, the Engliſh, and the French in time of war.

The Dutch ſhips from Europe touch at this iſland for intelligence, or proper pilots, and then proceed to the Spaniſh coaſts for trade, which they force with a ſtrong hand, it being very difficult for the Spaniſh guarda coſtas to take theſe veſſels; for they are not only ſtout ſhips, with a number of guns, but are manned with large crews of choſen ſeamen, deeply intereſted in the ſafety of the veſſels and the ſucceſs of the voyage. They have each a ſhare in the cargo, of a value proportioned to the ſtation of the owner, ſupplied by the merchants upon credit, and at prime coſt: this animates them with uncommon courage, and they fight bravely, becauſe every man fights in defence of his own property. Beſides this there is a conſtant intercourſe between this iſland and the Spaniſh continent.

Curaſſou has numerous ware-houſes, always full of the commodities of Europe and the Eaſt Indies. Here are all ſorts of woollen and linen cloths, laces, ſilks, ribbons, iron utenſils, naval and military ſtores, brandy, the ſpices of the Moluccas, and the calicoes of India, white and painted. Hither the Dutch Weſt India, which is alſo their African company, annually bring three or four cargoes of ſlaves, and to this mart the Spaniards themſelves come in ſmall veſſels, and cary off not only the beſt of the negroes, for whom they give a very high price, but great quantities of all the above ſorts of goods; and the ſeller has this advantage, that the refuſe of ware-houſes and mercers ſhops, with every thing that has grown unfaſhionable and unſaleable in Europe, go off here extremely well, every thing being ſufficiently recommended by its being European. The Spaniards pay in gold and ſilver, coined or in bars, cacao, vanilla, Jeſuits bark, cochineal, and other valuable commodities. The ſhips that trade directly from Holland to the Spaniſh continent not only touch here, on their outward paſſage, to gain intelligence or aſſiſtance, but on their return put in here to complete what is wanting of their cargo with the ſugar, tobacco, ginger, and other produce of the iſland itſelf.

The trade of Curaſſou, even in time of peace, is ſaid to be annually worth to the Dutch no leſs than five hundred thouſand pounds ſterling; but in time of war the profit is ſtill greater, for it is then in a manner the common emporium of the Weſt Indies: it affords a retreat to ſhips of all nations, and at the ſame time refuſes none of them arms and ammunition. The intercourſe with Spain being then interrupted, the Spaniſh colonies has ſcarce any other market from whence they can be well ſupplied either with ſlaves or goods. The French come hither to buy the beef, pork, corn, flour, and lumber, which the Engliſh bring from the continent of North America, or which is exported from Ireland; ſo that the trade of this iſland flouriſhes extremely.

This is far from being owing to any natural advantage whatſoever: for it ſeems as if it were the fate of the Dutch to be every where obliged, both in Europe and America, to exert their ingenuity and patience in oppoſing an unfriendly ſoil; for the iſland is not only barren, and dependent on the rains for its water, but the harbour is naturally one of the worſt in America. The Hollanders have indeed entirely remedied that defect; they have upon this harbour one of the largeſt, and by far the moſt elegant and cleanly towns in the American iſlands. The publick buildings are numerous and handſome, the private houſes commodious, and the magazines large, convenient, and well filled. Almoſt all kinds of labour is here performed by engines, ſome of them ſo admirably contrived, that ſhips are at once lifted into the dock, where they are completely careened, and then furniſhed with naval ſtores, proviſions, cannon, and every thing proper either for war or trade.

Bonaire is ſeated in the ſixty eighth degree ten minutes weſt longitude, and the middle of the iſland is laid down in the twelfth degree ſixteen minutes north latitude. It is about twenty leagues from the continent, and is ſixteen or ſeventeen leagues round. The road is on the ſouth-weſt ſide near the middle of the iſland, where a pretty deep bay runs in. The inhabitants are chiefly employed in raiſing maize and Guinea corn, yams, and potatoes; and alſo in grazing.

Aruba, which alſo belongs to the Dutch, is ſeven or eight leagues to the weſtward of Curaſſou. The two laſt iſlands have no trade of conſequence, but are chiefly employed in raiſing freſh proviſions for the principal iſland, and for the refreſhment of ſuch ſhips as uſe thoſe ſeas.

The trade of all the Dutch American ſettlements was originally carried on by the Weſt India company alone. At preſent ſuch ſhips as go upon that trade pay two and a half per cent. for their licences; the company, however, reſerve to themſelves the whole of what is carried on between Africa and the American iſlands.

SECT. III.

Of DUTCH GUIANA, *or* SURINAM.

Its Situation, Extent, Produce, Trade, and Government.

DUTCH Guiana begins at the river Maroni, in the ſixth degree twenty minutes north latitude, and extends to the mouth of the river Oroonoko. The mouth of the river Maroni is ſo choaked up with ſand banks, that often ſhift their places that no veſſel of above twenty tons can enter it, and even thoſe not without danger. The river runs moſtly from ſouth to north, it is about a league broad, and all the coaſt from Maroni to Surinam, which is about fifty-five miles, is low and commonly covered with water. This country is generally reckoned unwholeſome. From the end of November to the month of July, the weather is pretty temperate, on account of the clouds which ſhelter the people from the ſun, the great rains that fall at that time, and the north-eaſt wind, which continually blows: but during the reſt of the year the weather is ſultry hot.

The climate is however greatly improved, and rendered much more ſalutary than it was formerly by the induſtry of the Dutch, who have cut avenues through the woods, and made paſſages for currents of air that carry off the unwholeſome exhalations that proved fatal to the firſt coloniſts; and notwithſtanding the inconveniencies under which it once laboured, the great number of Dutch who have plantations here, have raiſed this colony to a very flouriſhing condition, ſo that it has extended itſelf thirty leagues above the mouth of the river Surinam; but it will probably never be extended much higher on account of the cataracts, which render it impoſſible to navigate the rivers, and the rocks which prevent their penetrating farther into the country; and even theſe have the advantage of forming a rampart for the ſecurity of the colony, againſt the inroads of the Indians who inhabit the mountains, and who cannot be civilized.

The chief ſettlement is at Surinam, a town built upon the river of the ſame name, in the ſixth degree ſixteen minutes north latitude, and this name now extends to the adjacent country for above a hundred miles round. Of this diſtrict the Hollanders regard themſelves as the ſovereign, and are ſaid to behave with the haughtineſs peculiar to that nation wherever they have gained the ſuperiority; a conduct, ſays a modern writer, by no means agreeable to the phlegm of that people, or the wiſdom of the conſtitution, ſince by gaining the deteſtation of the natives,

natives, they furniſh the means to any enterprizing European power to ſupplant them.

The planters and traders of this place take the name of the ſociety of Surinam; the ſettlement being the joint property of the Dutch Weſt-India company, the city of Amſterdam, and the proprietary of Samelſdyck: but in what manner their different rights aroſe, or how they were formed, we cannot learn.

The colony is now in the moſt flouriſhing ſituation, and a prodigious trade is carried on, not only with Europe, but with the Weſt-India iſlands. The river of Surinam facilitates commerce, and the Dutch have been careful to improve the natural ſituation by all that art and induſtry could beſtow. They have a fort called Zelandia, built with brick, about two leagues from the entrance, and at a little diſtance from it, a ſmall town called Paramairamba, containing about four hundred houſes. There are no leſs than ſeven or eight inland towns, all of which are rich, populous, and commercial, which evidently proves the aſſiduity with which that nation improves every advantage they have once obtained.

The chief trade of the colony conſiſts in the produce of the country, as ſugar, cotton, gums, tobacco, coffee, flax, ſkins, and wood for dying. For the tilling of the ground the proprietors have ſlaves, whom they purchaſe of the Weſt India company, who carry thither every year a certain number from Guinea.

The country is under the command of a governor, who has under him a commandant, and is appointed by the directors of the Weſt-India company, but muſt be approved by the States General, and take an oath to them, as well as to the directors. The governor has a ſovereign authority in their name over the whole colony, both in civil and military affairs. Yet in thoſe of moment he is obliged to aſſemble and conſult with the political council, of which he is preſident, as he is alſo of the court of juſtice; yet he has only one vote in each, and is obliged to determine according to the majority of voices. The political council is compoſed of the governor, the commandant, who is the firſt counſellor, and nine other members. The council, or court of juſtice, conſiſts only of five counſellors, a ſecretary, and a bailiff or mayor, beſides the governor. This great officer has the diſpoſal of all vacant employments, civil and military, till ſuch time as he can receive orders from the court of directors; and forms ſuch regulation as he imagines moſt conducive to the ſecurity of the colony againſt attacks of an enemy.

The troops kept in pay for the defence of the colony conſiſt of four companies of foot, each commanded by a captain, a lieutenant, an enſign, and two ſerjeants, and of which the governor is colonel. Beſides there is a militia compoſed of eight companies of burghers.

SECT. IV.

St. Thomas's *and St.* Croix, *or* Santa Cruz.

Their Situation, Extent, Produce, and Trade, with the Revolutions that have happened in the laſt iſland.

ST. Thomas's, the principal iſland ſubject to the Danes, is ſituated in the ſixty-fourth degree twenty minutes weſt longitude, and in the eighteenth degree thirty minutes north latitude. It has a ſafe and commodious harbour, in which are two mounds, that ſeem as if formed by nature for raiſing batteries upon them. Though the iſland is only fifteen miles in circumference, it is ſubject both to the Danes and Brandenburghers, but the latter are under the protection of the former. Almoſt in the center of the harbour is a ſmall fort, without ditch or outworks, and about fifty or ſixty paces to the weſt of it begins the town, which chiefly conſiſts of one long ſtreet; at the end of which is the Daniſh factory, a large building with convenient warehouſes both for the ſtowage of their commodities, and for the reception of the negroes, in which they trade with the Spaniards. On the right ſide of this factory is the Brandenburgh quarter, which conſiſts of two little ſtreets, full of French refugees from Europe and the iſlands. Moſt of the houſes are of brick, built and tiled after the Dutch manner, but only one ſtory high, on account of the badneſs of the foundation; for before they have dug three feet deep, they meet with water and quickſand.

The iſland produces oranges, citrons, lemons, guavas, bananas, mandiaca, millet, potatoes, and moſt ſorts of fruit and herbage, particularly ſugar and tobacco; but it is much infeſted with muſketoes. Theſe iſlands, ſo long as they remain in the hands of the Daniſh Weſt-India company, were ill managed, and nothing like the proper advantage was made of them; but that wiſe and benevolent prince, the late king of Denmark, bought up the company's ſtock, and laid the trade open, and ſince that time the iſland of St. Thomas has been ſo greatly improved, that it is ſaid to produce upwards of three thouſand hogſheads of ſugar at a thouſand pounds weight each, and others of the Weſt-India commodities in tolerable plenty. In time of war privateers bring in their prizes here for ſale, and a great many veſſels trade from hence along the coaſt of Terra Firma, and return with money in ſpecie or bars, and valuable merchandize.

St. Croix is about five leagues eaſt of St. Thomas's, eight from Porto Rico, and about thirty weſt of St. Chriſtopher's. It is ſeated in the eighteenth degree north latitude, and in the ſixty-fifth weſt longitude. It is about ten or twelve leagues in length, and about three on the eaſt ſide where it is broadeſt. The air is extremely unhealthy, but this will probably continue no longer than till the woods, with which the iſland is at preſent almoſt covered, are farther cleared, and room left for a proper circulation of the air. The ſoil is black, eaſy to be cultivated, very fertile, and produces ſeveral fine trees proper for the joiner and cabinet-maker, with ſugar canes, oranges, lemons, pomegranates, citrons, a ſort of papay called mamee, which is ſaid to bear once a month excellent fruit, ſhaped like a woman's breaſt, from whence it takes its name.

A large bay on the north ſide has a baſon and a ſmall iſland, and in another on the ſouth ſide oppoſite to it, the country is indented by the ſea with ſo many inlets, that it ſeems one continued marſh, intermixed with a number of ſmall iſlands, whence it has been called the drowned country.

With reſpect to its hiſtory; the Spaniards deſtroyed the natives, and, as in other places, ſoon after deſerted it, after which it lay for a long time deſolate; but it had afterwards ſeveral maſters in a ſhort compaſs of time; the Engliſh and Dutch, after diſputing the ſole poſſeſſion of it, ſhared it between them; but, in 1649, the Engliſh being moſt numerous, ejected their neighbours, and were ſoon after turned out themſelves by the Spaniards from Porto Rico, who in a deſcent burnt the houſes, put all the men they found in arms to the ſword, and ſent off the reſt with their wives and baggage to the iſland of Barbuda. Some Dutch from St. Euſtatia and St. Martin hearing that the Engliſh were expelled, and imagining that the Spaniards were alſo gone, came thither to repoſſeſs it, but the Spaniards being ſtill there, and ten times more numerous, attacked them by ſurprize, and forced them to ſurrender priſoners; but while the Spaniards were preparing to carry them to Porto Rico, Poincy, the French commander, came with a ſuperior force, upon which the Spaniards were glad to quit both the place and their priſoners, whom Poincy carried back to St. Euſtatia; and the next year, which was 1651, having reimburſed the Dutch merchants at Fluſhing for the expences they had been at in ſettling the colony, he made an acquiſition not only of this iſland, but of St. Martin's, St. Bartholomew's, and ſeveral others, for the uſe of the knights of Malta, of whom he was grand maſter. This iſland was afterwards purchaſed of thoſe knights by the French Weſt India company; but the French abandoning it in 1696, the Danes obtained the poſſeſſion of it, and it belonged to the Weſt India company till it was purchaſed by his late Daniſh majeſty. It was however then a perfect deſart, but it has begun to ſettle very faſt, for ſeveral perſons from the Engliſh iſlands, and among them ſome of great wealth, have gone to ſettle there.

We have now gone through the countries and iſlands in America poſſeſſed by the Engliſh, French, Dutch, and Danes; the remaining part belongs to Portugal and Spain; but, before we begin with their dominions, we ſhall conclude this chapter with the characters of the ſeveral European nations, as they regard America, which we ſhall extract from the ingenious author of a work intitled, An Account of the European Settlements.

"There ſeems, ſays he, to be a remarkable providence in the caſting the parts, if I may uſe that expreſſion, of the ſeveral European nations who act upon the ſtage of America. The Spaniard, proud, lazy, and magnificent, has an ample walk in which to expatiate; a ſoft climate to indulge his love of eaſe; and a profuſion of gold and ſilver to procure him all thoſe luxuries his pride demands, but which his lazineſs would refuſe him.

"The Portugueſe, naturally indigent at home, and enterprizing rather than induſtrious abroad, has gold and diamonds, as the Spaniard has, wants them as he does, but poſſeſſes them in a more uſeful, though leſs oſtentatious manner.

"The Engliſh, of a reaſoning diſpoſition, thoughtful and cool, and men of buſineſs, rather than of great induſtry, impatient of much fruitleſs labour, abhorrent of conſtraint, and lovers of a country life, have a lot which indeed produces neither gold nor ſilver; but they have a large tract of a fine continent; a noble field for the exerciſe of agriculture, and ſufficient to furniſh their trade without laying them under great difficulties. Intolerant as they are of the moſt uſeful reſtraints, their commerce flouriſhes from the freedom every man has of purſuing it according to his own ideas, and directing his life after his own faſhion.

"The French, active, lively, enterprizing, pliable, and politic; and though changing their purſuits, always purſuing the preſent object with eagerneſs, are notwithſtanding tractable and obedient to rules and laws which bridle their diſpoſitions, and wind and turn them to proper courſes. This people have a country, where more is to be effected by managing the people than by cultivating the ground: where a pedling commerce, that requires conſtant motion, flouriſhes more than agriculture and a regular traffic; where they have difficulties which keep them alert, and where their obedience ſerves them for perſonal wiſdom. In the iſlands the whole is the work of their policy, and of a right turn their government has taken.

"The Dutch have got a rock or two on which to diſplay the miracles of frugality and diligence, which are their virtues, and on which they have exerted theſe virtues, and ſhewn thoſe miracles."

CHAP. VII.

Of PORTUGUESE AMERICA, containing BRASIL.

SECT. I.

Its Name, Situation, Extent, Face of the Country, Climate, Vegetables, and Minerals; with a particular Account of the Gold and Diamonds of Braſil, the Manner in which they are obtained, and the Regulations in relation to them.

THE Portugueſe, by whom this country was firſt diſcovered, gave it the name of the Holy Croſs; but it afterwards obtained the name of Braſil, or Brazil, from the great quantity of Braſil wood which grows there, which was known in Europe and called braſil, before the diſcovery of the extenſive country that bears its name.

Braſil is ſeated between the mouth of the great river of the Amazons under the equator, and the river Plata in the thirty-fifth degree ſouth latitude, and between the thirty-fifth and fifty-firſt degree of weſt longitude; it being bounded on the north by the mouth of the river Amazon and the Atlantic ocean, on the eaſt by the ſame ocean, on the ſouth by the river Plata, and on the weſt by a chain of mountains which divide it from Spaniſh America and the country of Amazons; it being two thouſand five hundred miles in length along the coaſt from north to ſouth, and about nine hundred miles in breadth. The ſettlements of the Portugueſe, however, reach but a ſmall diſtance within land.

With reſpect to the coaſt of Braſil, it is proper to obſerve, that, beginning at the mouth of the river of the Amazons, it runs eaſtward as far as Cape St. Roque, which is thirteen hundred and fifty miles, from whence it winds to the ſouthward quite to the Spaniſh province of Paragua, ſo that almoſt the whole country lies under the torrid zone.

As to the face of the country, the land near the coaſt is, in general, rather low than high; but extremely pleaſant, it being interſperſed with meadows and woods, the trees of which are, for the moſt part, ever-greens; but on the weſt, far within land, are mountains in which are innumerable ſprings and lakes, from whence iſſue abundance of rivers, that fall into the great rivers the Amazon and the Plata, or run acroſs the country from weſt to eaſt, and fall into the Atlantic ocean; theſe laſt are very numerous, and of great uſe to the Portugueſe in turning their ſugar-mills, and meliorating their lands, which they annually overflow.

The north of Braſil lying almoſt under the equator, this, like other countries in the ſame ſituation, is ſubject to great rains and variable winds, particularly in March and September, when they have ſuch torrents of rain, with ſtorms and tornadoes, that the country is overflowed, and the air at that ſeaſon rendered unhealthy. But, with reſpect to the more ſouthern provinces, no country within the tropics has the heat more tolerable, or the air more healthful, it being conſtantly refreſhed with breezes from the ſea, and in the inland parts the winds from the mountains are ſtill cooler than thoſe that blow from the ocean.

The ſoil of Braſil is generally good, producing very large trees of various ſorts, fit for any uſe. Their ſavannas, or meadows, are covered with graſs and herbs, and where cultivated produce every thing proper for the climate, as ſugar-canes, tobacco, cotton, indigo, maize, and fruit.

The chief of the foreſt trees are the ſapiera, the vermiatico, the commeſſerie, the guiteba, and the ſerrie; ſpeckled wood, three kinds of mangrove trees, and the manchineel.

The ſapiera is a very tall tree, which has good timber, made uſe of in building houſes; the vermiatico is alſo a tall ſtraight-bodied tree, of which planks are made two feet broad, and of the trunks they likewiſe make canoes, they being only ſcooped hollow and ſhaped ſomething like a boat at the head and ſtern: though they are ſo narrow as frequently to overſet, yet they cannot ſink, and the Indians, who excel in ſwimming, make no difficulty when they are overſet to turn them up again.

The guiteba and commeſſerie are chiefly uſed in building of ſhips, and are as much eſteemed for that uſe as oak is with us, and are even ſaid to be a more hard and durable wood. The ſerrie tree reſembles the elm, and is very durable in water. Their mangrove trees are red, white, and black: the red are uſed in tanning leather,

of the white they make maſts and yards for their barks, and of the black good planks; both the white and black being much larger than in the gulph of Mexico. There grows here alſo a wild cocoa-nut tree, neither ſo tall nor ſo large as thoſe in the Eaſt or Weſt Indies, nor are the nuts a quarter ſo big, but are in eſteem for making beads for roſaries, bowls of tobacco-pipes, and other toys. At the top of the tree among the branches grows a long ſort of black thread, reſembling horſe hair, but much longer. Of theſe they make cables, that are very ſtrong, laſting, and ſerviceable, for they will not rot like cables made of hemp, though they lie expoſed to heat and wet. They have alſo three ſorts of cotton trees, but very little of the right Weſt India cotton ſhrub of which cotton cloth is made.

With reſpect to fruits, they have ſeveral kinds of European grapes, oranges, lemons, pomegranates, and pomecittrons, which were tranſplanted thither by the Portugueſe. They have alſo jenipahs, papaus, caſhews, ſourſops, cuſtard apples, cabbage trees, the true cocoa-nut, guavas, bananas, and plantanes.

The jenipah is a kind of fruit of the calabaſh or gourd kind, of the ſize of a duck egg, ſomewhat of an oval ſhape, and of a grey colour; but the ſhell is neither ſo thick nor ſo hard as that of the calabaſh. It is full of a whitiſh pulp mixed with ſmall flat ſeeds, and both the pulp and ſeeds are taken into the mouth, but on ſucking the pulp they ſpit out the ſeeds. It is of an agreeable ſharp taſte, and very innocent. The tree that bears it has ſome reſemblance to the aſh, is ſtraight bodied, and of a good height, clear from limbs till near the top, where the branches put forth a ſmall head.

The ſourſop is a fruit as large as a man's head, of an oval ſhape, and when ripe green on one ſide and yellowiſh on the other. The coat or outſide is pretty thick, and very rough, with ſmall ſharp knobs, and the inſide is full of a ſpongy pulp, with black kernels of the ſhape and ſize of pumpkin-ſeeds. The pulp is very juicy, of a pleaſant taſte, and wholeſome. The tree or ſhrub that bears this fruit, is only ten or twelve feet high, with a ſmall ſhort trunk, from which the branches grow pretty ſtraight up. This fruit alſo grows both in the Eaſt and Weſt Indies.

Beſides theſe here are many ſorts of fruit not to be met with any where elſe, as ariſahs, mericaſahs, petangoes, &c. The ariſah is an excellent fruit, ſomewhat bigger than a large cherry, and ſhaped like a Catharine-pear, it being ſmaller at the ſtem, and ſwelling bigger towards the end. They are of a greeniſh colour, and have ſmall ſeeds, are ſomewhat tart, yet very pleaſant and wholeſome.

The mericaſah is an excellent fruit, of which there are two ſorts; one that grows on a ſmall tree or ſhrub, which is accounted the beſt, and the other growing on a kind of vine, which is uſually planted about arbours for the ſake of the ſhade, they having many broad leaves. The fruit is as large as a ſmall orange; it is round, green, and when ripe it is ſoft, and full of a white pulp, mixed with little black ſeeds, and is very tart, pleaſant, and wholeſome.

The petango is a ſmall red fruit, that alſo grows on ſmall trees. It is of the ſize of a cherry, but not ſo round, having one flat ſide, and five or ſix ſmall ridges. It is a very pleaſant tart fruit, and has a large flattiſh ſtone in the middle.

The mungaroo is a fruit as large as a cherry, red on one ſide and white on the other, and contains ſmall ſeeds.

The muſteran de avo is a round fruit, of the ſize of a large haſle nut, covered with thin brittle ſhells of a blackiſh colour. It has a ſmall ſtone in the middle, incloſed with a black pulpy ſubſtance.

They have likewiſe plenty of callavances, pine apples, water-melons, muſk-melons, cucumbers, yams, potatoes, caſſavas, cabbages, turnips, onions, leeks, and a variety of ſallading, with ſeveral kinds of drugs, as ſaſſafras, ſnake-root, &c.

No ſort of corn thrives in Braſil like maize, for wheat and rye grow too rank, and run up into ſtraw. Their ſeed time is at the beginning of the rainy ſeaſon, and their harveſt a little after it is over. The trees and ſhrubs proper to the country bear leaves, bloſſoms and fruit all the year round; and the ſame is obſerved of their oranges, limes, and ſome other fruits that have been carried thither. It is ſaid that thoſe who would have ripe grapes all the year, only prune their vines at different times to effect it, and they produce a fine luſcious grape as ſweet as honey; and yet they can make no wine here that will keep.

As to their minerals they have gold and ſome ſilver; and here are found plenty of rich diamonds, jaſper, emeralds, and other precious ſtones.

Gold was firſt found in the mountains which lie adjacent to the city of Rio Janeiro. The occaſion of its diſcovery is variouſly related; but the common account is, that the Indians on the back of the Portugueſe ſettlements, were obſerved by the ſoldiers employed in an expedition againſt them, to make uſe of this metal for their fiſhing-hooks; and their manner of procuring it being enquired into, it appeared that great quantities of it were annually waſhed from the hills, and left among the ſand and gravel that remained in the valleys after the running off, or evaporation of the water. It is now little more than ſixty years ſince any quantities of gold worth notice have been imported from Braſil to Europe; but from that time the annual imports from thence have been continually augmented by the diſcovery of places in other provinces, where it is to be met with as plentifully as at firſt about Rio Janeiro. And it is now ſaid, that a ſmall ſlender vein of it ſpreads through all the country, at about twenty-four feet from the ſurface; but that this vein is too thin and poor to anſwer the expence of digging. However, where the rivers or rains have had any courſe for a conſiderable time, there gold may always be collected, the water having ſeparated the metal from the earth, and depoſited it in the ſands: whence it is eſteemed an infallible method of procuring it, to divert a ſtream from its channel, and to ranſack its bed. Indeed there are properly no gold mines in Braſil, all the gold being collected either from rivers, or the beds of torrents after floods.

The ſlaves, who are principally negroes, are kept in great numbers to examine the bottoms of rivers, the gullies of torrents, and to waſh the gold found in them from the ſand and dirt. The regulation of the duty of theſe ſlaves is very ſingular, for they are each of them obliged to furniſh their maſter with the eighth part of an ounce of gold every day; and if they are either ſo fortunate or induſtrious as to collect a greater quantity, the ſurplus is generally conſidered as their own property, and they have the liberty of diſpoſing of it as they think fit: ſo that it is ſaid ſome negroes, who have accidentally fallen upon rich waſhing places, have themſelves purchaſed ſlaves, and have afterwards lived in great ſplendor, their original maſter having no other demand on them than the daily ſupply of the above eighth part, which, as the Portugueſe ounce is ſomewhat lighter than our troy ounce, may amount to about nine ſhillings ſterling.

The quantity of gold thus collected in the Braſils, and annually returned to Liſbon, may in ſome degree be eſtimated from the amount of the king's fifth: this has been computed one year with another at one hundred and fifty arroves of thirty-two pounds Portugueſe weight, which at four pounds the troy ounce, makes very near three hundred thouſand pounds ſterling; and conſequently the capital of which this is the fifth, is about a million and a half ſterling. The annual return of gold to Liſbon cannot be leſs than this, though it be difficult to determine how much it exceeds it. It has been ſuppoſed that the gold exchanged for ſilver with the Spaniards at Buenos Ayres, and what is privately brought to Europe, amounts to near half a million more, which will make the whole annual produce of the Braſilian gold near two millions ſterling; a prodigious ſum to be found in a country, which at the cloſe of the laſt century was not known to furniſh a ſingle grain.

As to diamonds, the diſcovery of theſe valuable ſtones is ſtill more recent, it being ſcarce forty years ſince the firſt were brought to Europe. They are found in the ſame manner as the gold, in the gulleys of torrents and beds of rivers, but only in particular places, and not ſo univerſally ſpread through the country. They were

frequently found in washing the gold, before they were known to be diamonds, and were consequently thrown away with the sand and gravel separated from it. It is well remembered that numbers of very large stones, that would have enriched the possessors, have passed unregarded through the hands of those who afterwards bore with impatience the mortifying reflection. However, about forty years ago a person acquainted with the appearance of rough diamonds, imagined that these pebbles, as they were then esteemed, were of the same kind: but it is said there was a considerable interval between the first starting of this opinion, and its being confirmed by proper trials, it being difficult to persuade the inhabitants, that what they had been long accustomed to despise, could be of such importance as this discovery supposed. And it is said, that in this interval a governor of one of their places procured a good number of these stones, which he pretended to make use of in playing at cards instead of counters. But it was at last confirmed by skilful jewellers in Europe, who were consulted on this occasion, that these stones were real diamonds, and many of them not inferior, either in lustre or any other quality, to those of the East Indies. Upon this determination the Portuguese in the neighbourhood of the places where they had been found, began to search for them with great assiduity; and they had even hopes of discovering considerable masses of them, as they perceived large rocks of crystal in many of the mountains from whence the streams came that washed down the diamonds.

It was however soon represented to the king of Portugal, that if such plenty of diamonds should be found, as their sanguine conjectures seemed to indicate, this would so debase their value, that besides ruining all the Europeans who had any quantity of Indian diamonds in their possession, it would render the discovery itself of no importance, and prevent his majesty from receiving any advantages from it. On these considerations the king thought proper to restrain the general search for diamonds, and for that purpose erected a diamond company, with an exclusive charter. This company, in consideration of a sum paid to his majesty, is vested with the property of all diamonds found in Brasil: but to prevent their collecting too large quantities, and thereby reducing their value, they are prohibited from employing above eight hundred slaves in searching for them. And to prevent any of his other subjects from acting the same part, and to secure the company from being defrauded by interlopers, he depopulated a large town, with a considerable district round it, and obliged the inhabitants, who were said to amount to six thousand, to remove to another part of the country; for this town being in the neighbourhood of the diamonds, it was thought impossible to prevent such a number of people who were on the spot, from frequently smuggling.

SECT. II.

Of the Beasts, Birds, Reptiles, Insects, amphibious Animals, and Fishes, of Brasil: containing a particular Description of the Ant-Bear and Armadillo.

THE beasts that were found in this country on its being first discovered, were in general the same with those of Mexico and Peru, particularly the Peruvian sheep, the pecaree, called by the Europeans the hog, from their bearing some resemblance to that animal, a great variety of monkeys, deer, hares, and rabbits, some lions and tygers; but these are neither so large nor so fierce as those of Africa; the ant-bear, the porcupine, the racoon, and flying squirrel, the armadillo, the opossum, the guano, and the sloth.

The ant-bear is as long and as tall as a middle sized dog; his hind legs resemble those of a bear, but his fore legs are more slender: his fore feet are flat, and divided into four toes, armed with long claws; but those behind have five toes. His head is long, with a sharp snout, small round black eyes, and very black ears: the tongue is said to be upwards of two feet in length, but very slender: he is obliged to bend part of his back when he keeps it within his mouth, the jaws being otherwise too short to contain it. He lives upon ants, and when he has found any of their nests, he opens the upper part of them with his claws, that he may have room to put in his snout and his tongue: this is besmeared with a slimy liquor, and is soon covered with ants, when he draws it into his mouth and swallows them. This he repeats as long as they will run into the same snare. The tail of this animal in some measure resembles that of a fox; it is generally two feet long, almost flat, and covered with hair from fifteen to twenty inches long; it is harsh, very strong, and he can move it just as he pleases; when he turns it upon his back, it entirely covers it, and defends him from the rain, which he greatly dislikes.

The armadillo has his head, body, and tail, covered with a shield of a bony substance, forming most beautiful scales. On the upper part of the neck are two joints that he may move his head, and on the back seven divisions, with a yellow skin between each. The feet are covered with a thinner shield, but the lower parts of the body are without this covering. The head is like that of a hog, with a sharp snout. He has small eyes sunk deep in the head, and a narrow pointed tongue. The ears are naked, brown, and short, and the teeth of a middle size. The feet resemble hands, with five fingers and roundish nails. The tail at the root is near four inches thick, but grows gradually less to the end, where it terminates in a point. It lives upon melons, potatoes, and other roots, but will not eat flesh, and generally lies hid in the ground, which he turns up with the snout. This animal has a quick feeling, and will roll himself up like a ball. The flesh is white, fat, and delicate, but is best when seasoned with spices to quicken the taste.

Their fowls are maccaws, parrots, parroquets, the quam, the curasoe, the bill-bird, the cockrecoe, the crab-catcher, the fishing-hawk, and the humming bird; curlieus, partridges, wood-pigeons, herons, and pelicans; they have also great variety of singing birds, several species of wild ducks, wild geese, and common poultry; and there is not any sort of the latter in Europe that has not been carried thither by the Portuguese. However, in these hot climates fowls of all kinds are dry meat, nor is their mutton very good; the pork is esteemed the best flesh, and is here thought of easy digestion. All the horses, cows, sheep, asses, hogs, and cats, were brought hither from Europe.

In some parts of Brasil the heat of the climate is thought to favour the generation of a great variety of poisonous insects and reptiles; and it is certain that no country produces a greater variety of serpents, some of which are said to be of an incredible length. The rattle-snake and other reptiles of the same species grow to an enormous size, and the serpent called ibibaboca is affirmed to be seven yards long, half a yard in circumference, and possessed of a poison instantaneously fatal to mankind. Indeed the accounts authors have given of the monstrous size of these reptiles in this country are so very improbable, that it is dangerous to give any credit to what they say. That they are large and numerous is not doubted; and it has been justly observed, that Providence has thought fit to give an alloy, by these inconveniencies, to the many advantages of this invaluable country, in order to dispense her blessings more equally among the inhabitants of the earth in general.

Here are also scorpions, centepees, spiders, and other insects that are venomous and of an extraordinary size. Their ants are almost as troublesome here as in Africa, marching in great bodies, and devouring every thing in their way. Here is also the fire-fly, which seems to differ but little from the glow-worm, except in having wings: when a number of these fix on the boughs of trees, they in the night appear at a small distance like so many stars. There are said to be here twelve several sorts of bees, some of which have vast nests in hollow trees in the woods, and others in holes of the rocks, and yield great quantities of honey and wax.

With respect to the amphibious animals, they have the three kinds of turtle, the hawks-bill, the loggerhead, and the green turtle; which last is most excellent food. The lakes and rivers abound with crocodiles, and they have a creature which the Portuguese call cachora de agua,

or the water-dog. It is as big as a maſtiff, is covered with hair of a dark colour, and has a long head with four ſhort legs: he lives in freſh water lakes and ponds; but comes on ſhore to ſun himſelf, and is ſaid to be good food.

Their ſeas, lakes, and rivers are full of excellent fiſh; the lean fleſh of the whales, of which there are plenty on this coaſt, is eaten by the ſlaves and poor people of Braſil. The beſt fiſh on the coaſt is the manattee, which is as large as an ox. They have alſo the ſword-fiſh, thraſher, paracood, cavally, old-wife, gar-fiſh, mullet, mackarel, ſnook, turpoon, oyſters, crabs, ſhrimps, prawns, and other ſhell fiſh. Their beſt river fiſh reſembles our perch, and they have others not unlike pike and carp.

SECT. III.

Of the Diviſions of Braſil; with a Deſcription of the City of St. Salvador the Capital, and the Manners of its Inhabitants.

BRASIL is uſually divided into fifteen provinces, or captainſhips, of which eight only are annexed to the crown, the reſt being fiefs made over to ſome of the nobility on account of their extraordinary ſervices, who do little more than acknowledge the ſovereignty of the king of Portugal, and his repreſentative the viceroy of Peru. However, the whole gives the title of prince to the preſumptive heir to the crown of Portugal. Theſe captainſhips are, Paria, Maragnan, Siara, Poligi, or Rio Grande, Parayba, Tamara, Pernambuco, Seregippe, Batria de Todos Santos, Ilheos, Porto Seguro, Spirito Sancto, Rio Janeiro, St. Vincent, and Del Rey.

The principal city is St. Salvador, alſo called the city of Bahia, which is in the province of the ſame name, and was thus called from the commodiouſneſs of its harbour. It is ſeated on a hill, in the twelfth degree eleven minutes ſouth latitude. It is populous, magnificent, and beyond compariſon the moſt gay and opulent city in all Braſil. The trade carried on here is prodigious; the gentry are polite; but the vulgar, who have acquired wealth, are intolerably inſolent and brutal. In this city are no leſs than twelve or fourteen thouſand Portugueſe, with three times that number of negroes. The harbour is capable of receiving ſhips of the greateſt burthen, and its entrance is guarded by a ſtrong fort called St. Antony. There are other ſmall forts that command the harbour, one of which is built upon a rock about half a mile from the ſhore. Cloſe by this fort all ſhips muſt paſs that anchor here, and muſt alſo ride within half a mile of it, between this and another fort that ſtands on a point at the inner part of the harbour. Beſides theſe there is another fort on the hill upon which the town ſtands.

Here are about four hundred ſoldiers in garriſon, who commonly draw up and exerciſe in a large parade before the governor's palace, and many of them attend him when he goes abroad. They are decently dreſſed in brown linen, which, in theſe hot countries, is far more agreeable than woollen.

The city conſiſts of about two thouſand houſes, the greateſt part of which cannot be ſeen from the harbour; but as many as appear in ſight, being intermixed with trees, and placed on a riſing hill, afford a fine proſpect. The houſes are handſomely built, moſtly of brick or ſtone. The churches, convents, and hoſpitals, are not only built in the moſt ſumptuous manner, but adorned with every thing rich and coſtly, particularly with fine paintings. The upper town has many ſplendid ſtructures, particularly the cathedral of St. Salvador. The church which lately belonged to the Jeſuits college is very magnificent, and built of marble brought from Europe; and that college is a fine edifice. The viceroy's palace is a moſt ſumptuous building, as is alſo the palace of the archbiſhop, the courts of judicature, the hoſpitals, &c. The principal ſtreets are large, and all of them paved; there are alſo ſeveral ſquares, and many gardens, both within the city and its neighbourhood, in which are a great variety of fruit-trees and flowers, ſallading, and plants for the kitchen.

Moſt of the ſtreets are, however, ſo ſteep as to be impaſſable for coaches or chairs, to ſupply which defect the rich cauſe themſelves to be carried out in a kind of cotton hammocs, called ſerpentines, which are borne on the negroes ſhoulders by the help of a bamboo, about twelve or fourteen feet long. Moſt of theſe hammocs are blue, and adorned with fringes of the ſame colour; they have a velvet pillow, and above the head a kind of teſter with curtains, ſo that the perſon carried cannot be ſeen, unleſs he pleaſes; but may either lie down or ſit up, leaning on his pillow. When he has a mind to be ſeen he puts by the curtains, and ſalutes his acquaintance whom he meets in the ſtreets; for they take a pride in complimenting each other in their hammocs, and will even hold long conferences in them in the ſtreets; but then the two ſlaves who carry them make uſe of a ſtrong well-made ſtaff, with an iron fork at the upper end, and pointed below with iron; this they ſtick faſt in the ground, and reſt the bamboo, or pole, to which the hammoc is fixed, on two of theſe, till their maſter's buſineſs or compliment be over. Scarce any man of faſhion, or any lady, will paſs the ſtreets without being carried in this manner.

The lower claſs of the people are inſolent, and the ſoldiers given to all manner of vice; and ſome of them are dangerous aſſaſſins. The women are more ſtrictly watched than in Portugal, yet ſometimes find means to elude the vigilance of their keepers. However, the huſbands make no ſcruple to ſtab or poiſon their wives, if they find them falſe.

The chief mechanic trades in this city are hatters, ſmiths, ſhoe-makers, ſawyers, carpenters, coopers, taylors, and butchers. All theſe buy negroes, whom they train up to their ſeveral employments. Theſe ſlaves are alſo very uſeful as porters, for as there is here a great trade by ſea, and the landing-place is at the foot of the hill too ſteep for the paſſage of carts, there is great need of ſlaves to carry the goods up into the town: but the merchants have the convenience of cranes with ropes, one end of which goes up, while the other is let down. The houſe in which the crane is ſtands on the brow of the hill towards the ſea, and there are planks ſet ſhelving all the way up, againſt which the goods ſlide as they are hoiſted up or let down.

SECT. IV.

Of the different Inhabitants of Braſil, their Manners and Cuſtoms; with a more particular Account of the Braſilians.

THE preſent inhabitants of Braſil are Portugueſe, Creoles, Meſtizes, Negroes, and Braſilians. The Portugueſe of Europe, who enjoy the places of truſt and profit, are the feweſt in number; the Creoles, or thoſe born of Portugueſe parents in Braſil, are more numerous; and the Meſtizes, or mixed breed, are ſtill more numerous than either; for few of the Portugueſe have been without black or tawney miſtreſſes, and the iſſue of theſe having intermarried they are multiplied extremely. The Negroes are alſo very numerous, and thoſe ſlaves are much more valued than the Braſilians, they being of a more robuſt conſtitution and fitter for labour; for as they come from the coaſt of Africa oppoſite to Braſil, which is much hotter, they endure fatigue in the hot ſeaſon better than the original natives; nor are the latter very numerous, the Portugueſe in their invaſion of the country, like the Spaniards in their conqueſts, deſtroying the unfortunate natives by all the cruel ways they could invent.

The portrait given us of the manners and cuſtoms of the Portugueſe in America by the moſt judicious travellers, is very far from being favourable. They are deſcribed as a people who, while ſunk in the moſt effeminate luxury, practiſe the moſt deſperate crimes: of a temper hypocritical and diſſembling; of little ſincerity in converſation, or honeſty in dealing; lazy, proud, and cruel. In their diet penurious; for, like the inhabitants of moſt ſouthern climates, they are much more fond of ſhew, taſte, and attendance, than of the pleaſures of free

ſociety,

ſociety, and of a good table; yet their feaſts, which are ſeldom made, are extravagantly ſumptuous.

The pride, indolence, luxury, and cruelty of the maſters has, among other cauſes, been attributed to their being bred up among ſlaves, who perform all the buſineſs; and to their being permitted to keep a prodigious number of negroes, not merely to work in the field, nor for domeſtic employments, but ſolely for ſtate, to attend their perſons, and form their train. Theſe become as corrupt as their maſters, who make them the inſtrument of their crimes; and giving them an unbounded and ſcandalous licence, employ them as bullies or aſſaſſins whenever they are diſpoſed to terrify or ſeek revenge. Indeed nothing can be conceived more adapted to create the worſt diſorders than the unnatural junction of ſlavery, idleneſs, and a licentious life. They are ſuffered to go armed, and there are vaſt numbers who have merited or bought their freedom; and this is ſuffered in a country where the negroes are ſaid to be ten to one of the Portugueſe and Creoles.

However, this picture is perhaps too highly coloured; it at beſt does not reſemble thoſe in the northern captainſhips, nor thoſe in the moſt ſouthern, by the Rio Janeiro, who are far from being ſo effeminate and corrupted as thoſe of St. Salvador, which, beſides being in a climate favourable to indolence and debauchery, is the capital city, and in all reſpects worſe than the others.

Before the Portugueſe planted Braſil the country was not divided into provinces, but was all one great common, every tribe and family inhabiting and cultivating what part of it they thought fit, and removing their dwellings wherever they pleaſed; only every man was conſidered as the proprietor of the ground he planted, till he removed and left it for another place he liked better. Their towns uſually conſiſted of five or ſix great houſes, each of which contained two or three hundred people, and ſometimes many more. Over theſe the head of the tribe or family preſided. Their houſes were built of long poles, reeds, and palmeto leaves; and their furniture only conſiſted of hammocs of cotton net-work faſtened to poles, in which they ſlept; ſome earthen pots and pans, and their gourds and calabaſhes, which being cut in half, ſerved them for pails, tubs, and drinking-cups; for they have them of all ſizes: beſides which they had baſkets, in which they carried their proviſions. The ornaments of their houſes were their bows, arrows, ſpears, and other arms.

In this extenſive country were alſo ſome nations that had no ſettled abode; but living in tents, continually removed from place to place; and both theſe and the former ſlept as often without doors as within, tying their hammocs to the boughs of trees, and making fires near them to prevent the ill effects of the cold dews that fell in the night, or to keep off the wild beaſts and noxious vermin.

The Portugueſe and Dutch writers call the Braſilians who inhabit the north part of the country Tapuyers, and thoſe who dwell in the ſouth Tupinambes; but divide theſe into ſeveral petty nations differing in language, tho' very little in their manners and cuſtoms.

The Tapuyers are of a good ſtature, and of a dark copper colour; their hair black and hanging over their ſhoulders; but they have none on their bodies or faces, and go almoſt naked, the women only wearing at their waiſt a ſlight covering of leaves. Their ornaments are glittering ſtones hung upon their lips or noſtrils, bracelets of feathers about their arms, and a circlet of feathers upon their heads. Some paint their bodies of all manner of colours, while others rubbing them with gums ſtick beautiful feathers upon them, which makes them at a diſtance look more like fowls than human creatures.

The Tupinambes, who inhabit the ſouth of Braſil, are of a moderate ſtature, and of a leſs dark complexion than their northern neighbours, who lie nearer the line; but neither of them are ſo black as the Africans in the ſame latitude, for there were no negroes in America before they were tranſported thither by the Spaniards and Portugueſe. Theſe people have however flat noſes, which are not natural, but made ſo in their infancy; a flat noſe there being eſteemed a beauty: they have alſo black curled hair on their heads, and paintthemſelves like the northern Braſilians.

The general food of all the Braſilians was caſſava bread, of which they made cakes like our ſea biſcuit; they alſo uſed to feed on other roots, fruit, and herbs, with ſuch veniſon as they took in hunting, and with fiſh and oil. They have been repreſented by many writers as canibals, and all the Braſilians have been charged with eating human fleſh; but this appears to be nothing more than a ſlander caſt upon them to give a colour to the cruel treatment they have met with from their conquerors. The general liquor drank by the natives is ſpring water, of which they have the beſt and the greateſt variety in the world; but they have other kinds of liquor made of the juice of their fruits or honey, with which they ſometimes get very drunk, ſitting whole days and nights over their cups. They were formerly acquainted but with few arts, except ſpinning, weaving, and forming their bows, arrows, lances, darts, and building their houſes, which did not want any great contrivance. They had, however, ſome knowledge of the virtues of ſeveral herbs and drugs, which they frequently adminiſtered with ſucceſs to the ſick. Hunting, fiſhing, and fowling, were rather their buſineſs than diverſion, they being neceſſary for the ſupport of their families, in a country where they had neither corn nor tame cattle. Drinking, ſinging, and dancing, were their principal diverſions; theſe they practiſed on their rejoicing days, on a victory, or the birth of their children. They are ſtill great ſmoakers, and take the ſtrongeſt tobacco: their pipes are a hollow cane or reed, and the bowl a large nut ſhell, that holds almoſt a handful of tobacco.

The Portugueſe will not allow that the Braſilians had any kind of religion, and yet confeſs that they had prieſts, and admitted of a ſtate of rewards and puniſhments, according to their valour or cowardice. The prevailing notion among them is, that after death the good ſhall viſit their anceſtors, who dwell in a delightful place beyond the Andes. They believe in certain inviſible beings, the diſpenſers of good and evil, the rewarders of virtue, and the puniſhers of vice. As to their having no temples, this may poſſibly ariſe from their profound reverence of the Deity, who is not to be circumſcribed by time or place, or worſhipped in the mean houſes erected by human labour, but under the glorious canopy of the heavens.

Nor is the opinion of their living without any regard to government more agreeable to truth; for even thoſe writers who deny that they had any policy ſpeak of their kings, chiefs, and generals, and even admit that there was a ſcale of ſubordination among them. If one man injured another, he was obliged to make him ſatisfaction in kind if poſſible, and no people on earth diſplay more hoſpitality and civility to ſtrangers, which is acknowledged by the Portugueſe writers themſelves, even while they are endeavouring to ſtigmatize thoſe generous people with the odious appellation of cannibals.

The rites obſerved at funerals is a farther proof of their belief of a future ſtate. The friends and relations of the deceaſed ſet up a lamentable howl, praiſing alternately the beauty, virtue, ſtrength, and talents of their departed relation, crying out in the moſt melancholy voice, that they ſhall never ſee him more till they dance with him beyond the mountains. When theſe lamentations had laſted for the ſpace of ſix hours, preparation was made for burying of the corpſe in a ſitting poſture, and a dome erected over it by way of vault: here they depoſited meat and drink, his arms, and whatever was uſeful to him when alive. As to the maſter of the family, his tomb was uſually in the middle of his own houſe, and his monument was generally adorned with the moſt beautiful feathers and other ornaments.

Such, according to the moſt authentic relations, were the ancient Braſilians, and ſuch, with very little variation, are the modern race, where the manners of the Portugueſe and thoſe of the negroes have not mingled with their original cuſtoms.

In ſhort, the native Braſilians are at preſent a tractable and ingenious people, ready to learn any art or ſcience the Portugueſe will teach them, and take nothing ſo kindly of the prieſts as their inſtructing their children, which has given them an opportunity of making many converts;

converts; thoſe who live under the Portugueſe generally conform to their cuſtoms in eating, drinking, and cloathing, and few of theſe go naked.

SECT. IV.

Of the Government, Forces, and Trade of Braſil.

THE government of Braſil is in the Vice-roy, who, as we have already obſerved, reſides at St. Salvador. He has two councils, one for criminal, the other for civil affairs, in both which he preſides: but to the infinite prejudice of the ſettlement, all the delay, chicanery, and multiplied expences incident to the worſt part of the law, and practiſed by the moſt corrupted lawyers, flouriſh here; at the ſame time that juſtice is ſo relaxed, that the greateſt crimes are often ſuffered to paſs with impunity.

The Portugueſe in Braſil are ſufficient to maintain the dominion of that country againſt any other power; they have a good number of European regular troops; the militia too is regulated, among whom there are ſome bodies of Indians and free negroes. On the other hand, the Portugueſe, Creoles, Meſtizes, Negroes, and Braſilians, are now in a manner one people, their religion the ſame, and their blood intermixed by marriages; and therefore, however they may diſagree among themſelves while they have no enemy to contend with, they would infallibly unite againſt all the reſt of the world. This is an advantage which both the Spaniards, Portugueſe, and the French have over the Engliſh in America; for they always make the natives and negroes where they have any power, of their own religion; and theſe, in a ſhort time, diſcover as much zeal for their ſuperſtition as the Portugueſe themſelves, who would never bear that any people who bore the name of heretics ſhould plant themſelves among them; nor is the circumſtance of marriage and alliance inconſiderable: theſe lay ſtrong obligations upon all people to unite againſt ſtrangers, and this the Engliſh do not enough conſider, when they prohibit their people matching with the natives or negroes. Inſtead of this we treat the latter with greater cruelty than thoſe nations who are leaſt diſtinguiſhed for their humanity. Hence they generally remain in a ſeparate intereſt, and inſtead of ſerving their maſters faithfully, are ever conſpiring to cut their throats, or to eſcape out of their hands.

The trade of Portugal is carried on upon the ſame excluſive plan obſerved by the other European nations with the American colonies, and reſembles the Spaniſh method in not ſending out ſingle ſhips, as the convenience of the ſeveral places, and the judgment of the European merchants, may direct; but by annual fleets, which ſail at ſtated times from Portugal, and compoſe three flotas, bound to as many parts in Braſil, namely, to Fernambuca in the northern part, to Rio Janeiro at the ſouthern extremity, and to the bay of All Saints in the middle, where is the capital, of which we have given a deſcription, and there all the fleets rendezvous on their return to Portugal.

The trade of Braſil is very great, and increaſes every year; which is the leſs ſurpriſing as the Portugueſe have opportunities of ſupplying themſelves with ſlaves for their ſeveral works at a much cheaper rate than any other European power that has ſettlements in America; they being the only European nation that has eſtabliſhed colonies in Africa; and theſe being very conſiderable, both for their extent and the number of their inhabitants, they have of courſe advantages in that trade which no other nation can have, and every year draw from thence into Braſil between forty and fifty thouſand negroes; and for this the ſituation of Braſil is very convenient, it being nearer to Africa than any other part of America. Hence it is principally that Braſil is the richeſt, moſt flouriſhing, and growing eſtabliſhment in all America. The ſugar exported from thence is very great, and it is finer than what any of ours, the French, or Spaniſh ſugar plantations ſend us. Their tobacco is alſo remarkably good, though not raiſed in ſuch large quantities as in our American colonies. The northern and ſouthern parts of Braſil abound with horned cattle; theſe are hunted for their hides, of which no leſs than twenty thouſand are annually ſent into Europe.

A conſiderable part of the gold brought from Braſil is coined in America: thus, that coined at Rio Janeiro bears an R, and that which is ſtruck at St. Salvador, or the Bay, is marked with a B. Of the diamonds, there is ſuppoſed to be returned to Europe the value of one hundred and thirty thouſand pounds. This, with the ſugar, which is principally the cargo of the Fernambuca fleet, the tobacco, the hides, the valuable drugs for medicines and manufactures, may give ſome idea of the importance of this trade, not only to Portugal, but to all the trading powers of Europe.

The chief commodities the European ſhips carry thither are not the fifteenth part of the produce of Portugal; they conſiſt of the woollen goods of all kinds of England, France, and Holland; the linens and laces of Holland, France, and Germany; the ſilk of France and Italy; ſilk and thread ſtockings, hats, lead, tin, pewter, iron, copper, and all ſorts of utenſils wrought in theſe metals from England; as well as flour, ſalt fiſh, beef, and cheeſe. They have oil from Spain: wine, with ſome fruit, is nearly all they are ſupplied with from Portugal.

Though the profits in this trade are great, few Portugueſe merchants trade upon their own ſtock; they are generally credited by the foreign merchants, whoſe commodities they ſell, eſpecially by the Engliſh. In ſhort, though in Portugal as well as in Spain all trade with their plantations is ſtrictly forbidden to ſtrangers, yet, like all other regulations that contradict the very intention for which they were made, they are little attended to. The Portugueſe is, indeed, only the truſtee and factor; but his fidelity is equal to that of the Spaniſh merchant, and that has ſcarce even been ſhaken by any public or private cauſe. This is extremely ſurprizing in the Portugueſe, who in all other reſpects are far from being remarkable for their integrity, and is a ſtriking inſtance how far a cuſtom originally built upon a few examples, and a conſequent reputation built upon that, will be able to affect in ſucceſſion men of very different natural characters and morals.

England is at preſent moſt intereſted in the trade of Portugal, both for home conſumption, and what they want for the uſe of the Braſils; and deſerves to be moſt favoured, as well from the ſervices the Engliſh have always done that crown, and from the ſtipulations of treaties, as from the conſideration that no other people conſumes ſo much of the produce of Portugal. However, the French have become very dangerous rivals to us in this, as in many other branches of trade.

SECT. V.

ST. CATHARINE'S.

Its Situation, Extent, Face of the Country, Vegetables, Animals, and Climate.

BEFORE we take leave of Braſil, we ſhall take notice of St. Catharine's, the principal iſland on the coaſt of the ſouthern part of this country. It is no where above ſix miles in breadth, though about twenty-ſeven in length, extending from the twenty-ſeventh degree thirty-five minutes ſouth latitude to the twenty-eighth, and lying in the forty-ninth degree forty-five minutes weſt longitude from London.

Though it is of a conſiderable height, it is ſcarce perceivable at ten leagues diſtance, it being then obſerved under the continent of Braſil, the other mountains there riſing exceeding high; but on a nearer approach it is eaſily diſtinguiſhed, and may be known by a number of ſmall iſlands lying at each end, and ſcattered along the eaſt ſide of it. The harbour is defended by ſeveral forts.

The ſoil is truly luxuriant, ſpontaneouſly producing fruit of many kinds, and the ground is covered with one continued foreſt of trees of a perpetual verdure, which from the exuberance of the mould are ſo entangled with briars, thorns, and underwood, as to form a thicket abſolutely impenetrable, except by ſome narrow paths which the inhabitants have made for their own convenience. Theſe, with ſome ſpots cleared for plantations

along the ſhore facing the continent, ſeem the only uncovered parts of the iſland. The woods are extremely fragrant from the many aromatic trees and ſhrubs with which they abound; and the fruits and vegetables of all climates thrive here, almoſt without culture, and are to be procured in great plenty; ſo that here is no want of oranges, lemons, citrons, pine-apples, peaches, apricots, melons, and plantains; there are alſo abundance of onions and potatoes.

The fleſh proviſions are however much inferior to the vegetables; there are indeed to be purchaſed ſmall wild cattle, ſomewhat like buffaloes; but theſe are very indifferent food, their fleſh being of a looſe contexture, and generally of a diſagreeable flavour, owing perhaps to the wild calabaſh on which they feed. There are alſo great plenty of pheaſants, but they are far inferior in taſte to thoſe we have in England. The other proviſions are monkeys, parrots, and fiſh of various ſorts, which abound in the harbour, are extremely good, and eaſily caught.

The water both on the inland and the oppoſite continent is excellent, and preſerves at ſea as well as that of the Thames, for after it has been in the caſk a day or two, it purges itſelf, ſtinks moſt intolerably, and is ſoon covered with a green ſcum, which in a few days ſubſides to the bottom, leaving the water as clear as cryſtal, and perfectly ſweet.

Theſe are the advantages of the iſland; but it has ſeveral inconveniencies attending it, particularly with reſpect to the climate; for the woods and hills which ſurround the harbour, prevent a free circulation of air; and the vigorous vegetation which conſtantly takes place there, furniſhes ſuch a prodigious quantity of vapour, that all the night, and a great part of the morning, a thick fog covers the whole country, and continues till either the ſun gathers ſtrength to diſſipate it, or it is diſperſed by a briſk ſea breeze. This renders the place cloſe and humid. Strangers are here alſo much peſtered with a multitude of muſkettos, which are all day extremely troubleſome, and at ſun ſet, when they retire, they are ſucceeded by an infinite number of ſand-flies, which though ſcarce perceivable to the naked eye, make a great buzzing, and wherever they bite, raiſe a ſmall bump in the fleſh, which is ſoon attended with a painful itching, like that ariſing from the bite of an Engliſh harveſt bug. This iſland is ſubject to a governor appointed by the king of Portugal, and has a garriſon of ſoldiers for its defence.

SECT. VI.

A conciſe Hiſtory of Braſil.

BRASIL is ſaid to have been firſt diſcovered by Americus Veſputio, a Florentine, who had the good fortune to be honoured with giving his name to the immenſe continent ſome time before found out by Columbus. This was in the year 1498, but he then ſailed no farther than to the fifth degree of ſouth latitude. Afterwards, being employed by the king of Portugal, he ſailed again to Braſil, and extended his diſcoveries to the fifty-ſecond degree of ſouth latitude; and the ſame year his Portugueſe majeſty ſending a fleet to the Eaſt Indies under the admiral Peter Alvarez Capralio, he ſtanding out to ſea to avoid the calms upon the coaſt of Africa, fell in with the continent of South America, and landing in the ſeventeenth degree of ſouth latitude gave the country the name of Santa Cruz, which, as we have already ſaid, it ſoon after loſt, and obtained the name of Braſil. The admiral ſent one of his ſhips back to Portugal with an account of this diſcovery, the richneſs of the country, and its agreeable ſituation; and with the reſt continued his voyage to India. His majeſty, pleaſed with the account, reſolved to ſend a colony thither, and the firſt ſettlement was made; but this was performed in a very improper manner, for it was only by baniſhing thither a number of criminals of all kinds. This introduced an evil diſpoſition into the firſt principles of the colony, and made the ſettlement extremely difficult, from the diſorders they introduced, and the offence they gave to the original inhabitants. This ſettlement likewiſe met with ſome interruption from the court of Spain, who conſidered the country as within their dominions. However, the affair was at length accommodated by a treaty, in which it was agreed, that the Portugueſe ſhould poſſeſs all the country lying between the river of the Amazons and the river Plate.

Their right being thus confirmed, the Portugueſe purſued the ſettlement with great vigour: conſiderable grants were made to thoſe who were inclined to become adventurers; and many of the nobility of Portugal procured an intereſt in a country that promiſed ſuch great advantages. The natives were in moſt parts ſubdued, and the improvement of the colony advanced apace. In a little time the crown became attentive to ſo valuable an acquiſition; the government was new modelled, many exorbitant grants recalled, and every thing ſettled on ſo advantageous a footing, that all the ſea-coaſts for upwards of two thouſand miles were in ſome meaſure ſettled, to the great benefit of the mother country. The Portugueſe conqueſts on the coaſt of Africa greatly forwarded this ſettlement, by the number of negroes it afforded the ſettlers for their works; and this was the firſt introduction of negroes into America.

But in the very meridian of the proſperity of the Portugueſe, when they were in poſſeſſion of a moſt extenſive empire, and a flouriſhing trade in Africa, Arabia, India, the iſlands of Aſia, and one of the moſt valuable parts of America, they were ſtruck by one of thoſe blows which inſtantly decides the fate of kingdoms. Don Sebaſtian, one of their greateſt princes, loſt his life in an expedition againſt the Moors, and by that event the Portugueſe loſt their liberty, Portugal being abſorbed in the Spaniſh dominions.

Soon after the ſame yoke which galled the necks of the Portugueſe, becoming inſupportable to the inhabitants of the Netherlands, ſeven provinces ſhook it off; and not ſatisfied with forming themſelves into an independent ſtate, and ſupporting their independency by a ſucceſsful defenſive war, with amazing ardour purſued the Spaniards into the remoteſt receſſes of their extenſive territories, and grew rich, powerful, and terrible by the ſpoils of their former anceſtors. They particularly attacked the poſſeſſions of the Portugueſe, took almoſt all their fortreſſes in the Eaſt Indies, and then turned their arms upon Braſil, unprotected by the Spaniards, and betrayed by the cowardice of the governor of the principal city. They would have conquered the whole iſland, had not Don Michael de Texeira, the archbiſhop, who was deſcended from one of the nobleſt families in Portugal, believed that in ſuch an emergency the danger of the country ſuperſeded the common obligations of his profeſſion: he took arms, and at the head of the monks, and a few ſcattered troops, put a ſtop to the conqueſts of the Dutch, making a gallant ſtand till ſuccours arrived, and then reſigned the commiſſion, with which the public neceſſity and his own courage had armed him, into the hands of a perſon appointed by authority. By this ſtand he ſaved ſeven of the captainſhips out of fourteen into which Braſil is divided, the reſt falling into the hands of the Dutch, who conquered and kept them with the utmoſt bravery and conduct.

To the brave count Maurice of Naſſau the Dutch owed ſeveral of theſe conqueſts, the eſtabliſhment of their colonies, and the advantageous peace by which they were ſecured to them. But as it is natural for a mercantile people to be deſirous of ſudden profit, and as this colony was not under the immediate government of the ſtates, but ſubject to the Dutch Weſt India company, they, from principles narrowed by avarice and mean ſentiments, could not bear the preſent profits of the colony ſhould be ſacrificed to its future ſecurity. The prince kept up more troops and erected more fortreſſes than they were willing to allow him, and therefore treated him in ſuch a manner as obliged him to reſign.

The ſchemes of the company now took place; ſeveral perſons were ſent over who were to have the management of the colony, and who by their parſimony were to reimburſe the company the ſums the colony had coſt. The chief of the illuſtrious perſons who were the ſucceſſors of the great count Maurice of Naſſau, one of the ableſt,

ableſt, braveſt, and moſt worthy men of that family, ſo famous for producing heroes, were Mr. Hamel, a merchant of Amſterdam; Mr. de Baſſis, a goldſmith of Harlem; and Mr. Bulleſtraet, a carpenter of Middleburg; all men of good ſenſe and great fidelity to the company: but unfortunately for the republic, as well as their maſters, they underſtood trade better than the art of government. They ſent over to Holland the produce of thoſe lands which count Maurice had aſſigned for maintaining the fortifications, which in the mean time ran to ruin. They gave licences upon very eaſy terms to the ſoldiers to return home, which leſſened the expence of the army. The charge of a court was retrenched, the debts of the company exacted with the utmoſt rigour and ſeverity, their gains now increaſed cent. per cent. and in their opinion every thing was in a moſt flouriſhing ſtate. But in a ſhort time all theſe fine appearances ended in the total loſs of the country, and the entire ruin of the Weſt India company. The hearts of the ſubjects were loſt by their penurious way of dealing, the ſeverity of their proceedings, and their rigorous exactions; thoſe of the Portugueſe who had beeen long ſettled in the country, and had ſubmitted to the Dutch government, were now treated with very little ceremony: they therefore purchaſed fire-arms and ammunition of the government, and as they paid a very high price, they obtained whatever they wanted; joined the Portugueſe who came from Europe to their aſſiſtance; by degrees recovered all the towns the Hollanders were in poſſeſſion of, and in 1654 drove them entirely out of the country; ſince which time it has continued in the poſſeſſion of the crown of Portugal.

CHAP. VIII.

Of the SPANISH AMERICAN Dominions.

SECT. I.

Of the Iſle of CUBA.

Its Situation, Extent, Face of the Country, Climate, Soil, Vegetables, and Animals; with a particular Deſcription of the Havanna, the Manners and Cuſtoms of the People, and the Hiſtory of the Iſland.

OUR deſire to place the American dominions of each of the ſeveral European powers in one view, made it neceſſary to leave the Weſt India Iſlands, to which we now return, and ſhall give as perfect, and at the ſame time as conciſe an account of them as we are able.

The iſland of Cuba is ſeated between the twentieth degree north latitude and the tropic of Cancer, and between the ſeventy-fourth and eighty-fifth degree fifteen minutes weſt longitude; it extends ſix hundred and ſixty miles in length, from Cape St. Antonio on the weſt to Cape Maize on the eaſt, but is very narrow in proportion, it being generally from thirty to forty miles in breadth. It is ſeated twenty-five leagues to the north of Jamaica, ſixty miles to the weſt of Hiſpaniola, and a hundred miles to the ſouth of Cape Florida, commanding the entrance of the gulphs of Mexico and Florida, and of the windward paſſage.

The natives had given it the name of Cuba before it was diſcovered by Columbus, who at firſt called it Juanna, from Don John, and afterwards Ferdinandino, from king Ferdinand V. who was king of Spain when this iſland was diſcovered; but it ſoon after recovered its American name of Cuba, which it ſtill retains.

A ridge of mountains run almoſt through the iſland from eaſt to weſt, in which are mines of copper, which furniſh the Spaniſh plantations with the metal for all their braſs guns; and gold duſt being found in the ſands of the rivers, it is conjectured that there are veins of gold, if not of ſilver, in the mountains. Theſe mountains are ſhaded with trees, but the land near the ſhore is generally a plain champaign country. Abundance of rivulets run from the north and ſouth ſides of theſe eminences, but none of them are large, for they fall into the ſea after a very ſhort courſe. No place in the world has better harbours, the chief of which are the Havanna on the north weſt, which is one of the fineſt and moſt commodious havens in America; and that of St. Jago, which is at the bottom of a large bay, at the eaſt end of the iſland.

The rainy ſeaſon is in the months of July and Auguſt, when the ſun is vertical, and conſequently the weather muſt be extremely hot was the ſun not clouded, and the air freſhed by the torrents of rain which then fall. The faireſt ſeaſon is when the ſun is fartheſt from them, and then the morning is much the hotteſt part of the day, for towards noon the ſea breeze begins to blow pretty briſkly, and thus continues till the evening. The trade wind in theſe ſeas blows from the north eaſt. At the full and change of the moon, from October to April, they have briſk north or north weſt winds, which in December and January frequently become ſtorms, though this is uſually called the fair ſeaſon.

This iſland is ſaid to have in general the beſt ſoil, for ſo large a country, of any in America, and to produce all the commodities known in our American iſlands, particularly ginger, long pepper, and other ſpices, caſſia fiſtula, maſtic, and aloes. Here are large cedars and other odoriferous trees, oaks, pines, palm-trees, plenty of large vines, and fine cotton trees. There are two ſorts of fruit here, called camitor and guanavana; the firſt reſembles a China orange, and grows on a tree which has a leaf green on one ſide, and of a cinnamon colour on the other. The other is in the form of a heart, green without, and with ſome thorny prickles within: it has alſo ſome ſtones, and a tart juice. Their other fruits are plantanes, bananas, guavas, lemons, &c. here are alſo many large walks of cocoas. The country produces tobacco and ſugar, ſaid to be the beſt in the Weſt Indies, though in no great quantity for want of hands to cultivate the canes, but their ſugar works have both water mills and horſe mills.

The black cattle formerly brought hither by the Spaniards, have multiplied to ſuch an extraordinary degree, that numbers have run wild in the woods, and for want of people to eat the fleſh, many fine fat beaſts are killed purely for their hides, and left to rot on the ground. However, a great deal of fleſh is cut into pieces, and dried in the ſun, in order to ſerve for ſhips proviſions. There are here alſo horſes, mules, ſheep, hogs and wild boars, wild and tame fowl, parrots, and partridges with blue heads; the ſhores abound with ſea fowl, particularly with a ſort of cranes that are white when young, but of ſeveral colours when old. Here are likewiſe large turtle, and there is no place where the ſeas and rivers abound more with alligators. The fiſh are chiefly barbel and ſhads.

This iſland is far from being improved as it might; for here, ſays our author, are more churches than plantations, more prieſts than planters, and more lazy bigots than labourers. To this it is owing, that this large iſland, with a luxuriant ſoil, capable of producing abundance of food, and which is perhaps eaſier procured and obtained here than in any other part of the world, here being foreſts which, beſides the cattle juſt mentioned, afford plenty of veniſon; yet does not produce for exportation, including even their hides and tallow, their

ſugar,

ſugar, tobacco, and ſnuff, near the value of our little iſland of Antigua.

Here are many conſiderable towns, but though St. Jago ſtill retains the name of the capital, it is greatly inferior to the Havannah, which is by far the fineſt city in the iſland.

The Havannah is ſeated on the north weſt coaſt of the iſland, in the twenty-third degree twelve minutes north latitude, and in the eighty-ſecond degree thirteen minutes weſt longitude. It was built by Diego de Velaſquez, who landed here in the beginning of the ſixteenth century with three hundred Spaniards, and with the aſſiſtance of Bartholomew de las Caſas conquered Cuba. The laſt gentleman, after turning a Dominican friar, was made biſhop of Chiapa, in New Spain, and diſtinguiſhed himſelf greatly by his zeal in the cauſe of humanity; and from him we have the hiſtory of the Spaniſh cruelties, both here and in other parts of the Weſt Indies. Its fort is ſaid to be the moſt frequented, as well as the beſt in all the iſlands, and one of the fineſt in the world; it being ſo large, that a thouſand ſail of ſhips may commodiouſly ride in it in the utmoſt ſafety, without either anchor or cable, no wind being able to hurt them; and is ſo deep, that the largeſt veſſels anchor at a ſmall diſtance from the ſhore. The entrance, which has no bar to obſtruct it, is by a channel about three quarters of a mile in length, but ſo narrow, that only one ſhip can go in at a time. The harbour into which it leads at the north weſt corner, is a long ſquare lying north and ſouth; the other three corners forming three creeks or bays.

This city ſtands in the moſt fertile part of the iſland, on the weſt ſide of the harbour, in a delightful plain that extends along the ſhore, and backwards it is waſhed by two branches of the river Lagida. The city is of an oval form, and begins about a quarter of a mile from the mouth of the harbour. The buildings, which are of ſtone, are very handſome, but not lofty, and the ſtreets are narrow, but clean. Here are eleven churches and monaſteries, two handſome hoſpitals, and a fine ſquare in the middle of the town, encompaſſed with uniform buildings. The churches which are magnificent, are richly adorned, the lamps, candleſtics, and ornaments for the altars, being of gold and ſilver. Some ſilver lamps of moſt curious workmanſhip, are ſo large as to weigh two hundred marks, each mark being half a pound. The church of the Recollects has twelve beautiful chapels, and in their monaſtery are cells for fifty fathers. St. Clare's church has ſeven altars, all adorned with plate, and the nunnery contains a hundred women and ſervants. The church of the Auguſtines has thirteen altars, and that of St. John de Dieu nine altars, with a hoſpital for ſoldiers, that has a revenue of twelve thouſand pieces of eight.

The city on the land ſide is encompaſſed with a wall defended by baſtions, and a caſtle on the ſide towards the harbour; at the harbour's mouth are alſo two other ſtrong caſtles to defend its entrance: the ſtrongeſt of theſe has lines, which extend to the caſtle firſt mentioned, and is called the Moro fort: it is built on a rock at the foot of too hills, in which is cut a deep ditch, filled with ſea water. The walls are of a triangular form, with three large baſtions planted with forty heavy cannon. From this caſtle runs a line mounted with twelve prodigious long pieces of cannon, lying level with the water, each carrying a ball of thirty-ſix pounds, and theſe are by way of eminence called the twelve apoſtles. At the point between this caſtle and the ſea is a tower, with a round lanthorn at the top, where a man continually watches to ſee what ſhips are approaching, of which he gives notice by putting out as many flags as there are ſhips. The ſecond of the caſtles at the harbour's mouth is called the Puntal, and ſtands on a plain ground on the ſide of the entrance, oppoſite to the former. It is a regular fortification, with four good baſtions well planted with cannon. The third fort, which was that firſt mentioned, is called El Fuerte, or, The Fort, by way of eminence: it is a ſmall but ſtrong work towards the end of the narrow channel, with four regular baſtions, and another platform mounted with about ſixty large heavy braſs cannon. Beſides theſe three forts there are two others, each of twelve guns, which ſtand on the ſhore four or five miles from the port. That to the eaſt is called Coxemar, and that to the weſt Bariavans. Theſe forts have in the whole one hundred and twenty guns.

This city is of more importance to the Spaniards than any other in America, it being the place of rendezvous for all their fleets in their return from that quarter of the world to Spain; and from its lying at the mouth of the gulf of Florida, through which they are all obliged to paſs, it has been called by the Spaniards, the key of the Weſt Indies. Here rides the navy of the king of Spain; and here meet in September the merchant ſhips from ſeveral Spaniſh ports, both of the continent and iſlands, to the number of fifty or ſixty ſail, to take in proviſions and water, in order to return to Spain in a body. Within the city is a continual fair till their departure, which is generally before the end of the month, when proclamation is made, forbidding any that belong to the fleet to ſtay in the town on pain of death, and upon firing a warning gun, they all go on board.

The inhabitants are generally more familiar than at La Vera Cruz, and the women in particular have more liberty, but do not go abroad without their veils. Many of them ſpeak French, and dreſs after the French mode, ſome of that nation having ſettled there ſince Spain fell to the houſe of Bourbon. The diet moſt in uſe are hogs and turtle, with which all the ſhips complete their ſtore of proviſions. The pork is eſteemed very nouriſhing, and contrary to that of other countries is binding. They cut the fleſh of the turtle into long ſlices, and ſtrewing ſalt over them, dry them in the wind. The wine here is pretty cheap, but proviſions are in general dear, eſpecially wheat bread, which is frequently ſold at a penny an ounce, particularly when the galleons are here; this is aſcribed to the want of wheat, which does not thrive here, and therefore all they have is imported from abroad. The inhabitants, however, in general make uſe of bread made of the caſſava root. While the fleets are here, a fowl ſells for a noble, and fruit and other things in proportion, ſo that a man can ſcarce live for two pieces of eight a day.

The other principal towns in the iſland are Santa Cruz, which is ſeated ſixty-three miles to the eaſt of the Havannah, on the ſame coaſt, and has a very good harbour. Porto del Principe, on the ſame coaſt, ſtands about three hundred miles ſouth eaſt of the Havannah; it was formerly a rich town, and was taken by the Buccaneers, after a ſtout reſiſtance. Near it are ſome ſprings of bitumen.

St. Jago is ſeated in the twentieth degree two minutes north latitude, and in the ſeventy-fifth degree forty-ſeven minutes weſt longitude, at the bottom of a ſpacious bay, on the ſouth eaſt ſide of the iſland, about ſix miles from the ſea. The entrance to the bay is narrow, and within it are ſmall iſlands, which ſhelter it from ſtorms, and form a commodious harbour. It is a biſhop's ſee, and has a cathedral; it had once alſo a good trade, which is now removed to the Havannah, and though the city has juriſdiction over half the iſland, it has dwindled almoſt to nothing.

Though this iſland was diſcovered in 1492, it was not completely conquered till the year 1511. The natives were treated with all the cruelty that the united paſſions of ſavage bigotry, ſuperſtition, and avarice could invent; and it is ſaid that ſome millions of them were cut off, and that at laſt orders were ſent from the court of Spain to exterminate the few remains of its original inhabitants, which was accordingly executed with barbarous punctuality; ſo that the hiſtory of Cuba is no other than a relation of the moſt horrible maſſacres, which were induſtriouſly concealed by the Spaniards; for theſe monſters finding gold upon the iſland, concluded that it muſt come from concealed mines, and therefore tortured vaſt numbers of the natives, to make them diſcover where theſe mines lay; and it is ſaid, that in the ſingle year when the governor Velaſquez arrived on the iſland, no fewer than ſix hundred thouſand of the natives were put to death.

The houſes of the Havannah were at firſt of no better materials than wood, and that town was ſo inconſiderable in 1536, that it was taken by the crew of a French pirate ſhip, who obliged the inhabitants to pay ſeven hundred ducats to ſave it from being burnt. The very

day after the pirates departure three Spaniſh ſhips from Mexico arrived at the Havanna, and having unloaded their cargoes, ſailed in purſuit of the pirate ſhip; but ſuch was the cowardice of the Spaniſh officers, that the pirate took all their three ſhips, and returning to the Havanna obliged the inhabitants to pay them ſeven hundred ducats more.

To prevent the like accidents for the future, the inhabitants of the Havanna built their houſes of ſtone, and ran up a fort at the mouth of the harbour: but as the town was ſtill open on the land ſide, the Engliſh cruizers paid it ſeveral unwelcome viſits, and more than once drove the Spaniſh inhabitants into the woods, while they plundered the place. During the war between Henry II. of France with Spain, a Dieppe ſhip, with no more than ninety men, plundered St. Jago, and afterwards attacked the Havanna; but the Spaniards had been ſo often uſed to thoſe viſits, that they had retired to the woods; ſo that the French found no inhabitants there. After remaining for ſome time in the town, ſearching in vain for plunder, two Spaniards came to them, ſeemingly to treat of the ranſom of the town, but in reality to obſerve their numbers. The French demanded ſix thouſand ducats for ranſom-money, which the two deputies pretended was more than the inhabitants could raiſe, and took their leave. Upon their return to their countrymen, the majority came to a reſolution to ſurprize the French ſword in hand, and accordingly a hundred and fifty of them came, under cover of the night, to cut them off while aſleep; but the French, after loſing four of their number, ſtood to their arms, and ſoon put the Spaniards to flight. After this, by daubing the windows and doors of the houſes with pitch and tar, of which they found great plenty, they ſet fire to the town, and afterwards pulled down the walls and the fort. In the year 1669 the Engliſh Buccaneers under captain Morgan took the city of Havanna, and would have kept it could they have had the king of England's protection.

In July 1741, admiral Vernon and general Wentworth landed at Walthenam harbour in the ſouth-eaſt part of the iſland, with a ſquadron of ſhips, made an encampment, and erected a fort on the ſhore, to which they gave the name of Cumberland harbour and fort. They continued there till almoſt the end of November following, when the ſickneſs of the men obliged them to abandon the iſland.

The importance of the Havanna to the Spaniards was never thoroughly underſtood till after the ſucceſſion of the houſe of Bourbon to the throne of Spain, and then nothing was wanting that could contribute to render it impregnable.

When the amazing ſucceſſes of Great Britain in the late war united the three branches of the houſe of Bourbon, France, Spain, and Naples, in what was called the Family Compact, the miſtakes of the former plans of war againſt Spain were obſerved, and it was reſolved to begin the operations by the attack of the Havanna. This momentous plan depending ſo entirely upon military knowledge, his majeſty referred, in a great meaſure, the execution of it to his uncle, the late duke of Cumberland, whoſe long experience in the army undoubtedly rendered him the beſt judge of the abilities of the officers who were to be employed in the execution of it. The chief command was given to the earl of Albemarle, the diſciple of his royal highneſs in the art of war. Admiral Pocock, who had acquitted himſelf ſo much to the honour and intereſt of his country in the Eaſt Indies, had the command of the fleet, and Sir James Douglas was ordered to reinforce him with his ſquadron from Martinico.

The main fleet ſailed on the fifth of March 1761, and was joined by Sir James Douglas with his reinforcement on the twenty-ſeventh of May off the north-weſt point of Hiſpaniola; the whole armament then conſiſting of nineteen ſhips of the line, eighteen ſmaller ſhips of war, and about a hundred and fifty tranſports, with ten thouſand regular troops on board, which were to be joined about the time the operations were to commence by four thouſand troops more, who were ordered from North America. The admiral, preſſed by time, reſolved to run along the northern ſhore of the iſland, through the old ſtreights of Bahama, which form a narrow paſſage, bounded on each ſide by dangerous ſands and ſhoals about nine hundred miles in length. This the approach of the hurricane ſeaſon rendered in ſome meaſure neceſſary, and the admiral having procured from lord Anſon an excellent chart of thoſe ſtreights, conducted their paſſage with ſuch ſucceſs, that they got clear of all danger by the fifth of June.

Fourteen Spaniſh men of war, beſides ſmaller ſhips, were then lying in the baſon of the harbour of Havanna. The admiral, with twelve ſail of the line, bore away to block them up, and to make a diverſion on one ſide, while the landing was effected on the other, between the two forts, Barcarans and Coxemar, the firſt of which was taken poſſeſſion of by the Mercury man of war, and the other by the Dragon; their garriſon, which conſiſted of armed peaſants and negroes, flying into the woods. Mean while the earl of Albemarle, favoured by the fire of the Dragon, paſſed the Coxamar river, and the army lay under arms along the ſhore.

On the eighth of June lord Albemarle marched to Guanamacoa, about ſix miles from the landing-place, and ſaw ſix thouſand of the enemy, drawn up very advantageouſly, as if they intended to diſpute his paſſage to that village, but they were ſoon diſperſed; the next day his lordſhip formed the army into two bodies; one commanded by general Elliot lay towards the ſouth-eaſt of the harbour, extending conſiderably into the country, in order to cover the ſiege, and ſecure the foraging parties ſent out for proviſions. The other was commanded by general Keppel, and was employed in the attack of Moro caſtle, while colonel Howe was poſted with a detachment to cut off the communication between the town and the country, and keep the enemy's attention divided. The hardſhips the Engliſh army ſuſtained in carrying on the ſiege of the Moro caſtle, were inexpreſſible: the earth was every where ſo thin, that it was with great difficulty they could cover themſelves in their approaches. There was no ſpring or river near them; it was neceſſary to bring water from a great diſtance, and ſo precarious and ſcanty was this ſupply, that they were obliged to have it brought from their ſhips: roads for communication were to be cut through thick woods; the artillery were to be drawn a vaſt way over a rough rocky ſhore, and ſeveral of the men dropped down dead with heat, thirſt, and fatigue. In ſhort, the ſiege of Moro caſtle was carried on with the utmoſt difficulty; and the fire continued with equal fury on both ſides. To give the greater effect to the batteries, the Dragon, Marlborough, and Cambridge, laid their broadſides againſt the north eaſt part of the Moro, and a moſt dreadful cannonading enſued for ſeven hours, both from the forts and the ſea; but the ſituation and ſtrength of the caſtle gave it great advantages over the ſhips, which were terribly ſhattered and obliged to ſheer off. The enemy in the fort, who kept up a communication with the town, had landed two detachments of grenadiers of five hundred men each, with a great number of negroes and mulattoes, to attack the works of the Engliſh on the right and left; but they were defeated with the loſs of above two hundred men, and a great number wounded. At length the batteries from the army had diſplaced many of the enemy's guns; but when it was thought that a ſpeedy period would be put to the immenſe labours of the beſiegers, the grand battery took fire, and with it was conſumed the labour of ſix hundred men for ſeventeen days.

Sickneſs, the badneſs of proviſions, and the ſcarcity of water, with the heat of the climate, had at length killed or rendered uſeleſs two-thirds of the army, and the ſeamen were in very little better condition, while the growing diſtempers of the ſeaſon, and the expoſed ſituation of the ſhips, threatened deſtruction both to the land and ſea forces. After inexpreſſible toil the beſiegers batteries again took fire, and they had now nothing to truſt to but the arrival of their reinforcemen's from North America, becauſe whatever loſſes the Spaniards ſuſtained in the day time, were repaired in the night. At length the arrival of the Jamaica fleet inſpired the troops with freſh hopes. On the twenty-ſecond of July, a vigorous ſally of fifteen hundred men, divided into three parties, was

made from the town, but they were repulſed with the loſs of four hundred men, while that of the beſiegers did not exceed fifty men. The ditch which ſecured the caſtle was cut in the rock about ſeventy feet deep, and forty wide, and though the enemy ſent two boats and a floating battery out of the harbour, to fire grape-ſhot and ſmall arms into the ditch where the miners were at work, they were not only repulſed, but a mine was ſprung, which threw a part of the wall into the ditch, and left a breach, which though ſmall, the troops were ordered to ſtorm. The garriſon of Spaniards within the caſtle was ſtill conſiderable; but the ſoldiers mounting the breach, entered the fort with ſuch amazing intrepidity, that the Spaniards, who had been regularly drawn up to reſiſt them, loſt all the ſpirit they had before exerted. Four hundred of them were cut to pieces, or periſhed in the water; four hundred threw down their arms, and received quarters. The marquis de Gonzales, the ſecond in command, was killed while endeavouring to ſtop the ſhameful flight of his men: Don Lewis de Velaſco, the governor, with about a hundred of the garriſon, bravely defended their colours till he was killed, to the extreme regret of his generous conquerors. The Spaniards then directed their fire againſt Moro caſtle, now in the poſſeſſion of the Engliſh. New batteries were erected by the beſiegers, who battered both the Puntal and the town from forty-three pieces of cannon and eight mortars, with ſuch ſucceſs, that flags of truce appeared in all quarters of the Havannah, and a meſſenger was ſent to the Britiſh camp to ſettle the capitulation, which was ſigned on the fourteenth of Auguſt, by which the men of war in the harbour, as well as the forts and the town, were delivered up to the Engliſh. And thus, ſays our author, a prophecy which had been long current with the Spaniards in thoſe parts was fulfilled, namely, that the Engliſh ſhould one day walk as maſters through the ſtreets of the Havannah. However, this important conqueſt was reſtored to Spain in the nineteenth article of the definitive treaty of 1763.

SECT. II.

Of Porto Rico.

Its Name, Situation, Extent, Face of the Country, Climate, Soil, Vegetables, and Animals. A Deſcription of the City of Porto Rico, and a conciſe hiſtory of the Iſland.

THE next iſland belonging to Spain, is that of Hiſpaniola, but as the moſt valuable part of it belongs to the French, we have placed it among the American iſlands ſubject to France. We now therefore come to Porto Rico, the laſt of the great Antilles that remains to be deſcribed.

This iſland, which was diſcovered by Columbus in 1493, received from him the name of St. John; but the chief town being afterwards built upon a harbour called Rico or Rich, as is ſuppoſed from its excellence, the whole iſland has ſince obtained the name of Porto Rico. It is ſituated between the eighteenth degree and forty minutes north latitude, and between the ſixty-fifth and ſixty-ſeventh degree weſt longitude, lying about eighteen leagues from the north eaſt point of Hiſpaniola, extending one hundred and fifty miles from eaſt to weſt, and between forty and fifty in breadth.

The ſoil is beautifully diverſified with woods, vallies, and plains, and is extremely fertile. It abounds with fine meadows, and a ridge of mountains runs through the iſland from eaſt to weſt. The north part, which is more barren than the ſouth, has been repreſented by travellers as having mines of quickſilver, tin, and lead, with ſome of gold and ſilver; but there are none of the latter worked at preſent. It is well watered with ſprings and rivers, and there are reckoned no leſs than twenty-three that fall into the ſea on the north or ſouth ſide.

The rains which uſually render the ſeaſon unhealthy, generally fall in June, July, and Auguſt, which would otherwiſe be extremely hot, the ſun being vertical, and the wind is at ſouth eaſt, while at other times it is at north eaſt. From eight in the morning till four in the afternoon they have a ſea breeze, but from ſix in the morning till this refreſhing gale ſprings up, the air is very hot; but the moſt ſultry part of the day is at five in the afternoon, and the coolеſt from three in the morning till ſix.

The ſoil produces a long coarſe graſs, on which the cattle feed, but the inhabitants never make it into hay. It bears good ſhip timber, and variety of fruit trees, particularly cocoas, pine-apples, mammees, guavas, papahs, bananas, plantanes, palms, muſk-melons, oranges, limes, pomegranates, citrons, grapes, plums, figs, Jamaica pepper, ſpeckled wood, caſſia fiſtula, the ſenſitive plant, and the baſtard cinnamon, together with rice and Indian corn; but they make moſt of their bread of the caſſava root. The common liquor here, beſides water, is made of malaſſes and ſpices mixed together; but the better ſort drink a liquor made of ſpices alone, and all the wine is brought from abroad.

The iſland is well ſtocked with wild cattle, which were originally of Spaniſh breed, with goats, hogs, and ſheep. Their pork is excellent, as is alſo the fleſh of their kids; but their mutton is poor dry food. Here are great flocks of parrots, wood-pigeons, and other wild and tame fowl, with all manner of European poultry, and plenty of fiſh.

The inhabitants are ſaid not to exceed ten thouſand. This iſland might, however, be rendered one of the moſt flouriſhing of all the Spaniſh colonies, if it was not for the miſchief to which it is too liable from great droughts, hurricanes, and the deſcent of privateers, by which all the ſea-ports have been frequently ruined. The principal commodities exported from hence are ſugar, ginger, hides, cotton thread, raw cotton, caſſia, maſtic, &c. They have alſo great quantities of ſalt, and make conſiderable profit of their oranges, lemons, and ſweetmeats. The inhabitants have many good veſſels, in which they trade to various parts of America.

The city of Porto Rico is ſeated on the north ſide of the iſland, in a peninſula which joins to the continent by a cauſeway in the eighteenth degree twenty minutes north latitude, and the ſixty-fifth degree thirty-five minutes weſt longitude. It is well-built, populous, and both the ſeat of the governor and the ſee of a biſhop. The cathedral has a monaſtery belonging to it; but the heat of the climate renders it inconvenient to make uſe of glaſs-windows, and their canvas and wooden lattices diſfigure their buildings. The city is defended by a citadel and a caſtle, and is the center of the contraband trade uſually carried on by the Engliſh and French with the ſubjects of the king of Spain, notwithſtanding the ſeverity of the laws, and the extraordinary precautions taken to prevent it; hence it is large, and better inhabited than moſt of the Spaniſh cities in America.

When this iſland was taken by the Spaniards, it is ſaid the natives amounted to no leſs than ſix hundred thouſand, and had the character of a brave gallant people; but the Spaniards, by the advantage they had over them in the art of war, with much difficulty reduced them, and have ſince by degrees quite extirpated them. After which no more gold was to be found on the iſland; though the natives had a great deal of it, and on that account were murdered, that the Spaniards might have it all to themſelves.

In 1595 Sir Francis Drake burnt the ſhips in the harbour of Porto Rico, and three years after the town was reduced by the earl of Cumberland, who fitted out a fleet at his own expence, in which were two regiments of queen Elizabeth's troops. He conquered the town with great difficulty, and had thoughts of keeping it; but loſing four hundred of his men, who died of the bloody flux in a month's time, he abandoned it, after demoliſhing the forts, and carried off eighty pieces of braſs cannon and a great quantity of plate. In 1615 it was taken and plundered by the Dutch; but they could not take the caſtle, which is now in a better condition than ever, as are alſo the other forts.

SECT.

SECT. III.

Of the Iſlands of TRINIDAD *and* MARGARETTA.

Their Situation, Extent, and Produce; with ſome Obſervations on the Conduct of the Spaniards with reſpect to their Weſt India Iſlands, and the Continent.

THERE are ſeveral other ſmaller iſlands belonging to Spain in this ſea, particularly Trinidad, or Trinidada, which is ſeated in the tenth degree thirty-eight minutes north latitude, and in the ſixtieth degree twenty-ſeven minutes weſt longitude, forming one ſide of the ſtraights of Paria, or Bocca de Drago, and New Andaluſia, in Terra Firma. It is about ſixty-two miles in length, and forty-five in breadth. The ſoil is fruitful, producing ſugar, fine tobacco, Indian corn, variety of fruit, and ſome cotton trees. It was taken by Sir Walter Raleigh in 1595, and by the French in 1676, who plundered the iſland and extorted money from the inhabitants.

About five degrees to the weſtward of Trinidad is Margaretta, which is ſeated near the northern coaſt of New Andaluſia, from which it is ſeparated by a ſtraight twenty-four miles broad. It is fifteen leagues in length, ſix in breadth, and, as it is always verdant, affords a very agreeable proſpect. The iſland is very fertile, it abounding with paſtures, maize, and fruit; and has many groves. A great number of boats were formerly employed here in fiſhing for pearls; but this fiſhery is much declined, if not diſcontinued.

There are ſeveral other ſmall iſlands near the laſt of little conſequence, at leaſt to the Spaniards, who ſeem to have paid but ſmall attention to the cultivation of the larger and more valuable, and we do not find any thing relating to them worthy the obſervation of the reader. We ſhall therefore conclude this ſection, and our account of the Spaniſh Weſt India iſlands, with ſome obſervations on the conduct of the Spaniards, with regard to their ſettlement of them.

The Spaniards, by a ſeries of the moſt inhuman and impolitic barbarities, having exterminated the original inhabitants of Cuba, Hiſpaniola, and Porto Rico, have left them comparatively ſo many deſarts, and deprived themſelves of a thouſand advantages they might have enjoyed by an equitable trade with the natives. The commerce between the iſlands and the Spaniſh continent is carried on by the Barlevento fleet, conſiſting of ſix ſhips of good force and burthen, who annually make the tour of Cuba, Hiſpaniola, Porto Rico, and the coaſt of Terra Firma, not only to carry on the commerce between them, but to clear the ſea of pirates and illicit traders; and now and then a regiſter ſhip from Spain is bound to one or other of them. The Spaniards have hitherto ſeemed to keep poſſeſſion of them, rather to prevent any other nation growing too powerful in thoſe ſeas, than from the profit they expected to derive from them: for it is certain, that ſhould any other nations obtain the poſſeſſion of all theſe iſlands, the trade of the American continent, and perhaps the continent itſelf, would be entirely at their mercy. The Spaniards have, however, lately taken ſome ſteps towards the better ſettlement of Porto Rico; and are beginning to open the American trade to ſome other towns in Spain beſides Cadiz. They have made a difference in point of duty between their own manufactures and thoſe of foreigners; and are opening their eyes to the true intereſt of their country.

"Hitherto, ſays an ingenious author, the tide of wealth "that conſtantly flowed from America into Spain ran "through that kingdom like a haſty torrent, which, far "from enriching the country, hurried away with it all "the wealth it found in its paſſage. No country in "Europe has received ſuch vaſt treaſures as Spain. In "no country in Europe is ſeen ſo little money: for "from the time that the Indies fell into the hands of "Spain, the affairs of that monarchy have been conſtantly going backward. In America their ſettlements were "carried on conformably to that genius, and to thoſe "maxims which prevailed in their government in Europe. No means of retaining their conqueſts but by "extirpating the people; no ſchemes for the advancement of trade; no attempts at the reformation of abuſes, "which became venerable in proportion to the miſchiefs they had ſuffered by them: in government, "tyranny; in religion, bigotry; in trade, monoply.

"When the Spaniards found, to their ambition, which "was boundleſs, that they had joined a treaſure which "was inexhauſtible, they imagined there was nothing "too vaſt for them to compaſs. They embraced a thouſand projects at once; many of them noble ones in "theory; but to be executed with different inſtruments "in different parts of the world, and all at a vaſt expence of blood and treaſure. The wars, which were "the reſult of theſe ſchemes, and the Indies, which "were to ſupport them, were a continual drain, which "carried off their people, and deſtroyed all induſtry in "thoſe who remained. The treaſure which flowed in "every year from the New World, found them in debt "to every part of the Old; for to the reſt of their revenues they had forgot to add that, which is a great "revenue itſelf, and the great ſupport of all the others, "œconomy. On the contrary, an ill order in their "finances at home, and a devouring uſury abroad, ſwallowed up all their treaſure, whilſt they multiplied the "occaſions for it. With the beſt ſcheming heads in "Europe, they were every where outrivalled; with "brave and well-diſciplined troops, they were almoſt "always defeated; with the greateſt treaſures, they were "in want; and their armies were ill provided, and ill "paid. Their friends exhauſted them by trade; their "enemies by plunder. They ſaw new ſtates ariſe out "of the fragments of their dominions; and new maritime powers ſtart up from the wrecks of their navy. "In ſhort, they provoked, troubled, and enriched all "Europe; and at laſt deſiſted through mere want of "ſtrength. They were inactive, but not quiet; and "they were enervated as much by their lazineſs, during "this reſerve, as they had been weakened before by their "ill-judged activity. At preſent the politicks of Spain, "with regard to America, ſeem to be to preſerve South "America, and particularly the navigation of the South "Seas as much as poſſible to themſelves; to deſtroy "effectually the contraband trade, and to encourage the "export of their own manufactures."

CHAP.

CHAP. IX.

Of the SPANISH Dominions on the Continent of AMERICA; and firſt of NEW MEXICO, CALIFORNIA, and MEXICO, or NEW SPAIN.

SECT. I.

Of the Spaniſh Dominions on the American Continent in general: their Situation, Extent, Climates, and Produce: with ſome Reflections on the Conduct of the Spaniards with reſpect to Population, and the Manner in which Spain became impoveriſhed by the Acquiſition of Gold and Silver.

WE now come to the continent of Spaniſh America, which is of an amazing extent, it reaching from the thirty-fourth degree of north to the fifty-third degree of ſouth latitude; extending from Cape Sebaſtian, the moſt northern point of California, to the ſtreights of Magellan, a ſpace of between ſix and ſeven thouſand miles, the whole coaſt of which is on one ſide entirely Spaniſh; but on the other is Braſil, and a comparatively inconſiderable French and Dutch ſettlement. A great part indeed of this country is poſſeſſed by the natives, and ſome places lie deſolate; but Spain claims the dominion of the whole: however, it muſt be confeſſed, that only a very ſmall part of it is really cultivated by the Spaniards.

The climate in ſo great an extent of country muſt differ according to the latitude, and other circumſtances; and thus the general opinion, that the Spaniſh American dominions are unhealthy, is, like many other general propoſitions, at the ſame time both true and falſe. Thoſe colonies within or near the tropics are in many places exceeding hot, while others are remarkably cool; ſome where the climate is exceeding hot are both healthy and pleaſant, while others have an almoſt peſtilential air. Several of the provinces in New Spain and Peru are bleſſed with almoſt every advantage, and no country affords more delightful ſpots than are to be found in New Mexico in the north, Buenos Ayres in the ſouth, and ſeveral other countries on both ſides the Line in the temperate zones. Where the lands have never been cleared, where the ſoil is marſhy and ſwampiſh, where periodical deluges of rain pour down from the heavens, we may eaſily believe the climate muſt be unhealthy, and all theſe meet in ſome of the Spaniſh dominions in America.

The ſoil differs no leſs than the climate: ſome countries conſiſt of the moſt beautiful lawns, paſtures, fields, and meadows, watered with fine ſtreams, ſhaded with groves, and variegated with hills and valleys; while others only preſent to the eye dreary deſarts, dreadful rocks, and mountains of a ſtupendous height, vaſt foreſts, and the moſt tremendous ſcenes of wild, rude, and uncultivated nature. Several of the Spaniſh plantations are wonderfully rich and fruitful, abounding in corn, the moſt beautiful paſtures, trees that afford fruit, ſhade, and ornament, odoriferous ſhrubs, medicinal plants, woods, and roots, with flowers delightful to the ſenſes; in ſhort, almoſt every thing that nature or art produces, in any quarter of the globe, may here be found growing ſpontaneouſly, or raiſed by labour, in its greateſt perfection. In the boſom of the earth have been found immenſe treaſures of gold and ſilver, and in ſhort, this extenſive territory alſo produces emeralds, pearls, rich drugs, dyeing woods, tobacco, ginger, coffee, cotton, and ſweetmeats: and for the convenience of navigation, it is furniſhed with the nobleſt rivers in the world.

If we take a view of the country with reſpect to its inhabitants, we ſhall find the reaſon why theſe colonies have proved of little ſervice to Spain. The impolitic expulſion of the Moors proved an irreparable blow to that monarchy; and the colonization of America increaſed the evil. Yet though Spain was almoſt depopulated by the conſtant migration of her people to the continent of America and the Weſt India iſlands, ſtill the number was very inadequate to the purpoſe of rendering the plantation populous and flouriſhing, eſpecially as the cruelty of the firſt conquerors had almoſt extirpated the natural inhabitants. When America was firſt reduced, it was thought neceſſary to eſtabliſh great numbers of eccleſiaſtics in the country, for the inſtruction of the natives in the Chriſtian religion; and theſe have ſince multiplied to ſuch a degree, as to have the moſt pernicious effect upon population. Every province is filled with monaſteries, nunneries, and perſons condemned by ſuperſtition to celibacy, and doomed by the tyranny of the church to be denied the gratification of the moſt natural paſſion. The ſpirit of avarice and oppreſſion which reigns among all the officers of the crown, who are generally choſen out of families of diſtinction of broken fortunes, ſenſibly affects the ſtate by prejudicing the revenues, diſcouraging induſtry, and extinguiſhing public ſpirit. But what is of ſtill more importance is, that the fondneſs the Spaniards have ſhewn for gold and ſilver, has been equally prejudicial to the colonies, and to the mother country, ſince it has not only prevented thoſe commodities and manufactures which in themſelves would prove more valuable than the richeſt mines of gold and ſilver, but has diffuſed ſuch narrow and ſordid principles through the minds of the people, as are viſibly productive of the moſt fatal effects.

The juſtly celebrated baron de Monteſquieu, in his admirable work, intitled, The Spirit of Laws, after obſerving that from the time in which the Spaniards diſcovered the gold and ſilver of America, Spain has been inceſſantly declining, adds,

"Gold and ſilver are either a fictitious, or a repreſentative wealth. The repreſentative ſigns of wealth are extremely durable, and in their own nature but little ſubject to decay. But the more they are multiplied, the more they loſe their value, becauſe the fewer are the things they repreſent.

"The Spaniards, after the conqueſt of Mexico and Peru, abandoned their natural riches in purſuit of a repreſentative wealth, which daily degraded itſelf. Gold and ſilver were extremely ſcarce in Europe, and Spain becoming ſuddenly miſtreſs of a prodigious quantity of thoſe metals, conceived hopes to which ſhe never before aſpired. The wealth found in the conquered countries, great as it was, did not, however, equal that of their mines. The Indians concealed a part; and beſides, theſe people, who made no other uſe of gold and ſilver than to give magnificence to the temples of their gods, and to the palaces of their kings, ſought not for it with an avarice like ours. In ſhort, they had not the ſecret of drawing the metals from every mine, but only from thoſe in which the ſeparation might be made by fire.

"However, it was not long before the ſpecie of Europe was doubled; this appeared from the price of commodities; which was every where doubled.

"The Spaniards raked into the mines, ſcooped out mountains, invented machines to draw out water, to break the ore, and ſeparate it; and, as they ſported with the lives of the Indians, they forced them to labour without mercy. As the ſpecie of Europe ſoon doubled, the profit of Spain diminiſhed in the ſame proportion; and they had every year the ſame quantity of metal, which was become by one half leſs precious.

" In double the time the ſpecie ſtill doubled, and the " profit diminiſhed another half.

" It diminiſhed even more than one half: let us ſee in " what manner.

" To extract the gold from the mines, to give it the " requiſite preparations, and to import it into Europe, " muſt be attended with ſome certain expence; I will " ſuppoſe this to be as one to ſixty-four. When the " ſpecie was once doubled, and conſequently became " one half leſs precious, the expence was as two to ſixty-" four. Thus the galleons, which brought to Spain " the ſame quantity of gold, brought a thing which was " really of leſs value by one half, though the expences " attending it had been one half higher.

" If we proceed doubling and doubling, we ſhall find " in this progreſſion, the cauſe of the impotency of the " wealth of Spain."

SECT. II.

Of NEW MEXICO.

Its Situation, Extent, Climate, Rivers, Face of the Country, and Produce. A conciſe Account of its Government, and of its Indian Inhabitants.

THE province of New Mexico will not admit of our being very explicit in our account of it, ſince its boundaries are by no means aſcertained, and the far greateſt part of it is ſtill in the hands of the natives, who have the happineſs ſtill to enjoy that invaluable bleſſing their liberty. It is however ſuppoſed to extend between the twenty-eighth and thirty-eighth degree of north latitude. On the north it is bounded by very high mountains, and a country utterly unknown, and never pervaded by Europeans. On the eaſt it has the ſpacious country of Louiſiana; on the weſt the Californian lake, and the river Colorado; while on the ſouth it is bounded by the province of Mexico Proper.

As it lies in the midſt of the temperate zone, it enjoys a very pleaſant climate. The ſummers, indeed, are very warm, and the winters pretty ſharp; but then the former are neither ſtifling nor unhealthy, nor the latter intenſely cold, or deluged with floods of heavy rain, but the air is clear and ſalubrious. Thus each ſeaſon is what is very deſirable, and extremely agreeable to an European conſtitution.

This country is finely watered with rivers and rivulets, though few of theſe are large or navigable. The Rio Solado and the Rio del Norte alone deſerve notice; the laſt flowing the whole length of the country, and then making a ſweep eaſtward, runs through the province of New Leon, and diſcharges itſelf into the gulf of Mexico. There are alſo ſeveral ſmaller rivers that fall into the Mexican ſea, and ſome bays, ports, and creeks, on that coaſt, which might eaſily be converted into excellent harbours, had the Spaniards any ſhare of that diligence and commercial ſpirit which animates the other maritime powers of Europe.

The land is beautifully interſperſed with riſing grounds and fertile plains, covered with trees, ſome of which are fit for timber, and others produce various kinds of fruit. Here are ſaid to be found gold and ſilver, turquoiſes, emeralds, and other precious ſtones. Here are all kinds of wild and tame cattle, eſpecially cows, with a prodigious variety of fowl; and the rivers are abundantly ſtored with the moſt delicious fiſh. In ſhort, it is affirmed to be one of the pleaſanteſt, richeſt, and moſt plentiful countries in America, or in any other part of the world.

New Mexico is divided by ſome geographers into fifteen provinces, and by many of the Spaniſh writers into eighteen, of which they give us the names.

Santa Fe, the capital, is a handſome well built town, ſeated near the ſource of the Rio del Norte, in the thirty-ſixth degree forty minutes north latitude, and in the one hundred and firſt degree fifteen minutes weſt longitude from London. It is regularly built, and is the ſee of a biſhop, ſuffragan to that of Mexico, and the ſeat of the governor of the country, who enjoys his poſt five years. This governor is enjoined to maintain a conſtant force of ſix hundred horſe, half of which number, ſays our author, is ſeldom kept up, their pay going into the governor's pocket, which alone would make a conſiderable ſalary, no leſs than four hundred and fifty pieces of eight being allowed for the annual ſupport of every ſoldier.

The natives are eaſy, generous, and pacific, yet extremely formidable on account of the dexterity with which they handle their bows and arrows. They are better provided for their defence than any other inhabitants of the new world. When the Spaniards firſt entered the country, they found the natives well cloathed, their lands cultivated, their villages neat, and their towns built of ſtone, in which they ſhewed ſome knowledge in architecture not drawn from the rules of art, but the convenience dictated by nature. Their flocks of cattle were numerous, and they ſeemed to live in a very comfortable manner. We are told, that they were ſo ſkilful in ſhooting, that at a conſiderable diſtance, they would diſcharge an arrow ſo true, as to ſhake the grain out of a ripe ear of Indian corn without breaking it. They were great lovers of mules fleſh, and upon that account frequently ſeized the mules of the Spaniſh travellers, leaving their cheſts of ſilver upon the road, becauſe they ſet no value upon that metal. They worſhipped the ſun and moon, but diſcovered a greater readineſs to embrace the doctrines of Chriſtianity than any other of the American nations, expreſſing no other diſlike to it, but a fear that it would oblige them to part with their freedom, to which they are extremely attached. Their princes were little more than the leaders of their armies, elected at the pleaſure of the people, for their wiſdom or valour.

The Spaniſh writers ſay, that New Mexico is inhabited by a great variety of different nations, intirely unconnected with each other; but the principal are the Apaches, the ſeveral tribes of whom are diſtinguiſhed by their towns and ſettlements. They are a brave, warlike, reſolute people, fond of liberty, and the inveterate enemies of tyranny and oppreſſion, of which the Spaniards had fatal experience towards the cloſe of the laſt century, when they took arms and ravaged the country planted by the Spaniards. At length they were rather appeaſed than ſubdued, and ever ſince have remained the allies, but not the ſubjects of Spain. This is all the account we are able to give of the preſent ſtate of New Mexico, from authors that deſerve any credit. The Spaniards have been very ſparing in their accounts of this country, which is probably owing either to their indolence or caution. However, they have probably but few towns here, and an inconſiderable part of the country is cultivated, compared with its extent.

SECT. III.

Of CALIFORNIA.

Its Situation, Extent, Climate, Face of the Country, Vegetables, and Animals. With an Account of the Manners and Cuſtoms of the Natives.

CALIFORNIA, the moſt northern part of the Spaniſh dominions on the continent of America, towards the Pacific ocean, received the name of New Albion, from Sir Francis Drake, who took poſſeſſion of it in the name of queen Elizabeth. It is alſo called by ſome writers, Iſlas Carabiras. This province was for a long time conſidered as an iſland, but is now found to be a peninſula in the Pacific ocean, iſſuing from the north coaſt of America, and extending from Cape Sebaſtian, in the forty-third degree thirty minutes north latitude, to the ſouth eaſt, where it is terminated by St. Lucar, in the twenty-ſecond degree thirty-two minutes north latitude, the whole peninſula being eight hundred miles in length.

It is divided from Mexico by a gulf, in which are many iſlands. The peninſula is very unequal in breadth; towards the north it is near two hundred miles wide, but at the ſouthern extremity it tapers away, and is ſcarcely fifty miles over.

Though it lies for the moſt part in the temperate zone, the coaſt is very hot in ſummer, but the inland part is more temperate. In winter it is very cold, but healthy.

However, in ſo extenſive a country there muſt be great variations, both of ſoil and climate; and Califor-

hia has not only ſome of the moſt beautiful lawns, but has many of the moſt inhoſpitable deſarts in the univerſe. The lands to the weſtward of the river Colorado are level and fruitful, interſperſed with delightful woods, cool refreſhing ſprings and rivulets, and the moſt enchanting paſtures and meadows. Upon the whole, though California, on a general view, appears rather rough, craggy, and unpromiſing, yet we are aſſured, that with due culture it furniſhes every neceſſary of life.

California produces large quantities of timber fit for ſhip building; and among the ſhrubs is one called pitahaya, which is ſaid to be peculiar to California; its branches are finely fluted, and riſe vertically from the ſtem, ſo as to form a very beautiful top. The ſhrub bears no leaves, the fruit growing on the boughs, without ſhade or cover. It reſembles a horſe cheſnut, but contains a pulp, which has ſome reſemblance to that of a fig. In ſome it is white, in others yellow, and ſometimes red, but always exquiſitely delicious, it being a rich ſweet, tempered with a grateful acid. This peninſula has alſo moſt of the fruits to be found in other parts of America; and what is pretty extraordinary, there is here a ſpecies of manna, ſuppoſed to fall with the dew, and to become inſpiſſated on the leaves of the trees. Father Pinolo ſays, that without the whiteneſs of refined ſugar, it has all the ſweetneſs. Botaniſts are now agreed, that this manna is a juice exſudating from the tree, though the natives firmly believe that it drops down from heaven.

California has likewiſe all ſorts of domeſtic animals that are commonly uſed in Spain and Mexico, as horſes, mules, aſſes, oxen, ſheep, hogs, goats; and all other quadrupeds imported, thrive and increaſe in this country. Among the native animals is one called taye, which is of the ſize of a young heifer, and greatly reſembles it in its ſhape; but the head is like that of a deer, and the horns, which are thick and curved, reſemble thoſe of a ram. The hoof of this animal is large, round, and cloven; the ſkin ſpotted, but the hair thinner, and the tail ſharper than that of a deer. The fleſh is greatly eſteemed.

Father Torquemado deſcribes an animal ſomething like a buffalo, of the ſize of a ſteer, and nearly of the figure of a ſtag: its hoofs are cloven, like thoſe of an ox: its neck is long; on its forehead are horns, branched like thoſe of a ſtag, and its hair is a quarter of a yard long. The tail is a yard in length, and half a yard in breadth.

With reſpect to the feathered race, beſides the birds produced in other parts of America, there are ſaid to be many peculiar to this country; but we have no deſcription of any of theſe, the natural hiſtory of California being yet in its infancy. It is only mentioned, that the coaſt is plentifully ſtocked with peacocks, buſtards, geeſe, cranes, vultures, gulls larger than geeſe, cormorants, mews, quails, nightingales, larks, linnets, and moſt of the birds found in other parts of the world.

Inſects ſwarm here, as in moſt other warm countries; but they are neither ſo numerous nor ſo troubleſome, on account of the dryneſs of the ſoil and climate.

Turtle are caught in the utmoſt plenty on the coaſt, and the multitude and variety of fiſh with which the gulf of California and the Pacific ocean are ſupplied, is almoſt incredible. Salmon, turbot, barbel, ſkate, mackarel, pilchard, thornback, bonetos, ſoles, and all the reſt of the finny kind are caught here with very little trouble, together with pearl oyſters, fine eating oyſters, lobſters, and a variety of other excellent ſhell-fiſh. On the coaſt of the Pacific ocean is a ſmall ſhell-fiſh, which is perhaps the moſt beautiful in the world; its luſtre ſurpaſſing that of the fineſt pearl, and darting its ray through a tranſparent varniſh of an elegant vivid blue.

California is inhabited by ſeveral Indian nations, who are in general handſome, genteel, ſtrong, vigorous, and robuſt; of a healthy countenance, but very ſwarthy; but the paint with which they daub themſelves, and their making holes in their ears and noſtrils, are great diſadvantages to their appearance in the eyes of an European, though deemed a great beauty in their own. They ſay that their anceſtors came from the north, which might be reaſonably inferred from their ſituation, California being ſurrounded by the ſea, except on the north, where it joins the continent. They particularly mention the cauſe of their coming thither, alledging, that it aroſe from a quarrel at a banquet, at which the chiefs of all the nations were preſent. This was followed by a bloody battle, when the defeated party fled to the ſouth, to eſtabliſh ſettlements in a diſtant country, where they might at leaſt avoid ſervitude and oppreſſion. They are acquainted with no diviſions or poſſeſſions. On the firſt arrival of the miſſionaries, they were divided into tribes, which acknowledged no chief who had a right to tribute, homage, or external ceremonies. Every father was the prince of his own family, but the authority of parents over their children ceaſed as ſoon as they were able to provide for themſelves. Yet, in each tribe were two or more perſons who gave orders for gathering the productions of the earth, directed the fiſheries, and in caſe of a rupture with any neighbouring clan, headed the forces. This dignity was not acquired by blood, deſcent, or ſeniority: he who was the moſt brave, expert, and eloquent, was promoted to the command; but his authority was limited by thoſe who ſubmitted to his directions. This occaſional leader conducted them to the foreſts and ſea coaſts, in queſt of food; he ſent and received meſſages to and from the neighbouring nations; he gave the earlieſt notice of any impending danger; he ſpirited up the clan to revenge injuries; he directed the execution; and he headed the people in their wars. In all other particulars, every one was maſter of his own liberty.

Their houſes conſiſt of wretched huts, built near the few ſtreams, wells, or ponds, found in the country. As they are under the neceſſity of frequent migrations in ſearch of food, they eaſily ſhift their reſidence, it requiring only the labour of a few hours to build a little habitation fitted for all their purpoſes; and it is uſual with them, in the ſeverity of winter, to live in ſubterraneous caverns.

With reſpect to their dreſs, it conſiſts of a girdle, with a cloth round their waiſts, and a few ornaments about their hair, as ſtrings of pearls, which abound on the coaſt, and interweaving their locks with beautiful feathers. Some wear fillets of neat net-work. Their arms are likewiſe frequently adorned with net-work, or ſtrings of pearls, in the form of bracelets. The Indians of the north wear their hair ſhort, and inſtead of ſtrings of pearl, decorate the head with a ſplendid kind of tiara, made of mother of pearl, detached from the ſhell by a flint, and finely poliſhed on both ſides. Though many of the women go as naked as the men, yet they ſhew great regard to that decency, ſo neceſſary to the ſecurity of virtue. They generally, indeed, wear a kind of petticoat, made of palm-leaves; and all carefully conceal thoſe parts which decency teaches them to hide. A love of ornament prevails among the women more than the men.

Their greateſt ingenuity appears in their fiſhing-nets, which are made with admirable ſkill, of various colours, and ſuch diverſity of texture and workmanſhip, as cannot be deſcribed. Father Toraval ſays he can affirm, that of all the nets he ever ſaw in Europe and Mexico, none are comparable to theſe, either in the mixture of the colour, or the ſtrength and workmanſhip, in which they repreſent a great variety of figures. The nets are woven by the men, but the women ſpin and prepare the materials from plants, and a coarſe ſort of thread made from the palm. Some of them adorn the head and neck with theſe nets; they are likewiſe uſed for holding fruit, and the vegetable productions of the earth, as well as for catching fiſh.

They have a high feſtival at the gathering in of the fruits of the earth, when they reſign themſelves to feaſting, dancing, and mirth. Whole nights are then ſpent in jollity; they are even ſaid to act a kind of comedies, and to be very ſkilful in mimickry. Their dances are particularly extolled, and are ſaid to be of various kinds; their performers acquit themſelves with agility and gracefulneſs, repreſenting the different motions of war, fiſhing, hunting, marrying, and whatever is of moſt importance among them, by geſticulation and dumb ſhew.

The

The Jeſuits, who have given a deſcription of this country, have introduced ſo many abſurd and ridiculous circumſtances, that it is, perhaps, impoſſible to diſtinguiſh truth from fiction, in the account they give of the religion and cuſtoms of theſe people.

After all that has been ſaid of this extenſive country, it can hardly, with any propriety, be ſaid to be ſubject to Spain. The Jeſuit miſſionaries have indeed endeavoured to propagate the Romiſh religion, and a number of them have ſettled in the country, but at preſent a little Spaniſh town, near the Cape of St. Lucar, is the only place that can be ſtrictly called ſubject to Spain, and that is made no other uſe of than as a place of refreſhment for the Manilla ſhip, and its being the head reſidence of the miſſionaries.

SECT. IV.

Of MEXICO, *or* NEW SPAIN.

Its Situation, Extent, Climate, Soil, and Minerals, particularly Gold and Silver; its Vegetables, Beaſts, Birds, Inſects, and Fiſhes.

MEXICO, or New Spain, the firſt valuable acquiſition of the Spaniards on the continent of America, extends from the ſeventh degree thirty minutes to the thirtieth degree forty minutes: it is bounded on the ſouth eaſt by the iſthmus of Darien, and on the north-weſt by New Mexico; it is waſhed by the gulph of Mexico and the North ſea on the eaſt, and on the ſouth and weſt by the Pacific ocean, or South ſea. This country ſtretches along the Pacific ocean above two thouſand miles, and the coaſt towards the Atlantic ocean cannot extend leſs than ſixteen hundred; but the breadth is very unequal, for to the north-weſt it is ſuppoſed to be between ſix and ſeven hundred miles over, while towards the ſouth-eaſt the breadth cannot much exceed ſixty miles.

As the greateſt part of Mexico lies within the Torrid Zone, the air is exceſſively hot; but the heat is qualified with refreſhing ſhowers in the hotteſt months, and with land and ſea breezes, which blow alternately; in ſome parts the vapours riſing from a great number of lakes and rivers cool the air, and render it mild, ſoft, and pleaſant. The greateſt heats are during the months of February, March, and April, when the ſun is ſeldom obſcured by clouds, and the waters are ſo dried up, that in many places it is difficult to procure any. The rainy ſeaſon begins towards the cloſe of April, and continues till the month of September, and is always preceded by tempeſts of thunder and lightning, which increaſe till the month of June, at which time the rains fall as if a ſecond deluge was to enſue.

On the eaſtern coaſt, where the land is low, marſhy, and conſtantly flooded in the rainy ſeaſon, it is extremely unhealthy; the coaſt is far from being pleaſant, it being for the moſt part encumbered with almoſt impenetrable woods of mango trees, of a bare and diſagreeable aſpect, and which extend a conſiderable way into the water. The inland country, indeed, aſſumes a more agreeable aſpect, and the air is more temperate; here the tropical fruits grow in great abundance; the land is agreeably variegated, and the ſoil extremely fertile. On the weſtern ſide the land is not ſo low as on the eaſtern, is much better in quality, and abounds with plantations.

The Spaniards probably choſe to leave the eaſtern coaſt in its preſent ſtate of rudeneſs and deſolation, judging that a rugged and unwholeſome frontier is a better defence againſt an European army than fortifications and armies, that are maintained at a vaſt expence; or the ſtrength of the inhabitants, rendered by the climate effeminate and puſillanimous, and kept ſo by policy. Indeed it would be next to impoſſible to make any conſiderable eſtabliſhment on that coaſt, that could effectually anſwer the purpoſes of any power in Europe, without ſtruggling with the greateſt difficulties; and as for a ſudden invaſion, the nature of the country itſelf is a good fortification. In general few countries under the ſame aſpect of the heavens enjoy more of the benefits of nature, and the neceſſaries of life; but, like all the tropical countries, it is more abundant in fruit than in corn.

In almoſt all the accounts of New Spain, we are told that mines of gold and ſilver are found in moſt of its provinces. It is ſaid that there are no fewer than a thouſand different mines of ſilver, but gold only in the province of Veragua and New Granada; though the latter is indeed in Terra Firma, but is conſidered as a province of Mexico, from its being under the juriſdiction of the ſame viceroy. Gold is found either in grains, at the bottom of running ſtreams, or in mines. Acoſta affirms, that he has ſeen grains of pure gold that weighed two pounds, though in general they ſeldom exceed a twentieth part of that weight. The gold in the mines runs in veins through a hard ſtone, and it requires a great deal of labour and expence to ſeparate it, eſpecially as it is generally incorporated with ſilver or copper. Both the mines of gold and ſilver are uſually found in barren rocks, mountains, and ſuch places as are entirely unfit for paſture and tillage; as if nature had wiſely ordained that a fertile ſoil, fit for producing every thing neceſſary to the life of man, ſhould not be rendered uſeleſs by ſearching for thoſe metals, which frequently turn to its prejudice. Some of the mines are of an extraordinary depth; particularly that of Pachuca, which is above three hundred yards deep, and above a thouſand negroes are continually employed in it. From the mine called the Trinidada no leſs than forty millions of pieces of eight were drawn into the royal treaſury, free of all expences, in the ſpace of ten years.

Whoever diſcovers a mine of gold or ſilver is at liberty to work it, paying the king, and limiting himſelf within ſixty yards round the place upon which he has fixed. Beyond this ſpace another perſon may open a mine, leaving five yards between, to ſerve for a partition. All the gold and ſilver, either dug or found in grains, ought to be entered in the royal exchequer; and it is ſaid that, though great quantities are concealed, no leſs than two millions of ſilver marks, each weighing eight ounces, are annually entered, out of which they coin ſeven hundred thouſand marks into pieces of eight, half pieces of eight, quarter pieces, royals, and half royals; the value of the latter being about three-pence ſterling.

We cannot here forbear extracting ſome obſervations from an ingenious work we have often quoted, entitled, An Account of the European ſettlements in America. "Of the plenty of gold and ſilver which the mines of "Mexico afford, great things have been ſaid, and with "juſtice; as this, with the other Spaniſh colonies in "America, in a manner furniſh the whole world with "ſilver, and bears a great proportion in gold to the whole "of what the world produces. A late very judicious "collector of voyages ſays, that the revenues of Mexico "can hardly fall ſhort of twenty-four millions of our "money. He founds this upon a return made by the "biſhops of their tenths, which, without doubt, were "not over-rated; and that theſe amounted to one million and a half ſterling; that theſe are about a fourth "of the revenues of the clergy; and that the eſtates of "the clergy are about the fourth part of the whole revenues of the king, which at this rate amount to "twenty-four millions Engliſh. He takes another method of computing the wealth of this province, which "is by the fifth paid to the king of the gold and ſilver "dug out of the mines. This he obſerves, in the year "1730, amounted to one million of marks in ſilver, each "mark equivalent to eight ounces; ſo that if we compute this ſilver at five ſhillings per ounce, then the inhabitants receive from their mines ten millions in "money. For my part, I neither diſtruſt the candor "or good ſenſe of this writer; but I can hardly avoid "thinking he muſt be miſinformed in the accounts upon "which he has built his calculation. If New Spain "draws from her ſilver and gold mines ten millions annually, Peru, even ſince the decline of the mines of "Potoſi, has ſcarce ever been thought leſs rich in ſilver "than Mexico, and muſt therefore be rated at the ſame "proportion, and allowed to yield ten millions more annually. New Mexico abounds likewiſe in very rich "ſilver mines; but that we may not exceed, we will "allow for this province but two millions, which, allowing

" ing for the large produce of New Spain, is certainly " not above the proportion. Chili has, indeed, no in- " conſiderable mines of ſilver, but then thoſe of gold are " by far the richeſt in the world; and taking the com- " parative wealth of this province with the others, it " cannot be leſs than two millions, if we add to it what " is produced in Terra Firma; ſo that the gold and ſilver " raiſed in the Spaniſh colonies cannot be eſtimated at " leſs than twenty-four millions yearly."

Mexico has alſo quarries of jaſper, porphyry, and beautiful marble; and here alſo are found pearls, emeralds, and turquoiſes.

No country abounds more with grain, delicious fruit, roots, and vegetables of every kind, many of which are peculiar to the country, or at leaſt to America. The woods on the tops and declivities of mountains conſiſt either of fine foreſts or delightful groves of large trees of various kinds, unencumbered with bruſh-wood; ſo that a traveller may paſs through them on horſeback without any inconvenience. Among the moſt curious ſpecies of woods in this country are the cedar, bloodwood, maho, of which the natives make ropes and cables, lightwood, and other trees; of the fruit-trees and ſhrubs are the cabbage, cacao, or chocolate nut, the venilla, plantains, capadillo, avogato-peaer, mammee, mammee-ſapota, the prickly-pear, bibby, tamarind, and locuſt tree; the calabaſh, gourds of a prodigious ſize, grapes, and many others. To theſe may be added the grenadillo de China creeping plant, and the mayhey, which furniſhes the natives with thread for linen and cordage, and alſo with a balſam and liquor, which when fermented is as pleaſant and ſtrong as wine.

Trees are all the year in leaf, bloſſom, or fruit; and every month preſents the mingled appearance of ſpring, ſummer, and autumn.

Beſides maize, or Indian corn, the native grain of Mexico, the Spaniards have cultivated wheat, barley, peas, beans, and other corn, which, with roots and vegetables, are now found growing in every province. Rice grows abundantly, and flouriſhes, on account of the long wet ſeaſons.

Among the valuable commodities of New Spain are the following drugs: copal, anime, tacamahaca, caranna, liquid amber, oil of amber, balſam of Peru, which is found in Mexico, as well as in that country from which it takes its name, guyaiacum, the root mechoacan, China-root, and ſarſaparilla; all which are known in the ſhops of our apothecaries, and are of great uſe in a variety of diſtempers. The other commodities of New Spain are cotton, ſugar, cochineal, chocolate, feathers, honey, balſams, dying woods, ſalt, tallow, hides, tobacco, ginger, amber, pearls, precious ſtones, gold, and ſilver.

A conſiderable quantity of ſugar is raiſed in this country, ſo that there are more ſugar-mills than in any part of Spaniſh America; but all the ſugar is uſed in the country, and particularly in the monaſteries, in chocolate, ſweetmeats, preſerves, and confectionary wares. There is alſo a great home-trade in goods manufactured of cotton. They have the beſt indigo in the world, and the trade in that and cochineal is managed entirely by the merchants of Mexico and Carthagena, who export them to Europe. In the province of Guaxaca and Guatimala they raiſe the beſt and greateſt quantity of ſilk of any country in New Spain; but it is here only prepared for the needle. Cotton here is very good, and in great plenty: it is manufactured largely, for as it is light wear, ſuitable to the climate, and all other clothing being extravagantly dear, it is generally worn by the common people; the woollens and linens of Europe being rather luxuries worn only by perſons of ſome rank.

The number of their horned cattle is in a manner infinite; many of them run wild, and a very conſiderable trade is carried on in their hides and tallow. Sheep are numerous in Mexico, but it does not appear that wool is an article of any conſideration in their trade; and it is not probable that it is of a good kind, as it is ſcarce ever found uſeful between the tropics, where it is coarſe, ſhort, and hairy, except only in Peru, which enjoys a climate different from that of all other countries. Swine are equally numerous, and their lard is much in requeſt all over the country, where it is uſed inſtead of butter.

Beſides the beaſts already mentioned, which they have in common with us, they have ſeveral kinds of red and fallow deer, hares, rabbits, ſquirrels, foxes, otters, wild-cats, pole-cats, porcupines, jackalls, monkies, the pecaree, the warree, the guano, the ſloth, the armadillo, the racoon, and ounce.

The pecaree is a little, black, ſhort-legged animal, that has ſome reſemblance to a hog. Theſe herd together in great droves; and, what is moſt remarkable, the navel is ſaid to grow upon its back; and if it be not cut off as ſoon as the pecaree is killed, it inſtantly corrupts the whole carcaſe, which is otherwiſe very good food.

The warree is leſs than the pecaree, which it nearly reſembles, only its navel is in the uſual place. The ſkin is thick, and covered with hair, that looks like a coarſe fur. Both the pecaree and warree are ſo wild and fierce, that they will engage either man or beaſt. The Indians hunt them down with their dogs, and then ſhoot or kill them with ſpears.

The guano is ſhaped like a lizard; the body is as big as a man's leg, but grows tapering towards the end of its tail, which is very ſmall. They have four ſhort feet with claws, are of various colours, as of a dark and light brown, of a dark and light green, ſome of them yellow, and others ſpeckled. They live in water as well as upon the land, and both their fleſh and eggs are very good food.

The ſloth is about the ſize of a large ſpaniel, has a round head, ſmall eyes, and very ſharp teeth and claws: he feeds on the leaves of trees, and frequently kills them, not leaving a ſingle leaf on the tree he viſits; but he is ſo many days in getting down one tree, and climbing another, that though he be fat when he comes down, he grows lean before he can get to the top of the next tree. He receives his name from the ſlowneſs of his motions, for he is ſaid to be ſeveral minutes in moving one of his legs three inches, nor will blows make him mend his pace, for he ſeems inſenſible of ſtripes, and can neither be frightened nor provoked.

Here is an animal called a quaſh, which is bigger than a cat; its head reſembles that of a fox, with ſhort ears and a long noſe: the legs are ſhort, and it runs up trees like a cat; the body is covered with a fine yellow hair, and the fleſh is very good meat. The young ones may be tamed, and are as diverting as a monkey.

The monkeys of Campeachy are very ugly; they are much larger than a hare, and have tails two feet and a half long; the body and upper part of the tail are covered with a coarſe, long, black hair. They keep together twenty or thirty in a company, rambling over the woods, leaping from tree to tree, and if they meet with a ſingle perſon, he is in danger of being torn to pieces by them; at leaſt they chatter and make a terrible noiſe; ſome throw things at him, while others ſcatter their water and dung about his ears: they hang themſelves by the tail on the boughs, and ſeem to threaten him all the way he paſſes; but where two or three people are together they uſually ſcamper away.

With reſpect to the feathered race, we find in Mexico tame poultry, turkies, pigeons, parrots, parakeets, macaws, quams, curaſoes, cockricoes, bill-birds, humming-birds, black-birds, eagles, vultures, pelicans, cormorants, batts, and a multitude of others.

The macaw is ſhaped much like a parrot, but is twice as large; the feathers of the body are of ſeveral bright and lively colours, particularly red, blue, and green: it has a buſhy tail, with two or three long ſtraggling feathers, red or blue; the pinions of the wings of ſome of them are red, and of others blue; and their beaks yellow: they make a great noiſe in the morning, reſembling a hoarſe human voice: they will imitate not only the voices of the Indians, but their way of ſinging, and alſo mimic the noiſe of almoſt any bird or animal; and may be taught to talk. The natives tame them, and, when they are uſed to their houſes, ſuffer them to fly to the woods in the day-time, among thoſe that are wild, and they return in the evening to the houſe or plantation they belong to. There are great plenty of theſe birds in Mexico; and they are not only extremely beautiful and entertaining, but their fleſh, though black and pretty tough, is well taſted.

The

The quam is a wild land-fowl of the ſize of a hen-turkey, which it reſembles in its bill; the feathers are of a dun colour, the tail is ſhort, and darker than the reſt of the feathers. It feeds upon berries and other fruit, and the fleſh is very good food.

The curaſoe is larger than the quam, but much of the ſame ſhape: the cock has a crown of black or yellow feathers on his head, with red looſe fleſh on his neck like a turkey-cock; but the hen has neither. They have a big groſs voice, which the natives think melodious. The fleſh is tolerably good, but the bones ſo noxious that the natives bury them, and will not ſuffer a dog to eat them.

The cockricoes are of the colour of a partridge, but ſomewhat leſs, and their legs longer. They delight in creeks and watery places; are remarkable for their calling one another morning and evening, and are eſteemed delicious food.

They have two ſorts of pheaſants; the one of a dark colour, with black wings and tail, which they call gritones; and the other, much larger, called royal, from a tuft which appears like a crown upon its head. The batts of this country are as large as pigeons.

In all hot countries there are abundance of poiſonous and troubleſome reptiles and inſects, as ſnakes, ſcorpions, centipees, ſpiders, toads, ants, and muſkettoes.

Among the various kinds of ſerpents is a yellow ſnake, as big as the ſmall of a man's leg, and ſix or ſeven feet long. This is a lazy animal, that takes little pains to hunt for its prey, but lies concealed, and ſurprizes the lizards, guanoes, and other ſmall animals paſſing by. There is alſo a green ſnake, about the thickneſs of a ſmall cane, and four or five feet in length: theſe lie among buſhes and trees, full of leaves, and prey chiefly on ſmall birds. Here is alſo a dun-coloured ſnake about two feet long, that frequents houſes, and kills mice and other vermin, and is ſo harmleſs that no body endeavours to kill it. There are many other ſnakes, and particularly the rattle-ſnake, of which we have already given a very particular account.

The locuſt is an inſect that brings deſtruction where-ever it comes, and is moſt found in hot countries, where they ſometimes appear in ſuch clouds as to hide the ſun, and darken the brighteſt day. They are much like the graſshopper, but larger, and have wings. While Mr. Gage was in Mexico, a cloud of theſe inſects viſited that part of the country where he reſided, lighting upon the trees and ſtanding corn; and in one night devoured both the fruit and leaves of the trees, and conſumed the corn in every field where they fell. The high-ways were covered with them, and neither the plantations of ſugar or indigo eſcaped. Upon the approach of this winged army, all people were commanded out into the fields, with trumpets, braſs pans, kettles, and every thing that would make a noiſe, to frighten them away.

On the coaſts and the banks of the rivers are caught alligators, ſeveral ſorts of turtle, with oyſters and muſcles of a prodigious ſize, lobſters, crabs, and ſhrimps. Among the other fiſh are the paracoad, which is about three feet and a half in length, and it is ſaid will attack a man in the water. It is a firm well taſted fiſh, but ſome of them have been found unwholeſome food.

The gar-fiſh reſembles the former, but is leſs, and has a long ſharp bone in its ſnout, like a ſword-fiſh; only the ſword-fiſh's bone is flat, and indented like a ſaw, while that of the gar-fiſh reſembles a ſpear, it being round, ſmooth, ſharp at the end, and about a foot long. Theſe fiſh ſwim very ſwift, frequently leaping out of the water, and ſkimming, as it were, juſt above the ſurface, for twenty or thirty yards; then wetting their fins, ſpring forward again, darting themſelves with ſuch force, that they will ſtrike their long ſpear through the ſides of a canoe, or the body of a man, if they meet with him in the water. Theſe are eſteemed well taſted, wholeſome food.

Mullets and ſnooks are very plentiful; as are alſo Spaniſh mackerel, which reſemble thoſe of Europe, but are above a yard in length, and nine or ten inches round. Here are alſo the old-wife, the cavally, the turpom, and ſeveral other kinds of fiſh. In the lakes and rivers are pike and carp, with plenty of others that are excellent food.

SECT. V.

Of the three Audiences of Mexico, with whatever is moſt remarkable in each, including a Deſcription of the Cities and Trade of Mexico, Acapulco, Los Angelos, La Vera Cruz, and Guatimala.

IN order to give a more diſtinct idea of this extenſive country, it will be neceſſary to deſcribe it under its three grand diviſions, called audiences, Guadalajara, Mexico Proper, and Guatimala, all of which are under the government of the ſame viceroy, and are ſubdivided into ſeveral provinces.

Guadalajara, alſo called Galicia, is bounded on the north by New Mexico, on the eaſt and ſouth by the audience of Mexico, and on the weſt it is waſhed by the South ſea and the gulph of California; containing a ſpace of eight hundred miles in length, and above five hundred in breadth. It is divided into ſeven provinces, and being the moſt temperate diviſion of the empire, is generally pleaſant and healthy. Theſe provinces are Guadalajara Proper, Zacatecas, New Biſcay, Cinaloa, Culiacan, Chametlan, and Xaliſco.

The capital, called Guadalajara, is the ſeat of the royal courts of judicature, a biſhop's ſee, and is pleaſantly ſeated on the north banks of the river Bareinja. It has ſeveral churches, beſides the cathedral, with ſome monaſteries and nunneries. This audience is celebrated for the richneſs of the ſilver mines and its fertility. In each of the provinces are ſeveral towns, and that of Cinaloa is rendered extremely pictureſque, by a number of beautiful caſcades falling in ſtreams down the mountains. In this audience is the lake of Chapala, which is ſaid to be forty leagues in compaſs.

The audience of Mexico is beyond compariſon the moſt valuable of the Spaniſh dominions north of the equator. On the eaſt it is bounded by the gulph of Mexico, on the ſouth-eaſt by the audience of Guatimala, on the ſouth-weſt by the South ſea, and on the north-weſt by the audience of Guadalajara. It extends about ſix hundred miles in length, and in ſome places near as much in breadth; yet it is only about ſixty leagues in breadth from ſea to ſea acroſs the province of Guaxaca.

This audience, in rich commodities, gold, ſilver, and precious ſtones, far ſurpaſſes all the reſt of the empire, as it likewiſe does in its ſpacious extenſive vallies, the fertility of its arable lands, paſturage, and variety of fruits. The great lakes, rivers, and ſea-ports, with which it abounds, not only furniſh the inhabitants with plenty of excellent fiſh, but give them great advantages in trade, both foreign and domeſtic. It is divided into nine provinces, namely, Mexico Proper, Mechoacan, Panuco, Tlaſcala, Guaxaca, Tabaſco, Jucatan, Chiapa, and Soconuſco.

The province of Mexico Proper, which greatly exceeds the reſt, contains the capital, which is of the ſame name, and is ſeated in the lake of Mexico, on the eaſt ſide of a valley, at the foot of a range of hills, in the twentieth degree north latitude, and the hundred and firſt degree ten minutes weſt longitude, about a hundred and ſeventy miles weſt of the gulph of Mexico, and a hundred and ninety north of Acapulco. This is the capital of the kingdom, the reſidence of the viceroy, the ſeat of the firſt audience or chamber of juſtice, and the ſee of an archbiſhop. This is thought to be the moſt regular-built city in the world. It is a perfect ſquare, each ſide extending half a league, and conſequently the whole is about two leagues, or ſix miles in circumference. There is a great ſquare in the middle of it, from whence the ſtreets run in direct lines, either north and ſouth, or eaſt and weſt, croſſing each other at right angles; ſo that the length and breadth of the city may be diſcerned at the corner of every ſtreet. There are five entrances into it, but it has neither gates, walls, nor artillery. The houſes are built very ſtrong of brick and ſtone, but not very high, on account of its being ſubject to earthquakes, and great part of the town ſtanding upon a moraſs, this occaſions the foundations of ſome of them to ſink; but what is ſtill worſe, it is ſubject to inundations from the ſtreams which flow down from the mountains into the lake, ſo that it is often in danger of being

overflowed, and indeed many of the houſes and inhabitants have been actually ſwept away by floods, though they have been at a vaſt expence in making canals, dykes, and ſluices to carry off the water; ſo that it has often been debated, whether they ſhould not abandon the city, and build another upon better ground. All the buildings are convenient, and the public edifices magnificent. Here are twenty-nine cathedrals and churches, and twenty-two monaſteries and nunneries, of the wealth of which we may form ſome judgment from the revenue of the grand cathedral, which amounts to near eighty thouſand pounds ſterling a year, out of which the archbiſhop has fifteen thouſand pounds, beſides vaſt ſums that ariſe by perquiſites. The cathedral is a magnificent pile, built in the form of a croſs, which, with the cloyſters and dwellings of the clergy adjoining to it, take up a large ſpace of ground in the city, and was ſixty years in building, at the expence of above two millions of pieces of eight. The paintings, gilding, and carving are extremely fine, and it contains abundance of beautiful altars and chapels on each ſide; the high altar, which ſtands in the middle of the choir, coſt fifty thouſand pieces of eight. The image of the Virgin Mary is of maſſy ſilver, adorned with rubies and pearls to the value of thirty thouſand pieces of eight, and is once a year carried in proceſſion, when a number of maids draw lots for three hundred pieces of eight for their marriage portions. The chalice for the ordinary ſervice is worth eleven thouſand, being of gold, chaſed, and ſet with rubies. The hoſt is here carried to the ſick perſons not on foot, as in other countries, but in a coach drawn by four of the fineſt mules that can be had from Europe.

The great ſquare, or market, in the middle of the city is extremely magnificent, and has piazzas on one ſide, under which are ſome of the richeſt ſhops in the world; and on another ſtands the magnificent palace of the viceroy, the principal front of which faces the ſquare, and is not inferior to the palace at Naples.

The palace of the marquis de Valle, as it is called, is one of the nobleſt pieces of architecture any where to be met with. It is built on the very ſpot where formerly ſtood the palace of Motezuma, and takes up nearly the ſame ſpace.

Beſides the churches and monaſteries there are ſeveral hoſpitals richly endowed; among the reſt is one for young maids who are left orphans; theſe are handſomely maintained while they live ſingle, and are allowed five hundred pieces of eight when they marry. There is another hoſpital erected for thoſe who have venereal complaints, which has a revenue of thirty-ſix thouſand pieces of eight per annum; and a third for ſick prieſts.

The ſeveral trades have their reſpective ſtreets: a very ſpacious one that runs from the ſquare belongs to the goldſmiths, and has the ſhops furniſhed with ſuch a variety of utenſils and ornaments of gold, ſilver, and jewels, as is not to be paralleled in any city in the world, particularly with gilt plate in ſervices and ſets, and with vaſt quantities of rubies, emeralds, and pearls. The ſtreet of St. Auſtin, where the mercers expoſe their rich ſilks to ſale, has a very grand and beautiful appearance. The ſtreet called Tacuba, where the tradeſmen who deal in braſs, ſteel, and iron reſide, is very long and ſpacious. But Eagle-ſtreet, which is inhabited by the nobility, gentry, and great lawyers, is ſaid to excel all the reſt in magnificence.

The city is ſupplied with freſh water from a hill at three miles diſtance, to which an aqueduct ſupported on arches extends from the city.

There is a pleaſant park well planted and adorned with fountains, and other water-works, whither the quality of both ſexes and the gay part of the town reſort every evening, ſome in coaches, and others on horſeback; and here the young cavaliers endeavour to recommend themſelves to the ladies by feats of activity and horſemanſhip. Several hundreds of coaches are frequently ſeen here, with numerous retinues of black ſlaves. It is ſaid that the negro girls who run by the coaches of the ladies wear bracelets of gold, pearl necklaces, and jewels in their ears; while the black foot-boys are covered with lace and embroidery.

Though this city is no ſea-port, nor has a communication with the ſea by any navigable river, it has a prodigious commerce, and is itſelf the center of all the trade carried on between America and Spain on the one hand, and between America and the Eaſt Indies on the other; for here the principal merchants reſide; here the greateſt part of the buſineſs is negociated, and the goods that paſs from Acapulco to La Vera Cruz, or from La Vera Cruz to Acapulco, for the uſe of the Philippines, and in a great meaſure for the uſe of Peru and Lima, all paſs through this city, and employ an incredible number of horſes and mules in the carriage. Hither all the gold and ſilver comes to be coined; here the king's fifth is depoſited, and here is wrought all that immenſe quantity of utenſils and ornaments in plate which is every year ſent into Europe.

One of the principal diverſions of the citizens is fiſhing in boats upon the lake, whither they carry wine and cold proviſions to regale themſelves with upon the water. This lake, on the weſt ſide of which Mexico is ſituated, is about fifteen miles in length from north to ſouth, but the breadth is very unequal; however, in the broadeſt part it is ſomething more than twelve miles, and the north end of it is ſcarce ſo broad. To the north of this lake are three others that have a communication with it by canals, and on the ſouth are two other lakes, divided from it only by a cauſeway.

The neighbourhood of Mexico is rendered extremely pleaſant by the numerous palaces, country ſeats, monaſteries, and villages either on the iſlands in the lakes, or on the banks of the ſeveral lakes within view of the city, to which the citizens reſort in boats, when they are diſpoſed to retire from the hurry of the town.

It cannot be exactly aſcertained what number of people are in the city; it is certainly very conſiderable, and is by many computed at ſeventy or eighty thouſand. The bulk of the people are blacks and mulattoes, there having been abundance of black ſlaves brought hither, who have obtained their freedom and married with the natives, and their deſcendants are very numerous. There is alſo a ſtrange mixture of Spaniſh and Indian blood. The pure Spaniards, and thoſe deſcended from Spaniſh anceſtors on both ſides are a very ſmall number, both here and in the other towns of Mexico.

The port neareſt to this city is Acapulco, which is alſo in the province of Mexico Proper, and is a celebrated port on the South ſea, in the ſeventeenth degree north latitude, and the hundred and ſecond degree of weſt longitude, upwards of two hundred miles diſtant from the capital. It has one of the deepeſt, ſecureſt, and moſt commodious harbours in the South ſea, and indeed almoſt the only good one upon the weſtern coaſt of New Spain. The entrance of the harbour is defended by a caſtle of tolerable ſtrength; but the town itſelf is ill built, and makes but a miſerable figure except at the time of the fair, when it entirely changes its appearance, and becomes one of the moſt conſiderable marts in the world. About the month of December the great galleon, which makes the whole communication between America and the Philippines, after a voyage of five months, arrives here, loaded with all the rich commodities of the Eaſt; nutmegs, mace, cloves, pepper, cinnamon, china, Japan wares, callicoes plain and painted, chints, ſilks, muſlins of all ſorts, precious ſtones, and rich drugs. At the ſame time the annual ſhip from Lima arrives, and is computed to bring not leſs than two millions of pieces of eight in ſilver, beſides quickſilver, cacao, drugs, and other valueable commodities, to be laid out in the purchaſe of Eaſt India goods. Several other ſhips from different parts of Chili and Peru meet upon the ſame occaſion; and, beſides the traffic for the Philippine commodities, this cauſes a very large dealing for every thing thoſe countries have to exchange with one another, as well as for the purchaſe of all ſorts of European goods. The fair ſometimes laſts for thirty days. The goods are no ſooner diſpoſed of than the galleon prepares to ſet out on her voyage to the Philippines, with her returns chiefly in ſilver, but with ſome European goods and American commodities.

When this fair is over the town is comparatively deſerted; however, it remains during the whole year the moſt

conſiderable port in Mexico, from whence what exceeds their own conſumption is ſent by land-carriage to La Vera Cruz to paſs over to Terra Firma, to the iſlands, and a ſmall quantity even to Spain.

In the province of Tlaſcala, or Los Angelos, which is ſaid to be the beſt peopled by Indians of any in Mexico, is the city of Puebla de los Angelos, or the city of Angelos, which is ſeated in a fine valley on the banks of the river Zacatula, in the nineteenth degree of north latitude, twenty-five leagues to the eaſtward of Mexico. The buildings are principally of ſtone, and, like the other Spaniſh towns, has a beautiful ſquare in the middle, from whence run the principal ſtreets in a direct line, which are croſſed by others at right angles. On one ſide of the ſquare is the cathedral, which has a magnificent front, while the other three ſides have handſome uniform piazzas, under which are the ſhops of the principal tradeſmen. There are here many beautiful and magnificent parochial and conventual churches; with ſeveral rich monaſteries and nunneries. The city is the ſee of a biſhop ſuffragan to the archbiſhop of Mexico, and ſome judgment may perhaps be formed of the wealth of the inhabitants from the revenue of the biſhop and chapter; the former has eighty thouſand pieces of eight per annum, and there are two hundred thouſand more annually paid to the canons and officers of the church. The people of this city in general are exceeding wealthy, though the laity in this part of the world cannot pretend to vie with the clergy either in eſtates or influence.

In the province of Tlaſcala is alſo the city of La Vera Cruz, which is ſeated in the gulph of Mexico, in the nineteenth degree ten minutes north latitude, about two hundred miles ſouth-eaſt of Mexico. It is ſituated in a barren ſandy plain, but is conſiderable on account of its excellent harbour, which is naturally defended by rocks: but on one ſide the town is expoſed to clouds of dry ſand, and on the other to the putrid exhalations of bogs and marſhes, which impregnate the air with the moſt pernicious vapours. The town extends from eaſt to weſt, but is not more than half a league in circumference. The walls are of little uſe, the ſands being in many places level with the tops of them; but the caſtle and forts are ſo ſituated, as to be a defence to the ſhips in the harbour. The town is very poor, moſt of the houſes being no better than thatched cottages, inhabited by fiſhermen; but the Spaniſh garriſon conſiſts of a troop of ſixty horſe and two companies of foot. From this port the wealth of Mexico is poured out upon the Old World, and from this port they receive the numberleſs luxuries and neceſſaries that the Old World yields them in return. The annual fleet from Cadiz, called the flota, arrives about the latter end of November, and then vaſt multitudes reſort to La Vera Cruz from all parts, living in little huts or tents while the fleet remains there; their valuable merchandize being depoſited in ware-houſes built for that purpoſe. The fleet ſtays there during the winter, and upon its departure all the people of ſubſtance retire on account of their health.

This fleet, which ſails only from Cadiz, conſiſts of about fourteen or fifteen large merchant ſhips from four hundred to a thouſand tons burthen, under the convoy of three or four men of war. They are loaded with almoſt every ſort of goods which Europe produces for exportation; all ſorts of linens, woollens, ſilks, velvets, laces, cutlery, glaſs, watches, clocks, quickſilver, wrought iron, horſe-furniture, ſhoes, ſtockings, books, pictures, military ſtores, wine, and fruit; ſo that all the trading parts of Europe are highly intereſted in the cargo of the fleet. Spain ſends out little more than the wine and fruit, and this with the freight and commiſſions to the merchants, and the duty to the king, are almoſt all the advantages that kingdom derives from her commerce with the Indies. The ware-houſes of La Vera Cruz are conſtantly full of European goods and commodities, and its trade may be reputed nearly equal to all the commerce of Spaniſh America, though it is chiefly confined to the time the flota ſtays there.

The province of Tabaſco, which is waſhed on the north by the bay of Campeachy, is the place where logwood principally grows; the land near the coaſt is generally ſo flat and low, that it rains nine months every year, and, according to Dampier, remains under water ſix or ſeven months, during which the logwood-cutters uſually work up to the knees in mud and water in felling the trees; and can ſcarce find a dry ſpot to build their huts on. On the coaſt are almoſt impenetrable thickets of mangroves and bamboos; but farther up the country are fine ſavannahs and gentle riſing hills, adorned with variety of fruit-trees, and the banks of the river Tabaſco are ſhaded with large trees, particularly cabbage trees a hundred feet high.

The province of Jucatan is a peninſula ſeated in the gulph of Mexico, between the bays of Campeachy and Honduras, and is generally flat low land, with ſcarce any hills, unleſs on the weſtern part. It is thinly inhabited, for the air is exceſſive hot, and the lands near the coaſt frequently under water. Its chief produce is logwood, cotton, and ſalt. The only Spaniſh town in this extenſive coaſt is Campeachy, ſeated on the weſt ſide of the peninſula facing the ſea, and has a fine appearance, it being built of ſtone, and encompaſſed with a good wall; with a ſtrong citadel mounted with ſeveral pieces of heavy cannon placed at one end for its defence.

The audience of Guatimala forms a very fine country, capable of great improvements. It is bounded on the north-weſt by that of Mexico; on the north-eaſt by the North ſea; on the ſouth-eaſt by the province of Darien, or Terra Firma; and on the ſouth-weſt by the South ſea; thus enjoying every advantage of ſituation with reſpect to commerce. It is about a thouſand miles in length from the north-weſt to the ſouth-eaſt, but ſcarce half ſo broad in any part, and in ſome not a hundred miles in breadth: it is ſubdivided into the ſix following provinces: Guatimala Proper, Vera Paz, Honduras, Nicaragua, Coſta Rica, and Veragua; the two laſt provinces are, however, placed by the learned Don Antonio de Ulloa within Terra Firma.

This province is mountainous, filled with volcanoes that have dreadful fiery eruptions, and ſubject to earthquakes. It has, however, rich and fertile vallies that abound with corn, and paſtures that feed an incredible number of cattle; with rich drugs for dying, ſome ſilver mines, and ſugar plantations. Great quantities of bees-wax are alſo exported out of this province.

St. Jago de Guatimala, formerly the capital of the audience, and one of the fineſt cities in New Spain, was deſtroyed in 1541 by a dreadful earthquake and a neighbouring volcano. Never appeared a more terrible and awful ſcene: the day preceding it a prodigious noiſe was heard from a volcano ſeated in the mountain above the city, which was ſucceeded in the night by a furious exploſion, as if the mountain, ſays our author, had diſcharged all her bowels. This mountain has two tops, from one of which iſſued fire, and from the other a torrent of water, which ſwept all before it, and carried off the houſes and inhabitants. The horror of this ſcene was heightened by one of the moſt dreadful earthquakes ever felt in any part of the globe; and a hundred and twenty thouſand Spaniards and natives loſt their lives.

New Guatimala, the preſent capital of the audience and province, the reſidence of the preſident and royal courts, the ſee of a biſhop, the ſeat of an univerſity, and the center of the trade of theſe parts, is ſituated in a beautiful plain at a good diſtance from the fatal volcano; yet all their precautions cannot ſecure it againſt the dreadful earthquakes ſo frequent in this country. It is nevertheleſs well built and inhabited; the cathedral and pariſh-churches are exceeding rich, and here are two very fine monaſteries, a nunnery, and an hoſpital. The citizens trade largely, not only with all the provinces of Mexico, but even with Peru.

SECT. VI.

Of the different Ranks of People among the preſent Mexicans; with the Manners, Cuſtoms, and Government of the Spaniards and Creoles.

MEXICO is at preſent inhabited by a mixed people, conſiſting of the native Indians, the Spaniards, and the negroes; and the deſcendants of theſe are divided and diſtinguiſhed

diſtinguiſhed by various names; as the unmixed deſcendants of the Spaniards, who are called Creoli, or Creoles; the Meſtizes, or iſſue of the Spaniards by the native Indians; the Meſtiches, or the iſſue of ſuch iſſue; the Terceroons dez Indies, or the children of the laſt married to Spaniards; and the Quarteroons dez Indies, who are their deſcendants, and are allowed the ſame privileges as true Spaniards. The iſſue of an European and negro is called a mulatto; beſides which there is a mixed breed of negroes and Indians, which is generally deemed the loweſt rank of the people.

The whites are either born in Spain, or Creoles: the native Spaniards are moſtly in offices and in trade, and have the ſame characters and manners with the Spaniards of Europe; the ſame gravity of behaviour, the ſame natural ſagacity, the ſame indolence, and a ſtill greater ſhare of pride and ſtatelineſs; for they here conſider their being natives of Old Spain as a very honourable diſtinction, and are, in return, looked upon by the Creoles with no ſmall ſhare of hatred and envy. The latter have little of that firmneſs and patience which diſtinguiſhes the native Spaniard. They are deſtitute of courage, weak, and effeminate. Living in an enervating heat, ſurfeited with wealth, and ſpending their whole time in loitering and inactive pleaſures, they have nothing bold and manly, to fit them for making a figure in active life, and very few have any taſte for the ſatisfactions of a learned retiremen. They are luxurious without either variety or elegance, fond of ſhow and parade, temperate at their tables and in their cups, and merely from conſtitution and idleneſs make their whole buſineſs amour and intrigue, which they carry on in the old Spaniſh taſte, by doing and ſaying extravagant things, by bad muſic, worſe poetry, and exceſſive expences. The ladies are little celebrated for their chaſtity or domeſtic virtues; but exert all their genius and abilities in combating the reſtraints which are laid upon them.

It is allowed by the moſt judicious authors that the prieſts, monks, and nuns of all orders are upwards of one fifth of all the white people; but the clergy being here generally too ignorant to inſtruct by preaching, and too debauched in their manners to reform by their example, the people are little better for their numbers, wealth, or influence. Many of them are ſaid to be only adventurers from Old Spain, who without the leaſt regard to their character or their vows, direct all their ſtudies to raiſe a ſudden fortune, by abuſing the ignorance and extreme credulity of the people. Much attention is paid to mere mechanical methods of devotion. Moral duties are ſeldom mentioned. An extreme veneration for ſaints is ſtrongly inculcated, and forms the general ſubject of their ſermons, which are rather deſigned to raiſe a ſtupid admiration of their miracles, than an imitation of the ſanctity of their lives. However, it muſt be acknowledged, that there are ſome of the clergy who practiſe the duties of their ſtation, and are diſtinguiſhed by their learning and the purity of their manners; but theſe are very few.

As to the laity, it is ſaid there is not a more bigotted, or a lewder people upon earth: a preſent to the church wipes off the odium and the puniſhment of the greateſt crimes. The principal way in which they are inſtructed in religion, is by theatrical entertainments in their churches. There is ſcarce any part of the Goſpel, but is the ſubject of a play, which the loweſt of the people are here taught to act: one perſonates our Saviour, another Pilate, a third Herod, and ſo on: as their churches are exquiſitely fine, ſo is their muſic, both vocal and inſtrumental. The clergy collect the moſt harmonious voices, and have them taught to ſing not only anthems, but merry ſongs; and in their cloiſters are maſques, dances, and all the entertainments in which the laity indulge themſelves; and yet the people have their ſeaſons for penance and mortification, particularly in Lent, when they not only keep a rigorous faſt, but in their proceſſions laſh themſelves unmercifully. This is the exerciſe of the holy week before Eaſter, and in caſe of an earthquake, famine, or other general calamity, they endeavour by theſe auſterities, to appeaſe the wrath of heaven.

The civil government, adminiſtered by tribunals called audiences, conſiſts of a certain number of judges divided into different chambers, which have a greater reſemblance to the parliaments in France, than to our courts of juſtice. The viceroy himſelf preſides at the head of the chief of theſe chambers, when he ſees fit. His employment is one of the greateſt the king of Spain has in his gift, and his is perhaps the richeſt government entruſted to any ſubject in the world. All employments here are held by none but native Spaniards, and by them only for a limited time, which muſt not exceed three years. Jealouſy and avarice in this, as well as in every thing elſe that has a relation to the Indies, influences all public regulations; and every officer, from the higheſt to the loweſt, has the avidity which a new and lucrative poſt inſpires; ravenous becauſe his time his ſhort, he oppreſſes the people, and defrauds his ſovereign; another ſucceeds him with the ſame diſpoſitions; and no man takes care to eſtabliſh any thing uſeful in his office, knowing that his ſucceſſor will trample upon every regulation that is not ſubſervient to his own intereſt.

There are ſome troops kept in Mexico, and a good revenue appropriated for their maintenance, and for the ſupport of the fortifications; but the ſoldiers are few, ill-cloathed, ill-paid, and worſe diſciplined. Thus the military keep pace with the civil and eccleſiaſtical adminiſtration, and the whole form one regular ſcene of rapaciouſneſs, pride, arrogance, and oppreſſion.

SECT. VII.

Of the Perſons, Dreſs, Manners, Cuſtoms, Houſes, Food, and Feſtivals of the Mexicans, particularly of thoſe who are detached from the Spaniards, and ſtill enjoy their Liberty.

THE original Mexicans, like the other Americans, are in general tall, clean, well proportioned, and handſome, active, nimble, and remarkably ſwift of foot. They are of a deep olive complexion; their eyes large, lively, and ſparkling; the face round, and the features uſually agreeable. They wear their hair, either flowing looſe, cut ſhort, or twiſted and plaited on the head. Some nations within the limits of this vaſt country, differ widely from the general appearance and manners of the reſt; a few deem flat noſes the greateſt ornament, and early flatten thoſe of their infants, to produce that beauty on their faces; while others mould their thin tender ſkulls into a conical or pyramidical form, by means of compreſſion. Many of the Mexicans diſfigure themſelves with paint, or rather daubing, and repreſent on the body the figures of various birds and beaſts; or, in time of war, paint their faces red, to give them a warlike and bloody appearance: they alſo anoint their bodies with oil or fat, to prevent their being bit by muſquettoes, to preſerve the ſkin againſt the intenſe heat of the ſun, and to render their joints ſupple and pliant.

The people are however in general cloathed, though in a very different manner from the Spaniards; but in the province of Veragua, it is ſaid there is a nation where the men cloath nothing beſides the penis, which the vulgar are contented with wrapping in a leaf, while the great incloſe it in a caſe of gold or ſilver, of a conical form, adorned with jewels, letting the ſcrotum fall under it, in full view. This circumſtance, improbable as it appears, is mentioned by ſeveral authors; but with what degree of truth, we will not pretend to determine; yet it is ſaid that even theſe people, on feſtivals and other ſolemn occaſions, have a white or black cotton garment like a ploughman's frock, that reaches down to their heels; and if an European gives them a ſhirt or any other cloathing, they immediately put it on, and reckon themſelves very fine.

In general the Indians are fond of pendants, bracelets, and necklaces. The men wear a thin plate of gold or ſilver hanging over their upper lip, of an oval figure, in the form of a creſcent, the points of which gently pinch the bridle of the noſe, and faſten it on; the middle is about the thickneſs of a guinea, and it grows gradually thinner towards the edges. The women, inſtead of a plate, wear a ring, which goes through the bridle of the noſe, and by its weight ſometimes draws down it to the mouth. Theſe ſtrange kinds of ornaments they have of various ſizes; the larger ſort they lay aſide at their entertainments, and the ſmaller do not hinder their eating. Their great men likewiſe wear two gold plates of the

ſhape of a heart, a ſpan long at each ear, faſtened to it by a gold ring, which ſtretches the ear to an immoderate ſize. They alſo wear a kind of coronet or bandage of gold or ſilver about the head eight or ten inches broad, and indented on the upper ſide; others have only a bandage of cane painted red ſtuck round with beautiful feathers, ſtanding upright, and moſt of the Indians of both ſexes wear ſtrings of beads, teeth, ſhells, and other toys, hanging from the neck down to the breaſt.

Thoſe Indians who live in the Spaniſh towns wear a ſhort waiſtcoat and wide breeches, with a ſhort cloak of various colours, reſembling the Spaniſh dreſs; but their legs are bare, and only a few cover their feet with ſandals. The women wear a ſhort jacket of cotton or linen, over which flows a looſe robe, or a ſtraight petticoat, and ſometimes both. There are, however, ſuch varieties in dreſs, depending upon cuſtom and fancy, that it would be endleſs to enter upon particulars.

With reſpect to the genius, temper, and manners of the Mexicans, they ſeem to be greatly degenerated ſince their being conquered by the Spaniards. They were once ingenious, hoſpitable, civilized, and generous, except in the article of human ſacrifices; but now thoſe who live among the Spaniards are ſaid to be cowardly, treacherous, and ſtupid. The buildings, images, paintings, carvings, cotton cloths, manufactured feathers formed into beautiful pictures, and many other pieces of art, evince the genius of the ancient Mexicans; and the loſs of theſe is a demonſtration of the decline of that genius. Indeed the cauſe is not difficult to be aſſigned; their temples and images, on which they had laviſhed all the powers of art, being deſtroyed, themſelves reduced to a ſtate of ſervitude, and conſtrained to labour in the mines, to gratify the avarice of their new maſters; it is no wonder they were effectually diſcouraged from cultivating talents, that could only turn to their deſtruction, and gain them ſtripes inſtead of rewards. Beſides, the introduction of European arts, manufactures, and the implements of mechanics, made the Indians deſpiſe the inferiority of their own, all knowledge of which they ſoon forgot, without being able to acquire any degree of ſkill in the other, to the drudgery and lower branches of which they were confined. To what purpoſes then ſhould an Indian labour to improve talents that can only ſerve to render his bondage more irkſome? or why ſhould he ſtrive to accumulate that wealth, of which he knows he ſhall be ſtripped by his arbitrary maſter?

Thoſe Indians who have preſerved their freedom in the mountains and ſome other parts of the country are ſtill a brave, generous, and humane people, entirely untainted with the ſordid vices and corrupt manners of the inhabitants of the Spaniſh cities and towns. They ſpend their time in hunting, fiſhing, and field exerciſes; cultivate but little ſoil, ſow and plant what is juſt ſufficient to anſwer the purpoſes of nature, and allow nothing for the gratification of appetites founded on luxury.

The buſineſs of planting is performed by the women, after the men have cleared the ground. The females likewiſe execute all the domeſtic offices, ſpin, weave, and dreſs cotton and linen cloths for their own or their huſbands apparel. They are obedient and reſpectful to their huſbands, who return a mutual affection. This is at leaſt the picture given us by Engliſh and French travellers, though the Spaniards, perhaps to palliate their own conduct, ſpeak leſs favourably of them.

Theſe Indians live in thatched cottages, and obſerve little regularity in their towns; their houſes neither ſtanding contiguous, nor in any order, but are diſperſed here and there, only they have one common guard-houſe, or fort, ſeated on an eminence, to which they reſort on the approach of an enemy, or when they aſſemble in council. They never lay any deep foundations, but ſet up ſmall poſts ſeven or eight feet high, two or three feet aſunder, and cloſing up the intervals cover them with clay. They make the roof like that of an ordinary barn, and uſually cover it with palmetto leaves. The building is about twenty-four feet long, and twelve broad; the hearth is in the middle, and they have a hole over it, to let out the ſmoke: they have only the ground-floor, and uſe no partitions, ſo that the whole houſe forms but one room. Inſtead of beds they uſe hammocks, which are hung from the principal beam, and blocks of wood are their only ſeats and tables. Their furniture conſiſts of earthen veſſels, with calabaſhes of an uncommon ſize to hold their liquor; and their arms, bows, arrows, lances, darts, and quivers, with their tools, are hung as ornaments round the cottage.

Their guard-houſe is about a hundred and thirty feet long, and twenty-five broad; the walls nine or ten feet high, and the ridge of the roof about twenty feet in height, and thatched with palmetto leaves: they have narrow loop holes on the ſides, from whence they can repulſe an enemy with their arrows; they are ſeated, as hath been obſerved, on an eminence, and the ground is cleared of wood and ſhrubs for a good ſpace round, that an enemy may find no ſhelter from their arrows, or any place to lie concealed. They have ſtrong doors to defend the entrance; but the Spaniards eaſily burn them down by ſhooting flaming arrows into the palmetto leaves, which anſwer the purpoſe of thatch.

We ſhall now treat of the diet, exerciſes, feſtivals, and diverſions of thoſe Indians who ſtill enjoy their liberties. Their principal food is either Indian corn parched and ground into flour, and made into thin cakes, or fruit, roots, wild hogs, deer, &c. and ſometimes fiſh. They frequently go a-hunting in companies a week or a fortnight together, every man carrying with him his bow and arrows, a ſpear, a hatchet, and a long knife. Each man alſo takes a dog or two with him to beat for game. Some women alſo go with them to carry their proviſions of roaſted plantains, yams, potatoes, baſkets of parched Indian corn, and a few utenſils. The beaſts they hunt are chiefly the pecaree and warree, a ſort of wild hogs, of which we have given a deſcription. They alſo meet with a variety of fowls. They lodge at night wherever they happen to be at ſun-ſet, contriving to be near ſome river. They hang up their hammocks between the trees, and have ſcarce any other covering but a plantane leaf. They begin their hunting again at ſun-riſing the next morning. Their game, juſt mentioned, are not ſwift of foot, and uſually go together in droves of two or three hundred; but they ſometimes hunt a whole day without meeting any. When the beaſt is tired with the purſuit, or wounded, he will ſtand at bay with the dogs, till the maſter comes up and ſhoots him; he then ſtrikes his ſpear into the creature to let out the blood, embowels him, and cutting him in two pieces carries them on a ſtick laid acroſs his ſhoulder to a place where the women are appointed to wait: here they cut off the head of the animal, quarter and flea it; what they intend to preſerve they barbecue by laying it upon a wooden grate, under which is a fire of wood coals, which is kept up till the meat is as dry as a chip; and theſe pieces will keep a great while. When they have much game, the men aſſiſt the women in carrying it home; and when their ſtock of proviſions is almoſt ſpent, they go out again to look for more.

Whether their fleſh be dried, or freſh killed, they cut it into ſmall pieces, which they put into a kind of pipkin, adding ſome roots, green plantanes, or other fruit, with a great deal of pepper, ſtewing them together in water ſeven or eight hours, and not ſuffering them to boil, which reduces all the ingredients into a kind of pulp; they then pour it into an earthen diſh, or calabaſh, and ſetting it upon a wooden block that ſerves them for a table, ſit round it on leſſer blocks, all having a calabaſh of water ſtanding by their ſide on the ground, into which they frequently dip their fingers while they are eating. They have ſeldom more than one ſet meal in a day, but they eat plantanes and other fruit raw or roaſted almoſt all the day.

There is ſcarce any fleſh, fiſh, or fowl, but what the natives of Mexico eat either ſtewed or broiled on the coals: it does not appear that they uſe either knives, forks, or ſpoons, but fill their mouths with their hands, and tear the broiled fleſh off the bones with their teeth; but thoſe who are among the Spaniards conform to their cuſtoms, and every thing they eat is high ſeaſoned with pepper. Chocolate ſerves both for meat and drink in almoſt every province of Mexico, both among the free and thoſe called the civilized Indians, if they can obtain it; but it is ſo much uſed by the Spaniards, and ſuch quantities are

exported to Europe, that it is pretty ſcarce among the free Indians.

They have a great variety of liquors; the moſt ordinary drink is water, with the flour of Indian corn infuſed in it, and drank off preſently. This ſerves to keep them alive on a march, when they can get no other proviſions. They have a liquor named miſlaw, of which they have two ſorts; one made of plantanes freſh gathered, and the other of plantanes dried; the firſt they roaſt, and, peeling off the rind, maſh them in a bowl of water till they are diſſolved, and then drink the mixture; the other is made of cakes of plantanes dried over a ſlow fire: this they carry with them on journies, and drink it diſſolved in water. As their pine-apples are one of their moſt delicious fruits, an infuſion of theſe they are very fond of; and indeed they make an infuſion of almoſt all manner of fruits, adding honey to them at their entertainments: but the country affords no wine, for grapes will not ripen kindly in the rainy ſeaſon, and the heats at other times render the liquor ſour; for this reaſon ſcarce any country between the tropics affords good wine.

The Indians ſcarce undertake any buſineſs of conſequence without an entertainment. If they propoſe entering into a war, either with the Spaniards or any Indian nation, their chiefs are ſummoned to a conſultation, and eat and drink plentifully before they enter on their debates. A hunting-match, which uſually laſts ſome weeks, is alſo preceded by hard drinking. At weddings and other joyful occaſions they have their feaſts, where they continue drinking two or three days, till all the liquor is ſpent; and as they are very quarrelſome in their liquor, the maſter of the houſe always ſecures their arms before they begin to be merry; for they never go without them, if it be but to the next door. They uſually get ſo drunk as to be unable to ſtand, and having ſlept till they have become ſober, return home.

The men drink to one another at meals, but never to the women, who always ſtand by and wait upon their huſbands, while they are eating and drinking, ſerving them with liquor; even when at home the wife does not eat till the huſband has done; but the females feaſt among themſelves, when they are as merry as the men, and as little afraid of drinking to exceſs; they, however, take care to keep ſober till their huſbands are recovered, and indeed no ſooner perceive them in liquor, than they take them up and put them into hammocks. Both ſexes are alſo fond of ſmoking tobacco.

Their principal exerciſes, or rather employments, as hath been intimated, are hunting, ſhooting, and fiſhing; which they perform in order to provide for their families. Every man breeds up his ſon to theſe exerciſes, at which they are ſo dexterous when children, that it is ſaid a boy of eight years of age will ſplit a cane ſet up at twenty yards diſtance, with an arrow diſcharged from his bow, and kill a bird flying. But the moſt expert of all the Indians of Mexico are the Moſqueto Indians, who dwell in the province of Honduras. They are tall, well made, ſtrong and nimble, long viſaged, have a ſtern look, are hard favoured, and have lank black hair. Theſe people, who inhabit the ſea-ſhore and the banks of rivers, are bred to throw the lance, harpoon, and dart; draw the bow from their infancy, and they will turn aſide any miſſive weapons thrown at them with a ſmall cane no bigger than a gun-ſtick. Their principal employment is ſtriking fiſh, particularly the manatee and turtle. The Engliſh privateers, when they cruize on the Mexican coaſt, have uſually one or two of theſe Moſqueto men to ſtrike the fiſh, and they will take enough to maintain a ſhip's crew of a hundred men. When they ſerve the Engliſh they learn the uſe of the gun, and become exceeding good markſmen; they are alſo extremely daring in fight, and never give back while ſupported by the party that entertains them.

But to return to the Indians in general, who have their dances and muſic, if it may be called by that name, ſuch as wooden drums, and a kind of pipe made of a cane or reed, but very diſagreeable to an European ear; for they love every thing that makes a noiſe, how diſagreeable ſoever be the ſound: they will alſo hum over ſomething like a tune when they dance, but it does not appear that they have any thing like ſongs or ballads. They dance thirty or forty in a circle, ſtretching out their hands, and laying them on each others ſhoulders; ſtamp, jump, and uſe the moſt antic geſtures for ſeveral hours together, till they are heartily weary. Sometimes one or two of the company ſtep out of the ring, to divert the reſt by ſhewing tricks and feats of activity, throwing up their lances, catching them again, bending backwards, and ſpringing forwards with great agility.

CHAP. X.

Of TERRA FIRMA, or NEW CASTILE.

SECT. I.

The Situation, Extent, and Diviſions of Terra Firma; with a particular Deſcription of the Situation, Extent, Rivers, Face of the Country, and Climate of Terra Firma Proper; and of the Towns of Porto Bello and Panama: likewiſe an Account of the Pearl Fiſhery near the laſt City; and of a Scots Settlement on the Coaſt of Darien.

THE province of Terra Firma, or New Caſtile, is a very extenſive country, it being bounded on the north and eaſt by the North ſea; on the ſouth by part of Guiana and the country of the Amazons; and on the weſt by the South ſea, where the iſthmus of Darien alſo divides it from Mexico. Its greateſt length from the South ſea to the mouth of the river Oroonoko is upwards of thirteen hundred miles, and its greateſt breadth is about ſeven hundred and fifty; but in other places it is much pent in by the river Oroonoko, ſo that it is not above half that breadth, and towards the mouth of that river not above a hundred and eighty miles. It extends almoſt from the equator to the twelfth degree thirty minutes north latitude, and from the ſixty-ſecond to the eighty-third degree of weſt longitude.

Terra Firma is divided into the following diſtricts, or governments: the iſthmus of Darien, or Terra Firma Proper, Carthagena, Santa Martha, Rio de la Hacha, Venezuela, New Granada, New Andaluſia, and the province of Popayan.

The moſt northern of theſe is the country lying between the gulph of Darien and Mexico, along the coaſt of the South and North ſea, particularly diſtinguiſhed by the name of the iſthmus of Darien, and by ſome writers called the iſthmus of Panama. It divides North and South America, extending between the eighth and tenth degree north latitude, and between the ſeventy-eighth and eighty-ſeventh degree weſt longitude, in the form of a creſcent, round the bay of Panama for about three hundred miles in length, and ſixty in breadth, from the North ſea to the Pacific ocean. It is bounded on the eaſt by the river and gulph of Darien, which ſeparates it from Carthagena; on the ſouth by Popayan and the Pacific ocean, or South ſea; and on the weſt by the ſame ocean and Veragua.

The land has almoſt every where an equal ſurface, and is diſtinguiſhed by hills and valleys of great variety for height, depth, and extent. The valleys are generally watered with rivers, brooks, and perennial ſprings, ſome

ſome of which fall into the North and others into the South ſea: moſt of them riſe from a chain of higher hills than the reſt that extend the length of the iſthmus, in a manner parallel to the ſhore, and is in moſt parts neareſt the North ſea, from which it is ſeldom above ten or fifteen miles diſtant. On the north ſide of this main ridge, which is a continuation of the Andes, there are either no hills at all, or only gentle declivities. This ſide of the country is every where ſo covered with woods, that it is all one continued foreſt: nor is the main ridge itſelf carried on every where with a continued top; but is rather a range of diſtinct hills, and accordingly has frequent large valleys disjoining the ſeveral eminences that compoſe its length; and ſome of them are even ſo deep as to admit a paſſage for rivers.

Some of the rivers that water the country are pretty large, though few of them are navigable. On the north coaſt they are for the moſt part ſmall; for as they generally riſe from the main ridge, which lies near that ſhore, they have but a ſhort courſe. The Darien, from which the iſthmus is ſuppoſed to take its name, is indeed a very large river, but its depth at the entrance is not anſwerable to the wideneſs of its mouth. The river Chagre is pretty conſiderable; for though it riſes from the ſame ridge, it has a long bending courſe from the ſouth and eaſt part of the iſthmus. The river Conception is alſo conſiderable: theſe three fall into the North ſea. Into the South ſea fall the Santa Maria, the Congo, and the Cheapo.

In the river Chagre are bred a great number of alligators; and all the foreſts and woods near it are full of wild beaſts, eſpecially different kinds of monkeys, of various colours, as black, brown, and reddiſh; there is alſo the ſame diverſity in their ſize, ſome being a yard long, others half a yard, and others ſcarce a foot. The fleſh of all theſe different kinds is highly valued by the negroes, eſpecially that of the red; but however delicate the meat may be, ſays the learned Don Antonio Ulloa, the ſight of them is enough to make the appetite abhor them; for when dead they are ſcalded, in order to take off the hair, whence the ſkin is contracted by the heat; and when thoroughly cleaned looks perfectly white, and greatly reſembles a child of about two or three years of age when crying: yet the ſcarcity of food in many parts of America renders their fleſh valuable; and not only the negroes, but the Creoles, and the Europeans themſelves, make no ſcruple of eating it.

But to return, nothing can excel the proſpects which the rivers of this country exhibit. The moſt fertile imagination of a painter can never equal the magnificence of the rural landſcapes drawn by the pencil of nature. The groves, which ſhade the plains, and extend their branches to the rivers; the various dimenſions of the trees that cover the eminences; the texture of their leaves; the figure of their fruits, and the various colours they exhibit, form a moſt delightful ſcene, that is greatly heightened by the infinite variety of creatures with which it is diverſified. The different ſpecies of monkies ſkipping in troops from tree to tree, hanging from the branches; and in other places, fix, eight, or more of them, linked together, in order to paſs a river, with the dams carrying their young on their ſhoulders, throwing themſelves into odd geſtures, and making a thouſand grimaces, will perhaps appear fictitious to thoſe who have not actually ſeen it; but if the birds are conſidered, our reaſon for admiration will be greatly augmented. Theſe, from their great abundance, ſeem to have had their origin on the banks of the rivers, while the beauty and variety of their various plumage conſpire to charm the eye. Here are all the various kinds of parrots, parroquets, cotores, the tulcan, the gallinazo, the wild and royal peacock, the turtle dove, the heron, and many others.

The weather is much the ſame here as in other places of the torrid zone, inclining rather to the wet extreme. The rains begin in April or May, and are very violent during the months of June, July, and Auguſt: it is then very hot, whenever the ſun breaks out of a cloud, there being no breezes to fan and cool the air, it is all a glowing heat. About September the rains begin to abate, but it is November or December, and perhaps the beginning of January, before they are quite gone; ſo that the rainy weather laſts two-thirds of the year. They firſt come, like our ſudden April ſhowers, one in a day; at length a ſhower falls almoſt every hour, frequently accompanied with violent thunder and lightning; during which the air has often a faint ſulphureous ſmell, where pent up among the woods. After this variable weather there will be, for about a month or ſix weeks, a ſettled continued rain of ſeveral days and nights, without thunder and lightning, but extremely vehement, conſidering the length: yet at certain intervals, even in the wetteſt part of the ſeaſon, are intermixed ſeveral fair days, with only tornadoes or thunder ſhowers, and that ſometimes for a week together. Theſe thunder ſhowers uſually cauſe a ſenſible wind by the clouds preſſing the atmoſphere, which is very refreſhing from its moderating the heat; but as it ſhakes the trees of the foreſt, their dropping is as troubleſome as the rain itſelf. When the ſhower is over, you hear a great way together the croaking of frogs and toads, and the humming of muſkettoes, which chiefly infeſt the low ſwampy grounds near the rivers. The floods cauſed by the heavy rains often beat down the trees; ſo that they frequently bar up the rivers till they are cleared by another flood.

The ſoil of the inland part of the country is generally very good, and for the moſt part conſiſts of black fruitful mould. The hills are every where fertile to the top, though more fruitful nearer the bottom; but even the tops of the main ridge are covered with very flouriſhing trees. Indeed the ſoil ſeems capable of producing all the vegetables proper to the climate; yet the trees on the tops and ſides of the hills in the inland country are very different from thoſe in the ſea. The woods on the hills forming a large foreſt of timber trees, or a delightful grove of trees of ſeveral kinds, are very tall, with little or no underwood, and placed at ſuch a diſtance from each other, that a horſe may gallop among them a great way, and eaſily avoid them: their tops are generally very large and ſpreading, and it is probably their ſhade and dropping which hinder any thing elſe growing in the rich ground among them; for in the open ſavannas, or where the ground is cleared by induſtry, there is great plenty of ſmaller vegetables. On the ſea-coaſt, where the ſoil is frequently ſwampy drowned land, eſpecially near the mouths of rivers, the trees are not tall, but ſhrubby; conſiſting of mangroves, brambles, bamboos, &c. not growing in the manner of groves, but in a continued thicket.

The trees on the iſthmus are many of them the ſame as thoſe in Mexico, and they have alſo many of the ſame animals.

The principal towns in this province are Porto-Bello and Panama.

The town of St. Philip de Porto-Bello is ſituated in the ninth degree thirty-four minutes thirty-five ſeconds, north latitude, and in the eighty-ſecond degree five minutes, weſt longitude, from London; and ſtands on the declivity of a mountain that ſurrounds the whole harbour. Moſt of the houſes are built of wood; but in ſome the firſt ſtory is of ſtone, and the reſt of timber; but they amount only to about one hundred and thirty: moſt of them are however large and ſpacious. It conſiſts of one principal ſtreet, extending along the ſtrand, with others ſmaller croſſing it, and running from the declivity of the mountain to the ſhore. There are alſo ſome lanes in the ſame direction with the principal ſtreet, where the ground admits of it. Here are two large ſquares, one oppoſite to the cuſtom-houſe, which is of ſtone, adjoining to the quay; the other faces the great church, which is alſo of ſtone, large, and decently ornamented. Here are alſo two other churches, one called Nueſtra Signora de la Merced, with a convent of the ſame order; but both the church and convent are mean and ruinous; the other is St. Juan de Dios, which is a ſmall building, in no better condition than the former.

At the eaſt end of the town is a quarter called Guinea, where the negroes of both ſexes, whether ſlaves or free, have their habitations. This quarter is much crouded when the galleons are here. The mulattoes and other poor families alſo remove either to Guinea, or to cottages erected near it, or built upon the occaſion. Great numbers of artificers from Panama, who flock to Porto-Bello

to

to work at their reſpective buſineſſes, likewiſe lodge in this quarter for cheapneſs. Towards the ſea is a large tract between the town and Gloria-caſtle, where barracs are erected, and are principally filled with ſhips crews, who keep ſtalls of ſweet-meats and other eatables brought from Spain: but at the concluſion of the fair the ſhips put to ſea, and all theſe buildings are taken down; after which the town returns to its former tranquility.

The name of this port ſignifying Fine Port, or Harbour, indicates its being commodious for all ſhips; and though its entrance is very wide, it is well defended by Fort St. Philip. On the ſouth-ſide of the harbour, oppoſite to the anchoring place, is a large caſtle, called Saint Jago de la Gloria, to the eaſt of which, at the diſtance of two hundred yards, begins the town, having before it a point of land projecting into the harbour, on which ſtood a ſmall fort, called St. Jerom. All theſe were demoliſhed by admiral Vernon, in 1739, with only ſix ſhips under his command. Among the mountains, which ſurround the whole harbour, is one at its utmoſt extremity, remarkable for its ſuperior height. Its top is always covered with clouds, of a denſity and darkneſs ſeldom ſeen in thoſe of this atmoſphere: when theſe thicken, increaſe in blackneſs, and ſink below their uſual ſtation, it is a ſure ſign of a tempeſt; while on the other hand, their clearneſs and aſcent as certainly indicate the approach of fair weather. Theſe changes, however, are very frequent and ſudden.

The town is under the juriſdiction of a governor, who has the title of lieutenant general; he is always a gentleman of the army, and has under him the commandants of the forts that command the harbour. To theſe his juriſdiction is limited, the neighbouring country being full of mountains covered with impenetrable foreſts.

The inclemency of the climate of Porto-Bello is exceeding great: the heat is exceſſive, it being augmented by the ſituation of the town, which is ſurrounded with high mountains, without any interval to admit refreſhing winds. The trees on theſe mountains ſtand ſo thick as to intercept the rays of the ſun, and conſequently prevent their drying the earth under their branches: hence ariſe copious exhalations, which form large clouds that fall in violent torrents of rain; but this is no ſooner over, than the ſun breaks forth afreſh, ſhining with his former ſplendor; but has ſcarce dried the ſurface of the ground not covered by the trees, than the ſun is again concealed, and freſh ſhowers fall. Theſe torrents of rain, which, by their ſuddenneſs and impetuoſity, ſeem to threaten a ſecond deluge, are accompanied with ſuch dreadful tempeſts of thunder and lightning, as muſt daunt even the moſt reſolute ſtranger; and this dreadful noiſe is prolonged by the echoes from the caverns of the mountains, and the howlings and ſhrieks of the many kinds of monkeys which dwell in their foreſts: but what is ſtill worſe, the air is ſo unhealthy, that the galleons, or other European ſhips, which ſtay here any time, ſeldom leave it without burying half, or, at leaſt, one third of their men: hence it has been termed the grave of the Spaniards. It is univerſally aſſerted in that town, that the animals from other climates, on their being brought from Porto-Bello, ceaſe to propagate their ſpecies; thus hens brought from Panama, or Carthagena, immediately on their arrival, lay no more eggs. The horned cattle ſent from Panama, after being here a ſhort time, loſe their fleſh ſo as not to be eatable, though there is plenty of paſture; and it is certain that horſes and aſſes never breed here.

The number of inhabitants from the inclemency of the climate is very inconſiderable, and the greateſt part of theſe are negroes and mulattoes, there being ſcarce thirty white families; for none ſtay at Porto-Bello but thoſe whoſe employments oblige them to it, as the governor, the commanders of the forts, the civil officers of the crown, with the officers and ſoldiers of the garriſons.

Proviſions are ſcarce, and conſequently dear, particularly during the ſtay of the galleons and the fair, when there is a neceſſity for a ſupply from Carthagena and Panama. From the former are brought maize, rice, caſſava bread, hogs, poultry, and roots; and from the latter cattle. The only thing in plenty here is fiſh, of which there is a great variety, and very good. The adjacent country alſo abounds in ſugar-canes, and they make ſugar, molaſſes, and rum.

Snakes are extremely numerous, and the toads innumerable, ſwarming not only in damp and marſhy places, as in other countries, but even in the ſtreets, courts of houſes, and all open places in general. Thus, when it has rained in the night, the ſtreets and ſquares in the morning ſeem paved with them; ſo that you cannot ſtep without treading on them, which is ſometimes productive of troubleſome bites; for beſides their poiſon, they are ſo large that their teeth are ſeverely felt. They are generally about ſix inches long, and nothing can be imagined more diſmal than their croakings, during the night, in all parts of the town, the woods, and caverns in the mountains.

As the foreſts almoſt border on the houſes, the tygers often enter the ſtreets during the night, carrying off fowls, dogs, and other domeſtic animals, and ſometimes even boys have fallen a prey to them. Beſides the ſnares uſually laid for them, the negroes and mulattoes who fell wood in the foreſts of the mountains are very dexterous in encountering them, and ſome even ſeek them in their retreats. Their arms are only a lance, two or three yards long, made of a very ſtrong wood, with the point hardened in the fire, and a large ſcymetar. Thus armed, they ſtay till he flies at their left arm, which holds the lance, and is wrapped up in a ſhort cloak of baize. Sometimes the tyger ſeems to decline the combat, but his antagoniſt provokes him with a ſlight touch of the lance, which he no ſooner feels than he graſps it with one of his paws, and with the other ſtrikes at the arm which holds it: upon this, the perſon nimbly aims a blow with his ſcymetar, which he kept concealed in the other hand, and hamſtrings the creature, which immediately draws back enraged; but returning to the charge, receives another ſuch ſtroke, by which he is deprived of his moſt dangerous weapons, and rendered incapable of moving: after which the perſon kills him at his leiſure; and ſtripping off the ſkin, cuts off the head, with the fore and hind feet, and returns to the town with the trophies of his victory.

To return to Porto-Bello, which though ſo thinly inhabited, on account of its noxious air, becomes on the arrival of the galleons one of the moſt populous places in all South-America; for its ſituation on the iſthmus, between the North and South Sea, the goodneſs of its harbour, and its ſmall diſtance from Panama, have given it the preference, for the rendezvous of the joint commerce of Spain and Peru.

The inhabitants of Carthagena no ſooner receive advice that the Peru fleet has unloaded at Panama, than the galleons ſet ſail for Porto-Bello, where the concourſe of people is immediately ſo great, as to raiſe the rent of a middling chamber with a cloſet, during the fair, to a thouſand crowns, and ſome large houſes are let for that ſeaſon for four, five, or ſix thouſand crowns.

No ſooner are the ſhips moored in the harbour than a tent is erected in the ſquare, with the ſails of the ſhips, for receiving their cargo, and thither the bales are drawn on ſledges by the crew of every ſhip. While the ſeamen and European traders are thus employed, the land is covered with droves of mules from Panama, each drove conſiſting of above a hundred, loaded with cheſts of gold and ſilver, on account of the merchants of Peru. Some unload them at the exchange, and others in the middle of the ſquare; yet amidſt the hurry and confuſion of ſuch crowds, no theft, loſs, or diſturbance is ever known. He who has ſeen this place during the ſolitary time when it was poor, and a perpetual ſilence reigned every where, while every place wore a melancholy aſpect, muſt be filled with aſtoniſhment at the ſudden change, to ſee the buſtling multitudes, every houſe crowded, the ſquare and ſtreets encumbered with bales, and with cheſts of gold and ſilver, with the harbour full of ſhips and ſmaller veſſels; and, in ſhort, this abandoned town become the ſtaple of the riches of the Old and New World.

After the ſhips are unloaded, and both the merchants of Peru and the preſident of Panama arrived, the fair comes under deliberation, and the deputies of the ſeveral parties repair on board the commodore of the galleons, where, in the preſence of the commodore and the preſident of Panama, the former as patron of the Europeans, and the

latter of the Peruvians, the prices of the ſeveral kinds of merchandize are ſettled, and all preliminaries being adjuſted in three or four meetings, the contracts are ſigned and made public, that every one may conform to them in the ſale of his effects. Thus all fraud is precluded. The purchaſes and ſales, with the exchange of money, are tranſacted by brokers, both from Spain and Peru. After this every one begins to diſpoſe of his goods; the Spaniſh brokers embarking their cheſts of money, and thoſe of Peru ſending away the goods they have purchaſed in veſſels called chatas, and bongos, up the river Chagre, and thus the fair of Porto-Bello ends.

With reſpect to the hiſtory of this town, few places have been more unfortunate: in 1595 it was taken and ranſomed by Sir Francis Drake: in 1601 it was ſurpriſed by captain Parker: in 1699 it was taken by captain Morgan: in 1678, by captain Croxon; and in 1739, by admiral Vernon.

Panama, the moſt important place in the province, is built on the coaſt of the South Sea, in the eighth degree fifty-ſeven minutes forty-eight ſeconds, north latitude. But with regard to its longitude, there are various opinions, none of the aſtronomers were for a long time able, from the obſervations made on the ſpot, to aſcertain it; ſo that it was doubtful whether it lies to the eaſt or weſt of Porto-Bello; but Don Antonio de Ulloa has with great care determined the diſpute, and proved that it ſtands thirty minutes weſt of Porto-Bello. The houſes in general are of ſtone, but are only one ſtory high; however, from the ſymmetry of the windows, they make a handſome appearance. Without the city walls is an open ſuburb, larger than the city itſelf, and the houſes of the ſame materials and conſtruction. The decorations of the private houſes are elegant, but not coſtly, and though there are here no perſons of ſuch immenſe fortunes as in ſome other cities in America, yet it is not deſtitute of wealthy inhabitants, and all of them have a ſufficiency.

This city had the misfortune, in the year 1670, to be ſacked and burned by John Morgan, an Engliſh buccaneer, who had before taken Porto-Bello and Maracaybo, and retiring to the iſlands, every where publiſhed his deſign of going to Panama; upon which he was joined by many adventurers. He firſt ſailed to the river Chagre, where he landed ſome of his men, and battered the caſtle with his ſhips; but when he began to think it adviſeable to retreat, on account of the great number of his men killed and wounded by the fort, an extraordinary accident gave him ſucceſs. An arrow ſhot from the bow of an Indian, lodged in the eye of one of Morgan's companions; who being rendered deſperate with the pain, with a remarkable firmneſs and preſence of mind, plucked the arrow from the wound, and wrapping one of its ends in cotton or tow, put it into his muſket, which was ready loaded, and diſcharged it into the fort, where the roofs of the houſes were of thatch, and the ſides of wood. The arrow fell on one of the roofs, and immediately ſet it on fire, which was not at firſt obſerved by the beſieged, who were buſy in defending the place; but the ſmoke and flames ſoon informed them that the fort and magazine of powder were on the point of deſtruction. Such an unexpected accident filled them with terror and confuſion; and every ſoldier, being eager to ſave himſelf, abandoned the works, in order to eſcape the double danger, of being either burnt or blown up. The commandant, however, reſolving to do all in his power, ſtill defended the fort, with ſixteen or twenty ſoldiers, till he was ſlain; and Morgan obtained the fort, which was ſoon laid in aſhes.

Having ſurmounted this difficulty, he, with great part of his men, ſailed up the river in boats, leaving the ſhips at anchor; and having landed, marched towards Panama, and on the Sabana, a ſpacious plain before the city, had ſeveral ſkirmiſhes, in which Morgan always gained the advantage; ſo that he made himſelf maſter of the city; but found it almoſt forſaken; the inhabitants on ſeeing their men defeated, having retired into the woods. He now plundered it at his leiſure; and after ſtaying ſome days, agreed for a large ranſom, to leave it without damaging the buildings; but after the payment of the money, the city was ſet on fire by accident; a misfortune that rendered it abſolutely neceſſary to rebuild it, on which it was removed to its preſent ſituation, which is about a league and a half from the former, and much more convenient.

In this city is a tribunal, or royal audience, in which the governor of Panama reſides; and to this employment is annexed the poſt of captain-general of Terra Firma. The city has a court of inquiſition, a cathedral, and a chapter, conſiſting of a biſhop, and a number of prebendaries. The cathedral and convents are of ſtone; the latter are thoſe of the Dominicans, Franciſcans, Auguſtines, and fathers of Mercy; a college of Jeſuits, a nunnery of the order of St. Clara, and an hoſpital of St. Juan de Dios.

The harbour is formed in the road by the ſhelter of ſeveral iſlands, where the ſhips lie very ſafe. At the bottom of the ſea are a great number of pearls, and the oyſters in which they are found are remarkably delicious. This kind of fiſhery is of great advantage to the inhabitants of all the iſlands; and of this fiſhery we ſhall give a particular deſcription in treating of the trade of Panama.

The inhabitants are parſimonious, deſigning, inſidious, and ſtop at nothing when profit is in view. The ſame ſelfiſhneſs and parſimony reigns equally among the women, who when they go abroad begin to imitate the dreſs of thoſe of Peru, which conſiſts only of a gown and petticoats nearly reſembling thoſe worn in Spain; but at home, on viſits, and ſome particular ceremonies, their ſhift is the only cloathing from the waiſt upwards. The ſleeves are very long, broad, and quite open at the wriſt; and theſe, like the boſom, are adorned with very fine lace, the chief pride of the ladies of Panama. They wear girdles and five or ſix chaplets of beads about their necks, ſome ſet in gold, ſome of coral mixed with ſmall pieces of gold, and others leſs coſtly; but all of different ſizes; beſides theſe, they have one, two, or more gold chains, from which hang ſome relics. Round their arms they wear bracelets of gold and tombac; alſo ſtrings of pearls, corals, and bugles. Their petticoat reaches only from their waiſt to the calf of their legs, and from thence to a little above their ancle, a broad lace hangs from their under petticoat.

The land in the neighbouring country is left entirely to nature, nor does the leaſt veſtiges remain of its being formerly cultivated; whence the inhabitants are under the neceſſity of being ſupplied with every thing, either from the coaſt of Peru, or diſtant places in its own juriſdiction; and the ſhips of Peru are continually employed in exporting goods and proviſions from that country, as the coaſting barks are in bringing the produce of the ſeveral places in its juriſdiction; whence Panama is plentifully furniſhed with the beſt wheat, maize, cattle, and poultry, and the inhabitants are not ſo meagre and pale as thoſe who live at Carthagena and Porto-Bello.

From what has been ſaid of the commerce of Porto-Bello in the time of the galleons, an idea may be formed of that of Panama on the ſame occaſion; this city being the firſt where the treaſure from Peru is landed, and likewiſe the ſtaple for the goods brought up the river Chagre. This commerce is of the greateſt advantage to the inhabitants, both with regard to their letting their houſes, the freight of veſſels, the hire of mules and negroes. The city, during the abſence of the armada, is never without a great number of ſtrangers, it being the thoroughfare for all going to the ports of Peru in the South Sea, as alſo for any coming from thence to Spain; to which muſt be added the continual trade carried on by the Peruvian ſhips, which bring variety of goods; as meal of different ſorts, wine, brandy, ſugar, olives, oil, tallow, leather, and the like. The ſhips from Guayaquil bring cacao, and quinquina, or Jeſuit's bark. The coaſting barks, which make frequent trips from the adjacent ports, ſupply the city with hogs, poultry, hung-beef, hog's-lard, plantains, roots, and other food. The dearneſs of proviſions in the city, and its diſtrict, occaſioned by the great diſtance from whence they are brought, is amply compenſated by the multitude and value of the pearls found in the oyſters of its gulf, particularly thoſe near the iſlands Del Rey, Tabaga, and others, amounting in the whole to forty-three in number, forming a ſmall archipelago. At preſent they are found in ſuch plenty, that there are few perſons of ſubſtance near Panama who do not employ a

part of their ſlaves in this fiſhery, which is performed in the following manner:

The owners of negroes employ ſuch as are both expert ſwimmers, and are capable of holding their breath a long time: theſe they ſend to the iſlands, where they have huts built for their lodgings, and boats that hold eight, ten, or twenty negroes, under the command of an officer. In theſe boats they go to ſuch parts as are known to produce pearls, where the depth of the water does not exceed twelve or fifteen fathoms. Here they come to an anchor, and the negroes having a rope faſtened round their bodies, and the other end to the ſide of the boat, they carry with them a ſmall weight to accelerate their ſinking. On reaching the bottom, they take up an oyſter, which they put under their left arm, a ſecond they hold in their left hand, and a third in their right; with theſe three oyſters, and frequently another in their mouth, they riſe to take breath, and put them in a bag. When they have reſted themſelves ſome time, and recovered their breath, they perform a ſecond diving; and thus continue till they have completed their taſk, or their ſtrength fails. Each of theſe divers is obliged to deliver daily to his maſter, a certain fixed number of pearls; ſo that when they have the proper number of oyſters in their bag, they begin to open them, and deliver the pearls to the officer, till they have completed the number required; and if the pearl be but formed, it is ſufficient, without any regard to its being ſmall; and the remainder, however large or beautiful, are the negro's own property, the maſter not having the leaſt claim to them, the ſlaves being allowed to ſell them to whom they pleaſe, though they are generally purchaſed at a very ſmall price by the maſter. The negroes cannot however every day make up their number, and therefore are obliged to ſupply the deficiency.

Beſides the fatigue of this fiſhery, from the oyſters ſtrongly adhering to the rocks, they are in no ſmall danger from ſeveral kinds of fiſh, which either ſeize on them, or cruſh them by their weight againſt the bottom. The fiſhery on the whole coaſt is obnoxious to the ſame dangers; but theſe fiſh are much more frequent where ſuch riches abound. The tintoreras, and taburones, which are of an enormous ſize, feed on the bodies of theſe unfortunate fiſhermen; and the mantas or quilts preſs them to death. It wraps its fins round a man or any other animal that comes within its reach, and immediately deprives it of life by this preſſure. This fiſh, though of a prodigious ſize, in ſhape reſembles a thornback.

Every negro carries with him a ſharp knife to defend himſelf againſt theſe fiſhes, and if one of them offers to aſſault him, he attempts to ſtrike it, on which the fiſh inſtantly retires. The officers keep a watchful eye on theſe voracious animals, and on diſcovering them, ſhake the rope faſtened to the negroe's body to put him on his guard; and many upon ſeeing the diver in danger, have thrown themſelves into the water, and dived down to his aſſiſtance: but too often all their dexterity and precaution are incapable of preventing the diver being devoured, or his loſing a leg or an arm; and though ſeveral ſchemes have been tried to prevent theſe melancholy accidents, they have hitherto failed of ſucceſs.

The pearls of theſe fiſheries are generally of a good water, and ſome remarkable for their ſhape and ſize. A few of them are ſent to Europe, but the greateſt part are carried to Lima, where the demand for them is very great, they being not only univerſally worn there by perſons of rank, but from thence they are ſent into the inland parts of Peru.

Before we take leave of the Iſthmus, we ought not to omit obſerving, that near the north-weſt point of the gulph of Darien, a ſettlement was attempted by the Scots in 1699, who built a fortreſs, which they named New Edinburgh, and denominated the ſurrounding country New Caledonia. Several Engliſh and Hamburgh merchants engaged deeply in the adventure, and they were not only aſſiſted by an act of the Scots parliament, but by letters patent from king William III. The territory of which the adventurers took poſſeſſion, was governed by eight Indian chiefs, then at war with the Spaniards, who joyfully received the Scots, in hopes of being able, by their aſſiſtance, to expel their enemies.

For ſome time the new colony flouriſhed extremely, but their good fortune ſoon raiſed the jealouſy of the Engliſh Eaſt India company, and the complaints of the court of Madrid. The former repreſented this as an infringement of their charter, and the latter as a violation of the treaty ſubſiſting between Spain and Great Britain. Unhappily the Engliſh parliament interpoſed, and addreſſed his majeſty to vacate the charter granted to the Scots company. But though the Scots defended their rights with all the arguments of reaſon and juſtice, the influence of their adverſaries was too powerful, and all meaſures were taken to ruin the infant ſettlement. The Hamburghers were prevailed on to withdraw their ſubſcriptions; the merchants of London were even threatened with the miniſterial diſpleaſure; and orders were ſent to the Engliſh plantations to deny the coloniſts proviſions and aſſiſtance. In ſhort, ſuch was the power of faction and private intereſt, that the nation was robbed of the benefit of one of the moſt uſeful eſtabliſhments ever projected, the advantages of which muſt have fully appeared whenever a rupture happened between England and Spain; for while the iſthmus continued in the poſſeſſion of the colony, the Spaniſh treaſures muſt either have been detained in America, or have fallen into the hands of the Engliſh.

SECT. II.

Of CARTHAGENA.

The Situation, Extent, Face of the Country, Vegetables, and Animals of that Government: its Climate, and the Diſeaſes of the Inhabitants: a particular Deſcription of the City of Carthagena, its Trade, and Revenues; with the Manners and Cuſtoms of the Inhabitants.

THE government of Carthagena has the river of Santa Martha on the eaſt, which parts it from the province of that name; it has Popayan on the ſouth; the river and gulph of Darien on the weſt; and the North ſea on the north-weſt and north.

The country conſiſts of hills and valleys, covered with thick foreſts and groves. It is impoſſible to view without admiration the rich and perpetual verdure of the woods and plants it naturally produces: but of theſe advantages the natives make little uſe, their innate ſloth and indolence not allowing them to cultivate the gifts of nature, which here ſeem to be dealt out to them with a laviſh hand.

Though Carthagena has not the convenience of being furniſhed by its ſoil with the different kinds of European vegetables, it is in no want of others that are far from being contemptible, and of which the inhabitants eat with pleaſure: and though the Europeans at firſt ſeem to diſlike their ordinary food, they ſoon become ſo well accuſtomed to it, as to forget that of their own country. Thus, though the conſtant moiſture and heat of this climate will not admit of the cultivation of wheat, barley, and other European grain, it produces excellent maize and rice in ſuch abundance, that a buſhel of maize uſually produces an hundred. From this grain they make the bollo, or bread uſed in this country; and alſo uſe it in feeding hogs and fattening poultry. The method of making it is to ſoak the maize, and afterwards bruiſe it between two ſtones; it is then put into large bins filled with water, where, by rubbing and ſhifting it from one veſſel to another, they clear it from its huſk, and afterwards grind it into a paſte, and wrapping it up in plantain leaves boil it in water, and uſe it as bread; but in twenty-four hours time it becomes tough, and has a diſagreeable taſte. In families of diſtinction the bollo is kneaded with milk, which greatly improves it. They alſo make of the flour of maize ſeveral kinds of paſtry, and a variety of foods equally palatable and wholeſome. They have likewiſe caſſava bread, which is common among the negroes.

Wheat bread is not uncommon at the city of Carthagena; but as the flour comes from Spain, it is too dear for the common people, and is only uſed by the Europeans ſettled at Carthagena and a few Creoles, and by theſe

theſe only with their chocolate and conſerves. At all other meals they by cuſtom prefer bollo to wheat bread.

In this country the interwoven branches of the trees form a ſhelter impenetrable both to heat and light. The trees are not only large and lofty, but of an admirable variety, and entirely different from thoſe of Europe. The principal of theſe for dimenſions, are the acajou, the cedar, the maria, and the balſam tree. Of the firſt are made the veſſels uſed for fiſhing, and for the coaſt and river trade within the juriſdiction of this government; and the wood is compact, fragrant, and beautiful. The cedar is of two kinds, white and reddiſh; but the laſt is moſt eſteemed. The maria and the balſam tree, beſides the uſefulneſs of their timber, diſtil thoſe admirable balſams called maria oil, and balſam of Tolu, ſo called from a village, in the neighbourhood of which it is found in the greateſt plenty, and of a peculiar excellence.

Beſides theſe trees here are alſo the tamarind, the medlar, the ſapote, the papah, the caſſia, the palm, and the manchineel. The palm trees, riſing with their tufted heads above the branches of the others, form a grand perſpective on the mountains: theſe are of ſeveral kinds, and palm wine is extracted from them all, by boring a hole in the trunk, in which is placed a tap, with a veſſel under it, to receive the liquor. Guaiacum and ebony trees are equally common, and their hardneſs nearly approaches to that of iron.

Here are alſo many cotton trees, ſome planted and cultivated, and theſe are the beſt; others ſpontaneouſly produced. The cotton of both is ſpun and made into ſeveral ſorts of ſtuffs, which are worn by the negroes and the country Indians.

The cacao tree alſo grows in great plenty on the banks of the river Magdelena, and in other ſituations, which the tree delights in; but thoſe in the juriſdiction of Carthagena greatly excel what are to be found in other parts, both in the ſize and the goodneſs of the fruit. The chocolate made of it is little known in Spain; for as it is more eſteemed than that of other countries, the greateſt part of it is conſumed there, or ſent to other parts of America.

There are here a vaſt number of delicious fruits that evidently diſplay the exuberance of the ſoil, ſome reſembling thoſe of Spain, and others peculiar to the country. Thoſe of the ſame kind with the Spaniſh fruits are melons, water-melons, grapes, oranges, medlars, and dates. The grapes are not equal to thoſe of Spain; but the medlars as far exceed them. With regard to the reſt there is little difference.

Among thoſe peculiar to the country, the preference doubtleſs belongs to the pine-apple; hence its beauty, ſmell, and taſte have acquired it the denomination of queen of fruits. Many of the others have been mentioned already, and here are alſo plantations of ſugar-canes.

We ſhall now proceed to the animals, ſome of which are tame, and contribute to the uſe and pleaſure of the inhabitants; others are wild, and of ſuch different kinds and qualities, as diſplay in a ſurpriſing manner the wonderful variety of the works formed by the Author of nature. The quadrupeds and reptiles frequent the dry and deſart places, and are diſtinguiſhed by the prodigious variety of ſpots upon their ſkins; while the vivid plumage of the feathered race glows with exquiſite beauty, and the brilliant ſcales of one claſs of reptiles conceal the moſt active poiſons. The only tame animals are horned cattle and hogs, of which there are the greateſt plenty. Though the beef is not abſolutely bad, it cannot be ſaid to be palatable; for the conſtant heat of the climate renders the beaf lean, and deprives it of that ſucculency it would otherwiſe acquire; but the pork is delicate, and exceeds any in Europe. There are here wild boars, deer, rabbits, and tygers; the laſt make great havock not only among the cattle, but among the human ſpecies: their ſkin is very beautiful, and ſome are as large as ſmall horſes.

Here are alſo leopards, foxes, armadillos, ſquirrels, and many others, beſides innumerable kinds of monkeys, ſome remarkable for their ſize, and others for their colour. The fox's artifice in defending itſelf againſt dogs, or other animals, by whom it is purſued, by voiding its urine on its own tail, and ſprinkling it on them, here effectually anſwers its intention, the ſmell being ſo fetid, that the dogs are greatly diſordered by it, by which means the fox eſcapes. Indeed the ſtench is ſo great, that it may be ſmelt a quarter of a league from the place, and very often for half an hour after. What is here called the fox is little bigger than a large cat, but delicately ſhaped, and has a very fine ſkin of a cinnamon colour; the tail is not very buſhy, but the hair is ſpongy, and forms a bunch proper for this method of defence.

The birds ſeen in this hot climate are ſo very numerous, that it is impoſſible to give a full idea of the beauty and brilliancy of their various plumage; but the cries and croakings of ſome diſturb the pleaſure that would ariſe from the warblings of others. Here we ſee an inſtance of the equity obſerved by nature in diſtributing her favours, the plumage of thoſe birds being the moſt beautiful whoſe noiſe is the moſt offenſive; while on the other hand, thoſe whoſe appearance has nothing remarkable, excel in the ſweetneſs of their notes. This is particularly evident in the guacamayo, the beauty and luſtre of whoſe colours are abſolutely inimitable by painting, and yet nothing can make a more ſhrill and diſagreeable ſound.

The moſt extraordinary of all the birds ſeems to be the tulcan, or preacher. It is about the ſize of a common pigeon, but its legs much larger; its tail is ſhort, and its plumage of a dark colour; but ſpotted with yellow, purple, blue, and other colours, that have a beautiful effect on the dark ground. Its head greatly exceeds all proportion with reſpect to its body; but it would not otherwiſe be able to ſupport its bill, which is at leaſt ſix or eight inches from the root to the point: the lower mandible cloſes with the upper through the whole length, and both diminiſh inſenſibly to the end, when it ſuddenly bends, and terminates in a ſtrong ſharp point. The tongue is formed like a feather, and, as well as the inſide of its mouth, is of a deep red. The bill is variegated with all the bright colours that adorn the plumage of other birds: at the baſe, and alſo at the convexity, it is generally of a light yellow, forming a kind of ribbon, half an inch in breadth. The reſt is of a fine deep purple, except two ſtreaks near the root of a rich ſcarlet. The name of preacher has been given to this bird from its cuſtom of perching on the top of a tree above his companions while they are aſleep, and making a noiſe like ill-articulated ſounds, moving its head to the right and left, in order to keep off the birds of prey from ſeizing on the others. They are eaſily rendered ſo tame as to run about the houſe, and come when called. Their uſual food is fruit; but the tame eat other things, and in general whatever is given them.

Another extraordinary bird is the gallinazo, which is about the ſize of a pea-hen; but the head and neck ſomewhat larger. From the crop to the baſe of the bill, inſtead of feathers, it has a wrinkled glandulous rough ſkin, covered with ſmall warts and tubercles. Its feathers are black, which is alſo the colour of the ſkin; its bill is well proportioned, ſtrong, and a little crooked. Theſe birds are ſo numerous and tame in the city of Carthagena, that it is not uncommon to ſee the ridges of the houſes covered with them. They are alſo of great ſervice on account of their cleaning the city from all kinds of filth, greedily devouring any dead animal, and any thing moſt offenſive. They have ſo quick a ſcent, that they will ſmell a dead body at the diſtance of ten or twelve miles, and never quit it till they have entirely reduced it to a ſkeleton. The multiplicity of theſe birds found in ſuch hot climates is of the utmoſt conſequence, as otherwiſe the putrefaction cauſed by the exceſſive heat would render the air inſupportable to human life. At their firſt riſing they fly heavily, but ſoon after dart out of ſight. Though their legs are ſtrong and well proportioned, they hop along on the ground in a very aukward manner. They have the toes forward turning inwards, and one in the inſide turned a little backwards; ſo that the feet interfering occaſions their hopping and walking in the above manner. Each toe has long and thick claws.

There is another ſpecies of theſe birds, ſomewhat larger than the former, but only to be found in the country. In ſome of theſe the head and part of the neck are red, in ſome white, and in others a mixture of both theſe colours.

lours. At a ſmall diſtance from the crop they have a ruff of white feathers; and are equally fierce and carnivorous with the former: theſe are called the kings of the gallinazos; probably becauſe the number of them is but ſmall; and it is obſerved, that when one of theſe birds has faſtened on a dead beaſt, none of the others approach, till he has firſt eaten the eyes, which is generally the part he begins with firſt, and is gone to another place, when they all flock to the prey.

Batts are very common all over this government; but Carthagena is infeſted with ſuch an infinite number of them, that after ſun-ſet, when they begin to fly, they may, without exaggeration, be ſaid to cover the ſtreets like clouds. They are the moſt dexterous bleeders both of men and cattle; for the inhabitants being obliged, by the exceſſive heats, to leave the windows of their chambers open, the batts get in, and if they find a perſon aſleep with the foot bare, they inſinuate their tooth into a vein, with all the art of a moſt expert ſurgeon, ſucking the blood till they are ſatiated, after which it flows out of the orifice to the great danger of the perſon's life. The reaſon why the puncture is not felt, is attributed to the gentle and refreſhing agitation of the air by the batt's wings, throwing the perſon into a deeper ſleep, and thus preventing his feeling the ſlight puncture. This alſo happens to horſes, mules, and aſſes; but beaſts of a thicker ſkin are not ſo much expoſed to it. This account, which is extracted from the learned Don Antonio de Ulloa, is confirmed by M. Condamine, who obſerves, that there are ſome of a monſtrous ſize; and that they have entirely deſtroyed at Borja, and other places, all the black cattle which the miſſionaries had introduced there.

The great number of reptiles and inſects is not only an inconvenience to the inhabitants, but they are even very dangerous. The moſt common of the ſnakes, and at the ſame time the moſt poiſonous, are the coral-ſnakes, the rattle-ſnakes, and the willow-ſnakes. The firſt, which are generally between four and five feet in length, and an inch in diameter, make a very beautiful appearance, their ſkin being variegated with a vivid crimſon, green, and yellow. The head is long and flat, like a viper. Each mandible is furniſhed with a row of pointed teeth, through which, during the bite, they inſinuate the poiſon. The perſon bit ſwells to ſuch a degree, that the blood guſhes out through all the organs of ſenſe, and even the coats of the veins at the extremities of the fingers burſt.

The willow-ſnake reſembles in colour and form a ſtick of that tree, and as they frequently hang from the boughs, really ſeem to be a part of it, till a too near approach unhappily diſcovers the miſtake. Though their poiſon is leſs active than that of the others, it is mortal, unleſs a remedy be ſpeedily applied.

Scolopendra not only ſwarm in this country, but are of a monſtrous ſize, and are the more dangerous from their breeding in the houſes: they are generally a yard in length, and ſome a yard and a quarter, with about five inches in breadth. The back and ſides are covered with hard ſcales of a muſk colour tinged with red; but ſo articulated as not in the leaſt to impede their motion, and yet ſo ſtrong as to defend them againſt any blow; ſo that you can only kill them by ſtriking them on the head. They are very nimble, and their bite, without timely application, proves mortal.

Scorpions are not leſs common, and of different kinds, as black, red, muſk colour, and ſome yellow.

The ſoldier-ſnail, of which we have already given a deſcription, is here alſo dangerous, for the gripe which it gives with its two claws is attended with the ſame ſymptoms as the ſting of a ſcorpion.

There are here an infinite number of butterflies, which, though they differ in their figure, colours, and decorations, it is difficult to determine which are the moſt beautiful. But whatever pleaſure there be in ſeeing of theſe, it is far from equalling the pain which ariſes from the numberleſs muſkettoes, of which there are large clouds of four different ſorts, all of them extremely troubleſome.

The climate of Carthagena is exceſſive hot. From the month of May to the end of November is the ſeaſon they call winter, there being a continual ſucceſſion of thunder and tempeſts, the clouds precipitating the rain with ſuch impetuoſity, that the ſtreets of the capital have the appearance of rivers, and the country of an ocean. The inhabitants make uſe of this opportunity of filling their ciſterns, this being the only ſweet water they can procure. From the middle of December to the end of April the rains ceaſe, and the weather becomes agreeable, the heat being ſomething abated by the north-eaſt winds. This ſeaſon they call ſummer; beſides which there is another called the little ſummer of St. John, as about the feſtival of that ſaint the rains are intermitted, and refreſhing gales begin to blow, and continue about a month.

The almoſt invariable continuance of the great heats, without any ſenſible difference between night and day, occaſions ſuch profuſe perſpiration, that the wan and livid complexion of the inhabitants would make a ſtranger ſuſpect their being juſt recovered from ſome terrible diſtemper. In all their motions there is ſomething relax and ſluggiſh; it even affects their ſpeech, which is ſoft and ſlow, and their words generally broken: yet, notwithſtanding theſe appearances of ſickneſs and debility, they enjoy a good ſtate of health. Strangers from Europe generally retain their ſtrength and ruddy complexion about three or four months; but afterwards they are no longer to be diſtinguiſhed by their countenances from the old inhabitants.

The ſingularity of the climate is probably the cauſe of the ſingularity of ſeveral diſeaſes which here afflict mankind: ſome of theſe attack only the Europeans newly landed, and others are common to the inhabitants. The firſt kind carry off a multitude of people, and extremely thin the crews of European ſhips, but ſeldom laſts above three or four days. They are cauſed in ſome perſons by cold, and in others by indigeſtion, which ſoon bring on the black vomit, which very few recover. Some, when the vomit attacks them, are ſeized with ſuch a delirium, that, were they not tied down, they would tear themſelves to pieces, and expire in the midſt of the moſt terrible phrenſy.

The inhabitants throughout the whole extent of the government of Carthagena are very ſubject to the leproſy; and, in order to put a ſtop to the contagion of this diſtemper, there is without the capital an hoſpital called San Lazaro, in which all perſons of both ſexes labouring under this diſtemper are confined, without any diſtinction of age or rank; and if any refuſe to go, they are forcibly carried thither. But from thence the diſtemper is ſuffered to ſpread; for their allowance being too ſmall for their ſubſiſtance, thoſe who have no other ſupport are permitted to beg in the city, and from their intercourſe with thoſe in health, the number of lepers never decreaſes. The hoſpital reſembles a little town. Every perſon at his entering it, where he is to continue during life, builds a cottage, in which he lives in the ſame manner as before in his own houſe, none going out unleſs to aſk alms. The ground on which the hoſpital ſtands is encompaſſed by a wall, and has only one gate, which is always carefully guarded. They live a long time under this diſtemper, and as it greatly increaſes the natural deſire of coition, to avoid the diſorders that would reſult from this, which is almoſt impoſſible to be controuled, they are allowed to marry.

The itch and herpes are equally frequent among ſuch Europeans as are not ſeaſoned to the climate; and if neglected in the beginning, it is dangerous to attempt a cure.

A more ſingular and remarkable diſtemper, though leſs common, is the culebrilla, or little ſnake, which is perhaps a tumor cauſed by malignant humours ſettled longitudinally between the membrane of the ſkin, and daily increaſing in length, till it ſurrounds the part affected, which is uſually the arm, thigh, or leg. The external indications of it are a round inflamed tumor, a quarter of an inch thick, attended with pain, but not vehement, and a numbneſs of the part, which often ends in a mortification. The natives, who firmly believe it to be a ſmall ſnake, are very ſkilful in removing it. They firſt examine where the head is, as they call it, to which they apply

apply a ſmall ſuppurative plaſter, and gently foment the whole tumor with oil. The next day the ſkin under the plaſter is found divided, and through the orifice appears a kind of white fibre, about the ſize of coarſe ſewing thread, which they carefully faſten to a thread of ſilk, and wind the other end of it about a card, rolled up like a cylinder. After this they repeat the fomentation with oil, and the following day continue to wind about the cylindric card the part of this ſmall fibre that appears in ſight, and in this manner proceed till the whole is extracted, and the patient entirely cured. During this operation their chief care is not to break the culebrilla, becauſe, ſay they, it would then cauſe a humour to ſpread through the body, and produce a great quantity of ſuch little ſnakes, as they will have them to be, whence the cure would become extremely difficult.

The city of Carthagena is ſituated in the tenth degree twenty-five minutes forty-eight ſeconds north latitude, and in the ſeventy-ſeventh degree twelve minutes weſt longitude, three hundred and twenty miles ſouth of Port Royal in Jamaica, on a ſandy plain, which forms a narrow paſſage on the ſouth-weſt to a part called Tierra Bomba, as far as Bocca Chica. The fortifications both of the city and ſuburbs are conſtructed in the modern manner, and lined with free-ſtone. The garriſon, in time of peace, conſiſts of ten companies of regulars, each containing ſeventy-ſeven men, including the officers, beſides ſeveral companies of militia. The city and ſuburbs are well laid out, the ſtreets being ſtraight, broad, uniform, and well paved. The houſes are built of ſtone, except a few of brick, but chiefly conſiſt of only one ſtory above the ground-floor; however, the apartments are well contrived. All the houſes have balconies and lattices of wood, it being more durable in this climate than iron, which is ſoon corroded and deſtroyed by the moiſture and acrimonious quality of the nitrous air, from whence, and the ſmoaky colour of the walls, the outſide of the buildings make but an indifferent appearance. There are here a cathedral, a church dedicated to the Trinity, and a chapel of eaſe. The orders that have convents are thoſe of St. Francis in the ſuburbs, St. Auguſtine, St. Dominic, La Merced, that of the Jacobines, and the Recollects, a college of Jeſuits, and an hoſpital of San Juan de Dios. The nunneries are thoſe of St. Clara and St. Tereſa. The churches and convents are ſufficiently capacious, but not much ornamented in the inſide.

Carthagena, together with its ſuburbs, is equal to a city of the third rank in Europe. It is well peopled; but moſt of the inhabitants are deſcended from the Indians. The governor reſides in the city; it has alſo a biſhop, whoſe ſpiritual juriſdiction is of the ſame extent as that of the military and civil government: there is alſo a court of inquiſition. Beſides theſe tribunals, there is a ſecular magiſtracy, conſiſting of regidores, from whom every year are choſen two alcaldes, who are generally perſons of great diſtinction; and likewiſe a treaſury, in which all the taxes and money belonging to the king are received.

The bay is one of the beſt not only on the coaſt, but in all the known parts of the country. It extends two leagues and a half from north to ſouth, has a ſufficient depth of water, with good anchorage, and is ſo ſmooth that the ſhips are no more agitated than on a river. However, the many ſhallows at its entrance make the aſſiſtance of a good pilot neceſſary. The tides in this bay are very irregular, which is the caſe with almoſt the whole coaſt: it being often ſeen to flow a whole day, and afterwards ebb away in four or five hours; yet the greateſt alteration obſerved in its depth is two feet, or two feet and a half. The bay abounds with a great variety of wholeſome palatable fiſh, and a multitude of large turtle; but it is greatly infeſted with ſharks, which are extremely dangerous to ſeamen, as they immediately ſeize every perſon they diſcover in the water, and ſometimes even venture to attack them in their boats.

In this bay the galleons from Spain wait for the arrival of the Peru fleet at Panama, and on the firſt advice of this ſail away to Porto Bello. It is the firſt place in America at which the galleons are allowed to touch, and thus it enjoys the firſt-fruits of commerce by the public ſales made there. The ſales, though not attended with the ſame formalities as thoſe of Porto Bello, are very conſiderable: for the traders of the inland provinces of Quito, Popayan, and Santa Fe, lay out great ſums for ſeveral ſorts of goods, and thoſe ſpecies of proviſions that are moſt wanted in their reſpective countries. The traders bring gold and ſilver in ſpecie, ingots, and duſt; as alſo emeralds; for beſides the ſilver mines worked at Santa Fe, which are very numerous, there are others which yield the fineſt emeralds. The fair of Carthagena occaſions a great quantity of ſhops to be opened, and filled with all kinds of merchandize. This is a time of univerſal profit; to ſome by letting lodgings and ſhops; to others by the increaſe of their reſpective trades; and to others by the labour of their negro ſlaves, whoſe pay during this buſy time is proportionably increaſed; and it is not uncommon for ſlaves, out of their ſavings, after paying their maſters, and providing themſelves with neceſſaries, to purchaſe their freedom. This commercial tumult laſts only while the galleons continue in the bay; for they are no ſooner gone than ſilence and tranquility reſume their former place; for, with regard to the trade carried on with the other governments, it is not very conſiderable.

The inhabitants of this city may be divided into different tribes, who derive their origin from a coalition of whites, negroes, and Indians. The Europeans are not numerous; moſt of them, after acquiring a competent fortune, either return to Spain, or remove into the inland provinces, in order to increaſe it. The Europeans and Creoles ſettled at Carthagena carry on the whole trade of the place, while the other inhabitants are indigent, and reduced to have recourſe to hard labour for their ſubſiſtence. The dreſs of the whites, both men and women, differs but little from that worn in Spain; for perſons in high poſts have habits of the ſame form as in Europe, but with this difference, that they are all very light, the waiſtcoats and breeches being of fine linen, and the coat of ſome other thin ſtuff. Neckcloths are very uncommon, the neck of the ſhirt being adorned with large gold buttons, which generally hang looſe. On their heads they generally wear a cap of fine linen, and others go entirely bare-headed. Fans are worn by the men: theſe are made of a kind of palm, in the form of a creſcent, with a ſtick of the ſame wood in the middle.

The Spaniſh women wear a kind of petticoat made of thin ſilk, without any lining, and on their body a very thin white waiſtcoat; but even this is only worn in what they call winter, it being inſupportable in ſummer. They, however, always conceal their breaſts. When they go abroad they wear a mantelet, and on the days of precept go to the maſs at three in the morning, and return before the violent heat of the day, which begins with the dawn.

Thoſe women who are not perfectly of the white claſs wear over the above petticoat one of taffety, of any colour they pleaſe, except black; this is pinked all over, to ſhew the other they wear under it. On the head is a cap of fine white linen covered with lace, in the ſhape of a mitre, well ſtarched, and terminating forwards in a point. They never appear abroad without this and a mantelet on their ſhoulders. The ladies and other native whites uſe this as their undreſs: inſtead of ſhoes they wear, both within and without doors, a ſmall kind of ſlippers. In the houſe their whole exerciſe conſiſts in ſitting in their hammocks, and ſwinging themſelves for air. In theſe they paſs the greateſt part of the day, and men as well as women often ſleep in them, without regarding the inconvenience of being unable to lie at full length.

Both ſexes poſſeſs a great deal of wit and penetration, with a genius proper to excel in all kinds of mechanic arts. This is particularly conſpicuous in thoſe who apply themſelves to literature, who at a tender age ſhew a judgment which in other climates is attained only by a long ſeries of years. This happy diſpoſition continues till they are between twenty and thirty years old, after which they generally decline as faſt as they roſe; and frequently before they arrive at that age, when they ſhould begin to reap the advantage of their ſtudies, indolence checks their progreſs, and they forſake the ſciences, leaving the ſurpriſing effects of their capacity imperfect. This is doubtleſs owing to the want of proper objects for

exerciſing their talents, and the ſmall hopes of being preferred to any poſt anſwerable to the pains they have taken. However, there are often ſeen here perſons of extenſive talents, both in the ſpeculative and practical ſciences, who retain them in all their vigour to a very advanced age.

Charity is a virtue, in which the inhabitants of Carthagena remarkably excel; and did they not exert it in the moſt generous manner towards the Europeans who come thither to ſeek their fortune, they would often periſh with ſickneſs and poverty.

The houſes of perſons of wealth and diſtinction are ſerved with great delicacies; moſt of the diſhes are dreſſed in the manner of the country, and ſome of them are ſo agreeable, that foreigners are no leſs pleaſed with them than the natives. One of their favourite diſhes is the agiaco, there being ſcarcely a genteel family without it. This is compoſed of pork fried, birds of ſeveral kinds, plantains, maize, paſte, and ſeveral other things highly ſeaſoned with pimento.

The inhabitants of any figure generally make two meals a day, beſides a ſlight repaſt. Their breakfaſt is uſually compoſed of ſome fried diſh, paſtry of maize-flour, followed by chocolate. Their dinner conſiſts of a much greater variety; but at night they have only a ſlight regale of ſome ſweetmeats and chocolate. Some families indeed affect the European cuſtom of having regular ſuppers, though they are generally looked upon at Carthagena as detrimental to health.

The uſe of brandy is ſo common, that the moſt ſober people never omit drinking a glaſs of it at about eleven o'clock in the morning, alleging that it ſtrengthens the ſtomach, weakened by the conſtant perſpiration, and creates an appetite. Chocolate is ſo common that there is not a negro ſlave but conſtantly allows himſelf a regale of it after breakfaſt, and the negro women ſell it ready made about the ſtreets at the rate of a quarter of a real, or about five farthings a diſh. This, however, is mixed with maize flour; but that uſed by people in good circumſtances is neat and worked as in Spain. This they alſo conſtantly drink an hour after dinner, but never without eating ſomething with it. They alſo make great uſe of ſweetmeats and honey, never drinking a glaſs of water without previouſly eating ſome ſweetmeats.

The paſſion for ſmoaking is no leſs univerſal: the ladies and other white women ſmoke only in their houſes; but the women of the other caſts, and the men in general, regard neither time nor place. This cuſtom the ladies learn from their childhood, probably from their nurſes, who are negro ſlaves; and it is ſo common among perſons of rank, that thoſe who come from Europe learn it, if they intend to make any conſiderable ſtay in the country.

The natives are fond of balls, which in houſes of diſtinction are conducted in a very regular manner. They open with Spaniſh dances, and are ſucceeded by thoſe of the country, which are not without ſpirit and gracefulneſs. Theſe are accompanied with ſinging, and the parties ſeldom break up before day-light: but the balls of the populace are intermixed with indecent geſtures, and a continual round of drinking, which frequently produces quarrels.

Their burials and mournings are alſo ſomething ſingular, and in theſe they endeavour to diſplay their grandeur. If the deceaſed be a perſon of rank, his body is placed on a pompous catafalco erected in the principal apartment of the houſe, amidſt the blaze of tapers. The corpſe lies there twenty-four hours, or longer, during which it is viſited by the acquaintance of the family, and the lower claſs of women, who come to lament the deceaſed. Theſe women, who are generally dreſſed in black, come in the evening, or during the night, into the apartment where the corpſe lies, and throwing themſelves on their knees, riſe and extend their arms to embrace it; then in a doleful tone, mixed with horrid cries, they begin their lamentations, which always conclude with the name of the deceaſed. Afterwards they begin in the ſame diſagreeable tone his hiſtory, rehearſing all his good and bad qualities, not even omitting his amours, till at length, quite ſpent, they withdraw to a corner of the apartment ſtored with wine and brandy, on which they never fail plentifully to regale themſelves. No ſooner are theſe departed from the body, than others ſucceed, till the women have taken their turn. The ſame is afterwards repeated by the ſervants, ſlaves, and acquaintance of the family, which continues without intermiſſion during the remainder of the night. The funeral is alſo accompanied with the like noiſy lamentations, and even after the corpſe is depoſited in the grave the mourning is continued in the houſe for nine days; during which time the mourners never ſtir from the apartment, where they receive the compliments of condolance, and in the night are attended by their relations and intimate friends.

Before we conclude this article, it will be proper to give a conciſe account of the hoſtilities this city has ſuffered from foreigners, by whom it has been frequently attacked, taken, and plundered. The firſt invaſion was made in 1544, ſoon after its eſtabliſhment by certain French invaders, conducted by a Corſican pilot. In 1585 it was taken and almoſt deſtroyed by Sir Francis Drake, the ſcourge of the new Spaniſh ſettlements. M. de Pointis came before it in 1597 with a ſquadron of privateers, under the protection of the French king; and, after obliging the fort of Bocca Chica to ſurrender, whereby the entrance of the bay was laid open, he landed his men, and beſieged Fort Lazaro, the taking of which was followed by the ſurrender of the city; but the capitulation was no ſecurity againſt the rage of avarice, which had conſigned it to pillage. This conqueſt has been attributed to a private correſpondence between the governor and Pointis; and what increaſes the ſuſpicion is, that he embarked on board the French ſquadron, at his departure, taking with him all his treaſures and effects, none of which had ſuffered by the general calamity. In 1741 it ſuſtained a long ſiege from the Engliſh under admiral Vernon; but they were obliged to retire after they had made themſelves maſters of moſt of the forts and harbours, which was principally owing, beſides the ſtrength of the place, to the great mortality among the troops, and the differences that aroſe between the admiral and general.

SECT. III.

A conciſe Account of the Government of Santa Martha, Rio de la Hacha, Venezuela, New Andaluſia, and New Granada; their Situation, Extent, Climates, Produce, and principal Towns.

THE government of Santa Martha is bounded on the eaſt by Rio de la Hacha, on the ſouth by New Granada, on the weſt by Carthagena, and on the north by the North ſea; extending about a hundred and forty miles from eaſt to weſt, and about two hundred from north to ſouth.

The country is extremely mountainous, and ſome of theſe mountains, eſpecially that called Santa Martha, is ſaid to be higher than the pike of Teneriffe. From hence reſult conſiderable advantages to the inhabitants, the air being cooler and more wholeſome than in ſome other parts of America near the equator. The air, however, is extremely ſultry by the ſea-coaſt; yet the mountains in the interior country are covered with ſnow, and the cold ſo intenſe, that while the people in one place are ſcorched with the ſun-beams, others at ſixty miles diſtance are ſhivering with the rigours of the ſeaſon. It rains very much in the months of September and October in that part of the country which lies towards the ſea-coaſt; but there is little rain in the other months, becauſe the eaſt and north winds which blow there diſperſe and drive away the clouds. The valleys of this country are exceeding fruitful, and produce oranges, lemons, pine-apples, grapes, and many other fruits. The country abounds in rich gold mines, and in the mountains are found ſapphires, emeralds, jaſper, and marble moſt beautifully veined. At a league and a half's diſtance from the city of Santa Martha are ſalt-ponds, where they get very good ſalt, which is exported into the neighbouring provinces.

The city of Santa Martha, which gives name to the province, is ſituated on a branch of the Rio Grande near

the mountains of Santa Martha, in the eleventh degree thirty-four minutes north latitude. Formerly the city was flouriſhing and populous; but is much decayed ſince the Spaniſh fleets no longer touch there. The inhabitants amount to about three thouſand ſouls, including all degrees: it is honoured with the reſidence of the governor of the province, and is the ſee of a biſhop, ſuffragan to the metropolitan of New Granada. The houſes are built with canes, and covered with palmeto leaves; and ſome with pantiles. This town has frequently ſuffered by hoſtile fleets; for in 1525 it was entirely ruined by Sir Francis Drake, and the next year was plundered by Sir Anthony Shirley; in 1630 it was taken by the Dutch, and was afterwards frequently pillaged by the Buccaneers.

On the eaſt ſide of the Rio Grande, about twenty miles from the capital, is ſeated the town of Baranca del Malambo, a place of conſequence on account of the briſk trade carried on by the inhabitants. The merchandize of New Granada is brought down hither in boats, and conveyed to the bay about forty miles below the town, or elſe directly to Santa Martha by a branch of the Rio Grande.

On the ſouthern frontier of Santa Martha is ſeated the little province of Rio de la Hacha, in the form of a peninſula, between the gulph of Venezuela on the eaſt and a bay of the North ſea to the weſtward. The country is pleaſant, tolerably healthy, and exceeding fertile. The rains are not ſo violent as in Santa Martha, though there are frequent tornadoes and thunder ſhowers. In the middle of the province are ſome mines of jaſper and chalcedony, and on the coaſt a very rich pearl-fiſhery, in which the Indians are chiefly employed, and, notwithſtanding the vigilance of the Spaniards, reap the chief profits. The inhabitants of the open country ſtill enjoy the bleſſing of liberty, and form a numerous, reſolute, and brave nation.

Rio de la Hacha, the capital, which gives name to the province, and takes its own from the river, at the mouth of which it is ſituated, was formerly called Nueſtra Senora de los Remedios, and ſtands in the eleventh degree ſix minutes north latitude, about a hundred and twenty miles from the city of Santa Martha, and contains only about a hundred houſes. The town was formerly rich, but it was ſo often taken by the Buccaneers, that in 1682 the Spaniards abandoned it, but were afterwards induced to return, and defend it by building ſtrong fortifications.

Venezuela, the next province, is bounded on the eaſt by New Andaluſia, on the ſouth by New Granada, on the weſt by Rio de la Hacha, and on the north by the North ſea, and includes the diſtrict of Caraccas; extending, according to ſome authors, four hundred miles along the coaſt of the North ſea, and near three hundred into the interior country. The climate is moderately temperate, and the ſoil ſo rich and fertile as to produce two harveſts every year, and to feed great herds of black cattle and flocks of ſheep. The famous lake of Maracaibo, which is eighty leagues in compaſs, adds equally to the beauty and convenience of the province; but though the water of the lake and the rivulets which flow from it are drank, yet they are brackiſh and unwholeſome, and the natives are in great want of freſh water. The inhabitants of this province are ſaid to exceed a hundred thouſand, including Spaniards, mulattoes, and negroes.

Venezuela, or Cora, the capital of the province, is ſeated on the north-eaſt part of the peninſula, on the banks of the North ſea, and lies in about the tenth degree forty minutes north latitude. It is the reſidence of the governor, the ſeat of the courts of juſtice, and the ſee of a biſhop; but is neither remarkable for its commerce, its opulence, or buildings: its ſituation alone in the midſt of the waters engages attention, and from hence it is that it has been called Venezuela, or Little Venice.

The town of Maracaibo, though inferior in dignity to the former, is more elegant, pleaſant, and wealthy. It fronts the lake of the ſame name, and has a great number of ſplendid buildings, adorned with balconies that command a proſpect of the lake at a great diſtance. The inhabitants are reckoned to exceed four thouſand, eight hundred of whom are ſaid to be capable of bearing arms. Here is a governor dependent on the governor of the province, and it contains a large pariſh-church, four convents, and an hoſpital. Small veſſels are continually trading to this place with the merchandize and manufactures of all the towns contiguous to the great lake; particularly with cacao, or chocolate, indigo, ſugar, tobacco, and green hides. Maracaibo is alſo a celebrated port for ſhip-building, for which it is very convenient.

With reſpect to the country of Caraccas, it extends as far as Cape Blanco; but the coaſt is rocky and mountainous: it is, however, interſperſed with ſmall fertile valleys, which are ſubject, at certain ſeaſons of the year, to dry north-weſt winds; but is in general bleſſed with a clear air, and a wholeſome climate. A very extenſive illicit trade is carried on with this coaſt by the Engliſh and Dutch, notwithſtanding all the vigilance of the Spaniards, who have ſcouts perpetually employed, and breaſtworks raiſed in all the valleys.

Caraccas, the chief town in the diſtrict, is ſituated in the tenth degree ten minutes north latitude, at a conſiderable diſtance from the ſea. It is ſaid to be large, wealthy, populous, and extremely difficult of acceſs, on account of the ſteep and craggy hills, over which an enemy muſt march to it.

Porto Cavallo is a ſea port town on this coaſt, which was unſucceſsfully attacked in the late war by admiral Knowles.

New Andaluſia is allowed to be a pretty large province, the boundaries of which are not exactly known. However, it has a part of Guiana and New Granada on the ſouth, alſo part of New Granada and Venezuela on the weſt, the North ſea on the north, and the river Oroonoko on the eaſt; including the diſtricts of Camana and Paria, it extends, according to the moſt reaſonable limits, five hundred miles from north to ſouth, and about two hundred and ſeventy from eaſt to weſt. The interior country is woody and mountainous, variegated with fine valleys, that yield corn and paſturage. The produce of the country chiefly conſiſts in ſugar, tobacco, medicinal roots, gums, dying drugs, Braſil wood, and ſome valuable timber. To theſe may be added pearls, for which the Spaniards fiſh along the coaſt.

Cumana, or Comana, the capital of New Andaluſia, to which it ſometimes gives its name, ſtands in the ninth degree fifty-five minutes north latitude, and in the ſixty-fifth degree thirty minutes weſt longitude from London, about nine miles from the North ſea. It was built by the Spaniards in the year 1520, and is defended by a ſtrong caſtle, capable of making a vigorous defence, as appeared in the year 1670, when it was aſſaulted by the Buccaneers, who were repulſed with great ſlaughter.

New Granada, ſometimes called Santa Fe, and Caſtella del Oro, is bounded on the north by Santa Martha, Rio de la Hacha, and Venezuela; on the eaſt alſo by Venezuela; on the ſouth by Peru; and on the weſt by Popayan. The whole country is ſuppoſed to include a ſpace of three hundred and thirty-ſix miles in length, and near as much in breadth.

Though it lies between the firſt and ninth degree of north latitude, the climate is remarkably temperate; ſo that ſeveral writers affirm, that their equality of day and night is undiſturbed by any variety of ſeaſons; but, upon a ſtrict examination, this does not appear to be ſtrictly true, there being in reality two ſummers and two winters. The country is beautifully variegated with hills and valleys covered with verdure. The mountains contain gold, ſilver, and emeralds; and the valleys are enriched with all the neceſſaries of life, as corn, cattle, roots, and fruit: they produce likewiſe great quantities of guaiacum, gums, balms, drugs of various kinds, and other valuable articles of commerce.

The capital of the kingdom, as it is called, is the city of Santa Fe de Bogata, ſeated on the banks of the lake Gatavita. It is the reſidence of the royal audience, and of an archbiſhop, who has for his ſuffragans the biſhops of Carthagena, Santa Martha, and Popayan. The city is large, populous, opulent, well built, and adorned with magnificent palaces and fine houſes; but as we can meet with no particular deſcription of it for leſs than a century paſt,

paſt, we may reaſonably conclude that it is much changed ſince that time. There are, beſides the capital, Tunia, Marida, Trinidada, and Truxillo.

SECT. IV.

Of the Government of POPAYAN.

Its Situation, Extent, Diviſions, Climate, Soil, and Produce; with a particular Deſcription of the Plant called Cuca and the Mopa-mopa, the dreadful Inſect named the Coya, and the Manner of obtaining Gold from the Mines. A Deſcription of the City of Popayan, and its Government.

WE now come to the government of Popayan, which is bounded on the north by the government of Carthagena; on the eaſt by the kingdom of New Granada; on the ſouth by Peru; and on the weſt its ancient boundary was the South ſea; but it has ſince been contracted by the new government of Choco; ſo that only a part of it reaches to the ſea. Its extent is not preciſely determined; but it is from eaſt to weſt about eighty leagues, and little leſs from north to ſouth. This government is divided into two juriſdictions, of which that on the north and eaſt belong to Santa Fe, or New Granada, while all thoſe parts which lie towards the ſouth and weſt are reckoned in the province of Quito.

The climate varies according to the ſituation of places, ſome being more cold than hot, others the reverſe, and ſome throughout the whole year enjoy a continual ſpring, particularly Popayan the capital. The ſame may be ſaid of the ſoil, which produces in great abundance the corn and fruit proper to its ſituation, and the farmers breed great numbers of horned cattle and ſheep. The juriſdiction of Popayan is, however, ſubject to dreadful tempeſts of thunder, lightning, and earthquakes.

Among the plants of the country of Popayan grows the cuca, an herb ſo eſteemed by the Indians in ſome provinces of Peru, that they would part with any kind of proviſions, the moſt valuable metals, gems, or any thing elſe, rather than want it. It grows on a weak ſtem, which for ſupport twiſts itſelf round another ſtronger vegetable: its leaf is about an inch and a half or two inches in length, and extremely ſmooth. The Indians make uſe of it for chewing, mixing it with a kind of chalk or whitiſh earth, called mambi. They put into their mouth a few leaves of cuca, and a proper quantity of mambi, and chewing them together, at firſt ſpit out the ſaliva, but afterwards ſwallow it; thus moving it from one ſide of the mouth to the other, till its ſubſtance is quite drained, when it is thrown away and immediately replaced by freſh leaves. This herb is ſo nutritive and invigorating, that they labour whole days without any thing elſe, and on the want of it find a decay in their ſtrength. It alſo preſerves the teeth ſound, and fortifies the ſtomach. Great quantities of this herb are cultivated by the Indians in the ſouthern provinces of Peru, and it makes no ſmall article of trade; a vaſt deal of it is in particular carried to the mine towns, that the owners of the mines may furniſh the Indians with it, who otherwiſe could not be brought to work, or would not have ſtrength to go through it. This plant is the ſame with the betel of the Eaſt Indies, and it is uſed there in the ſame manner: the Eaſtern nations, as the reader has already ſeen, are exceſſively fond of their betel, and the Indians of Peru and Popayan are no leſs ſo of their cuca.

In the moſt ſouthern diſtricts of Popayan are certain trees which yield a reſin called mopa-mopa, of which is made a varniſh, which is not only exquiſitely beautiful, but will bear boiling water, and even acids. The method of applying it is to diſſolve ſome of the reſin in one's mouth, and then wet the pencil with it; afterwards it is dipped in the colour which is to be laid on, and when dried has all the luſtre of the Chineſe lac; but with this ſuperior quality, that it never wears off nor becomes moiſt, though rubbed with ſpittle. The cabinets, tables, and other furniture made by the Indians of this country are carried to Quito, where they are highly valued.

In the valleys of Neyba, and others within this juriſdiction, is an inſect extremely remarkable for the venom it contains. Its common name is coya, or coyba: it is ſhaped like a ſpider; but is much leſs than a bug. Its colour is of a fiery red, and, like the ſpider, is generally found in the corners of walls and among the herbage. Its venom is ſo extremely malignant, that on ſqueezing the inſect, if any of it happens to fall on the ſkin, either of man or beaſt, it immediately penetrates into the fleſh, and cauſes large tumours that are ſoon ſucceeded by death. The only remedy hitherto known is on the firſt appearance of a ſwelling to ſinge the party all over the body with a flame of ſtraw, or the long graſs growing in thoſe plains. In order to this the Indians of that country lay hold of the patient, ſome by the feet and others by the hands, and with great dexterity perform the operation; after which the perſon is thought to be out of danger. However, though this inſect is ſo very noxious, yet ſqueezing it between the palms of the hands is attended with no conſequence, the callous preventing the vermin reaching the blood: accordingly the Indian muleteers ſqueeze them between the palms of their hands to gratify the curioſity of the paſſengers; but ſhould a perſon of a delicate hand make that trial, the effect would doubtleſs be the ſame as on any other part of the body.

The people who travel along theſe valleys, where they are ſo much in danger from theſe coyas, are warned by the Indians who attend them, that if they feel any thing ſtinging or crawling on their neck or face, to be careful not to ſcratch the part, nor even ſo much as lift up their hand to it, the coya being of ſo delicate a texture, that it would immediately burſt; and as there is no danger while they do not eject the humour in them, the perſon acquaints ſome of the company with what he feels, and points to the place, where if it be a coya, the other blows it away. The beaſts who are incapable of ſuch warning, are by inſtinct taught a precaution againſt the danger; for before they offer to touch the herbage with their lips, they blow on it with all their force, in order to diſperſe any of theſe pernicious vermin; and when their ſmell acquaints them that they are near a neſt of coyas, they immediately leap, and run to ſome other part. Thus they ſecure themſelves from the venom of theſe inſects, though ſometimes a mule, after all his blowing, has been known to take in ſome with his paſture, on which after ſwelling to a frightful degree, it expires on the ſpot.

Every part of the juriſdiction of Popayan abounds in mines of gold, great numbers of which are ſtill worked, and new mines are daily diſcovered. In the gold mines in theſe parts the gold is not incorporated with ſtone or other heterogeneous bodies; but is found diſperſed and mixed with the earth and gravel, as ſands are found mingled with earths of different ſpecies. Thus the whole difficulty conſiſts in ſeparating the grains of gold from the earth, which is eaſily done by running conduits of water.

The manner of extracting the gold throughout the whole juriſdiction of Popayan, is to dig out the earth of the mine, and lay it in a reſervoir made for that purpoſe; and when this is filled, water is conveyed into it through a conduit. They then ſtir the whole, which ſoon turns to mud, and the lighteſt parts are conveyed away through another conduit, which ſerves as a drain, and this is continued till only the moſt ponderous parts, as little ſtones, ſand, and gold remain at the bottom. They then go into the reſervoir with wooden buckets made for that purpoſe, in which they take up the ſediment, then moving them circularly and uniformly, and changing the water, the leſs ponderous parts are ſeparated, and at laſt the gold remains at the bottom of the bucket clear from all mixture. It is generally found in grains as ſmall as thoſe of ſand, though ſometimes what are called ſeeds, are found among it of different ſizes; but generally they run ſmall. The water iſſuing from the firſt reſervoir is ſtopped in another a little beneath it, and there undergoes a like operation, in order to ſecure any ſmall particles of gold, which from their extreme minuteneſs might be carried off by the current of the water being mixed with the earth, and other ſubſtances. And laſtly, this water is paſſed into a third reſervoir; but the ſavings here are

generally inconſiderable. The labourers are negro ſlaves; ſome of whom are employed in waſhing, while others bring earth; ſo that the waſhers are kept in continual employment. The fineneſs of this gold is generally of twenty-two carats, ſometimes more, even to twenty-three, and it is ſeldom below twenty-one.

The city of Popayan, one of the moſt ancient in theſe parts, ſtands in a large plain, which on the north ſide affords an uninterrupted proſpect of the country. It is ſituated in the ſecond degree twenty-eight minutes north latitude, on the eaſt ſide of a mountain of a middling height called M, from its reſembling that letter, and being covered with a variety of trees, affords an agreeable proſpect. The city is of a middling ſize, with broad, ſtraight, and level ſtreets, which, though not every where paved, are equally convenient. The foot-path near the houſes being paved in all parts, and the middle of the ſtreets being compoſed of hard ſmall gravel, they are never dirty in rainy weather, nor duſty in dry. The houſes are built with unburnt bricks; thoſe of note have one ſtory, and the others only a ground-floor. The church was erected into a cathedral in the year 1547, and is the only pariſh-church in the city. Here are likewiſe convents of Franciſcans, Dominicans, and Auguſtines, with a college of Jeſuits, all of which have churches; and in the latter is a grammar-ſchool. Here are alſo two nunneries. From the mountain of M iſſues a river, which by running through the city, beſides other conveniences, carries away all its ſoil. Two bridges are erected over it, one of wood, and the other of ſtone; and its waters have a particular medicinal virtue. In this mountain is alſo a ſpring of very fine water; but it not being ſufficient to ſupply the whole city, it is conveyed to the nunneries and the houſes of people of rank.

A little above a league to the north of Popayan runs the river Cauca, which is very large and deep, its current rapid, and ſubject to dangerous ſwellings in the months of June, July, and Auguſt.

The inhabitants of Popayan, where the negroes abound, are chiefly deſcended from the marriages of the whites and negroes, ſo that the number of Indians here are in general very few. This government, however, has many large villages of them, and it is only in the capital and other Spaniſh towns that they are ſo greatly outnumbered by the negroes. The inhabitants of Popayan are computed at between twenty and twenty-five thouſand, and among theſe are many Spaniſh families. While other towns ſee their inhabitants daily decreaſing, Popayan conſtantly increaſes; for the many gold mines worked all over its juriſdiction afford employment to the indigent, and conſequently occaſion a great reſort of people to theſe parts. The city of Popayan is the conſtant reſidence of the governor, whoſe office being merely civil, it is not neceſſary, as in many other places, that he ſhould be acquainted with military affairs: however, within the juriſdiction of his government all civil, political, and military affairs are under his direction. He is alſo the chief magiſtrate of the city, beſides whom are two alcaldes annually choſen, and a proper number of regidores. Here is a chamber of finances, into which are paid the ſeveral branches of the royal revenue, as the tribute of the Indians, the duty on goods, the fifth of the metals, and the like. The eccleſiaſtical chapter is compoſed of the biſhop, whoſe annual revenue amounts to ſix hundred thouſand dollars; the dean, who has five hundred; the archdeacon, chanter, rector, and treaſurer, who have each four hundred. This ſee is a ſuffragan of the archbiſhop of Santa Fe de Bogota. As Popayan lies within the juriſdiction of the inquiſition of Carthagena, it has a commiſſary from thence. Here is alſo another of the croiſade; but the authority of theſe judges does not extend beyond the dioceſe, which is far leſs than the extent of the government, a conſiderable part of it being under the juriſdiction of the archbiſhop of Quito.

CHAP. XI.

Of PERU, including QUITO, LIMA, and LOS CHARCOS.

SECT. I.

Of QUITO.

The Situation and Extent of Peru in general, and of Quito in particular. Of the Climate, Diſeaſes, Soil, and Produce of the latter; with a Deſcription of ſome of the moſt remarkable Fruits; as alſo of the City of Quito, the Manners and Cuſtoms of the Inhabitants, and their Trade.

THE great empire of Peru is bounded on the north by Popayan, laſt deſcribed, on the eaſt by the Andes, on the ſouth by Chili, and on the weſt by the Pacific ocean; extending between the equator and the twenty-fifth degree ten minutes ſouth latitude, and between the ſixtieth and eighty-firſt degree of weſt longitude, that is about eighteen hundred miles in length, and its greateſt breadth does not much exceed three hundred and ninety.

This country is divided into three grand diviſions, Quito, Lima, or Los Reyes, and Los Charcos. As to its climate, mines, ſoil, and produce, they differ greatly in different parts of the country; we ſhall therefore treat of theſe in deſcribing its ſeveral diſtricts.

The extenſive province of Quito is bounded on the north by Popayan, and includes a part of that government, and alſo by Santa Fe de Bogota; on the ſouth by the governments of Piura and Chachapoyas; on the eaſt it extends over the whole government of Maynas and the river of the Amazons to the meridian of demarkation, which divides the Spaniſh from the Portugueſe dominions; and on the weſt it is bounded by the South ſea; extending, according to Antonio de Ulloa, ſix hundred leagues in length, and about two hundred in its greateſt breadth; but this greatly exceeds the computation of all other of the great geographers. He, however, obſerves, that it muſt be owned a great part of thoſe vaſt dominions are either inhabited by nations of ſavage Indians, or have not hitherto been ſufficiently peopled by the Spaniards, if indeed they have been thoroughly known; and that all the parts that can properly be ſaid to be peopled, and actually ſubject to the Spaniſh government, are thoſe intercepted by the two Cordilleras of the Andes, which in compariſon to the extent of the country may be termed a ſtreet, or lane, fifteen leagues, or ſometimes more, from eaſt to weſt; which is the diſtance intercepted between the two Cordilleras: but to this muſt be added ſeveral detached governments, ſeparated by very extenſive tracts, inhabited by free Indians.

In order to form a right judgment of the happy temperature of the air of Quito, it is neceſſary to correct our ideas of the heat in latitudes cloſe to the equator; for experience here ſhews, that in this reſpect the climate of Quito differs from all others, ſince in the center of the torrid zone, or rather under the equinoctial, the heat is not only very tolerable, but even in ſome places the cold is painful; while others enjoy all the advantages of a perpetual ſpring, the fields being conſtantly covered with verdure, and enamelled with flowers of the moſt lively colours. The mildneſs of the climate, free from the extremes of heat and cold, and the conſtant equality of

the day and night, render this country, which from its ſituation might be thought to be parched by the conſtant heat of the ſun, and ſcarcely inhabited, both pleaſant and fertile; for nature has here ſcattered her bleſſings with ſo liberal a hand, that this country in ſeveral reſpects ſurpaſſes thoſe of the temperate zones, where the viciſſitudes of winter and ſummer, and the change from heat to cold, cauſe the extremes of both to be more ſenſibly felt. However, in different parts of the country the air is very different; in one part are mountains of a ſtupendous height and magnitude, with their ſummits covered with ſnow. The plains are temperate, the valleys hot, and, according to the high or low ſituation of the country, are found all the variety of gradations of temperature poſſible to be conceived between the extremes of heat and cold.

Quito, the capital, is ſo happily ſituated, that neither the heat nor cold is troubleſome, though both may be felt in its neighbourhood; and what renders this equality more delightful is, that it is conſtant throughout the whole year, the difference between the ſeaſons being ſcarce perceptible. Indeed the mornings are cool, the remainder of the day warm, and the nights of an agreeable temperature. Theſe being almoſt the only variations, the inhabitants make no difference in their dreſs during the whole year; for though ſome wear ſilks or light ſtuffs, at the ſame time that others are dreſſed in ſubſtantial cloth, the former are as little incommoded by the cold, as the latter are by heat.

The winds, which are healthy, blow continually, for the moſt part from north to ſouth; but never with any violence, though they ſometimes ſhift their quarters, but without any regard to the ſeaſon of the year; and were it not for ſome inconveniences to which this country is ſubject, it might be conſidered as the moſt happy ſpot on the earth: but when on the other hand theſe diſagreeable circumſtances are conſidered, all its beauties are buried in obſcurity; for here are dreadful and amazing tempeſts of thunder and lightning, and the inhabitants, in the midſt of their ſecurity, are often ſurprized by deſtructive earthquakes. The weather, during the whole morning till one or two in the afternoon, is generally extremely delightful; a bright ſun and a clear and ſerene ſky are commonly ſeen; but then the vapours begin to riſe, the whole atmoſphere is covered with black clouds, which bring on ſuch dreadful tempeſts of thunder and lightning, that all the neighbouring mountains tremble, and the city frequently feels their dreadful effects. Soon the clouds diſcharge themſelves in ſuch impetuous torrents of rain, that the ſtreets appear like rivers, and the ſquares, though ſituated on a ſlope, like lakes. This generally continues till ſun-ſet, when the weather clears up, and nature again puts on the beautiful appearance of the morning. Sometimes indeed the rains continue all night, and they have been known to laſt three or four days or more ſucceſſively. On the other hand, this general courſe of the weather has its exceptions, three, four, ſix, or even eight fine days ſucceeding each other.

The diſtinction of winter and ſummer conſiſts in a very minute difference: the interval between the month of September and thoſe of April, May, or June is here called the winter ſeaſon, and the other months compoſe the ſummer. In the former ſeaſon the rain chiefly prevails, and in the latter the inhabitants frequently enjoy whole days of fine weather; but whenever the rains are diſcontinued for above a fortnight, the inhabitants are in the utmoſt conſternation, and public prayers are offered up for their return. On the other hand, when they continue a ſhort time without intermiſſion, the like fears prevail, and the churches are again crouded with ſupplicants for obtaining fine weather; for a long drought produces dangerous diſeaſes, and a continual rain, without intervals of ſun-ſhine, deſtroys the fruits of the earth.

It is probably owing to ſome unknown quality of the air that the city of Quito is entirely free from muſkettoes and other inſects of that kind, which in hot countries render life almoſt a burthen. They are not even known to the inhabitants, and even a flea is ſeldom ſeen here, nor are the people moleſted with venomous reptiles. The only troubleſome inſect here is the nigua, or pique, a very ſmall inſect ſhaped like a flea, but hardly viſible to the ſight. They live among the duſt, and inſinuate themſelves into the legs, the ſoles of the feet, or toes, and pierce the ſkin with ſuch ſubtlety that there is no being aware of them, till they have made their way into the ſkin, and taken up their lodging between that and the membrane of the fleſh, where ſucking the blood they form a nidus covered with a white and fine tegument, reſembling a flat pearl, where it depoſits its eggs, and as the number of theſe increaſes the nidus enlarges. There is an abſolute neceſſity of extracting it, for otherwiſe it would burſt of itſelf, and thus ſcatter an infinite number of ſmall nits, which becoming niguas would in a manner undermine the whole foot. Theſe cauſe extreme pain, eſpecially during the operation of extracting them; for ſometimes they penetrate even to the bone. Theſe inſects are very common at Carthagena, and many other places, as well as here.

Though the plague is unknown here, and in every other part of America; they have other diſeaſes that have many ſymptoms of it, as maligniant ſpotted fevers and pleuriſies, which, when they prevail, ſweep away prodigious numbers. Another diſeaſe here is called vicho, or mal del valle, which is a kind of gangrene in the rectum, and to which perſons afflicted with the flux are moſt liable. The venereal diſeaſe is ſo common, that few perſons are free from it, and its commonneſs effaces the diſgrace with which it is attended in other countries. During the continuance of the north and north-eaſt winds, which are the coldeſt, the inhabitants are afflicted with painful catarrhs. Canine madneſs is entirely unknown in America; but there is here a diſeaſe that in ſome reſpects reſembles it, and in others the ſmall-pox; this diſeaſe few or none eſcape, but having once had it, are never more afflicted with it. The ſymptoms are convulſions in every part of the body, a continual endeavour to bite, a delirium, and vomiting blood. Thoſe whoſe conſtitutions are unable to ſupport the conflicts of this diſtemper, periſh; but this is equally common throughout all South America.

The fertility of the ſoil is incredible, for the fruits and beauties of the ſeveral ſeaſons are ſeen here at the ſame time, and the curious European obſerves with a pleaſing admiration, that while ſome herbs of the field are fading, others of the ſame kind are ſpringing up; while ſome flowers loſe their beauty, others blow to continue the enamelled proſpect: thus, when the fruits of the trees have attained their maturity, and the leaves begin to change their colours, freſh leaves bloſſom, and fruit are ſeen in their proper gradations in ſize and ripeneſs on the ſame tree. The ſame inceſſant fertility is conſpicuous in the corn, both reaping and ſowing being carried on at the ſame time. That corn which had been lately ſown is coming up, that which has been longer ſown is in ear, and the more advanced is perfectly ripe; ſo that the declivities of the neighbouring hills exhibit all the beauties of the four ſeaſons in one ſingle view. Though all this is generally ſeen, yet there is a ſettled time for the grand harveſt: but ſometimes the moſt favourable ſeaſon for ſowing in one place is a month or two after that of another, though their diſtance does not exceed three or four leagues. Thus in different ſpots, and ſometimes in one and the ſame, ſowing and reaping are performed throughout the whole year, the forwardneſs or retardment naturally ariſing from the different ſituations, as mountains, riſing grounds, plains, and valleys; and the temperature being different in each, the beſt times for performing the ſeveral operations of huſbandry muſt alſo differ.

The only article of food of which there is here any ſcarcity is pulſe; but this deficiency is ſupplied by roots. The principal of theſe are the camates, arucachas, yucas, ocas, and papas. The three former are the natives of hot countries, and cultivated in the plantations of ſugar-canes, and in the ſpots called valleys and yungas, the former ſignifying here plains in a bottom, and the latter on the ſides of the Cordilleras; but both in a hot expoſure. In theſe are produced plantanes, guincos, Guinea pepper, granadillas, and others natural to warm climates. The cold parts produce pears, peaches, apricots, nectarines, melons, water-melons, quaitambos, and aurimelos. The parts which can neither be denominated hot nor cold produce frutillas, or Peruvian ſtrawberries. The

ſucculent

ſucculent fruits which require a warm climate are likewiſe here in great plenty throughout the whole year, as China and Seville oranges, lemons, citrons, limes, cidras, and toronjas. Theſe trees are full of bloſſoms and fruit all the year round, equally with thoſe that are natives of the climate, and abundantly ſupply the tables of the inhabitants.

We ſhall now give a particular account of ſome of the moſt remarkable of theſe fruits.

The chirimoya is univerſally allowed to be one of the moſt delicious fruits in the world. Its dimenſions are various, it being from one to five inches in diameter. Its figure is imperfectly round, flatted towards the ſtalk, where it forms a kind of navel; but all the other parts are nearly circular. It is covered with a thin ſoft ſhell, which adheres ſo cloſely to the pulp, as not to be ſeparated from it without a knife. The outward coat is green, variegated with prominent veins, forming all over it a kind of network. The pulp is white, and contains a large quantity of juice reſembling honey, of a ſweet taſte, mixed with a gentle acid of a moſt exquiſite flavour. The ſeeds are formed in ſeveral parts of the pulp, and are ſomewhat flat. The tree is high and tufted, the ſtem large and round, but with ſome inequalities full of elliptic leaves, terminating in a point. The bloſſom differs little from the colour of the leaves, which is a darkiſh green; and though far from being beautiful, is remarkable for its incomparable fragrance, and are therefore ſo much admired by the ladies, that they purchaſe them at any price.

The granadilla in its ſhape reſembles a hen's egg, but is larger. The outſide of the ſhell is ſmooth, gloſſy, and of a faint carnation colour, and the inſide white and ſoft. The ſhell contains a viſcous liquid ſubſtance full of very ſmall and delicate grains, leſs hard than thoſe of the pomegranate. This medullary ſubſtance is ſeparated from the ſhell by a fine and tranſparent membrane. This fruit has a delightful ſweetneſs blended with acidity, very cordial and refreſhing, and ſo wholeſome that there is no danger of indulging one's appetite.

The laſt of the fruits we ſhall mention is the frutilla, or Peruvian ſtrawberry, which is very different from that of Europe in ſize; for though they are here generally not above an inch in length, they are much larger in other parts of Peru; but their taſte, though juicy, and not unpalatable, is not equal to thoſe in Europe.

The city of Quito is ſeated in thirteen minutes thirty-three ſeconds ſouth latitude, on the eaſtern ſkirts of the weſt Cordillera of the Andes, thirty-five leagues weſt of the coaſt of the South ſea. The city is built on the acclivity of the mountain of Pichincha, which riſes far above the clouds, and ſurrounded by others of a middling height, among a number of breaches or clefts, ſome of which are of a conſiderable depth, and run quite through the city, ſo that great part of the buildings ſtand upon arches: this renders the ſtreets irregular and extremely uneven. Near the city are two ſpacious plains, one on the ſouth three leagues in length, and the other on the north about two leagues in extent; and both being interſperſed with ſeats and cultivated land, greatly add to the proſpect of the city, they being continually covered with a lively verdure enamelled with flowers. This ſcene is beautifully diverſified with a multitude of cattle feeding on the eminences. Theſe two plains contract as they approach the city, and at their junction form a neck of land covered with thoſe eminences on which part of Quito ſtands. It may perhaps appear ſtrange, that, notwithſtanding two ſuch beautiful and extenſive plains are ſo near, the city ſhould be placed in ſo inconvenient a ſituation; but the firſt founders were fond of building it on the ſpot where ſtood the ancient capital of the Indians. It was formerly in much greater repute than it is at preſent, for the inhabitants now daily decreaſe, and whole ſtreets of Indian huts are entirely forſaken.

The principal ſquare is ſpacious, well built, and furniſhed with ſome very magnificent buildings. On one ſide of the ſquare ſtands the cathedral, and oppoſite to it is the epiſcopal palace; the third ſide is taken up by the town-houſe; the fourth by the palace of the audience; and in the center is an elegant fountain: but the ſquare is rather diſfigured than adorned by the palace of the audience, the greateſt part of it being ſuffered to run to ruin, and only a few halls and offices taken care of. Four ſtreets terminating at the angles of the ſquare are ſtraight, broad, and handſome; but at the diſtance of three or four hundred yards from the ſquare begin the troubleſome declivities, which deprive the inhabitants of the uſe of coaches or any other wheel-carriages.

Except the four ſtreets above-mentioned, all the reſt are crooked, and deſtitute both of order and ſymmetry. Some of them are croſſed by breaches, and the houſes ſtand on the ſides of their winding, coarſe, and irregular projections. Some parts are ſituated at the bottom of theſe breaches, and others on their ſummits. The principal ſtreets are paved; but thoſe which are not are almoſt impaſſable after rain.

Beſides the chief ſquare there are two others, both very ſpacious, with ſeveral others that are ſmaller. In theſe the greateſt part of the convents are ſituated, and thence make a very handſome appearance, their fronts being adorned with all the embelliſhments of architecture, particularly the Franciſcan convent, which is built of free-ſtone, and from the diſpoſition of the parts, and the elegant taſte of the whole, is ſaid to be equal to the moſt admired buildings in Europe. The principal houſes are very large, and ſome of them have ſpacious and well contrived apartments, though none are above one ſtory in height, which is ſeldom without a balcony towards the ſtreet; but their doors and windows are very low and narrow. They are built with unburnt brick, cemented by a mortar of uncommon hardneſs, that was in uſe among the ancient Indians.

The city is divided into ſeven pariſhes, including the cathedral, which, beſides the richneſs of its furniture, is ſplendidly adorned with tapeſtry and other coſtly decorations; but others of the pariſh-churches are mean; tho' the chapel del Sagrario is very large, built wholly of ſtone, and its architecture executed in an elegant taſte.

The convents of monks are thoſe of the Auguſtines, Dominicans, and the fathers of Mercy, who are the heads of provinces: beſides theſe there is another of Franciſcan Recollects, another of Dominicans, and another of the fathers of Mercy; a college of Jeſuits, and two colleges for ſeculars, in one of which is an univerſity under the patronage of St. Gregory. Here are alſo ſeveral nunneries, as that of the Conception, the orders of St. Clare, St. Catharine, and two of bare-footed Thereſians. The college of Jeſuits, as well as all the convents of monks, are very large, well built, and ſplendid; and the churches belonging to them magnificently decorated, eſpecially on ſolemn feſtivals, when the vaſt quantities of wrought plate, rich hangings, and coſtly ornaments expoſed to public view, are really amazing; and the nunneries, though they do not exhibit ſuch riches, exceed them in the elegance and delicacy with which they are adorned. Here is alſo an hoſpital under the care of the order of Our Lady of Bethlehem.

The cathedral chapter conſiſts of the biſhop, whoſe annual revenue amounts to twenty-four thouſand dollars; a dean, who has two thouſand five hundred; an archdeacon, chanter, treaſurer, and a doctoral, who have two thouſand a year each; three canons, who have fifteen hundred each; four prebends, who have ſix hundred each; and two demi-prebends, each of whom has four hundred and twenty. In this cathedral the feſtivals of Corpus Chriſti and the Conception of Our Lady are celebrated with amazing magnificence; but the ſingular pomp in the proceſſion of the hoſt in the former ought not to be omittted. All the houſes of the ſtreets through which it paſſes are adorned with rich hangings, and ſuperb triumphal arches are erected, with altars at ſtated diſtances that riſe higher than the houſes, on which, as on the triumphal arches, are piled up ſuch immenſe quantities of wrought plate and jewels, diſpoſed in ſuch an elegant manner, as render the whole even more pleaſing than the aſtoniſhing quantity of riches. All the perſons in public offices march in magnificent dreſſes, and a number of Indians in rich habits, with bells on their legs and playing on the tabor and pipe, attend the ceremony with their dances.

With reſpect to the courts held at Quito, the principal is that of the royal audience, which conſiſts of the preſi-

dent,

dent, who is governor of the province, with regard to law affairs; four auditors, who are at the ſame time civil and criminal judges; a royal fiſcal, who, beſides the cauſes brought before the audience, takes cognizance of every thing relating to the revenue; and an officer ſtiled the protector of the Indians, who ſolicits for them, and when they are injured pleads in their defence.

The next is the treaſury, the chief officers of which are an accomptant, a treaſurer, and a royal fiſcal.

The tribunal of the Croiſade, which has a commiſſary, who is generally ſome dignitary of the church, and a treaſurer.

Here is alſo a treaſury for the effects of perſons deceaſed; an inſtitution eſtabliſhed all over the Indies, for receiving the goods of thoſe whoſe lawful heirs were in Spain, in order to ſecure them from thoſe accidents to which they might be liable in private hands.

Here is likewiſe a commiſſary of the inquiſition, with an alguazil-major and familiars, appointed by the inquiſition at Lima.

The corporation conſiſts of a corregidor, two ordinary alcaldes, choſen annually, and regidores. Theſe ſuperintend the election of the alcaldes, which is attended with no ſmall diſturbance, the people being divided into two parties, the Creoles and Europeans.

This city is very populous, and has among its inhabitants ſome families of high rank and diſtinction, deſcended either from the original conquerors, or perſons who at different times came from Spain inveſted with ſome lucrative poſt. The number of great families is however but ſmall.

The commonalty may be divided into four claſſes, the Spaniards, Meſtizos, Indians, and Negroes, with their progeny; but the laſt are not near ſo numerous in proportion to the reſt, as in other parts.

The Creoles are well made, of a proper ſtature, and of a ſively and agreeable countenance. The Meſtizos are alſo in general well made, often taller than the ordinary ſize, very robuſt, and have an agreeable air. The Indians, both men and women, are commonly low, though ſtrong and well proportioned; but more natural defects are to be found among them than in any of the reſt. Some are remarkably ſhort, ſome ideots, dumb, or blind. Their hair is generally thick and long, which they wear looſe on their ſhoulders; but the Indian women plait theirs behind with a ribbon, and cut that before a little above the eye-brows, from one ear to the other. The greateſt diſgrace that can be offered to an Indian of either ſex is to cut off their hair; for whatever corporal puniſhment their maſters think proper to inflict on them, they bear with patience; but this affront they never forgive; and accordingly the government has interpoſed and limited this puniſhment to the moſt enormous crimes. Its colour is generally a deep black: but it is lank, harſh, and as coarſe as that of a horſe. On the contrary, the Meſtizos, in order to diſtinguiſh themſelves from the Indians, cut off their hair; but the women do not imitate them.

The country is obſerved to abound more in women than in men, which is the more remarkable as thoſe cauſes which induce men to leave their country, as travelling, commerce, and war, naturally bring over more men from Europe than women. But there are many families in which there are a number of daughters, without one ſon among them. The women enjoy a more vigorous ſtate of health, which may be owing in ſome meaſure to the climate, and more particularly to the early intemperance and voluptuouſneſs of the other ſex.

The whites may be conſidered as one ſixth part of the inhabitants, and the Meſtizos, who are the deſcendants of the Spaniards and Indians, may be reckoned a third. The next claſs is the Indians, who form about another third, and the others who are deſcended from theſe are about one ſixth. Theſe, according to the moſt authentic accounts, amount to between fifty and ſixty thouſand perſons of all ages, ſexes, and ranks. The Spaniards it is natural to think are the moſt eminent for riches, rank, and power; yet it muſt be owned that many of them are, in proportion, the moſt poor, miſerable, and diſtreſſed; for whatever be their circumſtances, they diſdain to apply themſelves to any mechanic buſineſs, conſidering it as a diſgrace to that quality they ſo highly value themſelves upon, which conſiſts in their not being black, brown, or of a copper colour. The Meſtizos readily apply themſelves to arts and trades; but chuſe thoſe of the greateſt repute, as painting, ſculpture, and the like, in which they particularly excel. Some of them have acquired great reputation; and ſome of the works of one of theſe Meſtizos have been carried even to Rome, where they were honoured with the unanimous applauſe of the virtuoſi: and what renders their exquiſite performances ſtill more admirable, is their wanting the tools that might be thought neceſſary to perform them with any tolerable degree of accuracy: but they are exceſſively indolent and ſlothful. The Indians, who are generally ſhoemakers, bricklayers, weavers, and the like, are not more induſtrious. Of theſe the moſt active and tractable are the barbers and phlebotomiſts, who equal the moſt expert hands in Europe. The ſhoemakers, on the other hand, are ſo ſlothful, that you have frequently no other way left to procure the ſhoes you have beſpoke, than to purchaſe the materials, and lock up the Indian till they are finiſhed. This is chiefly owing to the cuſtom of paying for the work before it is done; for when the Indian has got the money, he ſpends it all in chicha, a kind of ale made of maize, and is never ſober while it laſts, and he is afterwards unwilling to work for what he has ſpent.

With reſpect to the dreſs of the inhabitants, the Spaniards, who wear a black cloak, have under it a long coat with a cloſe ſleeve open at the ſide; and along the ſeams of the body, as well as thoſe of the ſleeves, are button holes, and two rows of buttons for ornament. In every other particular, people of fortune affect great magnificence, wearing the fineſt cloths or ſilk ſtuffs, and very often gold and ſilver tiſſues.

The ladies of the firſt rank wear on the upper parts of the body a ſhift, on which is a looſe jacket laced; and over all a piece of baize. Every part of their dreſs is as it were covered with lace; and on days of ceremony, they wear the richeſt ſtuffs, with a profuſion of ornaments. Their hair is generally made up in treſſes, which they form into a kind of croſs on the nape of the neck, tying a rich ribbon twice round their heads, and forming the ends into a roſe at their temples. Thoſe roſes are intermixed with diamonds and flowers, and have a very pleaſing effect. When they go to church they ſometimes wear a full petticoat; but the moſt uſual dreſs on theſe occaſions is the veil.

The Meſtizos in general wear a blue cloth, manufactured in this country; but though the loweſt claſs of Spaniards are very ambitious of diſtinguiſhing themſelves from them, either by the colour or faſhion of the cloaths, there appears but little difference between them.

The Meſtizo women affect to dreſs in the ſame manner as the Spaniſh, though they cannot equal the ladies in the richneſs of their ſtuffs. The meaner ſort wear no ſhoes; but, like the men of the ſame rank, go barefooted.

The dreſs of the Indians conſiſts of white cotton drawers, which hang down to the calf of the leg, where they are looſe, and edged with a lace ſuitable to the ſtuff. The uſe of a ſhirt is ſupplied by a black cotton frock, made in the form of a ſack, with three openings at the bottom, one in the middle for the head, and others at the corners for the arms; and thus covers their naked bodies down to the knees. Over this is a ſerge cloak, with a hole in the middle for putting the head through, and a hat made by the natives. This is their general dreſs, which they never lay aſide, even while they ſleep; and they have no additional cloathing for their legs or feet. The Indians who have acquired ſome fortune, particularly the barbers and phlebotomiſts, diſtinguiſh themſelves from their countrymen by the fineneſs of their drawers, and by wearing a ſhirt, which, though without ſleeves, has a lace four or five fingers in breadth, faſtened round like a kind of ruff or band. They are fond of ſilver or gold buckles to their ſhoes, though they wear no ſtockings; and inſtead of a mean ſerge cloak, wear one of fine cloth, which is often adorned with gold or ſilver lace.

There are two kinds of dreſſes worn by the Indian women, made in the ſame plain manner with thoſe worn by the men in general, the whole conſiſting of a ſhort petticoat and a veil of American baize. But the dreſs of the loweſt

loweſt claſs of Indian women is only a bag of the ſame make and ſtuff as that of the men, which they faſten on their ſhoulders with two large pins: it reaches down to the calf of the leg, and is faſtened round the waiſt with a kind of girdle. Inſtead of a veil, they wear about the neck a piece of the ſame coarſe ſtuff, dyed black; but their arms and legs are naked. The caciqueſſes, or Indian women, who are married to the alcaldes-majors, governors, and others, diſtinguiſh themſelves by wearing a petticoat of baize adorned with ribbons, over which they have a ſort of black mantle, open on one ſide, plaited from top to bottom, and generally faſtened round the waiſt with a girdle. Inſtead of the veil worn by the common Indian women, they have one much fuller plaited and hanging down from the back part of the head almoſt to the bottom of the petticoat. This they faſten before with a large ſilver bodkin. Their head-dreſs is a piece of fine linen, curiouſly plaited, with the end hanging down behind, and they never appear abroad without their ſhoes.

The youth of family are here inſtructed in philoſophy and divinity; and ſome ſtudy the civil law, which they generally follow with reluctance. In theſe ſciences they ſhew a great deal of judgment and vivacity, but are very deficient in hiſtorical and political knowledge, as well as in other ſciences. The only employment of perſons of rank, who are not eccleſiaſtics, is viſiting their eſtates, where they reſide during the time of harveſt; but few of them apply themſelves to commerce, permitting that lucrative branch to be poſſeſſed entirely by the Europeans. However, a few Creoles and Meſtizos keep ſhops in the city.

The women of rank have a graceful carriage, and an amiable temper; qualities which are indeed common to the whole ſex in this part of America. Their children are always educated under their own eyes, though little to their advantage, their extreme fondneſs preventing their ſeeing thoſe vices which ſo often bring youth to ruin and infamy; they frequently endeavour to hide the vices of the ſon from the father; and when he diſcovers them, interpoſe paſſionately in defence of their favourite, in order to prevent his being corrected.

The want of proper employments, and the great neglect of education in the common people, occaſion their balls and entertainments, of which they are extremely fond, to be conducted in the moſt licentious manner; but perſons of rank and character are never ſeen at theſe meetings.

The people have diſhes unknown in Europe; but are particularly fond of cheeſe; and have alſo excellent butter in the neighbourhood of Quito. Sweetmeats are more admired here than in any other country, which neceſſarily occaſions a great conſumption of honey and ſugar. One method of indulging this appetite is to ſqueeze the juice out of the ſugar-canes, let it ſettle, and curdle it; out of this curd they make ſmall cakes, called raſpaduras, which are ſo highly valued by the lower claſs, that with a ſlice of it, and another of bread and cheeſe, they make as hearty a meal as the rich with all their variety of diſhes.

Rum is commonly drank here by perſons of all ranks; but their favourite liquor is brandy. The diſorders ariſing from the exceſſive uſe of ſpirituous liquors are chiefly ſeen among the Meſtizos; and the lower claſs of women, both among the Creoles and Meſtizos, are alſo extremely addicted to the ſame ſpecies of debauchery.

Another liquor much uſed in this country is mate, which is made of an herb, known in all theſe parts of America by the name of paraguay, as being the produce of that country. Some of it is put into a calabaſh tipped with ſilver, called here mate, with ſugar and ſome cold water. After it has continued thus ſome time, the calabaſh is filled with boiling water, and they drink the liquor through a pipe fixed in the calabaſh. In this manner the veſſel is filled ſeveral times with water, and freſh ſupplies of ſugar, till more of the herb is wanting. It is alſo uſual to ſqueeze into the liquor a ſmall quantity of the juice of lemons or Seville oranges, mixed with ſome perfumes from odoriferous flowers. This is their uſual drink in the morning faſting, and many uſe it alſo at their evening regale. The manner of drinking it appears very indelicate, the whole company drinking ſucceſſively through the ſame pipe, it being carried ſeveral times round the company till all are ſatisfied. This among the Creoles is the higheſt enjoyment; ſo that when they travel they never fail to carry with them a ſufficient quantity of it, and till they have taken their doſe of mate they never eat.

The vice of gaming is here carried to an extravagant height, perſons of rank and opulence have led the way, and their inferiors have almoſt univerſally followed their example, to the ruin of many families, ſome loſing their ſtocks in trade, others the very cloaths from their backs, and afterwards thoſe belonging to their wives, which they hazard with the hopes of by that means recovering their own.

The common people, the Indians, and even the domeſtics, are greatly addicted to ſtealing. The Meſtizos, though arrant cowards, do not want audacity in this way; for though they will not venture to attack any one in the ſtreet, it is a common practice to ſnatch off a perſon's hat, and immediately ſeek their ſafety in flight. Trifling as this acquiſition may ſeem, it is ſometimes of conſiderable value; the hats worn by perſons of rank, and even by the wealthy citizens when dreſſed, being of white beaver, worth fifteen or twenty dollars, beſides the hatband of gold or ſilver lace faſtened with a gold buckle, ſet with diamonds or emeralds. However, robberies on the high-way are ſeldom heard of.

In Quito, and in all the towns and villages of its province, different dialects are ſpoken, Spaniſh being no leſs common than the Inga, the language of the country. The Creoles uſe the latter as much as the former, but both are conſiderably adulterated by borrowed words and expreſſions. The firſt language generally ſpoken by children is the Inga; for the nurſes being Indians, many of them do not underſtand a word of Spaniſh, and thus they afterwards learn a jargon compoſed of both languages.

The ſumptuous manner of performing the laſt offices of the dead demonſtrates how far the power of habit is capable of prevailing over reaſon and prudence; for their oſtentation is ſo great in this particular, that many families of credit are ruined by prepoſterouſly endeavouring to excel others; and the people here may be ſaid to toil and ſcheme to lay up wealth to enable their ſucceſſors to laviſh honours upon a body inſenſible of all pageantry.

With reſpect to the commerce of the province of Quito, the perſons who are the chief conductors of it are the Europeans ſettled here, and others coming occaſionally. The latter purchaſe the country goods, and ſell thoſe of Europe. The manufactures of this province are only cottons, ſome white and ſtriped baize and cloths, which meet with a good market at Lima, for ſupplying the inward provinces of Peru. The returns are made partly in ſilver, and partly in fringes made of gold and ſilver thread, with wine, brandy, oil, copper, tin, lead, and quickſilver. On the arrival of the galleons at Carthagena theſe traders reſort thither to purchaſe European goods, which, at their return, they conſign to their correſpondents all over the province. The coaſts of New Spain ſupply this province with indigo, of which there is a very large conſumption at the manufactories, blue being univerſally the colour which this people affect in their apparel. They alſo import, by way of Guayaquil, iron and ſteel both from Europe and the coaſt of Guatemala.

SECT. II.

Of the ſeveral Juriſdictions in the Province of Quito; a Deſcription of the Town of San Miguel de Ibarra, with the Manner of catching wild Aſſes; and a particular Account of the Cochineal Inſect.

THE province of Quito is divided into nine juriſdictions, which, beginning at the north, are San Miguel de Ibarra, Otabalo, the city of Quito, Latacunga, Rio Bamba, Chimbo, or Guaranda, Guayaquil, Cuenca, and Loja, of which we ſhall only deſcribe what appears moſt worthy of notice.

The town of San Miguel de Iberra is ſeated at the extremity of an extenſive plain, at a ſmall diſtance from a chain of mountains, and between two rivers, which give the plain a perpetual verdure. It is of a middling ſize, with ſtraight broad ſtreets, and moſt of the houſes of ſtone or unburnt brick, and all tiled. It is ſurrounded with ſuburbs inhabited by the Indians, whoſe cottages make a mean appearance; but the houſes in the town are neat and uniform, though they have only a ground-floor, except thoſe in the ſquare, which have one ſtory. The pariſh-church is a large and elegant ſtructure well ornamented. The town has convents of Franciſcans, Dominicans, and the fathers of Mercy, with a college of Jeſuits, and a nunnery of the order of the Conception. The inhabitants are computed at ten or twelve thouſand ſouls.

In this juriſdiction ſugar-canes ripen pretty early, and yet may at any time be committed to the mill, there being no neceſſity for cutting them at any preciſe time, they retaining all their goodneſs even when ſuffered to ſtand two or three months after they are ripe; ſo that they are cut every quarter, and the mills kept at work during the whole year.

Within the diſtrict of the village of Mira in this juriſdiction are a great number of wild aſſes, which increaſe very faſt, and are not eaſily caught. The owners of the grounds where they breed allow all perſons, on paying a ſmall acknowledgment, to take as many as they can, in proportion to the number of days they employ in the ſport. The manner in which they are caught is as follows: ſeveral perſons go on horſeback, attended by Indians on foot, and on their arrival at a proper place form a circle in order to drive them into ſome valley, where, riding at full ſpeed, they throw a halter, the end of which is formed into a nooſe, over their heads; for theſe creatures, on finding themſelves encloſed, make furious efforts to eſcape, and if only one forces his way through, they all follow with irreſiſtible impetuoſity: but the hunters having caught them in the nooſe, throw them down, ſecure their legs, and leave them till the hunting is over, when, in order to bring them away, they pair them with tame beaſts; but this is not eaſily performed, they being ſo fierce as often to hurt the perſons who undertake to manage them. They have all the ſwiftneſs of horſes, and neither ſteep aſcents nor declivities retard them in their career; and when attacked they defend themſelves with their mouth and heels with ſuch activity, that without ſlackening their pace they often maim their purſuers: yet after carrying the firſt load their celerity leaves them, their dangerous ferocity is loſt, and they ſoon contract the ſtupid look and dullneſs peculiar to the reſt of their ſpecies. It is alſo obſervable, that they will not permit any horſe to live among them; and if one happens to ſtray into the places where they feed, they all fall upon him and, without giving him the liberty of flying from them, bite and kick him till they leave him dead on the ſpot. They are very troubleſome neighbours, for whenever one or two of them begins to bray, they are anſwered in the ſame vociferous manner by all within the reach of the ſound, which is greatly increaſed and prolonged by the repercuſſions of the valleys and cliffs of the mountains.

In the juriſdiction of Loja is produced that famous ſpecific for intermitting fevers known by the name of quinquina, or the Jeſuits bark. The tree which produces it is about ſeven yards high, and the body and branches of a proportionable thickneſs. The Indians, in order to take off the cortex, cut down the tree, bark it, and dry the quinquina. Though there are here large foreſts of this tree, there is a ſenſible diminution of them, occaſioned by the Indians not ſowing the ſeed, thoſe growing ſpontaneouſly being by no means equal in number to thoſe cut down.

The juriſdiction of Loja has alſo a very great advantage from breeding the cochineal inſect, which is reckoned of equal goodneſs with that of Oaxaca in New Spain: but the inhabitants are ſo far from applying themſelves to this buſineſs ſo effectually as to ſupply the demands of trade, that they breed no more than they imagine will be ſufficient for the dyers in that and the neighbouring juriſdiction of Cuenca. To this elegant and laſting colour it is probably owing, that the carpets of Loja and the baize of Cuenca are preferred to all others.

The cochineal inſect is bred on a plant called by the name of nopal, or the Indian fig tree, in Latin opuntia maxima. The method of planting it is by making rows of holes about half a yard deep, and about two yards diſtant from each other. In each of theſe holes is placed one or two leaves of the nopal in a flat poſition, and then covered with earth. This leaf ſoon ſhoots up into a ſingle ſtem, which, during its growth, divides into ſeveral branches, and theſe ſucceſſively produce freſh leaves, the largeſt being neareſt the ſtem, which is full of knots, as are alſo the branches, and from theſe the leaves have their origin. The plant ſeldom exceeds three yards in height, its bloſſom is ſmall, of a bright red, and in the ſhape of a bud, from the center of which proceeds the fruit. When the fig is ripe the outward ſkin becomes white; but the pulp is ſo fully impregnated with a deep red, that it tinges the urine of thoſe who eat it; yet few fruits are more pleaſant and wholeſome. The cochineal was formerly imagined to be a fruit or ſeed of ſome particular plant; but it is now known to be inſects which breed and are nouriſhed on theſe trees, where they place their eggs among the leaves. The juice of the plant, which is their ſole nouriſhment, is converted into their ſubſtance, which is thus rendered of a beautiful crimſon colour. When the inſects are at their full growth they are gathered, and put into earthen pots; but great care is neceſſary to prevent their getting out, as in that caſe great numbers would be loſt. When they have been confined ſome time in theſe pots, they are killed and put in bags. The Indians have three methods of killing them, one by fire, another by the rays of the ſun, and a third by hot water; and to theſe are owing the ſeveral gradations of the colour. The method of killing them by fire is to put them on ſhovels into an oven moderately heated, the fine quality of the cochineal depending on its not being over dried at the time of killing the inſects. However, the beſt method of deſtroying this valuable creature ſeems to be by the rays of the ſun. It is remarkable that this inſect does not in any viſible manner injure the plant, but extracts its nouriſhment from the moſt ſucculent juice which it ſucks by means of its proboſcis through the fine teguments of the leaves.

SECT. III.

Of the Governments of Quixos, Macas, and Jaen de Bracamoros; their Situation, Climate, Extent, and Produce.

BESIDES the juriſdictions we have mentioned, there are five governments in the province of Quito; one of which is included in part of the province of Popayan, already deſcribed; we ſhall begin with thoſe of Quixos, Macas, and Jaen de Bracamoros.

The two former are ſeated on the eaſt ſide of the cordillera of the Andes. Quixos, which lies on the north, joins to the juriſdiction of Popayan, to the eaſtward it extends to a river named Aguarico, and on the weſtward it reaches to a part of the cordilleras of the Andes. The towns are here very ſmall, and unworthy of a particular deſcription: the principal are the cities of Archidona and Avila, whoſe inhabitants are obliged to be conſtantly on their guard againſt the free Indians, by whom they are ſurrounded, who frequently commit depredations among their houſes and plantations. They compoſe different nations, and are ſo diſperſed all over the country, that every village is under continual apprehenſions from thoſe that live in its neighbourhood.

The air of this country is hot and very moiſt, the rains are almoſt continual, and the country is covered with thick woods, in which are ſome trees of a prodigious magnitude. In the ſouth and weſt part of Quixos is the cinnamon tree, a great quantity of which is cut for uſe in the province of Quito; but the cinnamon is inferior to that of the Eaſt Indies.

The government of Macas is bounded on the eaſt by the government of Maynas, on the ſouthward by that of Bracamoros, and on the weſtward by the eaſt cordillera

of the Andes. The nearneſs of Macas to thoſe mountains cauſes a ſenſible difference in the climate; for tho' it be alſo a woody country, the diverſity between the two moſt diſtant ſeaſons of the year is manifeſt. Thus winter begins here in April, and laſts till September; the atmoſphere is then clear, the ſky ſerene, and the earth cloathed with its various beauties.

The country is very fruitful in corn; but one of the chief employments of the country people is the culture of tobacco, which, being of an excellent kind, is exported in rolls all over Peru. Sugar-canes and cotton alſo thrive well; but the dread of the free Indians, who have often ravaged the country, diſcourages them from planting more than is juſt ſufficient for preſent uſe; they being here in the ſame unhappy ſituation as the people of Quixos, the villages having in their neighbourhood bands of Indians, who, when they imagine them to be fartheſt off, ſuddenly aſſault them.

Among the infinite variety of trees in this country, one of the moſt remarkable is the ſtorax, the gum of which is of a moſt exquiſite fragrance; but is ſcarce, the trees growing in places at ſome diſtance from the villages, and it is dangerous going to them, on account of the hatred of the free Indians to all the Spaniards, and who lie in wait for them. The ſame may be ſaid with reſpect to ſome mines of ultra marine, from which very little is brought, on account of the danger, though a finer colour cannot be imagined. This territory alſo produces cinnamon trees, which ſome, who are allowed to be extremely well verſed in natural hiſtory, maintain to be of a ſuperior quality to that of the iſle of Ceylon. It viſibly differs from that of Quixos; but is ſuppoſed to owe its ſuperior excellence to the trees being more fully expoſed to the rays of the ſun, they not being here intercepted by the foliage of any other trees. Great quantities of copal are brought from Macas, and alſo wild wax; but the latter is of little value.

The government, which on the ſouth limits the juriſdiction of the audience of Quito, and follows next to Macas, is that of Jaen de Bracamoros, whoſe inhabitants amount to about three or four thouſand, who are for the moſt part Meſtizos, with ſome Indians, and but very few Spaniards.

The climate is like that of Quixos, only the rains are neither ſo laſting nor ſo violent. The ſoil is very fruitful in all the grain and products agreeable to the climate, and the country full of wild trees, particularly the cacao, which is produced in the greateſt abundance; but though it is equal to that cultivated in plantations, it is of little uſe, for want of conſumption; and the carriage to any diſtant parts would be attended with ſuch expence as would prejudice the ſale. Thus the fruit rots on the trees, or is eaten by monkeys or other animals. There are here produced vaſt quantities of tobacco, the inhabitants being chiefly employed in its cultivation. It is prepared by ſteeping it in hot mead, or decoctions of fragrant herbs, in order to improve its flavour; and being made into rolls, is ſent all over Peru, and the kingdom of Chili. The country alſo produces a great deal of cotton, and a prodigious number of mules. In the three governments juſt mentioned are a great many wild beaſts, which have been already deſcribed in treating of countries of a like climate; but beſides theſe are baſtard lions, bears, and the danta, an animal of the ſize of a bullock, and very ſwift; its colour is generally white, and its ſkin very much valued for making buff leather. It is remarkable, that in the middle of its head is a horn bending inward. Theſe three kinds of wild beaſts are unknown in the other countries of the torrid zone, and their being known here, is owing to the proximity of this government to the cordilleras of the Andes; for in thoſe mountains they breed in a cold climate adapted to their nature, and from thence ſometimes come down into this country.

Among the reptiles is the maca, a ſnake that has a ſhining ſpotted ſkin, like that of the tiger; but entirely covered with ſcales. It makes a moſt frightful appearance, its head being greatly larger than might be expected from the thickneſs of its body, and has two rows of teeth and fangs, like thoſe of a large dog. The free Indians, to expreſs their intrepidity, and to give them a more terrible appearance, paint on their targets the figure of this ſnake; the bite of which is incurable, and wherever it has ſeized, it never lets go its hold.

SECT. IV.

Of GUAYAQUIL.

Its Situation, Extent, and Climate; the prodigious Number of Muſkettoes, and Rats, and the Diſeaſes it occaſions. Among its Produce are particularly deſcribed its Canes, the Vijahua, and Bejuco; and among the Animals is a large Account of the Alligator. The City of Guayaquil deſcribed, with the Manners and Cuſtoms of the Inhabitants.

WE ſhall now deſcribe the territory of Guayaquil, the laſt we have to mention in the government of Quito. It begins at Cape Paſſado, in the twenty-firſt degree ſouth latitude, about thirty miles to the north of the bay of Manta. From this Cape it extends along the coaſt, including the iſle of Puna, to the town of Machala, on the coaſt of Tumbez, where it is terminated by the juriſdiction of Piura; from whence it runs eaſtward, and is bounded by that of Cuenca; then turning northward, along the weſtern ſkirts of the Andes, it terminates on the juriſdiction of Bamba and Chimbo; extending about ſixty leagues from north to ſouth, and forty or forty-five from eaſt to weſt. The whole country is one continued plain, and in winter is entirely overflowed. It is divided into ſeven lieutenancies, for each of which the corregidor appoints a lieutenant, who muſt be confirmed by the audience of Quito.

The rainy ſeaſon ſets in during the month of December, ſometimes at the beginning, ſometimes in the middle, and in others not till the end of that month, and laſts till April or May. During this ſeaſon the elements, the inſects and vermin, ſeem joined in a league to incommode the human race. The heat is extreme, and the rains continue day and night, accompanied with frequent and dreadful tempeſts of thunder and lightning; the river of Guayaquil, and all thoſe that fall into it, overflow their banks, and people are peſtered with innumerable ſwarms of inſects and vermin.

The ſnakes, vipers, ſcorpions, and ſcolopendra in this ſeaſon, find methods of getting into the houſes, to the deſtruction of many of the inhabitants; though they are not free from them the reſt of the year, yet at this time they are far more numerous and active; ſo that it is neceſſary to examine carefully the beds, for fear they ſhould conceal themſelves in them. To avoid being tortured by the muſkettos, all perſons, even the Indians and negro ſlaves, are obliged to have curtains to their beds: thoſe uſed by the lower claſs of people are made of cotton, and others uſe white linen. Indeed the inhabitants are no where ſo greatly incommoded with volatile inſects, as at the town of Guayaquil, where it is impoſſible to keep a candle burning, except in a lanthern, above three or four minutes, numberleſs inſects flying into the flame, and extinguiſhing it; and any perſon who is obliged to be near any light, is ſoon driven away by the infinite numbers that fill his eyes, ears, and noſtrils. "Theſe inſects, "ſays Don Antonio Ulloa, were almoſt inſupportable to "us during the ſhort clear intervals of ſome nights, "which we ſpent in making obſervations on the heaven-"ly bodies. Their ſtings were attended with great tor-"tures, and more than once obliged us to abandon our "obſervations, being unable either to ſee or to breathe "for their multitudes."

Another very great inconvenience attending the houſes here, is the number of rats, every building being ſo infeſted with them, that in the evening they quit their holes, and make ſuch a noiſe in running along the ceiling, and in clambering up and down the ſides of the rooms and teſters of the beds, as to diſturb thoſe who are are not accuſtomed to them, and they are ſo little afraid of the human ſpecies, that if a candle be ſet down, without being in a lanthern, they inſtantly carry it off; but as this might be attended with dreadful conſequences, they are ſeldom put to the trial, though they take advantage of the leaſt neglect. All theſe inconveniences, which ſeem in-

inſupportable to ſtrangers, and ſufficient to render the country uninhabited, has little effect on the natives, who have been uſed to them from their infancy, and are more affected with cold on the mountains, which is ſcarce felt by the Europeans, than all theſe diſagreeable circumſtances.

The dry ſeaſon is the leaſt troubleſome, as then both the number and activity of theſe vermin are diminiſhed; the heat is then abated by the ſouth-weſt and weſt ſouth-weſt breezes, which conſtantly begin at noon, and continue to refreſh the earth till five or ſix in the morning of the following day. The ſky is then always ſerene and bright, and the gentleſt ſhowers are rarely known; but the capital advantage is the remarkable ſalubrity of the air in that ſeaſon. The natives of the neighbouring mountains, who are inured to a cooler climate, cannot endure the air of Guayaquil, it having a natural tendency to debilitate them, and by an intemperate uſe of its delicious fruits, they throw themſelves into intermitting fevers: theſe are common at Guayaquil during the winter ſeaſon, and are here particularly painful and dangerous. The black vomit is alſo dangerous in this country. The natives are likewiſe very ſubject to cataracts and other diſeaſes of the eye, which often cauſe a total blindneſs.

Among the vegetable productions, we ſhall mention the canes, the vijahua, and the bejuco.

The canes are remarkable both for their length, their thickneſs, and the water contained in their tubes. Their uſual length is between twelve and ſixteen yards, and though there is ſome difference in their ſize, the largeſt do not exceed ſix inches in diameter. The wood or ſide of the tube is about ſix lines in thickneſs, ſo that when the cane is opened, it is made to form a board near a foot and a half in breadth, and hence it is not ſtrange that houſes ſhould be built of them. From the time of their firſt appearance, till they attain their full perfection, many of the tubes contain a quantity of water, and what is very remarkable, at full moon, they are either quite or very nearly full, and with the decreaſe of the moon the water ebbs. During the decreaſe it appears turbid, and at the full is as clear as cryſtal. The water is not found in all the joints, one having water, and others not, alternately. This water is ſaid to be an excellent preſervative againſt the ill conſequence of bruiſes, and is therefore drank by thoſe who come from the mountains, where ſuch accidents are in a manner unavoidable.

The canes being cut, are left to dry, whence they acquire ſuch a degree of ſtrength, as to ſerve either for rafters, beams, flooring, or even maſts for veſſels, called balzas. Ships which load with cacao are alſo ceiled with them, to preſerve the timbers from the great heat of that fruit. They alſo ſerve as poles for litters, and for an infinite number of other uſes.

The vijahua is a leaf generally five feet in length, and two and a half in breadth; growing wild, without any ſtem. The principal rib in the middle is near half an inch broad; but all the other parts are perfectly ſoft and ſmooth. The under-ſide is green, and the upper white, covered with a fine white viſcid down. It is commonly uſed for covering houſes; and ſerves for packing up ſalt, fiſh, and other goods, ſent to the mountains, to ſecure them from the rain.

The bejucos are a kind of woody cordage, of which there are two ſorts; one of which grows from the earth, and twines round the trees; the other ſtrikes its root into certain trees, and from thence derives its nouriſhment. Both kinds, after growing to a great height, incline again to the earth, on which they creep, till they meet with another tree, to the top of which they climb as before, and then again renew their inclination towards the earth, and thus form a labyrinth of ligatures. Some are even ſeen extended, like a cord, from the top of one tree to another. They are ſo extraordinary flexible, that no bending or twiſting can break them. The ſlendereſt of them are between a quarter and half an inch in diameter; but the moſt common ſize is a little above half an inch: indeed there are others much thicker; but thoſe are of little or no uſe, on account of the hardneſs, contracted in their long growth. They are chiefly uſed for laſhing, tying, or faſtening different things together; and by twiſting ſeveral of them in the manner of ropes, they make cables and hawſers for balzas, and ſmall veſſels; and are found by experience to laſt a long time in the water.

Here are thick foreſts of various kinds of large trees differing in foliage, the diſpoſition of their branches, and the ſize of their trunks. In the level part of this woody extent are a great number of quadrupeds and birds, and among the latter are wild peacocks, buſtards, pheaſants, and ſome others, which are here ſo numerous, that did they not always reſt on the tops of the trees, where, from their enormous height, or their being covered with leaves, they are ſecured from danger, a traveller with a good fowling-piece might at any time procure himſelf an elegant repaſt. Theſe foreſts are, however, terribly infeſted with ſnakes. Among the monkeys is one ſpecies ſo very large, that when ſtanding on their hind legs, they are little leſs than ſix feet high. They are black and in every reſpect very ugly, but are eaſily tamed.

The river Guayaquil abounds in fiſh of various kinds; but their increaſe is greatly hindered by the prodigious number of alligators, amphibious animals that live both in the rivers and adjacent plains, though they are ſeldom known to go far from the banks of the river. When tired with fiſhing, they leave the water to baſk themſelves in the ſun, and then appear rather like rotten wood thrown aſhore by the current, than living creatures; but upon perceiving any veſſel near them, they immediately throw themſelves into the water. They are the largeſt animals of the lizard kind; ſome of them here are of ſo monſtrous a ſize, as to exceed fifteen feet in length. The head is long, turning up at the noſe like the ſnout of a hog, and furniſhed with two rows of ſtrong pointed teeth. During the time they lie baſking on the ſhore, they keep their huge mouths wide open, till filled with muſkettos, flies, and other inſects, when, ſuddenly ſhutting their jaws, they ſwallow their prey. They generally avoid a man, and on the approach of any one, plunge into the water. The whole body of the alligator is covered with ſcales, impenetrable to a muſket ball, unleſs it happens to hit him in the belly, which is the only part vulnerable. This is an oviparous animal.

The female makes a large hole in the ſand near the brink of a river, and in it depoſits her eggs, which are almoſt as large as thoſe of an oſtrich, and as white as thoſe of a hen; but much more ſolid. She generally lays about a hundred, continuing in the ſame place till they are all depoſited, which is about a day or two. She not only covers them with ſand, but, the better to conceal them, rolls herſelf over them, even to a conſiderable diſtance, and then returns to the water, till natural inſtinct informs her, that it is time to deliver her young from their confinement. When ſhe comes to the ſpot, ſhe is followed by the male; ſhe then tears up the ſand, and begins breaking the eggs, with ſuch care, that ſcarce a ſingle one is injured, and a whole ſwarm of little alligators are ſeen crawling about. She then takes them on her neck and back, to remove them into the water; but the watchful gallinazos ſeize this opportunity to deprive her of ſome; and even the male alligator, which indeed comes for no other purpoſe, devours what he can, till the female has reached the water with the few remaining; and then all that fall from her back, and do not ſwim, ſhe herſelf eats, whence of this formidable brood happily no more than four or five eſcape.

The gallinazos, which we have deſcribed in treating of Carthagena, contribute greatly to prevent the increaſe of the alligators, they being extremely fond of their eggs, in finding which they make uſe of extraordinary addreſs. Theſe birds often make it their ſole buſineſs to watch the females during the dry ſeaſon, when they lay their eggs, the ſides of the river not being then covered with water. The gallinazo conceals itſelf among the branches of ſome tree, where it ſilently watches the female alligator, till ſhe has laid her eggs and retires; but ſhe is no ſooner under the water, than the gallinazo darts down on the repoſitory, and with its beak, claws, and wings, tears up the ſand, and devours the eggs, leaving only the ſhells. This banquet would richly reward its long patience, did not a multitude of gallinazos from all parts join the fortunate diſcoverer, and ſhare in the ſpoil. Theſe eggs, when

when freſh, are alſo eat by the mulattoes. Thus Providence diminiſhes the number of thoſe deſtructive animals, which would ſoon increaſe ſo faſt, that neither the river nor the neighbouring fields would be ſufficient to contain them; for as it is, their numbers can hardly be imagined.

The alligators are not wanting in addreſs in catching the fiſh, which is their principal food: eight or ten, as it were by agreement, draw up at the mouth of a river or creek, while others go a conſiderable diſtance up the river, and chace the fiſh downwards, by which none of any bigneſs eſcape them. The alligators being unable to eat under water, on ſeizing a fiſh, raiſe their head above the ſurface, and thus devour them; and, after ſatisfying their appetite, retire to reſt on the banks. When they cannot find fiſh, they betake themſelves to the meadows on the banks of the river, and devour colts and calves. This is done in the night, that they may ſurprize them in their ſleep; and it is obſerved, that thoſe alligators that have once taſted fleſh, become ſo fond of it, as never to feed upon fiſh, but in caſes of neceſſity. There are indeed many melancholy inſtances of their devouring the human ſpecies, eſpecially children who are out of doors in the dark; and theſe voracious animals having once ſeized them in their mouths, make ſure of their prey, againſt that aſſiſtance which the cries of the victim conſtantly bring, by haſtening into the water, where they immediately drown it, and then riſing to the ſurface devour it at leiſure. The boatmen, by inconſiderately ſleeping with one of their arms or legs over the ſide of a boat, have been ſeized by theſe animals, and the whole body drawn into the water. Thoſe alligators who have once feaſted on human fleſh, are known to be the moſt dangerous, and entertain an inſatiable deſire of repeating the ſame delicious repaſt.

The inhabitants of the places where they abound, are very induſtrious in deſtroying them. Their uſual method is by a piece of hard wood, ſharpened at both ends, and baited with the lungs of ſome animal; this they faſten to a thong, the end of which is ſecured on the ſhore. The alligator, on ſeeing the lungs floating on the water, ſnaps at the bait, and both points of the wood entering his jaws, he is dragged on ſhore with his mouth wide open: he then endeavours violently to reſcue himſelf, while the Indians bait him, knowing the greateſt damage he could do them is to throw down ſuch as, for want of care or agility, do not keep out of his reach.

We ſhall now deſcribe the city of Guayaquil, which is ſeated on the weſt bank of the river of the ſame name, in the ſecond degree eleven minutes twenty-one ſeconds of ſouth latitude. The old city is built on the ſide of a mountain, and the new at the diſtance of ſeveral hundred yards; and, for preſerving a communication between them, a bridge of timber has been erected of about ſix hundred yards in length. The city is of conſiderable extent, it ſtretching along the bank of the river from the lower part of the old town to the upper part of the new, near a mile and a half; but it is not of a proportionable breadth, every perſon being fond of having a houſe near the river; both on account of the refreſhing winds, which in the rainy ſeaſon are more eagerly coveted, as they are then very rare, and for the amuſements the river affords. The houſes of both towns are built of wood, and many of them covered with tiles, though the greateſt part of thoſe in the old town are only thatched. They are, however, large and handſome, and have one ſtory above the ground-floor. In the front are ſhops of all kinds, and before them are generally ſpacious porticos, which, during the rainy ſeaſons, are the only places where you can walk, the ſtreets being utterly impaſſable. As a precaution againſt fire the kitchens ſtand twelve or fifteen paces from the houſes, to which they are joined by a long open gallery reſembling a bridge; but ſo ſlightly built, that it is inſtantly demoliſhed on the leaſt appearance of fire in the kitchen, by which means the houſe is preſerved. Perſons of rank and fortune live in the upper apartments, and the ground-floor is let to ſtrangers who come to trade, or paſs through the city with their goods.

The ground on which the new city is built, and the ſavannahs in its neighbourhood, are not to be travelled over, either on foot or on horſeback, during the rainy ſeaſon; for it is not only of a ſpongy chalk, but is every where ſo level, that there is no declivity for carrying off the water, whence on the firſt rain it becomes one general ſlough. In that ſeaſon the ſtreets of the city are croſſed by very large planks, but theſe ſoon becoming ſlippery, occaſion frequent falls into the water, which at the return of the dry ſeaſon is ſoon exhaled, and all the country rendered ſufficiently dry for travelling.

The city is defended by three forts, two on the river, and one behind it, all built after the modern method of fortification. Theſe forts are built of large pieces of a very hard wood, which retains its ſolidity either under the water or in the mud. All the churches and convents are likewiſe of wood, except that of St. Domingo in the old town, which is of ſtone; the great ſolidity of the ground in that part being ſufficient to ſupport heavy buildings. Here is a pariſh-church, and alſo a convent belonging to the Auguſtines, and another to the Franciſcans, with a college of Jeſuits; but the monks are not very numerous on account of the ſmallneſs of their revenues. Here is alſo an hoſpital.

The city and its juriſdiction are under a corregidor, who is nominated by the king, and holds his office during five years. Though he is ſubordinate to the preſident and audience of Quito, he appoints the deputies in the ſeveral departments under his juriſdiction; and the police and civil government are under ordinary alcaldes and regidores. The revenue is under the management of a treaſurer and an accomptant, who receive the tributes of the Indians, the duties on imports and exports, and the taxes on the commodities either conſumed in the city or carried through it. The eccleſiaſtical government is lodged in the biſhop of Quito's vicar, who is generally prieſt of the town.

Guayaquil contains as many inhabitants in proportion to its extent as any Spaniſh city in America; the continual reſort of ſtrangers greatly increaſe the number, which is computed at twenty thouſand. The inhabitants capable of bearing arms are divided into companies of militia according to their rank and complexion, and are commanded by officers choſen by themſelves, the corregidor being commander in chief.

Though the heat is here equal to that of Panama or Carthagena, all the natives, except thoſe born from a mixture of blood, are freſh-coloured, and are eſteemed the handſomeſt people not only in the province of Quito, but in all Peru. It is remarkable that the natives, notwithſtanding the heat of the climate, are not tawny, and that though the Spaniards have not naturally ſo fair a complexion as the northern nations, their children born here of Spaniſh women are very fair; a phænomenon which has yet never been fully accounted for. To theſe advantages it muſt be added, that the inhabitants are greatly diſtinguiſhed by their elegance and politeneſs.

In this city neceſſity has introduced ſeveral kinds of bread, to ſupply the want of wheat; and the moſt uſual is unripe plantanes cut into ſlices, roaſted, and ſerved up as bread, to which this is even preferred by the Europeans themſelves, the wheat-bread being here badly made, and this is far from being unpalatable.

In the dry ſeaſon good water is very ſcarce at Guayaquil, there being none at a leſs diſtance than four or five leagues up the river. In dreſſing their food they commonly uſe beef-ſuet inſtead of butter, but it has the ſmell and taſte of tallow, which renders their diſhes extremely nauſeous to ſtangers; and, what is little better, they are all ſeaſoned with Guinea pepper, which they think the fineſt ingredient in the world for giving a reliſh to their food, and uſe it in ſuch quantities as to make the mouth in a flame.

The inhabitants of Guayaquil affect great ſplendor in their entertainments. The firſt courſe conſiſts of different kinds of ſweetmeats, the ſecond of high-ſeaſoned ragouts, and thus they continue to ſerve up alternately a ſucceſſion of ſweet and high ſeaſoned diſhes. The common drink on theſe occaſions is brandy, cordials, and wine, of all which they drink freely during the entertainment; but the Europeans generally prefer wine. The cuſtom of drinking punch obtains greatly among perſons of diſtinction, who generally drink a glaſs of it at eleven, and another in the evening; it not only allaying the

thirſt, but correcting the water, which, beſides the diſagreeable taſte communicated to it by the heat, produces exceſſive perſpiration; and this cuſtom ſo prevails, that even the ladies punctually obſerve it.

With reſpect to the commerce of Guayaquil, it may be divided into two parts, one conſiſting of the products and manufactures of its juriſdiction, and the other tranſitory; its port being the place where the goods from the provinces of Peru and Terra Firma conſigned to the mountains are landed; and, on the other hand, thoſe from the mountains deſigned for theſe provinces are brought hither, and ſhipped for their reſpective ports.

Cacao, one of its principal products, is chiefly exported to Panama, New Spain, and Peru. Timber, which is eſteemed the ſecond article, is chiefly ſent to Callao. Theſe branches of trade are of great advantage to Guayaquil, from the prodigious quantities exported; and the trade of ſalt is not inferior to either, though the principal markets to which it is ſent are only the inland towns in the province of Quito. To theſe may be added cotton, rice, and fiſh, both ſalted and dried, horned cattle, mules and colts, tobacco, wax, Guinea pepper, and Ceibo wool, which is the produce of a very high tufted tree.

The goods imported hither from Peru in return for the above-mentioned commodities, are wine, brandy, oil, and dried fruits. From Quito it receives baize, flour, bacon, hams, cheeſe, and other goods; from Panama European goods purchaſed at the fairs; from Mexico iron found in that country, but much inferior to that of Europe, naptha, tar, and cordage.

SECT. V.

Of the Cuſtoms and Manners of the Indians throughout the Audience of Quito.

THE diſpoſition of the Indians in the province of Quito is extremely remarkable, and they appear to have no reſemblance to the people found there by thoſe who firſt diſcovered the country. They at preſent poſſeſs a tranquillity not to be diſturbed either by fortunate or unfortunate events. In their mean apparel they are as contented as a prince clothed in the moſt ſplendid robes. They ſhew the ſame diſregard to riches, and even the authority and grandeur within their reach is ſo little the object of their ambition, that to all appearance it ſeems to be the ſame to an Indian, whether he be created an alcalde, or obliged to perform the office of a common executioner. Among them a reciprocal eſteem is neither increaſed nor diminiſhed by ſuch circumſtances: the ſame moderation appears in their food, and they enjoy their ſimple diet with the ſame complacency as others do their well furniſhed tables. Nothing can move them to alter their minds, it being common for them to decline a little act of ſervice, though offered a very conſiderable reward. Fear cannot ſtimulate, reſpect induce, or puniſhment compel them. They are indeed proof againſt every attempt to rouſe them from their natural indolence, in which they ſeem to look down with contempt on the wiſeſt of mortals.

They are in general remarkably ſlow. Thus in weaving carpets, curtains, quilts, and other ſtuffs, being unacquainted with any better method, in forming the woof they have the patience every time to count the threads one by one; ſo that two or three years are requiſite to finiſh a ſingle piece. Their ſloth is ſo great, that ſcarcely any thing can induce them to work. Whatever therefore is neceſſary to be done is left to the Indian women, who are much more active; they ſpin and make the half ſhirts and drawers which form the only apparel of their huſbands; they cook the proviſions, grind barley, and brew the beer called chicha; while the huſband ſits ſquatting on his hams, the uſual poſture of the Indians, looking at his buſy wife. The only domeſtic ſervice they do, is to plough their little ſpot of land, which is ſowed by the wife. When they are once ſettled in the above poſture, no reward can induce them to ſtir; ſo that if a traveller has loſt his way, and happens to come to one of their cottages, they charge their wives to ſay that they are not at home. Should the paſſenger alight and enter the cottage, the Indian would ſtill be ſafe; for having no light but what comes through a hole in the door, he could not be diſcovered; and ſhould the ſtranger even ſee the Indian, neither entreaties nor rewards would prevail on him to ſtir a ſtep with him.

In order that they may perform the works appointed by their maſters, and for which they are paid, it is to little purpoſe to ſhew them their taſk; the maſter muſt have his eye continually upon them, for he no ſooner turns his back than they leave off working. They are lively only in parties of pleaſure, rejoicings, entertainments, and eſpecially dancing; but in all theſe the liquor muſt circulate briſkly, and they continue drinking till they are entirely deprived both of ſenſe and motion. Their propenſity to intemperance is ſo great, that the cacique and the alcalde never fail to be of the company at all entertainments, and drink like the reſt till quite overcome by the chicha.

It is remarkable that the Indian women, whether maids or married, and Indian young men before they are of an age to contract matrimony, are never guilty of this vice; it being a maxim among them, that drunkenneſs is the privilege of none but maſters of families, who, when they are unable to take care of themſelves, have others to take care of them.

When they celebrate any ſolemnity, the perſon who gives the entertainment invites all his acquaintance, providing for each a jug of chicha, containing two gallons. In the court of the houſe, if it be a large town, or before the cottage, if in a village, a table is placed, and covered with a carpet only uſed on ſuch feſtivals; and upon it is placed a ſlight repaſt. The women preſent the chicha to their huſbands in calabaſhes, till their ſpirits are raiſed; then one plays on a pipe and tabor, while others dance. Some of the beſt voices among the Indian women ſing ſongs in their own languages, and thoſe who do not dance ſquat down in the uſual poſture till it comes to their turn. When tired with intemperance they all lie down together, without minding whether they be near the wife of another, or their own ſiſter or daughter. Theſe feſtivities ſometimes continue three or four days, till the prieſt coming among them, throws away all the chicha, and diſperſes the Indians, leſt they ſhould procure more.

Their funerals are likewiſe ſolemnized with exceſſive drinking. The houſe is filled with jugs of chicha, for the ſolace of the mourners and other viſitors; the latter even go out into the ſtreets, and invite all of their nation who happen to paſs by, to come in and drink to the honour of the deceaſed. This ceremony laſts four or five days, and ſometimes more, ſtrong liquor being their ſupreme enjoyment.

Though they are ſo addicted to intemperance, they cannot be charged with gaming. They ſeem to have no inclination for play, nor have above one kind, and that is of great antiquity. This game they call paſa, or a hundred, as he who firſt gets that number wins. They play with two inſtruments, one a ſpread eagle of wood, with ten holes on each ſide, and pegs to ſet up the game: the other is a die of bone cut with ſeven faces, one of which has a particular mark, and is called guayro. Five of the others tell according to their number, and the laſt is a blank. In playing they toſs up the die, and the marks on the upper ſurface are ſo many gained; but the guayro goes for ten, and the like number is loſt if the blank ſide appears. This game is peculiar to the Indians; but is little uſed, except at their revels.

The habitations of theſe Indians, like thoſe of others we have deſcribed, conſiſt only of a little cottage, in the middle of which is their fire-place. Here both they and the animals they breed live promiſcuouſly. They have a particular fondneſs for dogs, and are never without three or four, a hog or two, and a few poultry. Theſe, with ſome earthen-ware, as pots and jugs, with the cotton which their wives ſpin, conſtitute the whole inventory of their effects, except two or three ſheep ſkins which ſerve them for beds. Though the Indian women breed fowl and other domeſtic animals in their cottages, they never

never eat them, and even conceive ſuch a fondneſs for them, that they will neither kill them with their own hands nor ſell them: ſo that if a ſtranger, who is obliged to paſs the night in one of their cottages, offers ever ſo much money for a fowl, they refuſe to part with it; and he finds himſelf under the neceſſity of killing the fowl himſelf, at which his landlady ſhrieks, diſſolves in tears, and wrings her hands; till at laſt, ſeeing there is no remedy for what is paſſed, ſhe wipes her eyes, and quietly takes what the traveller offers her.

Many in their journeys take their whole family with them. The cottages are in the mean time ſhut up, and there being no valuable furniture to loſe, a ſtring or thong of leather ſerves for a lock. If their journey is to laſt for ſeveral days, they take their animals to the cottage of ſome neighbour or acquaintance: if otherwiſe their dogs are left guardians of the whole, and diſcharge their truſt with ſuch care, that they will fly at any one, except their maſters, who offers to come to the cottage. It is obſervable that dogs bred by the Spaniards and Meſtizos have ſuch a hatred to the Indians, that if one of them approaches a houſe where he is not very well known, they fall upon him, and, if not called off, tear him to pieces; for they know them at a diſtance by their ſcent: on the other hand, the dogs of Indian breed are animated with the ſame rage againſt the Spaniards and Meſtizos, whom they likewiſe ſmell at a diſtance.

The Indians in the audience of Quito act contrary to all other nations in their marriages; for they never make choice of a woman who has not been firſt known by others, which they conſider as a certain ſign of her having ſomething pleaſing in her. After a young man has aſked the object of his affections of her father, and obtained his conſort, they immediately begin to live together as man and wife, and aſſiſt the father-in-law in cultivating the land. At the end of three or four months, and frequently of a year, he leaves his bride without any ceremony; and perhaps expoſtulates with his father-in-law for endeavouring to deceive him, by impoſing upon him his daughter, whom no body elſe had thought worthy of making his bedfellow. But if nothing of this happens, after paſſing three or four months in this commerce, which they call amanarſe, or to habituate oneſelf, they then marry. This cuſtom is ſtill very common, though the whole body of the clergy have uſed all their endeavours to put a ſtop to it. Accordingly they always abſolve them of that ſin, before they give them the nuptial benediction.

Their intrepidity ſhews itſelf upon many occaſions, particularly in the alacrity and reſolution with which they halter a bull at full ſpeed, and with the ſame dexterity and courage they hunt the bears; for a ſingle Indian, with only a horſe and his nooſe, never fails of getting the better of all the cunning and rage of this furious animal. This nooſe is made of cow-hide, ſo thin as not to be ſeized by the beaſt's paw, and at the ſame time ſtrong enough not to be broke by the ſtruggles of the bear. On their perceiving this animal they directly make towards him, whilſt he rears himſelf up in order to ſeize the horſe. But the Indian, being advanced within a proper diſtance, throws the nooſe about the creature's neck, and twiſting the other end two or three times round the ſaddle, he then with ſurprizing celerity claps ſpurs to his horſe, and the bear, unable to keep pace with the horſe, and ſtruggling to get free, is choaked. This atchievement is looked upon as an admirable piece of courage and dexterity; and is commonly practiſed in the province of Alauſi, near the eaſtern Cordillera, where theſe creatures abound.

A great part of the ruſticity in the minds of the Indians muſt be imputed to a want of culture; for they who in ſome parts have enjoyed that advantage, are found to have as good rational faculties as other men; and if they have not all the politeneſs of civilized nations, they at leaſt think properly. All the Indians brought up to handicraft trades in cities and large towns are far more acute and ſenſible than thoſe who have ſpent their lives in little villages, and many of theſe diſtinguiſh themſelves by their genius and abilities.

SECT. VI.

Of the CORDILLERAS *of the* ANDES.

The moſt remarkable of them with reſpect to their Height and Volcanoes: their Climate: a remarkable Phenomenon: the Animals found upon the Andes; with a particular Deſcription of the Condor: the Bridges over the Rivers in the Andes; and the Roads over the Mountains.

WE now come to the moſt remarkable mountains and deſarts in the Cordilleras of the Andes, near the countries laſt deſcribed. It has been obſerved, that the dependences of the juriſdictions of Quito are ſeated between the two Cordilleras of the Andes, and that the air is more or leſs cold, and the ground barren, according to the height of the mountains. Theſe barren tracts are called deſarts; for, though all the Cordilleras are dry, ſome are much more ſo than others; and the continual ſnows and froſts render ſome parts of them without a ſingle plant, and conſequently uninhabitable by man or beaſt.

Some of theſe mountains, which appear as if founded on others, riſe to a moſt aſtoniſhing height, and reaching far above the clouds, are here in the midſt of the torrid zone covered with perpetual ſnow. From barometrical experiments made on the mountain Cotopaxi, it appears that its ſummit is elevated ſix thouſand two hundred and fifty-two yards above the ſurface of the ſea, ſomething above three geographical miles, which greatly exceeds the height of any other mountain in the known world.

Cotopaxi became a volcano at the time of the Spaniards firſt arrival in this country. A new eruption happened in 1743, which had been for ſome days preceded by a continual rumbling in its bowels: after which an aperture was made in its ſummit, as alſo three others near the middle of its declivity, at that period buried under prodigious maſſes of ſnow. The ignited ſubſtances ejected on that occaſion, mixed with a conſiderable quantity of ſnow and ice, melting amidſt the flames, were carried down with ſuch amazing rapidity, that in an inſtant the plain from Callo to Latacunga was overflowed; and, beſides its bearing down the houſes of the poor inhabitants, great numbers of people loſt their lives. The river of Latacunga was the canal of this dreadful flood, till being too ſmall for receiving the prodigious current, it overflowed the adjacent country, carried away all the buildings within its reach, and rendered the land near the town of the ſame name like a vaſt lake. The inhabitants retired to a ſpot of higher ground behind their town; thoſe parts of which that ſtood within the limits of the current were entirely deſtroyed. During three days the volcano ejected cinders, while torrents of melted ice and ſnow poured down its ſides. The fire laſted ſeveral days longer, and was accompanied with terrible roarings of the wind, ruſhing through the mouths of the volcano. At laſt all was quiet, and neither ſmoke nor fire were to be ſeen. However, in May 1744, the flames forced a paſſage through ſeveral other parts on the ſides of the mountain; ſo that in clear nights the flames, being reflected by the tranſparent ice, formed a very grand and beautiful illumination. But on the thirteenth of November following it ejected ſuch prodigious quantities of fire and ignited ſubſtances, that an inundation equal to the former ſoon enſued, and the inhabitants of the town of Latacunga for ſome time gave themſelves over for loſt.

The moſt ſouthern mountain of the Cordilleras is that of Mecas, or Sangay, which is of a prodigious height, and the far greateſt part of it covered with ſnow; yet from its ſummit iſſues a continual fire, attended with exploſions which are plainly heard at forty leagues diſtance. The country adjacent to this volcano is entirely barren, it being covered with cinders ejected from its mouth. In this mountain riſes the river Sangay, which being joined by the Upano forms the Payra, a large river which diſcharges itſelf into the Maranon.

In order to convey an idea of the climate on the top of theſe mountains, we ſhall give ſome account of that which

prevailed on Pichincha, when Don George Juan and Don Antonio de Ulloa were ſtationed there in order to make their proper obſervations in relation to the figure of the earth, whence a judgment may be formed of the reſt; the inclemency of the weather being in proportion to the height of the mountains.

Pichincha, though famous for its great height, is twelve hundred and ſeventy-eight yards lower than the perpendicular height of Cotopaxi, and was formerly a volcano, but the mouth on one of its ſides is now covered with ſand and calcined matter; ſo that at preſent neither ſmoke or fire iſſues from it. Our learned author found the cold on the top of this mountain extremely intenſe, the wind violent, and they were frequently involved in ſo thick a fog, or, in other words, a cloud, that an object at ſix or eight paces diſtance was ſcarcely diſcernible. The air grew clear by the clouds moving nearer to the ſurface of the earth, and on all ſides ſurrounded the mountain to a vaſt diſtance, repreſenting the ſea with their rock ſtanding like an iſland in the center. When this happened, they heard the dreadful noiſe of the tempeſts that diſcharged themſelves on Quito, and the neighbouring country. They ſaw the lightning iſſue from the clouds, and heard the thunder roll far beneath them. While the lower parts were involved in tempeſts of thunder and rain, they enjoyed a delightful ſerenity; the wind was abated, the ſky clear, and the enlivening rays of the ſun moderated the ſeverity of the cold. But when the clouds roſe their thickneſs rendered reſpiration difficult; ſnow and hail fell continually, and the wind returned with all its violence; ſo that it was impoſſible entirely to overcome the fear of being, together with their hut, blown down the precipice, on whoſe edge it was built, or of being buried in it by the daily accumulations of ice and ſnow. Their fears were likewiſe increaſed by the fall of enormous fragments of rocks. Though the ſmalleſt crevice viſible in their hut was ſtopped, the wind was ſo piercing, that it penetrated through; and though it was ſmall, crowded with inhabitants, and had ſeveral lamps conſtantly burning, the cold was ſo great, that every one of them was obliged to have a chafing-diſh of coals, and ſeveral men were conſtantly employed every morning to remove the ſnow which fell in the night. By the aſperities of ſuch a climate their feet were ſwelled, and ſo tender, that walking was attended with extreme pain, their hands covered with chilblains, and their lips ſo ſwelled and chopt, that every motion in ſpeaking drew blood.

"There is in all this range of mountains, as far as "I have travelled, ſays M. Bouguer, who was engaged "in the ſame expedition as the gentlemen laſt mentioned, a conſtant inferior boundary, beyond which the "ſnow never melts; this boundary, in the midſt of the "torrid zone, I found to be two thouſand four hundred "and thirty-four fathoms above the level of the South "ſea. The ſnow indeed falls much lower, but then it "is ſubject to be melted the very ſame day; whereas "above that it preſerves itſelf,

"The gather'd winter of a thouſand years."

Before we conclude this article, it will be proper to mention a phænomenon of a very extraordinary nature, which, according to the author juſt mentioned, appears almoſt every day on the top of theſe mountains; and though it is doubtleſs as ancient as the world, it was perhaps never mentioned before. The firſt time our authors obſerved it was, when they were on the top of Pambamorca, a mountain leſs high than Pichincha. A cloud, in which they were involved at break of day, diſſipating, they ſaw the riſing-ſun extremely ſplendid, and the cloud paſſed on the other ſide oppoſite to the ſun, where it appeared very thin, and was about twenty yards diſtant from the place where they were ſtanding, when they ſaw in it, as in a looking-glaſs, the image of each of them; and what appeared ſtill more extraordinary, the head was adorned with a glory like what is ſeen round the heads of ſaints in pictures, each head being as it were the center of three concentric iriſes, of very lively colours, and each with the ſame varieties as a rainbow, the red being outward; the laſt or moſt external colours of one touched the firſt of the following; and from ſome diſtance from them all was a fourth arch, entirely white. Theſe were perpendicular to the horizon; and as the perſon moved, the phænomenon moved alſo. But what was moſt remarkable, though there were ſix or ſeven perſons, each could ſee none but his own ſhadow, becauſe the cloud had an uneven ſurface. The diameter of the arches gradually altered with the aſcent of the ſun above the horizon, and the phænomenon itſelf, after continuing a long time, inſenſibly vaniſhed. Don Antonio Ulloa gives a particular deſcription of this phænomenon, and M. Bouguer, after deſcribing it, ſays, "This was a kind of apotheoſis to each "ſpectator; and I cannot forbear mentioning again, "that each enjoyed the ſecret pleaſure of ſeeing himſelf "adorned with all theſe crowns, without perceiving "thoſe of his neighbours. I muſt obſerve, however, "that this phænomenon doth not appear unleſs the "aqueous particles of the cloud are frozen."

In thoſe parts of the mountains that are not ſo high as to expoſe them to an eternal froſt, there grows a kind of ruſh, and ſeveral other plants, with a few trees of one or two ſpecies, which are too barren to admit of cultivation.

Though the ſeverity of the air on theſe deſarts is ſo great, that all animals cannot live upon them, yet they afford many deer, which feed on the ſtraw or ruſhes peculiar to thoſe parts; and ſome of them are to be met with on the higheſt mountains, where the cold is intolerable to the human ſpecies. Among the ruſhes are alſo bred a great number of rabbits, and ſome foxes.

The only birds known in thoſe rigorous places are partridges, which are ſomething different from thoſe of Europe, and nearly reſemble the quail, with condors and hummers.

The condor, which is the largeſt bird in theſe parts, reſembles in its colours and appearance the gallinazo, already deſcribed, and ſometimes ſoars from the higheſt mountains ſo as to be almoſt out of ſight. From its being ſeldom ſeen in low places, a ſubtile air ſeems to agree beſt with it; though ſome that have been tamed when young live in the villages and plantations. They are extremely carnivorous, and are frequently known to ſeize and fly away with lambs that feed on the heaths upon the ſides of the mountains. Our author confirms this by his own obſervation; for ſeeing on a hill, adjoining to one on which he ſtood, a flock of ſheep in great confuſion, he perceived a condor flying upwards from it, with a lamb in its claws. When at ſome height he dropped it; but following it took it up, and let it fall a ſecond time; and then winged its way out of ſight, for fear of the Indians, who, at the cry of the boys and barkings of the dogs, were running towards the place.

In ſome deſarts this bird is more common, and as it preys on the flocks, the Indians are not wanting in their endeavours to catch it. One of theſe ways is killing an old cow, or ſome other beaſt, and rubbing the fleſh with the juice of ſome potent herbs, which they afterwards carry away, otherwiſe the bird would not touch the fleſh; and farther, to take off the ſmell, bury the fleſh till it becomes putrid, and then expoſe it; when the condors, allured by the ſmell of the carcaſe, haſten and feed on it greedily, till the herbs operating, they become ſenſeleſs and incapable of motion; when the Indians, ſeizing this opportunity, deſtroy them. They likewiſe catch them with ſprings laid near ſome fleſh; but ſuch is the ſtrength of this bird, that with a ſtroke of its wing it ſometimes knocks down the man who approaches it. Their wing alſo ſerves them as a ſhield, by which they ward off blows, without receiving any viſible hurt.

From moſt of theſe mountains flow rivers, which when too deep to be forded, bridges are made at the moſt frequented places. Of theſe there are two kinds, beſides thoſe of ſtone, which are very few. The moſt common are of wood, and the reſt of bejucos, the plant we have deſcribed as uſed for all the purpoſes of ropes. With regard to the firſt, they chooſe a place where the river is very narrow, and has on each ſide high rocks. Theſe only conſiſt of four long beams laid over the precipice, forming a path about a yard and a half in breadth, juſt ſufficient for a man to paſs over on horſeback; and cuſtom has

has rendered these so familiar, that the people pass them without any apprehensions.

The bridges of bejucos are only used where the breadth of the river will not admit of beams being laid across. In their construction several bejucos are twisted together, in order to form a large cable of the length required. Six of these are drawn from one side of the river to the other, two of which are considerably higher than the other four, and serve for rails. Across the latter are wattled cross sticks of bejucos, and the whole resembles a fishing-net, or Indian hammock stretched from one side of the river to the other. As the meshes of this net are very large, and the foot would be in danger of slipping through, they take care to strew reeds at the bottom, which serve for a floor. The reader will easily conceive, says our author, that the mere weight of this kind of basket machine, and much more the weight of a man passing over, must cause it to make a prodigious bend; and if it be considered that the passenger, when he is in the midst of his course, especially if there be a wind, is exposed to vast swingings from side to side, a bridge of this sort, sometimes more than ninety feet long, must at first sight be extremely frightful; yet the Indians pass over it running, though loaded with the baggage and pack-saddles of the mules, and laugh to see the Europeans hesitate in venturing. Most of these bridges are only for men and women, the mules swimming over the rivers; for their loading being taken off they are driven into the water near half a league above the bridge, that they may reach the opposite shore near it, they being carried so far by the rapidity of the stream.

Some rivers, instead of a bejuco bridge, are passed by means of a tarabita, a single rope made of bejucos, or thongs cut from the hide of an ox, and consisting of several strands, about six or eight inches in thickness. This rope is extended from one side of the river to the other, and fastened on each bank to strong posts. On one side it is fastened to a wheel, that it may be straightened or slackened to the degree required. From the tarabita hangs a kind of leathern hammock, capable of holding a man, suspended by a clue at each end. A rope is also fastened and extended to the sides of the river, for drawing the hammock to the side intended, which with a push at its first setting off sends it quickly to the other side. This not only serves to carry over persons and loads, but also the beasts themselves, where the rapidity of the stream, and the prodigious stones continually carried along by it, render it impracticable for them to swim over.

For carrying over the mules two tarabitas are necessary, one for each side of the river, and the ropes are much thicker and slacker. On this rope is only one clue, which is of wood, and by this the beast is suspended, he being secured with girts round the belly and neck. When this is performed the creature is shoved off, and immediately landed on the opposite side. Those that are accustomed to be conveyed over in this manner never make the least motion, but even come of themselves to have the girts fastened round them; yet it is with great difficulty they are at first brought to suffer this to be done, and when they find themselves suspended they kick and fling during their short passage.

The roads over some of these mountains are not the least of those extraordinary particulars relating to them. In many places the road is so narrow that the mules have scarce room to set their feet, and in others is a continued series of precipices. Besides, these roads are full of holes near three quarters of a yard deep, in which the mules put their fore and hind feet, so that sometimes they draw their bellies and the rider's legs along the ground. Indeed these holes serve as steps, without which the precipices would be in a great measure impassable; but should he happen to put his foot between two of these holes, or not place it right, the rider falls, and, if on the side of the precipice, inevitably perishes.

But the manner of descending seems still more dangerous. On one side are frequently steep eminences, and on the other frightful abysses; and as they generally follow the direction of the mountain, the road, instead of being on a level, forms steep eminences and declivities. The mules are sensible of the caution requisite in these descents, for coming to the top of an eminence they stop, and having placed their fore-feet close together, place their hinder feet a little forwards, as if going to lie down. Having in this attitude taken a survey of the road, they slide down with the swiftness of a meteor. All the rider has to do is to keep himself fast in the saddle, for the least motion is sufficient to disorder the equilibrium of the mule, in which case they both unavoidably perish. His address here is extremely wonderful; for in this rapid motion, when he seems to have lost all government of himself, he follows exactly the different windings of the road, as if he had accurately settled in his mind the road he was to follow, and taken every precaution for his safety. But the longest practice of travelling these roads cannot entirely free the mules from a kind of dread, on their arriving on the top of a steep declivity; for they not only attentively view the road, but tremble and snort at the danger. If the rider inadvertently endeavours to spur them on, they continue immoveable; and it is really wonderful to consider how, after having overcome the first emotions of their fear, they stretch out their fore-legs, that by preserving a proper equilibrium they may not fall, yet make with their body that gentle inclination necessary to follow the several windings of the road, and afterwards their address in stopping themselves at the end of their impetuous career.

SECT. VII.

Of the Audience of LIMA.

Its Situation, Extent, and Climate, particularly near the Capital, where the Rain, Snow, Hail, Thunder, and Lightning are unknown; but is subject to Earthquakes, some of which are described. Of the Soil and Produce. A particular Description of the City of Lima; with the Dress, Manners, Customs, and Trade of the Inhabitants.

THE next division of Peru is the audience of Lima, which is bounded on the north by Quito, on the east by the Cordillera of the Andes, on the south by the audience of Los Charcas, and on the west by the Pacific ocean, it being about seven hundred and seventy miles in length from north to south, but of an unequal breadth.

Nothing can be imagined more various than the climate and soil of this country, which in some places is exceeding hot, in others insupportably cold, and in the city of Lima, where it never rains, is always temperate. The seasons vary within the compass of a few miles, and in certain parts of the audience all the vicissitudes of weather are experienced in twenty-four hours. What is most singular is, that no rains fall or rivers flow on the sea-coasts, though they are supplied by thick fogs and dark clouds, that never condense into showers. This phænomenon has exercised the thoughts of many naturalists.

Spring begins towards the close of the year, that is towards the end of November or the beginning of December, when the vapours which fill the atmosphere during the winter subside, and the sun to the great joy of the inhabitants again appears, and the country now begins to revive, which during the absence of his rays had continued in a state of languor. This is succeeded by summer, which though hot, from the perpendicular direction of the sun's rays, is far from being insupportable, the heat, which indeed would otherwise be excessive, being moderated by the south winds, which always blow at this season, though with no great force. Winter begins at the latter end of June or the beginning of July, and continues till November or December, when the south winds begin to blow stronger, and bring the cold with them, not indeed equal to that in countries where ice and snow are known; but so keen that the light dresses are laid by, and cloth or other warm stuffs worn. During the winter the earth is covered with so thick a fog, as totally to intercept the rays of the sun, and the winds, by blowing under the shelter of this fog, retain the particles they contracted in the frozen zone. In this season only the vapours dissolve into a very small dew, which every where equally moistens the earth, by which means all the hills, which during the other parts of the year

offer nothing to the ſight but rocks and waſtes, are clothed with verdure and enamelled with flowers of the moſt beautiful colours. Theſe dews never fall in ſuch quantities as to damage the roads, or incommode the traveller; a very thin ſtuff will not ſoon be wet through; but the continuance of the miſts during the whole winter, without being exhaled by the ſun, render the moſt barren ſpots of this part of the country fertile.

Lima is as free from tempeſts as from rain; ſo that thoſe of the inhabitants who have neither viſited the mountains, nor travelled into other parts, are abſolute ſtrangers to thunder and lightning, and are therefore extremely terrified when they firſt hear the former or ſee the latter. But it is very remarkable, that what is here entirely unknown ſhould be ſo common thirty leagues to the eaſt of Lima, it being no farther to the mountains, where violent rains and tempeſts of thunder and lightning are as frequent as at Quito.

But though the capital is freed from the terror of theſe tempeſts, it is ſubject to what is much more dreadful. The earthquakes happen here ſo frequently, that the inhabitants are under continual apprehenſions of being, from their ſuddenneſs and violence, buried in the ruins of their own houſes: yet theſe earthquakes, though ſo ſudden, have their preſages, one of the principal of which is a rumbling noiſe in the bowels of the earth about a minute before the ſhocks are felt, that ſeems to pervade all the adjacent ſubterraneous parts. This is followed by diſmal howlings of the dogs, which ſeem to perceive the approaching danger. The beaſts of burthen paſſing the ſtreets ſtop, and by a natural inſtinct ſpread open their legs, the better to ſecure themſelves from falling. On theſe portents the terrified inhabitants fly from their houſes into the ſtreets with ſuch precipitation, that if it happens in the night, they appear quite naked; fear and the urgency of the danger at once baniſhing all ſenſe of decency. Thus the ſtreets exhibit ſuch odd and ſingular figures, as might afford matter of diverſion, were it poſſible to be diverted in ſo terrible a moment. This ſudden concourſe is accompanied with the cries of children waked out of their ſleep, blended with the lamentations of the women, whoſe agonizing prayers to the ſaints increaſe the common fear and confuſion. The men are alſo too much affected to refrain from giving vent to their terror; ſo that the whole city exhibits a dreadful ſcene of conſternation and horror.

The earthquakes that have happened at the capital are very numerous. The firſt ſince the eſtabliſhment of the Spaniards was in 1582; but the damage was much leſs conſiderable than in ſome of the ſucceeding: for ſix years after Lima was again viſited by another earthquake ſo dreadful, that it is ſtill ſolemnly commemorated every year. In 1609 happened another, which overturned many houſes. On the twenty-ſeventh of November, 1630, ſuch prodigious damage was done in the city by an earthquake, that, in acknowledgement of its not having been entirely demoliſhed, a feſtival on that day is annually celebrated. Twenty-four years after, on the third of November, the moſt ſtately edifices in the city, and a great number of houſes, were deſtroyed by an earthquake; but the inhabitants retiring, few of them periſhed. Another dreadful one happened in 1678; but one of the moſt terrible was on the twenty-eighth of October, 1687. It began at four in the morning, with the deſtruction of many of the fineſt public buildings and houſes, in which a great number of the inhabitants periſhed; but this was little more than a preſage of what followed; for two hours after the ſhock returned with ſuch impetuous concuſſions, that all was laid in ruins, and the inhabitants began to think themſelves happy in being only ſpectators of the general devaſtation, and the loſs of all their property. During this ſecond ſhock the ſea retiring conſiderably, and then returning in mountainous waves, entirely overwhelmed Callao and the adjacent country, together with the miſerable inhabitants. From that time ſix earthquakes happened at Lima before that of 1746. This laſt was on the twenty-eighth of October at half an hour after ten at night, when the concuſſions began with ſuch violence, that in little more than three minutes the greateſt part, if not all the buildings in the whole city were deſtroyed, burying under their ruins thoſe inhabitants who had not made ſufficient haſte into the ſtreets and ſquares, the only places of ſafety. At length the horrible effects of this firſt ſhock ceaſed; but the tranquillity was of ſhort duration, the concuſſions ſwiftly ſucceeding each other. The fort of Callao alſo ſunk into ruins; but what it ſuffered from the earthquake in its buildings was inconſiderable when compared to the dreadful cataſtrophe which followed; for the ſea, as is uſual on ſuch occaſions, receding to a conſiderable diſtance, returned in mountainous waves, foaming with the violence of the agitation, and ſuddenly turned Callao and the neighbouring country into a ſea. This, however, was not perfectly performed by the firſt ſwell of the waves; for the ſea retiring farther, returned ſtill with greater impetuoſity, and covered both the walls and other buildings of the place; ſo that what even had eſcaped the firſt, was now totally overwhelmed by thoſe terrible mountainous waves. Twenty-three ſhips and veſſels, great and ſmall, were then in the harbour, nineteen of which were ſunk, and the other four, among which was a frigate named St. Fermin, carried by the force of the waves to a conſiderable diſtance up the country. This terrible inundation extended to other parts on the coaſt, and ſeveral towns underwent the ſame fate as the city of Lima, where the number of perſons who periſhed in the ruin of that city within two days after the earthquake began amounted, according to the bodies found, to thirteen hundred, beſides the maimed and wounded, many of which lived only a ſhort time in torture.

Though it might naturally be expected that a country where rain is ſeldom or never known muſt be entirely barren, yet the country of Lima enjoys great fertility, it producing all kinds of grain and a prodigious variety of fruit; but here induſtry and art ſupply that moiſture which the clouds withold. The ancient yncas of Peru cauſed ſmall canals to be formed, in order to conduct the waters of the rivers to every part of this country, and render large fields capable of producing grain. The Spaniards finding theſe uſeful works ready executed to their hands, took care to keep them in order, and by theſe are watered ſpacious fields of barley, large meadows, plantations, vineyards, and gardens, all yielding uncommon plenty. Lima differs from Quito, where the fruits of the earth have no determined ſeaſon; for here the harveſt is gathered in, and the trees drop their leaves in the proper ſeaſon. The bloſſoms have alſo their reſpective times of blowing; ſo that this country reſembles thoſe of the temperate zones.

The fields in the neighbourhood of Lima are chiefly ſown with clover, on which feed an inconceivable number of mules and horſes. The other parts of the country are taken up with plantations, among which thoſe of the ſugar-cane yield an excellent kind of ſugar. The olive plantations appear like thick foreſts, for beſides the height, magnitude, and fullneſs of leaves of theſe trees, they are never pruned, by which means their branches become ſo interwoven, that the light cannot penetrate through their foliage. They produce an uncommon plenty of the fineſt olives, which are either committed to the preſs for oil, or pickled, they being particularly adapted to the latter, on account of their beauty, largeneſs, and flavour; and their oil is much preferable to that of Spain. All the fields and plantations are cultivated by negro ſlaves purchaſed for that purpoſe.

The country contiguous to the city of Lima is covered with gardens that produce all the herbs and fruits known in Spain, beſides thoſe common to America, all which flouriſh here in an uncommon degree. The city likewiſe enjoys another ſingular advantage, the whole year being as it were ſummer, with regard to the plenty and freſhneſs of the fruit, from the ſeaſons of the year varying alternately in the diſtrict called Valles and the mountains; for when fruit-time is over in Valles, it begins on the ſkirts of the mountains; and the diſtance from Lima not exceeding twenty-five or thirty leagues, they are brought thither, and by this means the city is conſtantly ſupplied with fruit, except a few, as grapes, melons, and watermelons, which requiring a hot climate do not come to perfection in the mountains. The grapes at Lima are of

various kinds, and among them one ſpecies called the Italian, are very large and delicious. The vines extend themſelves on the ſurface of the earth, which is either ſtony or full of ſand. Theſe vines are pruned and watered at proper times, and without any other care thrive remarkably.

Beſides the orchards, fields, and gardens, with which the country is delightfully variegated, there are other parts where nature ſpontaneouſly furniſhes beautiful proſpects for the inhabitants, and plenty of excellent food for their cattle, particularly the hills of St. Chriſtopher and Amancaes, whoſe perpetual verdure, diverſified in ſpring with elegant flowers, ſeems to invite the neighbouring inhabitants to a nearer enjoyment of the beauties it preſents at a diſtance to their view. The parts in the neighbourhood of the city, to the extent of ſix or eight leagues, offer the like entertainment, and accordingly many families reſort thither for change of air and rural amuſements.

After giving this account of the climate and produce of this country, it ought not to be omitted, that though the ſummer here is pretty warm, yet venomous creatures are unknown, and the ſame may be ſaid of the territory called Valles, though here are ſome ports, as Tumbez and Piura, where the heat is almoſt as great as that of Guayaquil. This ſingularity can therefore proceed from no other cauſe than the natural drought of the climate.

We ſhall now give a deſcription of the city of Lima, alſo called Los Reyes, or the city of the Kings, as it appeared before the dreadful calamity in 1746. It is ſeated in the ſpacious and delightful valley of Rimac, in the twelfth degree two minutes thirty-one ſeconds ſouth latitude, and in the ſeventy-ſixth degree weſt longitude, in one of the moſt advantageous ſituations that can be imagined; for being in the center of that ſpacious valley, it commands the whole without any difficulty. The river Rimac waſhes the walls of the city, and when not increaſed by the torrents from the mountains, is eaſily forded; but as it is at other times deep and rapid, a very elegant and ſpacious ſtone bridge was built over it, having at one end a very fine grate, which formed the entrance into the city, and led to the grand ſquare, which was very large and finely ornamented, having in the center a fountain, in which was a ſtatue of Fame in bronze, ejecting water through her trumpet, and through the mouths of eight lions ſurrounding the ſtatue. The eaſt ſide of the ſquare contains the cathedral and archiepiſcopal palace, fronted with free-ſtone, and adorned with columns and pilaſters. On the north ſide was the viceroy's palace, in which were the ſeveral courts of juſtice, the offices of the revenue, and the ſtate priſon. On the weſt ſide of the ſquare, facing the cathedral, were the council-houſe and the city priſon. The ſouth ſide was filled with private houſes, which, like the others in the city, had only one ſtory; but the fronts being of ſtone, their uniformity, porticos, and elegance, were great embelliſhments to the ſquare.

The city was of a triangular form; the baſe, extending along the banks of the river, was about two miles in length, and its greateſt breadth from north to ſouth, from the bridge to the oppoſite angle, a thouſand and eighty fathoms. It was ſurrounded with a brick wall, flanked with thirty-four baſtions; but without platforms and embraſures, and had ſeven gates and three poſterns.

On the oppoſite ſide of the river was a ſuburb called St Lazaro, all the ſtreets of which were broad, and ran parallel from north to ſouth and from eaſt to weſt, forming ſquares of houſes a hundred and fifty yards in front. The ſtreets were paved, and along them ran ſtreams of water conducted from the river, a little above the city; and, being arched over, contributed to its cleanlineſs. The houſes were commodious, and made a good appearance; but were for the moſt part low, that they might bear the ſhock of earthquakes; the principal parts were of wood mortiſed into the rafters of the roof, and the walls lined both within and without with wild cane or oſiers. Theſe laſt were plaſtered over with clay and white-waſhed; but the fronts were painted in imitation of free-ſtone. They had cornices and porticos alſo painted of a ſtone-colour. The roofs were flat, and covered only ſo far as was neceſſary to keep out the wind and intercept the rays of the ſun, a ſlender covering, but ſufficient in a country where there was no danger of rain. Within the walls were many fruit and kitchen-gardens, and moſt of the principal houſes had pleaſure-gardens behind them.

The city had five pariſh-churches, and two chapels of eaſe, with a pariſh of Indians under the care of Jeſuits. The convents were very numerous, there being four of Dominicans, three of Franciſcans, three of the order of St. Auguſtine, three belonging to the order of Mercy, and the Jeſuits had ſix colleges. There were likewiſe a monaſtery of the order of St. Benedict, a convent called Nueſtra Senora de la Buena Muerte, and a convent of St. Francis de Paula; with fourteen nunneries, twelve hoſpitals, an orphan-houſe, and other public buildings.

All the churches, both conventual and parochial, and alſo the chapels, were large; they were built partly of ſtone, and adorned with paintings and other decorations of great value, particularly the cathedral and the churches of the Jeſuits, the fathers of Mercy, St. Dominic, St. Francis, and that of St. Auguſtine, were ſo ſplendid as to ſurpaſs deſcription. The riches and pomp of the city, eſpecially on ſolemn feſtivals, were aſtoniſhing. The altars, from the very baſes to the borders of the paintings, were covered with maſſy ſilver wrought into various ornaments. The walls of the churches were hung with velvet, or tapeſtry of equal value, adorned with gold and ſilver fringes, all which in this country are remarkably dear, and on theſe were ſuſpended pieces of plate in various figures. If the eye was directed from the pillars, walls, and ceiling to the lower part of the church, it was equally dazzled with glittering objects, among which were candleſticks of maſſy ſilver, ſix or ſeven feet high, placed in two rows along the nave of the church, emboſſed tables of the ſame metal, and in the intervals between them pedeſtals, on which ſtood ſtatues of angels. Such immenſe riches were beſtowed on the body of the church; but thoſe immediately uſed in divine worſhip, as the ſacred veſſels, the chalices, oſtenſoriums, &c. were much more valuable, ſince an emulation between the ſeveral churches ſubſiſted, each endeavouring to procure the moſt valuable. In theſe the gold was covered with diamonds, pearls, rubies, and ſapphires, ſo as to dazzle the eyes of the ſpectators. The gold and ſilver ſtuffs, fringes, laces, &c. for veſtments and other decorations were always the richeſt and moſt valuable of thoſe brought over by the regiſter ſhips, and every thing employed in ornamenting the churches was the richeſt of the kind poſſible to be procured.

The principal convents were very large, with convenient and many apartments. The roofs of many of the churches were arched; the frontiſpieces and principal gates had a majeſtic appearance, and the columns, friezes, ſtatues, and cornices were of wood finely carved, and not to be diſtinguiſhed from ſtone. The churches were decorated with ſmall cupolas; the towers were of ſtone from the foundation to the height of about eight or ten feet, and from thence to the roof of brick; but the remainder of wood, painted of a free-ſtone colour, terminating in a ſtatue of the ſaint to which the church was dedicated, and theſe were hung with very tunable bells.

Thus ſplendid was the city of Lima before the laſt dreadful earthquake, in which every building was levelled with the ground; and how far they have recovered from that dreadful calamity it is impoſſible to determine, ſince the authors who have beſt deſcribed that country wrote at the time of its deſtruction, and no later pen has given us any account how far they have recovered their former ſplendor.

The univerſity made a ſtately appearance, and had a large ſquare, encompaſſed by a handſome piazza. There the genius of the people is cultivated in that ſpecies of divine and human knowledge in repute in Old Spain. The Ariſtotelian and old ſchool philoſophy ſtill maintain their ground; ſo that the inhabitants are much more indebted to the kind gifts of nature for any extraordinary exertions of genius, than to culture and education; and their little progreſs in uſeful learning appears to be owing rather to the want of proper inſtruction than of talents.

The viceroy of Lima uſually reſides in that city; his government is triennial; he enjoys all the pomp and pre-

prerogatives of royalty, and is abſolute in all affairs, whether military, civil, criminal, or relating to the revenue. Under him are officers and tribunals for executing the ſeveral departments of government, and he fills up all vacant poſts. For the ſecurity of his perſon he has a body of guards of a hundred and ſixty horſe, under the command of a captain and lieutenant, all in a blue uniform richly laced with ſilver: a body of fifty halberdiers who do duty in the rooms leading to the royal audience-chamber, who have waiſtcoats of crimſon velvet, with a broad gold lace: beſides theſe, there is another guard within the palace, conſiſting of a detachment from the garriſon at Callao. All theſe are occaſionally employed in executing the viceroy's orders, and enforcing the decrees of the tribunals, after their having received his aſſent. The viceroy, beſides aſſiſting at the courts of juſtice, and the councils relating to the finances and war, gives daily audience to all ranks of people; for which purpoſe the palace is furniſhed with three very grand and ſpacious rooms; in the firſt of which he receives deputations from the Indians and different caſts: in the ſecond he gives audience to the Spaniards; and in the third receives all thoſe ladies who deſire a private audience.

The viceroy has an annual ſalary of ſeven thouſand one hundred and ſixty-ſeven pounds ſterling, beſides his lawful perquiſites, which amount to three times that ſum. It is ſaid that he can raiſe a hundred and twenty thouſand horſe and foot within his juriſdiction; but it is acknowledged that he cannot arm a fifth part of the number. The garriſon of Lima is compoſed of militia, fourteen companies of which entirely conſiſt of Spaniſh infantry, ſeven companies of the corporation of commerce, eight companies of Indians, and ſix companies of mulattoes, with ten troops of Spaniſh horſe, all forming a body of forty thouſand able-bodied but ill-diſciplined troops.

The forms of government are conducted with the greateſt regularity, and while every thing appears to be managed with the moſt ſcrupulous juſtice, it flows entirely from the pleaſure of the court. The affairs relative to the cabinet are diſpatched by a ſecretary of ſtate, with an aſſiſtant; and from this office orders are received for paſſports, which muſt be obtained from every corregidor within his juriſdiction. The ſecretary, with the viceroy's approbation, fills all juridical employments for the term of two years.

Cauſes relating to equity are tried in the court called Audiencia, from the decrees of which there is no appeal to the council of the Indies, except in caſes of the moſt notorious injuſtice. This tribunal, which is the ſupreme court at Lima, is compoſed of eight auditors, and a fiſcal for civil affairs. It is held in the viceroy's palace, in three different ſaloons, the deliberations being held in one, and the cauſes tried either publickly or privately in the two others.

The next is a chamber of accompts, which conſiſts of a commiſſioner, five chief accomptants, and two doctors, with inferior officers belonging to each claſs. Here the corregidors entruſted with the public revenue paſs their accounts, and here alſo the diſtribution and management of the royal revenue are regulated.

Within the palace is alſo the royal treaſury, under the direction of an accomptant and agent, who ſuperintend his majeſty's revenue within the juriſdiction of the audience of Lima.

The magiſtracy conſiſts of regidors, or aldermen, alfarez real, or ſheriffs, two alcaldes, or royal judges; all of whom are noblemen of the firſt diſtinction. Theſe have the direction of the police, and the ordinary adminiſtration of juſtice. The juriſdiction of the corregidor here only extends to the Indians.

One of the moſt uſeful inſtitutions, when juſtly adminiſtered, is the court for the effects of deceaſed perſons, which takes charge of all the goods of people dying inteſtate, and inſpects the conduct of thoſe intruſted with the effects of other perſons. It conſiſts of a judge, a counſellor, and an accomptant.

The next is the board of trade and commerce, compoſed of a preſident and two conſuls, who preſide over every thing relating to trade, decide all commercial diſputes, and are governed by the ſame rules as the conſulados at Cadiz and Bilboa.

The tribunal of the inquiſition is compoſed of two inquiſitors and a fiſcal, who, like the ſubordinate officers, are nominated by the inquiſitor-general, and in caſes of a vacancy filled by the ſupreme council of the inquiſition. This court is only adapted to inſpire horror, and gain univerſal deteſtation.

The inhabitants of Lima are compoſed of Spaniards, negroes, Indians, Meſtizos, and other caſts proceeding from the mixture of all three. The Spaniſh families are very numerous; Lima, according to the loweſt computation, containing ſixteen or eighteen thouſand whites. Among theſe are reckoned a third or fourth part of the moſt diſtinguiſhed nobility of Peru, in which number are included no leſs than forty-five counts and marquiſes. The number of knights belonging to the ſeveral military orders is alſo very conſiderable. Beſides theſe there are twenty-four gentlemen of large eſtates; but without titles, one of whom traces his deſcent from the ancient yncas of Peru, and to this family the kings of Spain have been pleaſed to grant ſeveral diſtinguiſhed honours and privileges.

Thoſe who make the greateſt figure have a multitude of ſlaves and other domeſtics, and keep coaches; while others are content with having a chaiſe, and theſe are ſo common that no family of any ſubſtance is without one. Indeed they are no where more neceſſary, for the numberleſs droves of mules continually paſſing through Lima, cover the ſtreets with their dung, which being ſoon dried by the ſun and wind, turns to a nauſeous duſt ſcarce ſupportable to thoſe who walk on foot. Theſe chaiſes which are drawn by a mule, and guided by a driver, have only two wheels, with two ſeats oppoſite to each other; ſo that on occaſion they will hold four perſons; but tho' they are very ſlight and airy, yet on account of the gildings and other decorations, ſometimes coſt eight hundred or a thouſand crowns. The number of them is ſaid to amount to five or ſix thouſand.

Commerce is ſo far from being conſidered as a diſgrace at Lima, that the greateſt fortunes have been raiſed by it; and thoſe who have not a ſufficient eſtate, are here deſpiſed, if through indolence or neglect they have not recourſe to it for improving their fortunes; for a royal proclamation has removed all the prejudices of the Spaniards againſt trade, by wiſely declaring, that commerce in the Indies ſhould not exclude from nobility or the military orders.

The negroes, mulattoes, and their deſcendants, form the principal part of the inhabitants, and of theſe are moſt of the mechanics; though here the Europeans alſo follow the ſame employments; for gain being here the univerſal paſſion, the inhabitants purſue it by means of any trade, none of which are here deſpiſed as at Quito, on account of their being followed by mulattoes.

The third and laſt claſs of inhabitants are the Indians and Meſtizos, who are few in proportion to the largeneſs of the city, and the multitude of the ſecond claſs. They are chiefly employed in agriculture, in making earthen ware, and bringing all kinds of proviſions to market; the domeſtic ſervices being chiefly performed by negroes and mulattoes.

The dreſs of the men in general differs but little from that worn in Spain; nor is there much diſtinction between the ſeveral claſſes; for here every one is allowed to wear whatever he can purchaſe: ſo that it is not uncommon to ſee a mulatto, or any other mechanic, dreſſed in a rich tiſſue. They are all fond of fine cloaths; and vanity and oſtentation being under no reſtraint, they are extremely laviſh in this article: but the dreſs of the men is greatly exceeded by that of the women, who in the choice of their laces carry their taſte to a prodigious exceſs; nor is this confined to perſons of quality; but has ſpread through all ranks, except the loweſt claſs of negroes. Theſe laces muſt be all made in Flanders, no woman of rank condeſcending to look on any other.

The dreſs of the ladies conſiſts of a pair of ſhoes, ſtockings, a ſhift, a dimity-petticoat, an open petticoat, and a jacket, which in ſummer is of linen, and in winter of a beautiful ſtuff. To this ſome add a mantelet, that the former

former may hang looſe. From the under-petticoat, which reaches no lower than the calf of the leg, hangs a border of very fine lace, through which the ends of the garters are diſcovered, embroidered with gold or ſilver, and ſometimes ſet with pearls. The upper petticoat, which is of velvet, or ſome rich ſtuff, is fringed all round, and adorned all over with fringe, lace, or embroidery. The ſhift ſleeves, which are a yard and a half in length, and two in width, when worn for ornament, are covered with lace in ſuch a manner as to render the whole truly elegant. Over the ſhift is worn the jacket, the ſleeves of which are exceſſively large, of a circular figure, and conſiſt of rows of lace, or ſlips of cambric with lace diſpoſed between each. The body of the jacket is tied on the ſhoulders with ribbons faſtened to the back of the ſtays, and its round ſleeves, being tucked up to the ſhoulders, form, with thoſe of the ſhift, what may be termed four wings. If the jacket be not buttoned or claſped before, it is faſtened on their ſhoulders. In ſummer they have a kind of veil of the fineſt cambric or lawn, richly laced; but in winter the veil worn in their houſes is of baize, which, when they go abroad full dreſſed, is adorned like the ſleeves. Over the petticoat is an apron of the ſame ſtuff as the ſleeves of the jacket, hanging down to the bottom of it. In ſhort, ſo expenſive are they, that the marriage ſhift alone frequently coſts a thouſand crowns, and ſometimes more.

The women value themſelves extremely on the ſize of their feet, a ſmall foot being eſteemed one of their chief beauties; and therefore from their infancy they are accuſtomed to wear ſtraight ſhoes, that their feet may not be ſuffered to grow beyond their proper ſize: ſome of them do not exceed five inches and a half, or ſix inches in length. Their ſhoes have little or no ſole, one piece ſerving both for that and the upper leather, and are of an equal breadth and roundneſs at the toe and heel, ſo as to form a long figure of eight; but the foot not complying with this figure, brings it to a more natural ſhape. Theſe ſhoes are always faſtened with diamond buckles, or ſomething very brilliant in proportion to the ability of the wearer; but theſe are worn leſs for uſe than for ornament; for they are made in ſuch a manner, that they never looſen of themſelves, nor do the buckles prevent their being taken off. They are alſo fond of white ſilk ſtockings, which are made extremely thin, the better to ſhew the ſhape of the leg, the greateſt part of which is expoſed to view.

The reader will conceive a ſtill higher idea of their magnificence, when he is informed of the ornaments with which they are adorned in their viſits, and upon public occaſions. Their hair, which is naturally black, and capable of reaching below the waiſt, they diſpoſe in a very graceful manner. They tie it up behind in ſix braided locks, through which is inſerted a gold bodkin, a little bent, with a cluſter of diamonds at each end, and on this the locks are ſuſpended, ſo as juſt to touch the ſhoulders. On the front and upper-part of the head, they wear diamond egrets, and the hair is formed into little curls hanging from the fore-head to the middle of the ear, with a large black patch of velvet on each temple. Their earrings are of brilliants, intermixed with tufts of black ſilk covered with pearls; and beſides their necklaces, they alſo wear about their neck roſaries, the beads of which are of pearls, either ſeparate or ſet in cluſters, to the ſize of a large filbert.

Beſides their diamond rings, necklaces, girdles, and bracelets, all very curious, both with regard to water and ſize, many ladies wear a round jewel enriched with diamonds ſuſpended from their girdle, and much more ſuperb than their other ornaments. In ſhort, a lady thus covered with lace, inſtead of linen, and glittering from head to foot with jewels, is ſuppoſed to be dreſſed at the expence of no leſs than thirty or forty thouſand crowns; yet the ſmall value they ſeem to ſet upon them, by wearing them in the moſt careleſs manner upon all occaſions, is really ſurpriſing, ſince by this means they bring upon themſelves freſh expences in repairing the old or purchaſing new jewels, eſpecially pearls, which are liable to be damaged.

The women of Lima are generally of a middling ſtature, handſome, genteel, and have a remarkable luſtre and dignity in their eyes. Their perſonal charms are ſaid to be heightened by thoſe of the mind; for they have clear and comprehenſive intellects, an eaſineſs of behaviour ſo well tempered, that while it invites love, it commands reſpect: the charms of their converſation are beyond expreſſion; their ideas juſt, and their manners inimitably graceful. But they are ſo exceſſively fond of perfumes, that they always carry ambergriſe about them; and not content with the natural fragrancy of flowers, of which they are alſo extremely fond, they ſcatter perfumes even on their noſegays. The moſt beautiful flowers they place in their hair, and others which are moſt valuable for their odour, they ſtick in their ſleeves. Hence the effluvia iſſuing from theſe ladies, it may be eaſily imagined, reach to no inconſiderable diſtance.

The lower claſs of women, even to the very negroes, endeavour, according to their abilities, to imitate their ſuperiors, not only in the faſhion of the dreſs, but in its richneſs. Their linen is always ſtarched to a great degree, in order to diſplay the coſtly patterns of their laces, and they give themſelves the pain of pinching up their feet in little ſhoes, in order to imitate the ladies in the ſmallneſs of their feet. Their next care, which is indeed much more commendable, is cleanlineſs, which is ſeen in the uncommon neatneſs of their houſes.

They are naturally gay, ſprightly, and jocoſe, without levity; remarkably fond of muſic; ſo that even among the loweſt you are entertained with agreeable ſongs; for they have in general good voices. They are very fond of balls, where they diſtinguiſh themſelves by the gracefulneſs and agility of their motions.

The manners and diſpoſitions of the nobility correſpond with their rank and fortune; they are extremely courteous to ſtrangers, who are charmed with their probity, their politeneſs, candour and magnificence. Though the natives of an inferior rank have too great a ſhare of pride, they do not want docility; they inſtantly ſhew their reluctance to a command given with haughtineſs; but when delivered with mildneſs and affability, are equally obſequious and ſubmiſſive. They are charmed with gentleneſs of manners, and a few inſtances of kindneſs make a laſting impreſſion on their minds; but the mulattoes, being leſs civilized, are haughty, turbulent, and quarrelſome.

The diſtempers moſt common at Lima, are malignant, intermitting, and catarrhous fevers, pleuriſies, conſtipations, and convulſions. Theſe laſt are divided into two kinds, common or partial, and malignant. They both come when nature is ſtruggling in the criſis of ſome acute diſtemper; but thoſe afflicted with the former often recover, tho' the greater part die on the third or fourth day; while thoſe who have the misfortune of being attacked by the latter, ſink under it in two or three days. Both are attended with inſupportable pains; ſo that the groaning patient cannot be moved without inconceivable tortures, even from one ſide to the other. The throat is ſo contracted, that nothing can be conveyed into the ſtomach. The jaws are alſo ſometimes ſo cloſely ſhut that it is impoſſible to open them. Thus the miſerable patient lies without motion, and tortured in every part of his body. The malignant or arched ſpaſm is even in the firſt ſtage ſo violent as to cauſe a contraction of the nerves of the vertebræ, from the brain downwards, which with all the muſcles become more and more conſtricted all over the body, till it is drawn backward in the form of an arch, and all the joints diſlocated.

The women of Lima are ſubject to a cancer in the matrix, which is extremely painful, very contagious, and almoſt incurable. Slow and hectic fevers alſo greatly prevail here, and the venereal diſeaſe is as common as in any other part of Spaniſh America, few being entirely free from it.

We ſhall now conſider the commerce of Lima, which is the general emporium of trade of every kind, the center of the products and manufactures of other provinces, together with thoſe of Europe imported by the galleons, and the ſtaple of the whole kingdom. All the wealth of the ſouthern provinces pours into this capital, and is diſcharged into the fleet, which ſails with the galleons from Callao to Panama. At the head of this commerce is the tribunal del Conſulado, already deſcribed, which appoints

commiſſaries to reſide in the other cities of its dependence all over Peru. When commodities arrive at Lima, the merchants remit to their correſpondents ſuch goods as have been beſpoke, reſerving the reſt in ware-houſes, to diſpoſe of on their own account to the traders who then reſort to Lima. The produce of the ſales in the interior country is ſent to Lima in bars of ſilver, and a kind of amalgama of mercury and ſilver duſt, which is coined in the mint of this city. The remittances ſent to Lima during the interval between the flotillas, are expended in the manufactures of the country, great quantities of which come from the province of Quito, and the conſumption is very large; they being worn by all the lower claſs of people, who cannot afford to purchaſe European ſtuffs. Lima has alſo its particular trade with the kingdoms both of North and South America. The moſt conſiderable commodity imported from the former is ſnuff, brought from the Havanna to Mexico, from thence tranſported to Lima, and diffuſed by the merchants of this city all over the province of Peru. Thoſe who deal in this merchandize never engage in any other branch of commerce, except in the ſale of perfumes, porcelain, ambergriſe, and muſk. From New Spain, Lima receives tar, naptha, indigo, and iron; from Terra Firma is imported leaf tobacco, which is greatly uſed by putting a ſmall roll in the mouth called a limpian, both by the gentlemen and ladies, as well as by the vulgar; from Terra Firma are alſo imported pearls, and a few other articles. The timber uſed in building houſes, ſhips, and boats, is brought from Guayaquil, together with cacao. The coaſts of Naſca and Piſco ſend to Lima raiſins, olives, wine, brandy, and oil; and the kingdom of Chili flour, wheat, dried fruits, wine, lard, leather, cordage, and ſome gold. Copper and tin are brought from Coquimbo; and from the mountains of Caxamarca and Chacapoyas, are brought a ſort of canvas made of cotton for ſails, &c. From the ſouthern provinces are ſent Vicuna wool for making hats, and ſome ſtuffs of a peculiar fineneſs; and laſtly from Paraguay is ſent the herb called by that name, of which there is an amazing conſumption.

Thus this city is the emporium to which people reſort from all quarters, and trade is in a conſtant circulation. The inhabitants of Lima are even ſaid to have a natural diſpoſition for commerce, and the city may be conſidered as an academy to which great numbers reſort to perfect themſelves in the various arts of trade. They penetrate into the deſigns of the ſeller, and artfully draw the purchaſer into their own views. They have beſides a remarkable talent of perſuaſion, at the ſame time that they are incapable of being perſuaded. They affect to ſlight what they are moſt deſirous of purchaſing, and by that means frequently make very advantageous bargains, which none can obtain from them. However, notwithſtanding theſe mean fineſſes in buying and ſelling, for which they are particularly diſtinguiſhed, none are more punctual in performing their contracts.

SECT. VIII.

Of the other principal Towns in the Audience of Lima, namely, Callao, Truxillo, Guamanga, Cuſco, and Arequipa.

CALLAO is the port of Lima, from which it is five miles diſtance, and extends along the ſea-coaſt on a low flat point of land. The Spaniards have no harbour equal to this in the South-ſea, for beauty, ſecurity, and convenience; for the largeſt veſſels may lie with perfect ſafety in the road, the water being extremely deep, and the port ſheltered from the winds by the iſland of St. Laurence, which alſo breaks the ſurges rolling from the ſouth-weſt. The town from the ſea makes a tolerable figure, it having ſeveral public edifices; and beſides the churches there are five monaſteries, though according to ſome authors the inhabitants do not exceed four or five hundred. The government has expended large ſums of money in giving this important harbour all the advantages of ſtrength that it was thought art could beſtow. Hence that town is conſidered in Spain as almoſt impregnable, though in fact both the garriſon and fortifications are very inconſiderable. The latter conſiſted of an incloſure on the land ſide, flanked by ten baſtions, and ſeveral redans and plain baſtions on the edge of the ſea, with four ſtrong batteries to command the port and road; but theſe being in a manner demoliſhed in the laſt great earthquake, have never ſince been thoroughly repaired, the money appropriated by the government having been expended in other purpoſes, more agreeable to the viceroy of Peru. It is alſo reported, that his Catholic majeſty is annually charged with large ſums for the garriſon, fortifications, and the men of war ſuppoſed to lie in the harbour; yet ſuch is the integrity of the royal offices there, that the ſoldiers are hardly ſufficient to mount guard; the walls are in many places in ruins, and the ſhips could not be fitted for ſea in the ſpace of ſeveral months.

A judgment may be formed of the importance of this harbour from what has been ſaid of the commerce of Lima chiefly carried on by this channel. Two flotas annually ſail from hence, one for Arica, the other from Panama; the former about the cloſe of February, which having received the ſilver ſent from Potoſi, returns in March. In the beginning of May the flota ſails from Panama with all the treaſures of Potoſi, the wealth of Chili brought by the Valparaiſo fleet, and the royal revenues and merchandize brought from the moſt diſtant parts of Peru and Los Charcas. Beſides theſe fleets there annually ſail from hence two ſhips from Acapulco, freighted with gold and ſilver, and the commodities they bring back are lodged in the magazines here, and retailed to all the ſouthern provinces of America.

This town and the city of Lima are the principal places in the archbiſhopric of that name. The audience of Lima is alſo divided into four biſhoprics, Truxillo, Guamanga, Cuſco, and Arequipa.

The dioceſe of Truxillo lies to the north of the archiepiſcopal dioceſe of Lima, and, like all the others, is divided into ſeveral juriſdictions.

The city of Truxillo is ſeated in the eighth degree ſix minutes three ſeconds, ſouth latitude, in a pleaſant ſituation, though in a ſandy ſoil. It is ſurrounded by a brick wall; and its circuit intitles it to be claſſed among the cities of the third order: it is ſituated about half a league from the ſea; and ſix miles to the northward of it is the port of Guanchaco, the channel of its maritime commerce. The houſes, which are moſtly built of brick, make a handſome appearance, they being adorned with ſtately porticos and balconies; but are low on account of the frequent earthquakes, few having ſo much as one ſtory. It is the reſidence of a biſhop, who has a chapter, conſiſting of a dean, an arch-deacon, a chanter, four canons, and two prebendaries. Here is alſo an office of revenue with convents of ſeveral orders, a college of Jeſuits, an hoſpital of the lady of Bethlehem, and two nunneries.

The inhabitants conſiſt of Spaniards, Indians, and all the other caſts. Among the former are ſeveral rich and diſtinguiſhed families, all in general civil, friendly, and regular in their conduct. The women in their dreſs and cuſtoms follow nearly thoſe of Lima. A great number of chaiſes are ſeen here; for as the ſandy ſoil renders walking very troubleſome, there are few families of any credit without one.

The valley in which Truxillo is ſeated is extremely fruitful, abounding with ſugar-canes, maize, fruit, and plants proper for the kitchen, with vine-yards and olive-yards. The parts of the country neareſt the mountains produce wheat, barley, and other grain, whence the inhabitants not only enjoy plenty of all kinds of proviſions, but export conſiderable quantities, eſpecially of wheat and ſugar to Panama. This remarkable fertility has been improved ſo as to embelliſh the country. The city is ſurrounded by ſeveral groves and delightful walks of trees; the gardens are alſo well cultivated, and make a beautiful appearance.

The city of Guamanga, the capital of the ſecond dioceſe, in the audience of Lima, is ſituated on the declivity of ſome mountains not remarkable for their height, which extending ſouthward incloſe a ſpacious plain to the eaſtward of the city, watered by a ſmall ſtream. Guamanga has at leaſt twenty noble families, who live in the center of the town in ſpacious houſes of a conſiderable height, built partly of ſtone, and accommodated with

with extenſive gardens and orchards. The cathedral is very ſplendid, and its chapter conſiſts of a dean, an archdeacon, a chanter, two canons, and a penitentiary. It has a ſeminary for the ſervice of the church, under the title of St. Chriſtopher. Here are two pariſh-churches, one for the Spaniards, and one for the Indians, with four chapels. The city has alſo an univerſity, with profeſſors of philoſophy, divinity, and law; and enjoys equal privileges with that of Lima, they being both royal foundations. Within the walls of the city are the convents of St. Dominic, St. Francis, the fathers of Mercy, St. Auguſtine, St. Juan de Dios, a college of Jeſuits, and an hoſpital of St. Francis de Paula. The nunneries are of the orders of St. Clare, the Carmelites, and a religious ſiſterhood.

The large Indian ſuburbs round the city add greatly to its extent; and the houſes, though low, are chiefly of ſtone.

In this dioceſe is a rich quickſilver mine, from which the inhabitants of a neighbouring town procure their whole ſubſiſtence, the coldneſs of the air in that place checking the growth of all kinds of grain and fruit; ſo that they are obliged to purchaſe them from their neighbours. The quickſilver mines wrought here ſupply all the ſilver mines of Peru with that neceſſary mineral, and, notwithſtanding the prodigious quantities already extracted, no diminution is perceived.

Cuſco is the moſt ancient city in Peru, it being of the ſame date with the empire of the yncas, and was founded by them as the capital of the empire. It ſtands in a very uneven ſituation on the ſides of the mountains, there being no other near it more convenient. On a mountain contiguous to the north part of the city are the ruins of a famous fort built by the yncas, from whence it appears that their deſign was to incloſe the whole mountain with a prodigious wall of ſuch conſtruction, as to render its aſcent abſolutely impracticable to an enemy, in order to prevent all approach to the city. This wall was entirely of free-ſtone and ſtrongly built, ſome of the ſtones being of a prodigious magnitude.

The city of Cuſco is nearly equal to that of Lima. The north and weſt ſides are ſurrounded by the mountain of the Fortreſs, and on the ſouth it borders on a plain in which are ſeveral beautiful walks. Moſt of the houſes are of ſtone, covered with tiles of a lively red, that gives the houſes an elegant appearance. The apartments are very ſpacious, and as the inhabitants are famous for their elegant taſte, they are finely decorated, the mouldings of all the doors being gilt, and the other ornaments and furniture very ſplendid.

The cathedral nearly reſembles that of Lima, though it is much ſmaller; it is built entirely of ſtone, and the architecture is even thought to exceed it. Here are alſo eight other pariſhes, with a convent of Dominicans, the principal walls of which were formerly thoſe of the temple of the Sun, and the high altar ſtands in the very place where was once an image of gold of that imaginary deity. There is alſo a convent of Franciſcans, which is the head of that order in this province. The convents of St. Auguſtine and the fathers of Mercy are likewiſe the principal of their reſpective orders. The Jeſuits have alſo a college here. The convent of St. Juan de Dios, and that of the Bethlehemites, which are both very large, contain hoſpitals for the ſick; the latter is particularly appropriated to the Indians, who are uſed there with great care and tenderneſs.

The government of the city conſiſts of a corregidor placed at the head of the magiſtrates, who are the chief nobility; and out of theſe are annually choſen two ordinary alcaldes.

Here are three colleges: in the firſt, called St. Anthony, is a ſeminary for the ſervice of the cathedral, in which are taught Latin, the ſciences, and divinity: the ſecond is under the direction of the Jeſuits, who inſtruct youths of fortune: the third, called St. Francis de Borja, belongs alſo to the Jeſuits, and is founded for the education of the ſons of Indian princes. The two former confer all degrees below that of doctor, and have been erected into univerſities. Here is alſo a court of inquiſition, and another of the croiſade.

In this biſhopric are ſeveral mines of gold and ſilver, that are extremely rich.

The fourth dioceſe of the audience of Lima is Arequipa, which contains the city of the ſame name, one of the largeſt in all Peru. It is delightfully ſeated in a plain; the houſes are well built of ſtone, and are generally lofty, commodious, finely decorated on the outſide, and neatly furniſhed within. The temperature of the air is extremely agreeable, the cold being never exceſſive, nor the heat troubleſome; ſo that the fields are always cloathed with verdure, and enamelled with flowers as in a perpetual ſpring. The inhabitants enjoy an exemption from many diſeaſes common in this part of America, which is ſuppoſed to be in a great meaſure owing to their care in keeping the ſtreets clean, by means of canals which extend to a river that runs near the city, and by which all its filth is ſwept away. But theſe advantages are allayed by its being frequently expoſed to dreadful earthquakes; for by theſe convulſions of nature it has been four times laid in ruins. The city is, however, very populous, and among its inhabitants are many noble families. A great number of them have ſettled here on account of the goodneſs of the air, the fertility of the ſoil, and the convenience of commerce at the port of Arante, at twenty leagues diſtance. The chapter, beſides the biſhop, conſiſts of a dean, an archdeacon, a chanter, a rector, and treaſurer, three canons, and two prebendaries: beſides the ſacriſty, which is ſerved by two prieſts for the Spaniards, the pariſh of Santa Martha is appropriated to the Indian inhabitants. Here are two Franciſcan convents, one of Dominicans, another of Auguſtines, a monaſtery of the fathers of Mercy, a college of Jeſuits, and a convent and hoſpital of St. Juan de Dios, with three nunneries, and a ſeminary for the ſervice of the cathedral. The civil, political, and military government of the city is executed by a corregidor, who is placed at the head of the regidores, from whom are annually choſen two ordinary alcaldes. Here is likewiſe an office of the revenue under the direction of a treaſurer and accomptant, with commiſſaries of the inquiſition and croiſades.

In this biſhopric are ſeveral gold and ſilver mines, and in ſome parts are large vineyards, from which conſiderable quantities of wine and brandy are made. Among the other productions is Guinea pepper, in which the juriſdiction of Arica in this dioceſe carries on a very advantageous trade, the annual produce of theſe plantations bringing in no leſs than ſixty thouſand dollars per annum. The pods of this pepper are about a quarter of a yard in length, and when gathered are dried in the ſun and packed up in bags of ruſhes, each bag containing an aroba, or a quarter of a hundred weight, and thus they are exported to all parts. Other places of this juriſdiction are famous for vaſt quantities of large and excellent olives, far exceeding the fineſt produced in Europe, they being nearly as big as a hen's egg.

SECT. IX.

Of the Audience of LOS CHARCAS, *or* LA PLATA.

Its Situation, Extent, and Climate. A particular Account of the famous Mountain of Potoſi, and of the Lumps of Silver found in the Province of Carangas: with a Deſcription of the City of Plata.

THE audience of Charcas, the laſt diviſion of Peru, is equal in extent to that of Lima; but many of its parts are not ſo well inhabited, ſome being full of vaſt deſarts and impenetrable foreſts, while others have extenſive plains intercepted by the ſtupendous height of the Cordilleras; ſo that it is inhabited only in thoſe parts that are free from thoſe inconveniencies. It is bounded on the north by the dioceſe of Cuſco, and reaches ſouthward to Buenos Ayres; on the eaſtward it extends to Braſil; and on the weſtward reaches to the South ſea, particularly at Atacama. The remainder of the province borders on the kingdom of Chili.

The climate of this country is various; on the ſhore it is exceſſive hot, and the inland parts of the country are in ſome places extremely cold: the ſoil is, however, generally

nerally fruitful in the cultivated parts, particularly in the valleys between the mountains, where it is watered by ſeveral rivers. With reſpect to its produce, it is chiefly famous for its gold and ſilver.

This audience of Charcas is divided into the archbiſhopric of Plata, and five biſhopricks. We ſhall begin with the former.

The famous mountain of Potoſi is known all over the commercial world for the immenſe quantity of ſilver it has produced. The diſcovery of this amazing treaſure happened in the year 1545, by a fortuitous accident. An Indian, by ſome called Hualpa, and by others Gualca, purſuing ſome wild goats up this mountain, and coming to a very ſteep-part, laid hold of a ſhrub in order to climb it with greater celerity; but the ſhrub being unable to ſupport his weight, came up by the roots, and diſcovered a maſs of fine ſilver; and at the ſame time he found ſome lumps of the ſame metal among the clods that adhered to the roots. This Indian, who lived at Porco, haſted home with theſe firſt-fruits of his diſcovery, waſhed the ſilver, and made uſe of it, repairing when his ſtock was near exhauſted to his perpetual fund. At length an intimate friend of his, named Guanca, obſerving the happy change in his circumſtances, longed to know the cauſe, and repeated his queſtions with ſuch earneſtneſs, that Gualca revealed the ſecret to him. For ſome time they retired in concert to the mountain for freſh ſupplies of ſilver, till Gualca refuſing to diſcover his method of purifying the metal, Guanca revealed the whole ſecret to his maſter Villarroel, a Spaniard, who alſo lived at Porco; and on this information went, in April 1545, to view this fortunate breach in the mountain, and the mine was inſtantly worked with immenſe advantage.

The firſt mine was called the Diſcoverer, from its diſcovering other ſources of riches, incloſed in the bowels of this mountain; for in a few days another was found equally rich, and called the Tin Mine: ſince that another has been diſcovered, and diſtinguiſhed by the name of Rica, or rich, it ſurpaſſing all the reſt. It was afterwards ſucceeded by one named the Mendieta. Theſe are the principal mines of Potoſi; but there are ſeveral ſmaller croſſing the mountain on all ſides.

On a report of theſe important diſcoveries people from all parts repaired to Potoſi, particularly from the city of Plata, which is ſituated about ſeventy-five miles from the mountain; ſo that at preſent the town of Potoſi is near ſix miles in circuit, and inhabited by many noble families, particularly thoſe concerned in the mines. Though the air of the mountain is ſo extremely cold, as to render the adjacent country remarkably barren, it producing neither corn, fruit, nor herbs; yet the town is ſo plentifully ſupplied as to enjoy an abundance of every kind, and the trade for proviſions is greater here than in any other place except Lima. Some provinces ſend the beſt of their corn and fruit, others their cattle, others their manufactures, and thoſe who trade in European goods reſort to Potoſi as to a market, where there is a great demand, and no want of ſilver to give in exchange. A Spaniſh author declares, from very good authority, that before the year 1638 it appeared by the public accounts, that the produce of the ſilver amounted to three hundred ninety-five millions ſix hundred and nineteen thouſand dollars; which, in ninety-three years, the time it had then been diſcovered, amounted to forty-one millions two hundred fifty five thouſand and forty-three dollars per annum. Hence an idea may be formed of the vaſt trade which has for many years been carried on in this town, and is ſtill likely to continue for a long time, its whole trade conſiſting in the ſilver extracted from this mountain; and though ſome diminution has been perceived in its produce, it is ſtill very conſiderable.

At a ſmall diſtance from Potoſi are the hot medicinal baths, called Don Diego, whither ſome reſort for health, and others for diverſion.

In the province of Carangas, which is remarkably cold, is a great number of ſilver mines, conſtantly worked; among which one called Turco is very remarkable for a ſort of ore termed by miners machacado, the fibres of the ſilver forming an admirable intertexture with the ſtones in which they are contained. Mines of this kind are generally the richeſt. Beſides theſe there are others in this juriſdiction; for in the barren ſandy deſarts extending towards the coaſt of the South ſea are found, by digging in the ſand, detached lumps of ſilver unmixed with any ore or ſtone, but what adheres to ſome parts of the metal. The lumps are called papas, from their being taken out of the ground in the ſame manner as that root. Theſe lumps of ſilver are of a different compoſition from thoſe found in the mines, having all the appearance of melted ſilver. In them the ſilver forms a maſs, and the ſurface is covered over with black terrene particles, that have all the marks of calcination; but few or none of them are mixed with the ſilver. The ſize and figure of theſe lumps are very different, ſome weighing about two marks, or ſixteen ounces, and ſome above a hundred marks. Theſe lumps of ſilver are found in different parts of the ſame ground, though not often near one another.

We ſhall now give a deſcription of the city of Plata, which received its name from the ſilver mines in its neighbourhood. It ſtands in a ſmall plain environed by eminences, that defend it from the winds. The temperature of the air in the dry ſeaſon is very mild; nor is there any conſiderable difference throughout the year; but in the winter, or rather the rainy ſeaſon, which begins in September and continues till March, tempeſts of thunder and lightning are very common, and the rains of long continuance; but, during all the other parts of the year, the atmoſphere is bright and ſerene. The houſes both in the great ſquare and thoſe adjoining to it have one ſtory above the ground-floor, and are covered with tiles. They are large and convenient, and have delightful gardens planted with the fruits of Europe; but water is ſo ſcarce, that they have hardly enough to ſupply the neceſſary purpoſes of life, the little they have being fetched from ſeveral public fountains diſperſed in different parts of the city. The inhabitants, who conſiſt of Spaniards and Indians, are ſaid to amount to about four thouſand.

The cathedral is large and divided into three iſles, and is finely adorned with paintings and gildings. Its chapter conſiſts of a dean, an archdeacon, chanter, treaſurer, and rector, five canons, four prebendaries, and four minor prebendaries. The archbiſhop and his chancellor conſtitute the eccleſiaſtical tribunal. The pariſh of the cathedral is ſerved by two prieſts, one for the Spaniards, and the other for the Indians. At the end of the city is St. Sebaſtian's church, which is appropriated ſolely to the Indians living within its precinct, who are thought to be about three thouſand. The convents are thoſe of the Auguſtines, Dominicans, Franciſcans, the fathers of Mercy, and a college of Jeſuits, all ſpacious buildings, with ſplendid churches. Here is alſo a conventual hoſpital of St. Juan de Dios, the expences of which are defrayed by the king; with two nunneries, one of the order of St. Clare, and the other of St. Monica. The city of La Plata has alſo an univerſity dedicated to St. Francis Xavier, the chairs of which are filled indifferently either by the ſecular clergy, or by laymen; but the rector is always a Jeſuit. Here are alſo two other colleges, in which lectures are read: that of St. John is under the direction of the Jeſuits; while the archbiſhop nominates to that of St. Chriſtopher, which is a ſeminary.

The chief tribunal in Plata is that of the audience, whoſe preſident has the titles of governor and captain-general of the province, excluſive of the governments of Santa Cruz de la Sierra, Tucuman, Paraguay, and Buenos Ayres, which are independent, and in military affairs abſolute. It has alſo a fiſcal, a protector-fiſcal of the Indians, and two ſupernumerary auditors. The magiſtracy, or corporation, as in all the other cities of this country, conſiſt of regidores, who are perſons of the firſt diſtinction, with the corregidor at their head; and from them are annually choſen two ordinary alcaldes for maintaining order and the police. Here is alſo a tribunal of croiſade, with a commiſſary, ſubdelegate, and other officers; a court of inquiſition ſubordinate to that of Lima; and an office for taking care of the effects of perſons dying inteſtate.

Two leagues from Plata runs the river Cachimayo, which has on its banks ſeveral pleaſant ſeats of the inhabitants; and about ſix leagues in the road leading to

Potoſi is the river Philcomayo, which is paſſed over by a large ſtone bridge. During ſome months in the year this river furniſhes the city of Plata with great plenty of delicious fiſh: among theſe is one called the dorado, which generally weighs between twenty and twenty-five pounds. The other proviſions, as bread, fleſh, and fruits, are brought from the neighbouring provinces.

SECT. X.

Of the Dioceſe of La Paz in the Audience of Plata. Its Climate and Produce; with a Deſcription of the Lama, the Guanaco, and Vicuna, of the Lake of Titicaca, and the City of La Paz.

WE now come to the five dioceſes in the audience of Plata, and ſhall begin with that of La Paz, which is divided into ſix juriſdictions. Great part of the country is expoſed to a cold air; ſo that hard froſts, ſnow, and hail, are not uncommon; but the city of La Paz is ſecured from them by its happy ſituation. Other parts are alſo ſo well ſheltered from the piercing air of the Andes, that they produce all the vegetables of a hot climate, as ſugar-canes, cacao, and the like. In the mountainous parts are large woods of valuable timber, but infeſted with tygers, leopards, and bears: they have alſo a few deer, and a great number of cattle of the European kinds, which feed on the heaths; as do alſo guanacos, vicunas, and lamas.

It will be proper here to deſcribe the laſt of theſe animals, and we ſhall begin with the lama, which in ſeveral particulars reſembles the camel, as in the ſhape of its head, neck, and ſome other parts; but has no bunch on its back, and is much ſmaller, cloven-footed, and of a different colour; for though moſt of them are brown, ſome are black, others white, and others of different colours. Its pace reſembles that of a camel, and its height is equal to that of an aſs between one and two years old. The Indians and Spaniards uſe them as beaſts of carriage, and they anſwer very well for any load under a hundred weight. Anciently the Indians uſed to eat their fleſh, as they ſtill do when they are paſt their labour, and ſay there is no difference between it and mutton, except its being ſomething ſweeter. It is a very docile animal, eaſily kept; its whole defence is ejecting from its noſtrils a viſcous matter, which is ſaid to give the itch to any one on whom it falls; ſo that the Indians, who firmly believe this, are very cautious in provoking it.

The guanaco and the vicuna are but little different from the lama. The guanaco is larger, and its wool long and harſh; the vicuna, which is ſmaller than the lama, has ſhorter and finer wool, and is brown all over the body, except the belly, which is whitiſh. The laſt are of great ſervice in the mines, carrying metals in ſuch rugged roads, as would be impaſſable for any other beaſts.

In the cordillera near the city is a mountain of remarkable height, called Illimani, which doubtleſs contains immenſe riches; for a crag of it being ſome years ago ſeparated from it by a flaſh of lightning, and falling on a neighbouring mountain, ſuch a quantity of gold was found in the fragments, that for ſome time that metal was ſold at Paz at eight pieces of eight per ounce. But its ſummit being perpetually covered with ice and ſnow, no mine has been opened in the mountain.

In this dioceſe is the lake of Titicaca, which is ſomewhat of an oval figure, and about eighty leagues in circumference, and the water in ſome parts ſeventy or eighty fathoms deep. Ten or twelve large rivers, beſides a great number of ſmaller ſtreams, empty themſelves into it. The water, though neither bitter nor brackiſh, is turbid, and its taſte ſo nauſeous, that it cannot be drank. It contains ſeveral iſlands, among which is one of a conſiderable ſize, on which the yncas erected a magnificent temple to the ſun, the walls of which were covered with plates of gold and ſilver; but this immenſe maſs of riches the Indians, on ſeeing the rapaciouſneſs of the Spaniards on their conquering the country, are thought to have thrown into the lake, to prevent its falling into their hands.

The city of La Paz is of a middling ſize, and from its ſituation among the breaches of the Cordillera, the ground on which it ſtands is not only unequal, but alſo ſurrounded by mountains; without any other proſpect than that of thoſe mountains and the channel of the river. When this river is increaſed either by the rains or the melting of the ſnow on the mountains, its current forces along large maſſes of rocks with ſome grains of gold, which are found after the flood has ſubſided. Hence ſome idea may be formed of the riches incloſed in the bowels of theſe mountains, a remarkable proof of which appeared in the year 1730, when an Indian waſhing his feet in the river diſcovered ſo large a lump of gold, that the marquis de Caſtel Fuerte gave twelve thouſand pieces of eight for it, and ſent it as a preſent to the king of Spain.

The chapter of the cathedral conſiſts of a dean, an archdeacon, a chanter, four canons and prebendaries. Here are alſo four pariſh-churches and monaſteries of Auguſtines, Dominicans, Franciſcans, fathers of Mercy, a college of Jeſuits, and a convent and hoſpital of St. Juan de Dios, with a nunnery of the order of Conception, and another of Santa Tereſa. The city is governed by a corregidor, under whom are regidores and ordinary alcaldes, as in the other towns.

SECT. XI.

Of the Biſhopries of Santa Cruz de la Sierra and Tucuman, in the Province of Los Charcas: their Climate, Soil, Produce, and Inhabitants.

THE biſhopric of Santa Cruz de la Sierra is a government and captain-generalſhip, and though its juriſdiction is of large extent, not many Spaniards are found in it; and its few towns are in general miſſions, comprehended under the name of miſſions of Paraguay.

The winter here is ſevere; it begins in May, and ends in Auguſt, during which the ſouth wind blows for ſeven weeks, and the rains overflow great part of the country; but the ſummer is exceſſive hot.

The ſoil abounds with ſeveral kinds of fruit. Here is a ſpecies of palm tree, from the trunk of which they get a ſort of meal that is very good food. Grapes, figs, and muſk-melons, alſo thrive well here.

The city of Santa Cruz, the capital of this government, ſtands eighty or ninety leagues eaſt of Plata, but is neither large nor well built, nor has any thing anſwerable to the name of a city. The houſes are of ſtone covered with palm leaves: there is one church, which is the cathedral; its chapter conſiſts only of a biſhop, dean, and archdeacon; it having neither canons, prebendaries, nor other dignitaries.

The miſſions belonging to the Jeſuits in the parts dependent on this biſhopric are called Indios Chiquitos, or Little Indians, a name they received from the Spaniards, from the extreme ſmallneſs of the doors of their houſes. Their country lies between Santa Cruz de la Sierra and the lake of Xarayes, from whence the river Paraguay has its riſe, and being increaſed by the conflux of others, forms the famous river of Plata. About the cloſe of the laſt century the Jeſuits began preaching in this nation, and had ſuch ſucceſs, that in 1732 they had formed ſeven towns, each conſiſting of above ſix hundred families, and were then building others for aſſembling under their laws the great number of Indians they brought over to the Romiſh church.

The Indios Chiquitos are active and well made, and their courage has been frequently experienced by the Portugueſe, who uſed to make incurſions into their country, in order to carry off the inhabitants for ſlaves: but their valour has taught them to keep within their own limits. The arms of theſe Indians are poiſoned arrows, muſkets, and ſabres. Though their language is different from that of the other nations of Paraguay, they have nearly the ſame cuſtoms. Near theſe is another nation of Indians, who have always ſtrenuouſly refuſed to liſten to the miſſionaries, who have been able to make very few converts among them.

The biſhopric or government of Tucuman lies in the center of this part of America, beginning ſouth of the

river Plata beyond the towns of Chicas, which furniſh Indians for the mines of Potoſi; on the eaſt it borders on Paraguay and Buenos Ayres, reaching weſtward to the kingdom of Chili, and ſouthward to the plains of Magellan.

The territories of this government are of ſuch extent, that they reach above two hundred leagues from north to ſouth, and in ſome parts little leſs than a hundred from eaſt to weſt; but all the towns are ſmall, and built without either order or ſymmetry. The principal part of the country is not habitable, either from the want of water, or the impenetrable foreſts with which it is covered; and the Spaniards are prevented from extending their ſettlements by the ravages of the free Indians, who take all opportunities to deſtroy them.

Thoſe parts of the country that are watered by rivers are ſo fertile, as to produce corn and fruit ſufficient for the conſumption of the inhabitants. The woods abound in wild honey and wax, while the hot parts produce ſugar and cotton; the laſt of which is manufactured in the country, and, with the woollen ſtuffs alſo wove by the inhabitants, form an advantageous branch of trade. But its great article conſiſts in the mules bred in the luxuriant paſtures of its valleys; inconceivable droves of theſe animals are ſent to all parts of Peru, they being famous for exceeding all others in ſtrength and docility.

SECT. XII.

Of PARAGUAY.

Its Situation, Climate, and Produce; with a particular Account of the Miſſions of the Jeſuits, and the Orders, Regulations, and Government of the Towns and Villages under their Authority.

THE fourth biſhopric of the audience of Charcas is Paraguay, which lies to the eaſt of Tucuman, and is bounded on the north by Santa Cruz de la Sierra, on the ſouth by Buenos Ayres, and on the weſt by Braſil.

The air in general is moiſt and temperate, though in ſome places it is rather cold. The temperate parts abound with all kinds of proviſions. Cotton is produced in great quantities; and the induſtrious, in the miſſions of the Jeſuits, are very ingenious in weaving it into ſtuffs for exportation. It alſo abounds in tobacco, and in the valuable herb called Paraguay; with plenty of a variety of fruits, and rich paſtures, in which are bred vaſt herds of cattle.

The only ſettlements in this government are the city of Aſſumption, Villa Rica, and ſome other towns, whoſe inhabitants are a mixture of Spaniards, Meſtizos, and ſome Indians; but the greateſt part are of the ſeveral caſts. As the city Aſſumption is but ſmall and irregular, it cannot be expected that Villa Rica and the other towns and villages ſhould be better. The houſes of the capital are indeed intermixed with gardens and plantations, but without any ſymmetry. It is, however, the reſidence of the governor of the province, who had formerly under his juriſdiction part of the towns which compoſed the miſſion of Paraguay; but a few years ſince they were ſeparated from it, and annexed to the government of Buenos Ayres. In the city of Aſſumption is a cathedral, whoſe chapter, beſides the biſhop, conſiſts of a dean, an archdeacon, a treaſurer, and two canons. The pariſhes of the city of Villa Rica, and of the other towns depending on this government, are ſerved by the Franciſcans; but in the miſſionary towns they are ſolely under the care of the Jeſuits; and theſe compoſing moſt of the towns in this province, we ſhall treat particularly of them, in which we ſhall follow the account given by the learned and ingenious Antonio de Ulloa, and Muratori.

The miſſions of Paraguay, beſides thoſe in the province of that name, include a great many in Santa Cruz de la Sierra, Tucuman, and Buenos Ayres.

Soon after the city of Aſſumption was founded, a few Jeſuits entering Paraguay, brought over to the Romiſh church about fifty Indian families, who ſoon induced many others to follow their example, on account of the peace and tranquillity they enjoyed under the direction of the fathers. They had long diſdained to ſubmit to the arms of the Spaniards and Portugueſe; but became willing converts to the religious tenets propoſed by the Jeſuits, who, in order to cultivate their minds and gain their affections, learned their language, and conformed to their manners; thus obtaining an entire aſcendant over their affections, they eſtabliſhed the moſt ſolid and real authority, a dominion over the mind.

They began with aſſembling them in towns, and forming them into ſocieties, regulated by a very extraordinary ſyſtem of civil policy. They engaged to protect them againſt the inſolence of the Spaniſh ſoldiers and the tyranny of the governors, and actually kept their word with reſpect to the Portugueſe, againſt whom they obtained leave from the court of Spain to arm the natives. The Portugueſe, then only intent on the improvement of their colonies, in violation of the moſt ſacred laws, did not, even after the converſion of theſe people, ceaſe from making incurſions, in order to carry off the young inhabitants as ſlaves for their plantations; ſo that it became abſolutely neceſſary, in order to preſerve theſe converts, to remove into Paraguay about twelve thouſand of all ages, and a like number were brought from other places. The Jeſuits ſet about diſciplining the Paraguans, taught them the uſe of fire-arms, and ſoon rendered them able to cope with their enemies, and, when they appeared, to drive them out of the country. The mildneſs of the Chriſtian yoke, the exemption from taxes and marks of ſervitude, rendered them extremely attached to the fathers; and at preſent above three hundred and forty thouſand families are ſubject to the Jeſuits, living in obedience and an awe bordering upon adoration, yet procured without any violence or conſtraint.

The Paraguay miſſions are on all ſides terminated by nations of idolaters, ſome of which, however, live in perfect harmony with them, while others make frequent incurſions into the country; and among the latter the fathers chiefly employ their zeal, in order to bring them over to their religion and diſcipline; and having brought over a number of theſe to their principles, they conduct them to the Chriſtian towns, where, after proper inſtructions, they are admitted to baptiſm.

There are about threeſcore pariſhes on the banks of the rivers Paraguay and Panama, at not above the diſtance of thirty miles from each other. In each of theſe is a Jeſuit, who is ſupreme in all cauſes civil, military, and eccleſiaſtic; and may be regarded as a petty prince, who governs not only with the authority of a ſovereign, but with the influence and reputation of an oracle. The important office of governor is, however, always filled by a perſon choſen by the Indians, with the approbation of the prieſt. The alcaldes are annually appointed by the regidores, and the governor jointly with them attends to the maintenance of good order and tranquillity among the inhabitants; but that theſe officers, who are ſeldom perſons of diſtinguiſhed abilities, may not abuſe their authority, and either through intereſt or paſſion carry their revenge too far againſt the other Indians, they are not to proceed to puniſhment without previouſly acquainting the prieſt, that he may compare the offence with the ſentence. The prieſt, on finding the perſon really guilty, delivers him up to be puniſhed, which generally conſiſts in impriſonment for a certain number of days, and ſometimes faſting is added to it; but if the fault be very great, the delinquent is whipped, which is ſaid to be the moſt ſevere puniſhment uſed among them. The execution of the ſentence is preceded by a diſcourſe made by the prieſt before the delinquent, in which he repreſents, with the greateſt mildneſs, the nature and guilt of his crime, by which means he is brought to acknowledge the juſtice of the ſentence, and to receive it rather as a paternal correction, than a rigorous puniſhment; and indeed they are ſaid to have ſo high an opinion of the Jeſuits, that they are more ready to blame themſelves, than to think it poſſible for the prieſt to do wrong.

Every town has a particular armoury, in which are kept all the fire-arms, ſwords, and weapons uſed by the militia when they take the field, whether to repel the inſults of the Portugueſe, or any of the free Indians inhabiting their frontiers; and, that they may be dexterous in the management of them, they are exerciſed on the evening of every holiday in the market-places of the town.

All perſons capable of bearing arms are alſo in every town divided into companies under their proper officers, who owe this diſtinction to their military qualifications. Their uniform is richly laced with gold or ſilver, according to their rank, and embroidered with a device of their towns. In theſe they always appear on holidays at the times of exerciſe. The governor, alcaldes, and regidores, have likewiſe very magnificent habits of ceremony, which they wear on ſolemn occaſions.

Every town has a ſchool for teaching reading, writing, dancing, and muſic; and whatever the natives undertake they generally make a great proficiency in; for the inclination and genius of every one is carefully conſulted, before he is forwarded in any branch of ſcience. In one of the courts of the houſe belonging to the prieſt of each town are work-houſes for painters, ſculptors, gilders, ſilver-ſmiths, lock-ſmiths, carpenters, weavers, watch-makers, and other mechanic arts and trades, where the Indians work for the benefit of the whole town, under the inſpection of the prieſt's coadjutors; and boys are alſo inſtructed in the arts or trades to which they have the greateſt inclination.

In each of the towns is a houſe in which women of ill fame are placed; it alſo ſerves for the retreat of married women who have no families, during the abſence of their huſbands. For the ſupport of this houſe, and alſo of orphans, and thoſe who by age or any other circumſtance are diſabled from earning a livelihood, two days in the week are ſet apart, in which the inhabitants of every village are obliged to ſow and cultivate a piece of ground, called Labor de la Comunidad, the Labour of the Community, and the ſurplus of the produce is applied to procure furniture and decorations for the church, and to clothe the orphans, the aged and diſabled. By this benevolent plan all diſtreſs is precluded, and the inhabitants provided with every neceſſary of life.

That the Indians may never want materials for work, it is one part of the prieſt's care to have always in readineſs a ſtock of different kinds of tools, ſtuffs, and other goods; ſo that all who are in want repair to him, bringing, by way of exchange, wax, of which here are great quantities, and other products. The goods received in exchange are ſent by the prieſt to the ſuperior of the miſſions, and with the produce a freſh ſtock of goods is lain in. The prieſt likewiſe viſits perſonally the Indian plantations, in which he is remarkably ſedulous, in order to prevent the indulgence of that ſlothful diſpoſition natural to the natives. He alſo attends at the ſlaughter-houſes where cattle are daily killed, large herds of which are kept for the public uſe, and their fleſh is diſtributed by the prieſts in lots proportioned to the number of perſons in each family. In ſhort, he viſits the ſick, to ſee that they are duly attended and provided with every thing neceſſary to their recovery.

The civil government of theſe towns ſeems admirably calculated to produce happineſs; and the eccleſiaſtical appears no leſs extraordinary. The prieſt inſtructs the Indians in his diſtrict, and obliges them punctually to frequent Divine ſervice on Sunday. The children repair every morning by break of day to the churches, where they take their places on oppoſite ſides, according to their ſex. There they recite alternately the morning prayer and Chriſtian doctrine, till ſun-riſe, when maſs is celebrated, at which all the inhabitants are obliged to attend, except they can give a ſufficient reaſon for their abſence. After maſs all go to work, and in the evening the children aſſemble to be catechiſed, and the adults to pray. Marriages are, for the greater ſolemnity, celebrated on Sunday; high maſs is then ſung, and an exhortation to the married pair is pronounced from the pulpit; after which a liſt is called over to ſee who is abſent, and penances are impoſed on all treſpaſſes committed in the pariſh. This regularity is ſaid to produce an aſtoniſhing effect on the minds and morals of the Indians, who are punctual in their religious duties, faithful in their dealings, charitable to the diſtreſſed, humble, obedient, and induſtrious, beyond what could be reaſonably expected from a people naturally indolent and ſlothful.

The pariſh-churches in Paraguay are capacious, rich, elegant, and ſplendidly furniſhed; gilding and painting attract the eye, and on every ſide ſtrike the imagination; all the utenſils uſed in religious worſhip are of gold and ſilver, many of them curiouſly emboſſed and ſet with precious ſtones. Magnificent galleries are erected on one ſide the altar for the civil magiſtrates, and on the other for the military officers, and all the vulgar are ſeated with great order on ſeats round the area. Every church has its band of muſic, conſiſting of a great number of performers in vocal and inſtrumental muſic, and Divine ſervice is celebrated in them with all the pomp of cathedrals. The ſame is obſerved in public proceſſions, eſpecially on that of Corpus Chriſti-day, at which the governor, alcaldes, and regidores aſſiſt in their habits of ceremony, and the militia in their uniforms; the reſt of the people carry flambeaux: theſe proceſſions are likewiſe accompanied with dancing, and the performers wear particular dreſſes, extremely rich, and adapted to the characters repreſented. In ſhort, the whole is conducted with the utmoſt pomp and parade, and every thing relating to religion is contrived to ſtrike the ſenſes and captivate the imagination of the weak and ſuperſtitious.

The houſe or rather palace of the prieſt, who may be conſidered as a ſpiritual prince within his juriſdiction, is grand, ſpacious, and conſtructed in the form of a church, in order to ſtrike his ſubjects with religious awe and reverence: it conſiſts of different apartments, ſuited to the various offices of the prieſt, as a civil and eccleſiaſtical magiſtrate. Every morning after prayers is devoted to hearing the complaints and redreſſing the grievances of thoſe who demand an audience. At noon he hears confeſſions and grants abſolutions, in which he is extremely rigid and exact. In the afternoon he walks abroad, inſpects the public and private affairs, and ſuperintends the labour of his pariſhioners; while the evening is devoted to catechiſing and diſcourſing on moral and religious ſubjects.

The houſes of the Indians are built with that ſymmetry and convenience, and ſo compleatly furniſhed, as to excel thoſe of the Spaniards in many towns in this part of America. Moſt of them, however, have only mud walls; but ſome of them are of unburnt brick, and others of ſtone; yet in general are covered with tiles. All private houſes are ſaid to make gun-powder, that a ſufficient quantity may not be wanting, either on any exigency, or for fire-works on holidays and anniverſary rejoicings.

Such at leaſt is the idea conveyed of the behaviour of the Jeſuits here by Muratori and the learned Don Antonio Ulloa, who are undoubtedly the beſt writers on the ſubject. Indeed ſome have treated their characters with great ſeverity, and they may juſtly be accuſed of ambition; but perhaps this paſſion was never directed to more noble and uſeful purpoſes than inſtructing the ignorant, promoting induſtry, and inſpiring a love of order, with temperance, frugality, and every other virtue that can humanize the mind. It is not ſurprizing if the exceſſive reverence paid here to the Jeſuits fills them with pride, ſo natural to an elevated ſtation. However, it is affirmed, but with what juſtice we will not pretend to determine, that they carry their authority to ſuch an exceſs, as to cauſe even the magiſtrates to be corrected before them with ſtripes, and ſuffer perſons of the higheſt diſtinction within their juriſdictions to kiſs the hem of their garments as the greateſt honour. It muſt, however, be added, that the utter abolition of all ideas of property, which is rendered uſeleſs by the general magazines and ſtore-houſes, doubtleſs contributes to the happineſs of the people, ſince they are certain of never wanting, and are deprived of the very inclination of committing the numerous vices that ſpring from ſelfiſhneſs, avarice, and diſcontent. From this and other particulars one would imagine, that they had taken the general ſcheme of their government from Sir Thomas Moor's Utopia; yet the prieſts themſelves poſſeſs large property, all manufactures are theirs, every natural commodity is brought to them, and the treaſures annually remitted to the ſuperior of the order plainly evince that zeal for religion is not the only motive of their forming theſe miſſions.

The miſſionary fathers will not permit any of the inhabitants of Peru, whether Spaniards, Meſtizos, or even Indians, to come within their miſſions in Paraguay. This, their friends ſay, is not with a view of concealing their tranſactions from the world, but to prevent their Indians being

being corrupted by the example of others. They are ſaid to be at preſent ſtrangers to ſedition, pride, malice, envy, and other paſſions ſo fatal to ſociety; but were ſtrangers admitted among them, their bad examples would ſoon teach them what at preſent they are happily ignorant of. The vigilance and jealouſy which the fathers expreſs in this particular has given birth to many unfavourable reports. If a ſtranger, in ſpite of all their precaution, ſhould find his way into the country, he is immediately ſecured by the ſuperior of the pariſh, a houſe aſſigned him, and every ſatisfaction is generouſly allowed him, except his liberty. If the father ſhould permit him to ſee the town, it is always in his own company, and after notice has been given to the inhabitants to keep cloſe in their houſes, where they barricade themſelves as if they dreaded the aſſault of a powerful enemy. As ſoon as an opportunity offers for his embarking at Buenos Ayres, the ſtranger is ſent thither under a guard of Indians, who are entire ſtrangers to every European language; whence it is impoſſible for them to communicate any thing with reſpect to the ſtate of the country.

It ought not to be omitted, that, beſides the provincial governments, there is a ſupreme council, compoſed of an annual meeting of all the fathers, who adjuſt the methods neceſſary to be executed for promoting the common concerns of the miſſion, for framing new laws, correcting or aboliſhing old ones, and adapting every thing to the preſent circumſtances.

It has been already intimated, that the natives are trained up to the exerciſe of arms, and the military of Paraguay is at preſent ſo formidable as to raiſe the jealouſy of Spain and Portugal, and is probably able to foil all the attempts of the Portugueſe and Spaniards to reduce them to obedience. Every pariſh has its body of horſe and foot, who are duly exerciſed every Sunday in the manual exerciſe and evolutions, in the ſame manner as the militia of Swiſſerland. This force is ſaid to be divided into regiments, compoſed of ſix companies of fifty men each. The officers hold their commiſſions of the fathers, and are ſelected out of the body of the people for their valour, activity, and obedience. The cavalry is on much the ſame footing as the infantry, only the regiments are leſs numerous. It is even ſaid, that the Jeſuits can raiſe ſeventy or eighty thouſand well diſciplined troops, amazingly expert in the uſe of the firelock and bayonet, and that with their ſlings they can throw ſtones of four or five pounds weight with aſtoniſhing force, and ſuch dexterity, as to hit the ſmalleſt mark at any propoſed diſtance within the compaſs of their ſtrength.

With reſpect to the trade of Paraguay, it conſiſts of cotton ſtuffs, made in the country; of tobacco, a great deal of which is planted here; and of the herb called Paraguay, which alone would be ſufficient to form a flouriſhing commerce. Theſe goods are carried for ſale to the cities of Santa Fe and Buenos Ayres, where the fathers have factors, who diſpoſe of what is conſigned to them from Paraguay, and lay out the money in ſuch European goods as the towns are then in want of, in ornaments for the churches, and for the prieſts who officiate in them; but the greateſt care is taken in deducting from what each town ſends the amount of the tribute of its Indian inhabitants, which is immediately remitted to the officers of the revenue belonging to the crown of Spain.

SECT. XIII.

Of Buenos Ayres, *including* Patagonia.

Its Situation and Produce; with a particular Account of the Manner of hunting the wild Cattle for their Hides, in order to take them alive; with a Deſcription of the City of Nueſtra Senora de la Buenos Ayres.

BUENOS Ayres, which is included by Ulloa within the juriſdiction of Los Charcas, and termed the fifth biſhopric of that audience, received its name from the extraordinary ſalubrity of the air, and is extended to all that country from the eaſtern and ſouthern coaſt of that part of America as far as Tucuman on the weſtward, on the north to Paraguay, and on the ſouth to Terra Magellanica. This country is watered by the great river La Plata. The diſtinctions between ſummer and winter are here very viſible. In ſummer the exceſſive heats are mitigated by gentle breezes, which conſtantly begin at eight or nine in the morning, and in winter violent tempeſts of wind and rain are very frequent, accompanied with ſuch dreadful thunder and lightning as fill the inhabitants, though uſed to them, with terror and conſternation.

There is no place either in America or Europe where meat is better or cheaper; it is always fat and very palatable, and in ſuch plenty, that it is ſaid the hides of the beaſts, which are moſt valuable, are all that is properly bought, the carcaſe being in a manner given in the bargain. The country to the weſt, north, and ſouth of the city of Buenos Ayres lately abounded ſo greatly in cattle and horſes, that the whole coſt conſiſted in taking of them; and even then a horſe was ſold for a dollar, and the uſual price for a beaſt choſen out of a herd of two or three hundred was only four rials. At preſent there is no ſcarcity; but they keep at a greater diſtance, and are more difficult to be catched, from the prodigious havock made of them by the Spaniards and Portugueſe, merely for the ſake of their hides, the principal branch of the commerce of Buenos Ayres.

Though the Spaniards claim the whole country as far as the ſtreights of Magellan, yet the ſouthermoſt part, uſually diſtinguiſhed by the name of Patagonia, is unpoſſeſſed by the Spaniards. This country is on the eaſt ſide extremely remarkable for a peculiarity not to be paralleled in any other part of the known world; for though the whole territory to the northward of the river Plata is full of wood, and ſtored with immenſe quantities of large timber trees; yet to the ſouthward of the river no trees of any kind are to be met with, except a few peach trees, firſt planted by the Spaniards in the neighbourhood of Buenos Ayres; ſo that on the whole eaſtern coaſt of Patagonia, extending near four hundred leagues in length, and reaching as far back as any diſcoveries have yet been made, no other wood has been found than a few inſignificant ſhrubs.

The country, however, abounds with paſture; for the land appears in general to conſiſt of a light, dry, gravelly ſoil, and produces great quantities of long coarſe graſs, which grows in tufts, interſperſed with large barren ſpots of gravel between them. This graſs feeds immenſe herds of cattle; for the Spaniards at Buenos Ayres having, ſoon after their firſt ſettling there, brought over a few black cattle from Europe, they have thriven prodigiouſly by the plenty of herbage they met with, and are now increaſed to that degree, and are extended ſo far into different parts of Patagonia, that they are not conſidered as private property; but many thouſands have been annually ſlaughtered by the hunters, only for their hides and tallow.

The manner of killing theſe cattle being peculiar to this part of the world, deſerves a particular deſcription. The hunters being all mounted on horſeback, both the Spaniards and Indians being excellent horſemen, arm themſelves with a kind of ſpear, which at its end has its blade fixed a-croſs; with this inſtrument they ride at the beaſt, and the hunter who comes behind him ham-ſtrings him. As the beaſt after this operation ſoon falls, without being able to riſe, they leave him and purſue others, whom they ſerve in the ſame manner. Sometimes a ſecond party attend the hunters, to ſkin the cattle as they fall: but it is ſaid, that at other times the hunters chooſe to let them languiſh in torment till the next day, from the opinion that the anguiſh the animal endures facilitates the ſeparation of the ſkin from the carcaſe: and though their prieſts have loudly condemned this moſt barbarous practice, yet all their efforts to put an entire ſtop to it have hitherto proved ineffectual.

Theſe cattle are ſlaughtered, as hath been already ſaid, only for their hides and tallow, to which ſometimes are added their tongues; but the reſt of their fleſh is left to putrify, or to be devoured by the birds and wild beaſts. The greateſt part of it falls to the wild dogs, of which there are immenſe numbers in that country. Theſe are ſuppoſed to have been originally produced by Spaniſh dogs from the city of Buenos Ayres, who, allured by the great quantity of carrion, and the facility they had by that

means of ſubſiſting, left their maſters, and run wild among the cattle; for they are plainly of the breed of the European dogs, animals not originally found in America: but though theſe dogs are ſaid to be ſome thouſands in a company, they neither diminiſh nor prevent the increaſe of the cattle, not daring to attack the herds on account of the numbers which conſtantly feed together; but contenting themſelves with the carrion left by the hunters.

As it is often neceſſary for the uſes of agriculture, and for other purpoſes, to take the cattle alive, without wounding them, this is performed with admirable dexterity by throwing a thong of ſeveral fathoms in length, with a running nooſe at one end, over the horns of the beaſt, much in the ſame manner as we have already deſcribed in hunting the wild aſs and other animals. Another hunter who follows the game, throws another nooſe about one of its hind legs, and as the other end is faſtened to the ſaddle of the riders, this is no ſooner done, than the horſes, who are trained to the practice, turn different ways, by which means the beaſt is ſoon thrown down; the horſes then ſtopping, keep their thongs upon the ſtretch, and the hunters alighting, ſecure the beaſt in ſuch a manner, that they afterwards eaſily convey him to whatever place they pleaſe. They in like manner nooſe horſes, and it is ſaid even tygers.

The horſes which were firſt brought from Spain, and are likewiſe prodigiouſly increaſed, run wild to a much greater diſtance than the black cattle; and though many of them are excellent, yet their number renders them of very little value, the beſt of them being often ſold in the neighbouring ſettlements, where money is plenty, for not more than a dollar a-piece.

In all parts of this country are a good number of vicunas or Peruvian ſheep; but theſe, from their ſhyneſs and ſwiftneſs, are killed with difficulty. On the eaſtern coaſt are found immenſe quantities of ſeals, and a vaſt variety of ſea-fowl, among which the moſt remarkable are the penguins, which in ſize and ſhape reſemble a gooſe; but inſtead of wings have ſhort ſtumps like fins, which are of no uſe to them except in the water; their bills are narrow, and they ſtand and walk in an erect poſture.

The inhabitants of the eaſtern coaſt appear to be but few, and rarely more than two or three at a time have been ſeen by any ſhips that have touched there. However, towards Buenos Ayres they are ſufficiently numerous, and frequently very troubleſome to the Spaniards. Theſe laſt exceed the ſouthern Indians in activity and ſpirit, and ſeem in their manners to be nearly allied to thoſe gallant Indians of Chili, who have long ſet the whole Spaniſh power at defiance, have often ravaged their country, and ſtill remain independant.

The capital of this government is called Nueſtra Senora de Buenos Ayres. It was founded in 1535, on the ſouth ſide of the river Plata, cloſe by a ſmall river, in the thirty-fourth degree thirty four minutes thirty-eight ſeconds ſouth latitude, and in the ſixtieth degree five minutes weſt longitude from London. This city, which is built on a large plain, gently riſing from the little river, is far from being ſmall, it having at leaſt three thouſand houſes inhabited by Spaniards and different caſts. Like moſt towns ſeated on rivers, it is much longer than it is broad; but the ſtreets are ſtraight, and of a proper breadth. The principal ſquare is very large, and built near the little river; the front anſwering to it being a caſtle, in which the governor conſtantly reſides, and, with the other forts, has a garriſon, with a thouſand regular troops. The houſes, which were formerly of mud thatched with ſtraw, and very low, are now much improved, ſome being of chalk, and others of brick, with one ſtory above the ground-floor, and moſt of them tiled. The cathedral is a ſpacious elegant ſtructure, and is the pariſh-church for the greateſt part of the inhabitants; the other at the farther end of the city being only for the Indians. The chapter conſiſts of the biſhop, dean, and two canons. There are alſo ſeveral convents, and a royal chapel in the caſtle, where the governor reſides.

Within the government of Buenos Ayres are three other cities, named Santa Fe, Las Corientes, and Monte Video. Santa Fe lies about ninety leagues north-weſt of Buenos Ayres, between the rivers Plata and Salado, which, after running through the country of Tucuman, joins the former. The city is but ſmall and meanly built, which is in a great meaſure owing to the frequent inſults the inhabitants have received from the free Indians in its neighbourhood, who have ſometimes pillaged the city and the adjacent villages. It is, however, the channel of the commerce between Paraguay and Buenos Ayres. The city of Las Corientes, which is ſeated on the eaſtern banks of the Plata, between it and the river Parana, is about a hundred leagues north of the city of Santa Fe; but is much inferior to it, and indeed has no marks of a city except the name. Monte Video, which was lately built, ſtands on the border of the bay from whence it derives its name, and, like the former, is of little conſequence. Each of theſe cities has its particular regidor, as lieutenant of the governor, and its inhabitants, together with thoſe of the neighbouring country, are formed into a militia, which on any appearance of an invaſion from the Indians, aſſemble in order to repel their attacks, in which they have been frequently ſucceſsful.

CHAP. XII.

Of CHILI, the Iſlands of TERRA DEL FUEGO, JUAN FERNANDES, &c.

SECT. I.

Of CHILI.

Its Situation, Extent, Climate, and Produce: the Number of its Inhabitants, and the Manners and Cuſtoms of the free Indians.

THE kingdom of Chili is very extenſive, but its limits are not exactly aſcertained; ſome confine it within the Spaniſh juriſdiction, others extend it from the twenty-ſixth to the forty-ſeventh degree of ſouth latitude, and there are even ſome who include within its limits Terra del Fuego and the very extremity of Cape Horn. We ſhall, however, upon the beſt authority confine the name of Chili to that tract of land between the twenty-ſixth and forty-fifth degree of ſouth latitude, and between the forty-ſeventh and fifty-fourth degree of weſt longitude. Agreeable to which limits it is bounded by Peru on the north, by the province of La Plata on the eaſt, by Patagonia or Terra Magellanica on the ſouth, and by the South ſea or Pacific ocean on the weſt; containing a ſpace of between twelve and thirteen hundred miles in length, and about half as much in breadth, if we include the vaſt plains of Chicuito, which lie on the oppoſite ſide of the lofty ridge of the Andes, which are here of a ſtupendous height. The country indeed ſtrictly called Chili lies between this chain of mountains on the South ſea, including only a ſpace of about ninety miles in breadth.

The ſeaſons here are almoſt oppoſite to thoſe in the northern hemiſphere; but the face of the country is beautiful, and the climate wholeſome. Here is felt heat and cold in the different ſeaſons. On the eaſt the country is ſcreened by the Andes; while from the weſt the

air is cooled by the moſt refreſhing ſea-breezes: yet in ſome parts the piercing winds which in winter blow from the mountains are exceeding ſharp. However, this country may in general be eſteemed one of the moſt agreeable climates in South America. In winter a light coat of ſnow falls upon the valleys; but the mountains are covered with ſuch quantities, as in ſummer ſupply the country with innumerable rivulets, which produce the moſt extraordinary fertility; for here Indian and European corn, wine, and fruits, with all the neceſſaries of life, are produced in the utmoſt abundance and perfection.

Among the corn great quantities of excellent wheat are produced; the vines are of ſeveral kinds, and, with regard to the richneſs and flavour of their grapes, are eſteemed beyond any produced in Peru. A ſort of muſcadel is made here, whoſe flavour far exceeds any wine of the kind made in Spain. The fruits which moſtly abound in Chili are of the ſame kind as thoſe known in Europe; its cherries in particular are large and of a fine taſte. The ſtrawberries, like thoſe of Peru, are of two kinds; and in the gardens of the cities near the ſea-coaſts, orange trees are kept covered with bloſſoms and fruit all the year, and in the plains are a prodigious variety of beautiful flowers without cultivation.

Among the remarkable herbs, many of which are medicinal, and others applied to various uſes, is the panque, which is of great ſervice in tanning of leather.

Beſides the rich variety of productions upon the ſurface of the earth, the country abounds with mines of gold and ſilver, copper, tin, and iron; and with quarries of lapis-lazuli and loadſtone.

The chief uſe of the rich lands is the fattening of oxen, goats, and ſheep, which is the principal employment of the greateſt part of the inhabitants in the country. All other proviſions are in equal plenty; turkeys, geeſe, and all kinds of poultry are ſold at a very low price. Wild-fowl are alſo very common, and are of the ſame ſorts as thoſe found in the deſarts of Quito; as are likewiſe wood-pigeons, partridges, woodcocks, and ſnipes. Among the ſinging birds is the goldfinch, which reſembles thoſe of Spain, except a ſmall variation in its plumage. There are beſides others proper to the country, particularly the piche, which is ſomething larger than a ſparrow, of a brown colour, ſpotted with black, except the breaſt, which is of a moſt beautiful red, and ſome feathers of the ſame colours in the wings intermixed with others of a bright yellow. Though ſome ſnakes are found in the fields and woods, their bite is not dangerous, neither are the country peaſants under any apprehenſions from ravenous beaſts; whence if this country was not ſubject to earthquakes, nature might be ſaid to pour her treaſures on this country, without blending them with the uſual inconveniences.

The number of inhabitants in this extenſive country bears no proportion to its extent. All the Spaniards in Chili are ſaid not to exceed twenty thouſand, and theſe are diſperſed in ſuch a manner as hath given the free Indians the greateſt advantages in all their wars with them. This was the great overſight of Valdivia, the firſt invader of Chili, who, upon his diſcovering gold, attempted to make ſo many eſtabliſhments, as furniſhed the Indians whom he had treated very cruelly with an opportunity of recovering their liberty and expelling the Spaniards out of the mountains. The Europeans, Meſtizos, mulattoes, and negroes, are reputed at a hundred and fifty thouſand; but the Indians are much more numerous. The ſubjected Indians belong entirely to the Spaniards, live among them, and ſerve them in the ſame manner as the original natives of Peru and Mexico. For the better eſtabliſhment of good order and a regular police, they are divided according to their habitations into ſmall lordſhips, ſtyled commanderies.

The Chileſians are tall, robuſt, active, and courageous. No other Indian people have coſt the Spaniards ſo much trouble; for they are dexterous in the uſe of the ſword, pikes, bows, and arrows; and their diſcipline more regular and rational. They fight in ſquadrons, retire when broke, rally, fortify themſelves with great addreſs, and chooſe their ground either to engage, attack, or defend themſelves, with admirable judgment.

The Indians in ſeveral parts of Chili are not governed by caciques like thoſe of Peru, the only ſubordination among them being with regard to age; ſo that the oldeſt perſon of the family is reſpected as its governor. Thoſe who inhabit the ſouthern parts of the river Biobio, and thoſe who live near the Cordillera, have hitherto eluded all attempts made for reducing them under the Spaniſh government; for when ſtrongly puſhed they abandon their huts, and retire into the more diſtant parts of the kingdom, where, being joined by other nations, they return in ſuch numbers, that they eaſily take poſſeſſion of their former habitations, the Spaniards being unable to oppoſe them. If at that time a few only call for a war againſt the Spaniards, the flame inſtantly ſpreads, and their meaſures are taken with ſuch ſecrecy, that the firſt declaration of it is by attacking the neighbouring villages. When they are not already aſſembled, the firſt ſtep, when a war is agreed on, is to ſummon the nations, which they term ſhooting the dart, the ſummons being ſent from village to village with the utmoſt ſilence and rapidity, ſpecifying the very night when the irruption is to be made; and though advice of it is ſent to the Indians who reſide among the Spaniards, nothing tranſpires; nor is there a ſingle inſtance among all the Indians that have been taken up on ſuſpicion, that one ever made a diſcovery. Thus their deſigns continue impenetrable, till their execution withdraws the veil.

The Indians of the ſeveral nations being aſſembled, chooſe a general; and when the night fixed upon for executing their deſigns arrives, the Indians who live near the Spaniards attack them by ſurprize; and having cut them off, divide into ſmall parties, and deſtroy the ſeats, farm-houſes, and villages, giving no quarter, and paying not the leaſt regard to youth or age. Theſe parties afterwards unite, and in a body attack the larger ſettlements of the Spaniards, beſiege the forts, and, by the greatneſs of their numbers, frequently carry all before them. If at any time the Spaniards gain the ſuperiority, the Indians retire ſeveral leagues, where concealing themſelves a few days they ſuddenly attack a different part from that where they were encamped, and endeavour to carry the place by a ſudden aſſault, in which they are frequently ſucceſsful, unleſs the commandant's vigilance has provided againſt a ſudden ſurprize; when, by the advantage of the Spaniſh diſcipline, they are generally repulſed with great ſlaughter.

Theſe wars againſt the Spaniards uſually continue ſome years, they being of little detriment to the Indians; for moſt of their occupations conſiſt of cultivating a ſmall ſpot of ground, and weaving a little cotton cloth for their apparel, and theſe are carried on by the women. Their huts are built in a day or two, and their food conſiſts of roots, maize, and other grain.

The firſt advances towards a treaty of peace with theſe Indians are generally made by the Spaniards, and as ſoon as the propoſals are agreed to a congreſs is held, at which the governor, major-general of Chili, and the principal officers, with the biſhop of Conception, and other perſons of eminence aſſiſt. On the part of the Indians, the general and captains of his army, as repreſentatives of the communities, repair to the congreſs. Theſe congreſſes are held with the Indians not only for concluding a peace, but on the arrival of a new preſident, and the ſame ceremonies are obſerved in both; ſo that an account of one will be ſufficient to give a juſt idea of the other.

On holding a congreſs the preſident ſends notice to the frontier Indians of the day and place, whither he repairs with the perſons above-mentioned; and on the part of the Indians the heads of their ſeveral communities: both, for the greater ſplendor of the interview, being accompanied with an eſcort, conſiſting of a certain number previouſly agreed on. The preſident and his company lodge in tents, and the Indians encamp in their huts at a ſmall diſtance. The elders, or chiefs of the Indians, pay the firſt viſit to the preſident, who drinks their healths in wine, and himſelf gives them the glaſs that they may drink his; he then makes them a preſent of knives, ſciſſars, and ſuch toys as they moſt value. The treaty of peace is then brought on the carpet, and the manner of obſerving the ſeveral articles is ſettled: after which they return to their camp, and the preſident makes them a viſit,

carrying with him a quantity of wine ſufficient for a moderate regale.

The chiefs of the communities who are not preſent at the firſt viſit now go in a body to pay their reſpects to the preſident, who at the riſing of the congreſs makes each a ſmall preſent of wine, which they liberally return in horſes, black cattle, calves, and fowls. After which both parties return to their reſpective habitations.

It ought not to be omitted, that the preſident, in order to gain more effectually the hearts of the Indians, invites ſeveral of them to his table, and, during the three or four days of the congreſs, neglects no means of ingratiating himſelf into the good graces of the whole body. On theſe occaſions a kind of fair is held at both camps, great numbers of Spaniards repairing to the Indians with ſuch goods as they know will pleaſe them, and the Indians come with cotton cloth and cattle to the Spaniſh camp. Both parties deal by exchange, and never fail of ſelling their whole ſtock, and of obſerving in their dealings the moſt exact candor and regularity, as a ſpecimen of the manner in which their future commerce is to be conducted.

Amidſt the utmoſt rage of the Indians in their hoſtilities againſt the Spaniards, they generally ſpare the white men, whom they carry to their huts, and uſe as their own; whence many Indians of thoſe nations have the complexion of the Spaniards born in that country. In time of peace a number of them enter the Spaniſh territories, hiring themſelves for a certain time to work at the farm-houſes; and at the expiration of the term return home, after laying out their wages in the purchaſe of ſuch goods as are valued in their country.

During peace the Spaniards ſell the free Indians hardware, as bits, ſpurs, knives, and edge-tools, toys, and ſome wine. This is done by way of barter; for though the countries inhabited by the Indians are not deſtitute of gold, yet knowing the fondneſs of the Spaniards for that metal, and the miſeries it has occaſioned where it has been found, they cannot be prevailed upon to open mines; ſo that the returns conſiſt in horſes, horned cattle, and cotton cloth. The Spaniard begins his negociation with offering the chief of the nation a cup of wine, and then diſplays his wares, that the Indian may chooſe what he likes beſt, mentioning at the ſame time what he expects in return. If they agree, the Spaniard makes him a preſent of a little wine, and the chief informs the community that they are at liberty to trade with that Spaniard as his friend. Relying on his protection, the Spaniard goes from hut to hut, recommending himſelf by giving the head of every family a taſte of his wine, after which they enter upon buſineſs, and the Indian having taken what he wants, the trader goes away without receiving any equivalent, and viſits the other huts, as they lie diſperſed over the country, till he has diſpoſed of all his ſtock. He then returns to the cottage of the chief, calling on his cuſtomers in his way, and acquainting them that he is on his return home. Upon this not one fails of bringing to the chief's hut what had been agreed on. Here they take their leave with all the appearance of a ſincere friendſhip, and the chief even orders ſome Indians to eſcort him to the frontiers, and aſſiſt him in driving the cattle he has received in exchange for his goods. The Spaniards acknowledge that the Indians are remarkable for the fairneſs of their dealings, that they are never known to recede from what has been agreed on, and are very punctual in their payments.

SECT. II.

Of the Diviſions of Chili; with a Deſcription of the principal Cities, as St. Jago, Conception, Copiapo, Coquimbo, Valparaiſo, and Baldivia; with whatever is moſt remarkable in each.

CHILI is divided into four governments, namely, the major-generalſhip of the kingdom of Chili, Valparaiſo, Valdivia, and Chiloe. It is likewiſe ſubdivided into eleven juriſdictions; the limits of which are not exactly aſcertained by any of the Spaniſh authors, and we ſhall content ourſelves with giving our readers a deſcription of the principal cities, and of whatever appears to us moſt worthy of notice.

The city of St. Jago, or Sant Iago, the capital of Chili, was founded by captain Pedro de Valdivia in 1541 in the valley of Mapocho, in the thirty-third degree forty minutes ſouth latitude, and in the ſeventy-ſeventh degree weſt longitude, about twenty leagues from the harbour of Valparaiſo, the neareſt port to it in the Pacific ocean. Its ſituation is one of the moſt convenient and delightful that can be imagined, it ſtanding in a beautiful plain, ſixty miles in extent, flowing in meanders through the middle of it, and called by the name of Mapocho. This river runs ſo near the city, that water is conveyed from it by conduits through the ſtreets; and it alſo ſupplies the gardens, which few houſes are without. The city is two thouſand yards in length from eaſt to weſt, and twelve hundred in breadth from north to ſouth. On the oppoſite ſide of the river, which waſhes the north part of it, is a large ſuburb named Chimba, and on the eaſt ſide is a mountain of a middling height called Santa Lucia. All the ſtreets are of a handſome breadth, ſtraight, and paved, running exactly eaſt and weſt, while they are croſſed by others at right angles, which run exactly north and ſouth. Near the middle of the city is a grand ſquare encompaſſed with piazzas, with a very beautiful fountain in the center. On the north ſide are the palace of the royal audience, where the preſidents have their apartments, the town-houſe, and the public priſon; on the weſt ſide is the cathedral and the biſhop's palace; the ſouth ſide conſiſts of ſhops, each decorated with an arch; and on the eaſt is a row of private houſes.

The houſes are in general built of unburnt brick, and very low, on account of the terrible devaſtation occaſioned by the earthquakes with which this city has been often viſited; particularly on the eighth of July, 1730, when the greateſt part of the city was deſtroyed; and this cataſtrophe was ſucceeded by an epidemical diſtemper, which ſwept away even greater numbers than had before periſhed by the earthquake. But though the houſes are low they make a handſome appearance, and are well contrived to anſwer the purpoſes of convenience and pleaſure. Beſides the cathedral, the chapter of which, beſides the biſhop, conſiſts of a dean, archdeacon, chanter, and four canons, with other ſubordinate eccleſiaſtics; here are the pariſh-churches of Sagrario, St. Anne, and St. Iſadoro; there are alſo three convents of Franciſcans, two of Auguſtines, one of Dominicans, one of the fathers of Mercy, one of St. Juan de Dios, five colleges of Jeſuits, St. Diego, a college for ſtudents, and without the city a convent of Recollects. Here are alſo two nunneries of St. Clare, two of Auguſtines, and one of Carmelites; and a religious ſiſterhood, under the rules of St. Auguſtine; all which have a great number of recluſes, as is common in all the cities of this part of the world. The churches of the convents, beſides being very ſpacious, are built either with brick or ſtone, and thoſe of the Jeſuits are diſtinguiſhed by the beauty of their architecture. The pariſh-churches are in every reſpect greatly inferior to them, both within and without.

In this city is a royal audience, which conſiſts of a preſident, four auditors, a fiſcal, and a patron of the Indians. The determinations of this court are without appeal, except to the ſupreme council of the Indies, and this only in matters of notorious injuſtice or denial of redreſs. Though the preſident is in ſome particulars ſubordinate to the viceroy of Lima, he is governor and captain-general of the whole kingdom of Chili, and as ſuch reſides one half of the year at St. Jago and the other at Conception. During his abſence from St. Jago the corregidor acts as his repreſentative, and his juriſdiction on this occaſion extends to all the other towns of the kingdom of Chili, except the military governments.

The office for the royal revenue is under the direction of a treaſurer and accomptant. Here are paid the tributes of the Indians, and other parts of the revenue; the ſalaries of the officers within its department, and other aſſignments, are likewiſe paid here.

Here are alſo a tribunal of croiſade, the members of which are a ſubdelegate commiſſary, a treaſurer, and accomptant;

comptant: likewiſe a commiſſion of inquiſition, all the officers of which are apponted by the tribunal of inquiſition at Lima.

The magiſtracy of this city, at the head of which is the corregidor, conſiſts of regidores, and two ordinary alcaldes. In theſe are lodged the police and civil government of the city. During the time the preſident reſides here, the juriſdiction of the corregidor is limited to the liberties of St. Jago.

The cuſtoms of the people differ but little from thoſe already mentioned in large cities; but, inſtead of the oſtentation of Lima, dreſs with great decency, without ſplendor; but all the families who can afford it keep a calaſh for driving about the city.

The men are robuſt, of a proper ſtature, well ſhaped, and of a good air. The women have all the charms of thoſe of Peru, and are even more remarkable for the delicacy of their features, and the fineneſs of their complexions; but they diſfigure their natural beauty by painting themſelves in ſuch a prepoſterous manner, as not only ſpoils the delicacy of their ſkins, but even their teeth; ſo that it is very uncommon to ſee a woman with a good ſet.

The city of Conception is ſeated in the thirty-ſixth degree forty-three minutes fifteen ſeconds ſouth latitude. It is built on the ſouth-eaſt ſhore of a beautiful bay, on an uneven ſandy ground, and on a ſmall declivity, having a little river running through it. The deſtruction it ſuffered in the terrible earthquake of 1730, occaſioned all the houſes to be built low. This dreadful event happened on the eighth of July: the firſt motions were felt at one in the morning, and the concuſſions increaſing, the ſea, as uſual, retreated to a conſiderable diſtance; but ſoon returned ſo impetuouſly, and with ſuch a ſwell, that it overflowed the whole city and the neighbouring countries. In this ſudden calamity many of the inhabitants found an aſylum on the adjacent eminencies. This inundation was ſoon ſucceeded by three or four ſhocks, and at about four in the morning, a little before break of day, the concuſſions returned with the moſt tremendous violence, demoliſhing the few buildings that remained.

The houſes have either mud walls, or are built with unburnt brick, but are covered with tiles. The churches are ſmall and mean, as are alſo the Franciſcan, Dominican, and Auguſtine convents, as well as that belonging to the fathers of Mercy; but the college of Jeſuits is well built.

The political government of this city conſiſts of a corregidor nominated by the king, who is at the head of the ordinary alcaldes and regidores. During the vacancy of this poſt the duty is performed by the preſident of Chili, who is governor and captain-general of the whole kingdom, and preſident of the audience of St. Jago, on which Conception is dependent. The preſident is obliged to reſide ſix months in the year at Conception, in order to attend to the military concerns of the frontiers, to ſee that the forts are in a good condition, and the troops well diſciplined. Conception has all the courts and offices uſual in the cities of South America.

As all the inhabitants of the towns, villages, and country within the juriſdiction of Conception form different bodies of militia, ſome of which are in pay, and all muſt be ready on any ſudden alarm; there is, beſides the corregidor, a camp-maſter, who commands in all military affairs without the city.

The inhabitants conſiſt of Spaniards and Meſtizos, which are here hardly to be diſtinguiſhed by their complexion; both being very fair, and ſome have freſh complexions. The goodneſs of the climate, together with the fertility of the country, have drawn hither many Creoles and Europeans, who live together in that harmony and friendſhip which ſhould be an example to the other parts of theſe provinces, where pride and jealouſy occaſion frequent feuds. The men, inſtead of a cloak, wear a poncho, which is made in the form of a quilt, about two yards and a half or three yards in length, and two in breadth, having an opening in the middle juſt ſufficient to put their head through, the reſt hanging down on all ſides. This is their dreſs in all weathers, whether walking or riding; and the peaſants never pull it off but when they go to reſt, tucking it up in ſuch a manner that both their arms and whole body are at full liberty, either for labour or diverſion. This is an univerſal garb among all ranks when they ride on horſeback. Though ſo plain and uniform, it ſerves to diſtinguiſh the quality and rank of the wearer, ſome wearing it only as a covering, and others for ſhow. Accordingly thoſe of the common people coſt only four or five dollars, while others are worth a hundred and fifty or two hundred. This difference ariſes partly from the fineneſs of the ſtuff, and partly from the laces and embroidery with which they are adorned. They are of a double woollen ſtuff manufactured by the Indians, and generally blue.

The people here are excellent horſemen, and the women are particularly famous for their great ſkill in horſemanſhip; they are equally ſkilled in throwing the nooſe with the people of Patagonia, juſt deſcribed, in catching of wild bulls and other animals; but this is uſed here on many other occaſions, particularly on private quarrels, in which they uſe an amazing addreſs in throwing the nooſe, and in avoiding it with a lance. It is the only method they take to ſatisfy their revenge, and in this caſe the only reſource in an open country is for a man to throw himſelf on the ground, keeping his legs and arms as cloſe to it as poſſible. A perſon may alſo ſave himſelf by ſtanding cloſe to a tree, and if in the ſtreet by placing himſelf againſt a wall.

Having deſcribed the two principal cities of Chili, we ſhall proceed with the reſt in the order in which they are ſituated, proceeding from north to ſouth.

Copiapo, the firſt port on this coaſt, ſtands in the twenty-ſeventh degree ſouth latitude. The harbour is indeed properly called Caldera, but it is commonly known by the former name, on account of its contiguity. This, from its natural ſituation, is improperly ſaid to be the richeſt town in the world, it being ſeated on a gold mine; which, however, is not wrought by the inhabitants, becauſe a ſtill richer mine of that metal has been been diſcovered at ſix miles diſtance. The town is very irregularly built, and its inhabitants amount to about ſeven hundred; but there are no leſs than a thouſand labourers employed in the mines. There are twelve mills conſtantly employed, which extract at the rate of a hundred and fifty ounces one day with another. There are here alſo other valuable articles of commerce; ſalt-petre lies on the ground in many places two feet deep, and under any other government than the Spaniſh would attract a conſiderable trade. To the ſouth of the town are the rich lead mines of Copiapo, which lie neglected; yet ſeveral intelligent writers are of opinion they might be turned to more advantage than the gold, on account of the great quantities of lapis lazuli found on the ſurface.

Coquimbo, or La Serena, is ſeated in the twenty-ninth degree fifty-four minutes ſouth latitude, about a mile from the coaſt of the Pacific ocean, in a moſt delightful ſituation, having an extenſive proſpect of the ſea, of a river, and the country, which preſents to the view a pleaſing variety of fields of different kinds of grain, and woods of a very lively verdure. The town is pretty large, but not proportionably peopled; the number of families not amounting to above four or five hundred, conſiſting of Spaniards, Meſtizos, and a few Indians. The ſtreets are ſtraight and of a convenient breadth, interſecting each other at right angles, ſome extending from north to ſouth, and others from eaſt to weſt, forming ſquares of buildings, as at St. Jago and other places of note in this part of America. Though the houſes have mud walls, and are covered with leaves, none are without a large garden planted with fruit-trees, and the eſculent vegetables, both of America and Spain; for the climate is happily adapted to a variety of both kinds, the heat not being exceſſive, nor the cold ſevere; ſo that both in the fertility of the earth, and the chearful appearance of the country, the whole year wears an aſpect of one perpetual ſpring. The ſtreets, though regular and convenient, are not entirely formed by the houſes, a part of the interval between the ſeveral ſquares of buildings being filled up with gardens; and moſt of them have ſo agreeable an appearance, as to atone for the mean aſpect of the houſes. On the north ſide of the town runs the river, after flowing in various meanders through the whole

valley; and thus, by canals cut from it, furniſhes the town with water, one great uſe of which is to preſerve the beauty of their favourite gardens.

Beſides the pariſh-church here is an Auguſtine, a Dominican, and Franciſcan convent, one belonging to the fathers of Mercy, another to the order of St. Juan de Dios, and a college of Jeſuits. The churches of theſe religious fraternities are large and decent. The pariſh-church takes up part of one ſide of the great ſquare, and on the oppoſite ſide is the town-houſe, where the alcaldes and regidores meet, who, with a corregidor, form the corporation.

The whole trade of Coquimbo conſiſts of ſending three or four veſſels annually to Lima, laden with wine, flour, and other proviſions; in exchange for which they receive all kinds of European commodities, and theſe are carried from hence to all the other towns of Chili.

Valparaiſo is ſeated in the thirty-third degree two minutes thirty-ſix ſeconds north latitude, and is at preſent both large and populous, it having the moſt conſiderable haven in thoſe ſeas, conſtantly filled with ſhips from Callao and Panama; whence it would be ſtill larger were it not for its inconvenient ſituation, it ſtanding at the foot of a mountain, and a great part of the houſes being built on its acclivity. The broadeſt and moſt convenient part is that along the coaſt; but this is very diſagreeable in winter, it being ſo expoſed to the north winds, that the waves beat againſt the walls of the houſes, ſome of which are built with unburnt bricks, and ſome of chalk and pebbles. Beſides its pariſh-church, it has a convent of Auguſtines, and another of Franciſcans; but they have few monks, and the churches belonging to them are ſmall and mean. It is inhabited by Spaniards, Mulattoes, and Meſtizoes. In its neighbourhood are ſeveral villages, and the great number of farm-houſes give the country a chearful appearance.

Here is a military governor nominated by the king, who having the command of the garriſons in the ſeveral ports, and of the militia of the town and its dependences, is to take care that they are properly diſciplined.

The proximity of Valparaiſo to St. Jago has drawn hither all the commerce formerly carried on at that city, and to this it owes its foundation, increaſe and proſperity. The cargoes brought hither by the Callao ſhips are indeed but ſmall; but they take from hence wheat, dried fruits, Cordovan leather, tallow, and cordage; and with thoſe return to Callao. A ſhip has been known to make three voyages in one ſummer, that is between November and June; during which the droves of mules and carriages from all the farms in the juriſdiction of St. Jago bring freſh ſupplies to the ware-houſes. Thus the ſummer ſeaſon may be termed the fair of Valparaiſo; but on the approach of winter it becomes as remarkably deſolate, the crowd of traders repairing to St. Jago, and none ſtaying that are able to remove.

The fruits that grow in the neighbourhood of this town are admirable for their ſize and beauty, particularly a ſort of apples called quillota, which greatly exceed the largeſt in Spain; and, beſides their exquiſite flavour, are ſo juicy that they melt in the mouth. Among the ſeveral kinds of game, there are here ſuch numbers of partridges in their ſeaſon, which begins in March, and laſts ſeveral of the following months, that the muleteers knock them down with their ſticks, without going out of the road, and bring great numbers of them to Valparaiſo: but few of theſe, or any other birds, are ſeen very near the town. It is the ſame with regard to fiſh, very little being to be caught either in the harbour or along the coaſt.

Baldivia, or Valdivia, a celebrated port, is ſeated at the bottom of a fine bay, in the thirty-ninth degree ſix minutes ſouth latitude, and in the eightieth degree weſt longitude. It takes its name from Valdivia, the Spaniſh general, who conquered the country. A conſiderable ſum is annually granted to keep the fortifications in repair, which conſiſt of four ſtrong caſtles, mounting above a hundred pieces of fine braſs cannon, for which, however, it is ſaid, there is never a ſufficient number of gunners and carriages; nor ever a proper ſupply of ammunition: and the garriſon is chiefly compoſed of malefactors tranſported from Spain. The governor is indeed always a perſon of quality; but as he is promoted merely to repair his fortune, it is alſo expected that he ſhould improve the opportunity. The inhabitants amount to about two thouſand, who are chiefly Spaniards, Creoles, and Meſtizos. Its trade is leſs conſiderable than formerly, becauſe the gold mines in its neighbourhood are ſhut up; yet ten large ſhips are employed in the trade between this port and Lima, which chiefly conſiſts in corn, ſalt proviſions, gold, and hides, which are exchanged for ſlaves, ſugar, chocolate, and European commodities and manufactures.

The iſland of Chiloe, the laſt of the governments, extends from the forty-ſecond to the forty-fourth degree of ſouth latitude, and is about a hundred and fifty miles in length, and ſeventeen in breadth. The coaſt is very ſubject to ſtorms, eſpecially in March, when winter begins. The iſland has a military governor, who reſides at Chacao, the principal harbour of the iſland, which is well fortified, and capable of making a good defence. Beſides Chacao, which has the title of a city, is a town called Calbuco, which is much larger, and is the reſidence of a corregidor, who is nominated by the preſident of Chili: it has alſo regidores and alcaldes annually choſen. It has a pariſh-church, a college of Jeſuits, a convent of Franciſcans, and another of the fathers of Mercy. The iſland, which is extremely fertile and produces all the neceſſaries of life, is well peopled with Spaniards, Meſtizos, and Chriſtian Indians.

SECT. III.

Of Terra Magellanica, the Iſlands of Terra del Fuego, and Staten Land.

THE country called Terra Magellanica is the laſt we have to deſcribe on the continent of America. It takes its name from Ferdinand Magellan, a Portugueſe, who firſt coaſted the country before he diſcovered and paſſed the ſtreights at its ſouthern extremity. which bear his name. Its northern part borders on Chili, the eaſt and weſt coaſt are waſhed by the Atlantic and Pacific ocean, as it is improperly called, and its ſouthern extremity is waſhed by the ſtreights of Magellan, the continent gradually leſſening till it comes to thoſe ſtreights, where it is very narrow. It extends from the forty-fifth to the fifty-ſeventh degree thirty minutes north latitude, and from the ſeventieth to the eighty-fifth degree of weſt longitude.

Pigafetta, an Italian, the lying author of Magellan's voyage, pretends that in the forty-ninth degree thirty minutes they found people of ſuch a gigantic ſtature, that a middle ſized man could hardly reach their waiſt with his head; that they were clad with the ſkins of beaſts as monſtrous as themſelves, and armed with huge bows and arrows of a ſtrength proportionable to their bulk; and that one of them devoured a whole baſket full of biſkets every day with his fiſh and raw fleſh, and drank a pail full of wine or water at every meal. Later navigators have, however, entirely overthrown this improbable account: but few of the natives have ever been ſeen, and theſe were of the common height; indeed this country appears to be but thinly peopled. We have already given ſome account of it under the name of Patagonia, by which it is alſo diſtinguiſhed, and ſhall therefore now proceed to the iſlands Terra del Fuego and Staten Land.

The iſlands that lie to the ſouth of the ſtreights of Magellan are commonly known by the name of Terra del Fuego, and are thus called from the fires and ſmoke perceived by the firſt diſcoverers of them, occaſioned by a volcano in the largeſt iſland, the flame of which, tho' not ſeen in the day-time, is viſible at a vaſt diſtance in the night, and ſometimes throws up great quantities of ſtones and aſhes. Theſe iſlands, the far largeſt of which is that properly called Terra del Fuego, extend along the Magellanic coaſt from eaſt to weſt about four hundred miles, and were thought contiguous to the continent, till Magellan diſcovered and ſailed through the ſtreights that part them from it. They were likewiſe then thought to be one continued iſland, till ſeveral navigators afterwards

wards discovered them to be divided by several narrow channels.

Terra del Fuego is mostly very mountainous and rough, with the tops of the mountains covered with snow; but it is said to have fertile valleys, plains, and pasture-grounds, watered by a multitude of fine springs that flow from the mountains. Between the several islands are capacious bays and roads, in which large fleets may ride in safety. The lands are said to abound with wood and stone, and to be inhabited by a people as white as the Europeans, who, notwithstanding the extreme severity of the climate, go naked, and paint their bodies of several colours.

The Spaniards, who are best acquainted with the streights of Magellan, say, that they are above a hundred leagues in length from the cape of the Virgins at the eastern entrance, to the cape of Desire at the opposite end. The breadth is very various, it being in some places but a league wide, and in others two or more; there are many safe harbours running into the continent, with narrow entrances, and bays that extend quite out of sight, encompassed with high mountains which shelter them on all sides; so that ships may safely ride in them upon the least anchor in any weather.

On the east side of the islands which form this streight is Staten Land, in about the fifty-fifth degree of south latitude; and between it and Terra del Fuego runs streight Le Maire, which is about seven or eight leagues in length. "I cannot but remark, says the author of Lord Anson's "Voyage, that though Terra del Fuego had an aspect "extremely barren, yet this island of Staten Land far "surpasses it, in the wildness and horror of its appear-"ance; it seeming to be entirely composed of inaccessi-"ble rocks, without the least mixture of earth or mould "between them. These rocks terminate in a vast num-"ber of ragged points, which spire up to a prodigious "height, and are all of them covered with everlasting "snow; the points themselves are on every side sur-"rounded with frightful precipices, and often over-hang "in a most astonishing manner; and the hills which "bear them are generally separated from each other by "narrow clefts, which appear as if the country had been "frequently rent by earthquakes; for these chasms "are nearly perpendicular, and extend through the "substance of the main rocks, almost to their very bot-"toms: so that nothing can be imagined more savage "and gloomy than the whole aspect of this coast." The passage into the South Sea, or Pacific Ocean, is now generally performed by running through streight Le Maire, by these inhospitable islands, and then doubling Cape Horn, the most southern promontory of Terra del Fuego.

There are several other islands about those just mentioned; but as they are of little consequence, and none of them planted by any European nation, we shall leave this inhospitable climate, and proceed to the small but fine island of Juan Fernandes.

SECT. IV.

Of the Island of JUAN FERNANDES.

Its Situation, Extent, Soil, and Produce; the Face of the Country; the Courage of the Goats, and a particular Description of the Sea-Lion: with a concise Account of the Lesser Juan Fernandes, or Masa Fuero. Concluding with some Observations on America in general.

THE delightful island of Juan Fernandes is said to have received its name from a Spaniard who formerly procured a grant of it, and resided there some time with a view of settling it, but afterwards changed his mind. It lies in the thirty-third degree forty minutes south latitude, a hundred and ten leagues to the west of the continent of Chili. The island is of an irregular figure; its greatest extent does not exceed fifteen miles, and its greatest breadth is somewhat less than six. The only safe anchoring is on the north side, where are three bays; but the middlemost, known to the English by the name of Cumberland-bay, is the widest, deepest, and in all respects the best. The north part of the island is composed of high craggy hills, many of them inaccessible, though generally covered with trees. The soil of this part is so loose and shallow, that very large trees on the hills soon perish for want of root, and are then easily overturned. Several of these hills have a peculiar sort of red earth exceeding vermilion in colour, and perhaps on examination might prove useful for many purposes. The trees of the woods on the northern side of the island are most of them aromatics, and of many different sorts: there are none of them so large as to yield any considerable timber, except the myrtle-trees, which are the biggest on the island; but even those will not work to a greater length than forty feet. The top of the myrtle is circular, and appears as uniform and regular as if it had been clipped by art: it bears on its bark an excrescence moss, which in taste and smell resembles the garlic. There is here also the pimento tree, and the cabbage tree, besides a great number of plants of various kinds, and almost all of those which are usually esteemed particularly adapted to the cure of those scorbutic disorders that are contracted by salt diet and long voyages, particularly great quantities of water-cresses and purslain, with excellent wild sorrel, and a vast profusion of turnips and Sicilian radishes. There are likewise many acres of ground covered with oats and clover.

The face of the country, at least of the north part of the island, is extremely singular: the woods that cover most of the steepest hills are free from bushes and underwood, and afford an easy passage through every part of them, and the irregularities of the hills and precipices trace out by their various combinations a great number of romantic valleys; most of which have a stream of the clearest water running through them, that falls in cascades from rock to rock, as the bottom of the valley, by the course of the neighbouring hills, is broken into a sudden sharp descent. In these valleys are some particular spots, where the shade and fragrance of the contiguous woods, the loftiness of the over-hanging rocks, and the transparency and frequent falls of the neighbouring streams, present scenes of such elegance and dignity as would with difficulty be rivalled in any other part of the globe; for here the simple productions of unassisted nature may be said to excel all the fictitious descriptions of the most animated imagination.

We cannot here forbear describing the spot where commodore Anson pitched his tent, which we shall take verbatim from the account of his voyage published under the name of his chaplain. "The piece of ground which "he chose was a small lawn, that lay on a little ascent, "at the distance of about half a mile from the sea. In "the front of his tent there was a large avenue cut thro' "the woods to the sea-side, which sloping to the water "with a gentle descent, opened a prospect of the bay "and the ships at anchor. This lawn was screened be-"hind by a tall wood of myrtle sweeping round it, in "the form of a theatre, the slope on which the wood "stood rising with a much sharper ascent than the lawn "itself, though not so much but that the hills and pre-"cipices within land towered up considerably above the "tops of the trees, and added to the grandeur of the "view. There were besides two streams of crystal "water, which ran on the right and left of the tent, "within an hundred yards distance, and were shaded "by the trees which skirt the lawn on either side, and "completed the symmetry of the whole"

With respect to the animals and provisions to be found on this island, it has been represented as abounding with a vast number of goats, which was doubtless true, it being the usual haunt of the Buccaneers and privateers, who formerly frequented those seas. There are two instances, one of a Musquito Indian, and the other of Alexander Selkirk, a Scotsman, who were left by their respective ships, and lived for some years alone upon the island, and were consequently no strangers to its produce. Selkirk, who was the last, and from whom Daniel de Foe took the hint of writing his Robinson Crusoe living alone in an island, staid there between four and five years, and, during his continuance, frequently catching more goats than he wanted, sometimes marked their ears and let them go. This was about thirty-two years before commodore

modore Anſon's arrival in the iſland; and it is remarkable, that the firſt goat that was killed by his people at their landing, had his ears ſlit; whence they concluded, that he had doubtleſs been formerly under the power of Selkirk. This was an animal of a moſt venerable aſpect, with an exceeding majeſtic beard, and many other ſymptoms of antiquity. During their ſtay in the iſland, they met with others marked in the ſame manner, all the males being diſtinguiſhed by an exuberance of beard, and every other characteriſtic of great age.

The number of goats are now, however, greatly diminiſhed; for the Spaniards being informed of the advantages which the Buccaneers and privateers derived from the goats fleſh, with which they were here furniſhed, endeavoured to deprive their enemies of this relief, by extirpating the breed. For this purpoſe they put on ſhore great numbers of large dogs, who have increaſed ſo faſt, that they have deſtroyed all the goats in the acceſſible part of the country; ſo that there now remain only a few among the crags and precipices, where the dogs cannot follow them. Theſe are divided into ſeparate herds of twenty or thirty each, which inhabit diſtinct faſtneſſes, and never mingle with each other. The author of commodore Anſon's voyage mentions a remarkable diſpute between a herd of theſe animals and a number of dogs, which we cannot forbear repeating. Going in their boat into the eaſtern bay, they perceived ſome dogs running very eagerly upon the foot, and being willing to diſcover what game they were after, they lay upon their oars for ſome time to view them, and at laſt ſaw them take to a hill, where looking a little farther they obſerved upon the ridge of it an herd of goats, which ſeemed drawn up for their reception. There was a very narrow path ſkirted on each ſide by precipices, on which the maſter of the herd poſted himſelf fronting the enemy, the reſt of the goats being all behind, where the ground was more open. As this ſpot was inacceſſible by any other path, except where this champion had placed himſelf, the dogs, though they ran up hill with great alacrity, yet when they came within about twenty yards of him did not dare to encounter him, as he would infallibly have driven them down the precipice; but giving over the chace quietly laid themſelves down, panting at a great rate. As at preſent it is rare for goats to fall in their way, they are ſuppoſed to live principally upon young ſeals. Upon this iſland are found a great number of the laſt mentioned amphibious animals, which mariners uſually eat with pleaſure, and compare their fleſh to lamb. But there is another animal of the ſame amphibious kind, called a ſea-lion, that has ſome reſemblance to a ſeal, but is much larger, and its fleſh has ſome reſemblance to that of beef. They are in ſize, when full grown, from twelve to twenty feet in length, and from eight to fifteen in circumference; and are ſo extremely fat, that having cut through the ſkin, which is about an inch in thickneſs, there is at leaſt a foot of fat before you come at either lean or bones. They are likewiſe very full of blood; for if they are deeply wounded in a dozen places, there will inſtantly guſh out as many fountains of blood, ſpouting to a conſiderable diſtance. Their ſkins are covered with ſhort hair of a light dun colour; but their tails and their fins, which on ſhore ſerve them for feet, are almoſt black: their fins, or feet, are divided at the ends like fingers, the web which joins them not reaching to the extremities, and each of theſe fingers is furniſhed with a nail. The head is ſmall in proportion to the reſt of the body, and terminates in a ſnout. They have a row of large pointed teeth in each jaw, two-thirds of which are in ſockets; but the others, being the moſt hard and ſolid, are without them. He has whiſkers like thoſe of a cat; has ſmall eyes and ears; and the noſtrils, which are alſo very ſmall, are the only parts deſtitute of hair. They have a diſtant reſemblance to an over-grown ſeal, though in ſome particulars there is a manifeſt difference between them, eſpecially in the males: theſe have a large ſnout or trunk hanging down five feet ſix inches below the end of the upper jaw, which the females have not; and this renders the ſexes eaſily to be diſtinguiſhed from each other; and, beſides, the males are of a much larger ſize. Theſe animals divide their time equally between the land and ſea, continuing at ſea all the ſummer, and coming on ſhore at the ſetting in of the winter, where they reſide during that whole ſeaſon. In this interval they engender, and bring forth their young; having generally two at a birth, which they ſuckle with their milk, they being at firſt about the ſize of a full-grown ſeal. While the ſea-lions continue on ſhore they feed on the graſs and verdure that grows near the banks of the freſh-water ſtreams; and when not employed in feeding, ſleep in herds in the moſt miry places they can find. As they ſeem of a very lethargic diſpoſition, and are not eaſily awakened, each herd places ſome of their males at a diſtance, who never fail to alarm them, when any one attempts to moleſt, or even to approach them, which they do by making a very loud noiſe, ſometimes grunting like hogs, and at others ſnorting like horſes in full vigour. The males have often furious battles, when they gore each other with their teeth, and cover one another with blood: the author we have laſt quoted mentions one whom they named the baſhaw, who generally lay ſurrounded with a ſeraglio of females, which no other male dared to approach, and who had not acquired that envied pre-eminence without many bloody conteſts, of which the marks ſtill remained, in the numerous ſcars that were viſible in every part of his body.

There are but few birds, and thoſe chiefly hawks, blackbirds, owls, and humming-birds. But the bay is moſt plentifully ſtored with the greateſt variety of fiſh, particularly cod of a prodigious ſize, which are in no leſs plenty than on the banks of Newfoundland, alſo cavallies, gropers, large breams, ſilver fiſh, maids, congers of a peculiar kind, and above all a black fiſh, much eſteemed, called by ſome a chimney-ſweeper, in ſhape reſembling a carp, beſides excellent cray fiſh that generally weigh eight or nine pounds, and are of an exquiſite taſte. There are likewiſe a great quantity of dog-fiſh, and large ſharks.

The Spaniards have generally mentioned two iſlands under the name of Juan Fernandes, ſtyling them the Greater and the Leſs; the Greater being the iſland juſt deſcribed; and the Leſs being ſtill more diſtant from the continent, has been alſo called Maſa Fuero, and is about twenty-two leagues weſt by ſouth of the Greater Juan Fernandes. It is covered with trees, and has ſeveral fine falls of water pouring down its ſides into the ſea. This place has at preſent one advantage beyond the iſland of Juan Fernandes; for it abounds with goats who are far from being ſhy, and reſide there in great tranquillity, the Spaniards not having thought the iſland conſiderable enough to be frequented by their enemies, and have not therefore been ſolicitous to deſtroy the proviſions upon it. The iſland alſo abounds with ſea-lions and ſeals.

We have now finiſhed our deſcription of America; in the parts ſubject to Great Britain, to France, and to the United Provinces, we have ſeen rich plantations abounding with the neceſſaries and even the luxuries of life, the ſource of an immenſe commerce, furniſhing Europe with their ſuperfluities and valuable productions, and employing not only a prodigious number of ſhips, and thereby promoting navigation and giving employment to many thouſand hands, but producing an immenſe trade in the mother countries, by employing there an infinite number of people in different manufactures, to ſupply America with the goods of Europe. Thus giving life to trade, and ſpirit to induſtry, they produce a circulation that is of infinite advantage to both the mother country and its colonies, while their intereſts being reciprocal, ought to draw cloſely the knot of union which at ſuch a diſtance ſubſiſts between them.

On the other hand, Portugal and Spain, and particularly the latter, with countries immenſely rich, extenſive, and capable of rendering thoſe nations extremely powerful, have been far from anſwering that purpoſe. With reſpect to Spain, whatever may be ſaid to the contrary, the diſcovery of America was the greateſt misfortune that could have happened: it has drained, and continues ſtill to drain Spain of its moſt uſeful inhabitants; while the prepoſterous conduct of that court in preventing the people of other nations freely ſettling in their American dominions, and the multitude of monaſ-

teries

teries and nunneries in every city and every town prevent the increaſe of their own, and muſt render the regions of Spaniſh America thinly peopled. Britiſh America has made the manufactures of Great Britain flouriſh: Spaniſh America, with all its gold and ſilver, has rendered the Spaniards too proud to apply themſelves to manufactures, and conſequently poor.

CHAP. XIII.

Of the New Diſcoveries made in the PACIFIC OCEAN.

SECT. I.

North America found by the Ruſſians to extend weſtward almoſt to the Coaſt of Tartary. A general Account of another Continent to the South.

WE have now, according to the plan we propoſed in the beginning of this work, proceeded from eaſt to weſt, deſcribed the countries of Aſia, Africa, Europe, and America, and have entered the South Sea, or Pacific Ocean, which is of amazing extent, it being upwards of ten thouſand miles in breadth, and waſhes at the ſame time the coaſt of Peru and Chili, and that of Japan, China, and Tartary. It had its name from being ſuppoſed free from ſtorms and tempeſts; but very unjuſtly, for in particular ſeaſons of the year they are perhaps more violent in this ſea than in any other. It is alſo called the South Sea from the Spaniards diſcovering it by croſſing the iſthmus which divides North and South America, by paſſing from north to ſouth.

Though this ſea, after its firſt diſcovery, was imagined to extend from the north to the ſouth pole, yet it has been found that it is in a manner encompaſſed by two continents, which were for a long time not known to have any exiſtence, beſides innumerable iſlands. The continent on the north is ſuppoſed to be that of America, which extends almoſt as far to the weſt as Kamtſchatka. By the diſcoveries made by the Ruſſians, this country has been coaſted from the fifty-ſecond to the ſixtieth degree north latitude, and extends from the ſouth-weſt to the north-eaſt ſide about thirty-ſeven degrees in length; but whether it joins to the weſt ſide of North America, or is ſeparated from it by a channel, or by one croſſing through it into Hudſon's-bay, has not yet been determined.

This part of America enjoys a much better climate than the coaſt of the north-eaſt ſide of Aſia, though equally near the ſea, and every where full of high mountains continually covered with ſnow; for the mountains on the north-eaſt of Aſia are every where rocky and ragged, have no valuable metals, nor ſcarcely any trees or herbs, except in the valleys, where grows only ſome ſmall ſhrubby wood and hardy plants. The American mountains, on the contrary, in the neighbourhood of Siberia are cloſe, and their ſurface not like thoſe covered with moſs, but ſhaded from the bottom to their tops with thick and fine woods. In this new diſcovered part of America are found a ſort of raſberries of a very extraordinary ſize and fine taſte, beſides honey-ſuckles, cranberries, blackberries, and bilberries in great plenty; but as the coaſt has only been viſited, what fruits are to be found in the heart of the country is unknown. Among the birds have been diſcovered ten ſpecies different from the European, beſides ſwans, quails, plovers, Greenland pigeons, cranes, ſea-gulls, and magpyes. The fiſh enter the rivers of America earlier than at Kamtſchatka, and great plenty of them has been ſeen.

The natives who have been diſcovered by the Ruſſians are plump, broad ſhouldered, of a middling ſize, with ſtraight black hair that hangs looſe; their faces are flat and ſwarthy, and they have black eyes and thick lips. They wear ſhirts which hang below the knee, and are girded about the waiſt with leather ſtrings, and they have trowſers made of the ſkins of ſeals. In ſhort, they greatly reſemble the Kamtſchatdales; they uſe bows and arrows, and have boats twelve feet long and two broad, ſharp both at the head and ſtern, and are formed of a frame of wood and ſkins, which ſeem to be thoſe of ſeals, dyed of a cherry colour. They are made much in the ſame manner as thoſe we have deſcribed in the treating of Greenland and Hudſon's-bay; for the ſeat is round, two yards from the ſtern, and ſewed about with guts, which, with the help of leather thongs laced round the edges, can be drawn together, and opened like a purſe. The American ſitting in this place, ſtretches out his legs, and draws the ſkin tight about his body. Theſe boats will live in the moſt ſtormy weather, though they are ſo light that they may be eaſily carried by a ſingle perſon. They receive ſtrangers very kindly, converſe in a friendly manner, with their eyes fixed upon them, treat them with much civility, and make them preſents of whales fat.

Hence it is not improbable, that the northern parts of America were originally peopled from Siberia; for though it ſhould be granted that America and Aſia were never joined, yet theſe two parts of the globe lie ſo near each other that the impoſſibility of the inhabitants of Aſia going over to America, eſpecially as the number of iſlands lying between them made the paſſage more eaſy, cannot be maintained. The curious reader will ſoon ſee ſufficient evidence of a ſouthern continent ſloping away from the Spice Iſlands towards the continent of South America, by which Mexico, Peru, and Chili, might probably be firſt peopled.

It has been obſerved by the judicious compiler of the improved edition of Harris's collection of Voyages, that Antony Van Deman's Land, New Holland, and Carpentaria make one continent, from which New Zealand appears to be ſeparated by a ſtreight, and is part of another continent, anſwering to Africa, as this of which we are now ſpeaking, plainly does to America. This continent reaches from the equinoctial to the forty-fourth degree of ſouth latitude, and ſixty-ſix degrees from eaſt to weſt; whence the longeſt day in the moſt northern part muſt be twelve hours, and in the ſouthern about fifteen hours, or ſomething more; extending from the firſt to the ſeventh climate, which ſhews its ſituation to be extremely happy; and as to the produce and commodities of this country in general, there is the greateſt reaſon in the world to believe that they are extremely rich and valuable, becauſe the fineſt and richeſt countries in the known world all lie within the ſame latitude, and indeed this is more than conjecture; for ſome part of it we are told by the firſt diſcoverers abound with gold, ſilver, pearls, nutmegs, mace, ginger, and ſugar-canes of an extraordinary ſize.

It ought not to be omitted, that there are an infinite number of iſlands near the continent, and others ſcattered at a conſiderable diſtance from it, many of which are placed between that part which has been diſcovered and America.

It will be proper juſt to take notice of the ſeveral parts of this country that have been mentioned, and we ſhall begin with New Holland, a very extenſive tract of land, which, as Dampier obſerves, joins neither to Aſia, Africa, nor America, though it extends from the tenth to the thirty-firſt degree of ſouth latitude, or above twelve thouſand miles, and how much farther it ſtretches to the ſouthward is not certainly known. The Dutch, who

are

are much better acquainted with these countries than any other nation in Europe, from their possessing the Spice Islands in its neighbourhood; but have with great care endeavoured to conceal their discoveries, though they have given names to several parts of the country. New Holland has, however, been visited by several other Europeans, and particularly by Dampier, who observes, that part which he saw consists of low even land, with sandy banks next the sea. In one part most of the trees are dragon-trees, which are pretty large, the gum distilling from knots or cracks in the trunk. In another part were various other sorts of trees; but none of them above ten feet high, their bodies about three feet round, and five or six feet before you come to the branches. Some of the trees had a fragrant smell, and were red within the bark; most of them had blossoms or berries, the former of which were of several colours, as red, white, and yellow; but mostly blue, and these had generally a very fragrant smell. There were likewise flowers of several kinds growing on the ground, some of which were very beautiful, and of such kinds as he had never seen before.

The land-animals he saw here were only a sort of racoons, differing from those of the West Indies, and a kind of guanos that were extremely ugly. Of the land-fowls he saw none of the larger birds but eagles, and five or six sorts of small birds, which sung with a great variety of fine shrill notes. The water-fowl were ducks, curlieus, crab-catchers, pelicans, and some which our author never saw before. The natives, according to Dampier, were tall, straight-bodied, with small long limbs, large heads, round foreheads, flat noses, pretty full lips, and wide mouths: their hair black, short and curled like those of the negroes, and the colour of their skins very black: they had no sort of cloaths, but the rhind of a tree tied like a girdle about their waist, and a bundle of long grass, or the bough of a tree full of leaves, fastened under their girdle to hide their nakedness. But the people of distant parts of the country are very differently described.

Van Diemen's land is a very extensive country, discovered by Abel Jansen Tasman, of which we have no other account worthy of notice but the extent of the coast, which he discovered in the forty-second degree twenty-five minutes south latitude, and in the hundred and thirty-third degree fifty minutes east from London; he steered east-south-east along the coast to the height of forty-four degrees south latitude, where the land runs away east and afterwards north-east-by-north. In the forty-third degree ten minutes south latitude, and in the longitude of a hundred and thirty-seven degrees fifty minutes east from London, he anchored in a bay to which he gave the name of Frederick Henry. The trees in this country where he observed them did not grow very close, nor were incumbered with bushes or under-wood. From these trees he gathered some gum and lac.

The land of Australia delle Spiritu Santo lies in about the fifteenth degree of south latitude, and according to Pedro Fernandez de Quiros, by whom it was discovered, extends from the hundred and fiftieth degree of longitude east from London to the hundred and thirtieth degree of west longitude from the same meridian, which is eighty degrees, or about four thousand six hundred miles. But with respect to this extent he seems to speak mostly from conjecture, he having not actually discovered the whole coast he mentions. In several memorials he presented to his Catholic majesty, he particularly describes the plants, trees, beasts, birds, and fishes of the country; mentions its producing a variety of spices, and excellent sugar-canes, with a great deal of gold and silver. He describes several commodious harbours, and extols the salubrity of the air, which he declares to be such, that notwithstanding he had a considerable body of men, who, like himself, were strangers to the climate, yet though they were exposed to continual labour in the open air, and often to the cold dews, while hot, none of them were taken sick. As for the natives, he found them strong, healthy, and many of them of a great age.

New Guinea, the country we shall next describe, extends from Cape Mabo, in about fifty minutes south latitude, and a hundred and six degrees thirty minutes east longitude from London, to King William's Cape, in the sixth degree thirty minutes south latitude, and about a hundred and forty-three degrees of longitude: thus the coast extends from the north-west to the south-east; but how far it reaches to the southward is still unknown.

This country, which was discovered in 1529 by Saavedra, received from him the name of Terra de Papuas; but Van Schouten, the Dutch discoverer, gave it the name of New Guinea. Some distinguish it into three different parts; calling that which lies from the hundred and forty-third to the hundred and thirty-fifth degree of longitude New Guinea: to a narrow slip of land which extends from thence to Cape Mabo, they give the name of Terra de Papos; and that which lies on the south of it, round a large gulf, between the eighth and fifteenth degree of south latitude, they term Carpentaria, or Carpenter's Land, from a Dutch captain by whom it was discovered: but it is not certainly known whether what is here called a gulf is not a streight.

Commodore Roggewein observes, that the continent of New Guinea appeared to him very high land, extremely full of plants and trees; so that in sailing four hundred leagues along the coast he did not observe one barren spot; and from thence thinks it extremely probable, that it abounds with many rich commodities. He adds, that persons worthy of credit assured him, that some of the free burgesses in the Moluccas go annually to New Guinea, where they exchange small pieces of iron for nutmegs. But the best account of New Guinea in general is that published by Dampier, who first discovered it on New-year's-day 1700, in between the third and fourth degrees of south latitude, where it was high even land, well cloathed with tall flourishing trees that appeared very green, and afforded a pleasant prospect. In the woods he found several sorts of fruit, such as he had never seen before; but he describes none of them. One of his men shot a stately fowl, as big as the largest dunghill cock, of a sky colour, with a white spot on the middle of each wing, about which were spots of red: its head was crowned with a bunch of long feathers that appeared very beautiful; it had strong legs with reddish claws, and its crop was filled with small berries. Its nest was in a tree, where was found an egg as large as that of a hen. The yawl, which was sent another way for water, returned at night, and brought a wooden fissgig, very ingeniously made: this they found by a small barbecue, used for drying fish, where they also saw a shattered canoe; but saw none of the inhabitants.

A little to the northward of this place captain Dampier found a stream of good water, where a boat could come up to it, and a ship might anchor close to the shore. The captain going ashore here, found a small cove, where he beheld two barbecues, which appeared not to be above two months standing; and the spars being cut with some sharp instrument, it seemed as if the natives had iron.

Schouten, and other navigators, who visited different parts of this continent, conceived very high ideas of it, and have represented it as one of the richest in the world; but they were not able to penetrate far into it; for they found the country extremely populous, and the inhabitants of a martial disposition, and generally speaking, well armed.

Thus imperfect are the accounts of this continent, though a number of navigators of different nations have fallen in with it. We shall now conclude with mentioning some of the islands in the Pacific Ocean that have been best described.

SECT. II.

Of the moſt remarkable of thoſe Iſlands in the Pacific Ocean that have been diſcovered by the Europeans, particularly Paſch Iſland, Nova Britannia, Gerrat Dennis's Iſle, Anthony Cove's Iſland, Moa, Arimoa, the Thouſand Iſlands, the Iſle of Recreation, Bowman's Iſlands, Miſchievous Iſland, the Brothers, the Siſter, Cocoa, Hope, and Hoorn Iſlands: with ſome Account of their Inhabitants.

PASCHAL, or Eaſter Iſland, is ſituated in the twenty-eighth degree thirty minutes north latitude, and is ſuppoſed to be in about the hundred and ſecond degree of weſt longitude from London; it received its name from commodore Roggewein, who diſcovered it on Eaſter-day 1722. The commodore, who had three ſhips with him, ſent the ſmalleſt to examine the country, which brought word that it ſeemed very fertile and well inhabited, and the next day an Indian came off to them in his canoe. They made ſigns to him to come on board, which he readily did, and was well received; for as he was naked, they gave him a piece of cloth, pieces of coral, beads, and other toys, all which he hung about his neck. His body was painted all over with a variety of figures; his natural complexion appeared to be a dark brown, and his ears were exceſſively large and long. He was tall, robuſt, and had an agreeable countenance: he was briſk, active, and lively. They gave him a glaſs of wine to drink, which he threw away in a manner that ſurprized them. They next clothed him from head to foot, with which he was diſpleaſed, and appeared aukward and uneaſy. They gave him victuals, but he could not be prevailed on to uſe either a knife or fork. As they found it impoſſible to come to an anchor that day, they reſolved to ſend him aſhore, allowing him to keep what he had got, in order to encourage others; but what is really ſurprizing, the poor creature had no mind to go, and they had much ado to get him into his canoe.

The next morning by break of day they entered a gulph, and many thouſand of the inhabitants came down to receive them, bringing with them vaſt quantities of fowls and roots, with which many came on board, while the reſt ran about on the ſhore. The next morning the Dutch prepared to land, when the friendly Indian who had been with them before came on board a ſecond time, bringing with him many of his countrymen, who, to make themſelves welcome, had loaded their canoes with plenty of live fowls, and roots dreſſed after their manner. Among them was a man perfectly white, in whoſe ears hung round white pendants as big as one's fiſt. He had an air extremely devout, and ſeemed to be one of their prieſts. An hundred and fifty Dutch ſeamen now landing, theſe innocent and inoffenſive people, probably filled with curioſity, crowded thick upon them, and ſome of them took hold of their arms; on which the Dutch thinking themſelves obliged to make way by force, had the raſhneſs and cruelty to fire upon them, by which means many of them were killed, and among them the friendly Indian who had been twice on board. This diſperſed the Indians, and frighted them almoſt out of their wits; yet in a few minutes they recovered from their aſtoniſhment and terror, and aſſembling again, did not approach nearer than ten yards, where they probably imagined they might be ſafe from the effects of that thunder and lightning they had ſeen diſcharged from the muſkets; yet howled and made diſmal lamentations. They now brought vaſt plenty of proviſions, and that they might leave no means untried to pacify their invaders, we are told, that both the men, women, and children ſoon came before them holding branches of palm in ſign of peace, and by the moſt humble poſtures expreſſed their deſire of mollifying theſe ſtrangers. They even ſhewed them their women, and made them underſtand that they were at their diſpoſal. The Dutch, ſoftened by theſe tokens of humility and deep ſubmiſſion, repented their raſhneſs, and, inſtead of doing them any farther harm, made them a preſent of a piece of painted cloth ſixty yards long; and of many beads, and ſmall looking-glaſſes, with which they were extremely pleaſed. As the Indians ſaw that the Dutch were now diſpoſed to treat them like friends, they brought them five hundred live fowl at once, like the barn-door fowls of Europe, with a great quantity of red and white roots, and potatoes, which theſe people uſe inſtead of bread. They alſo gave them ſome hundreds of ſugar-canes, and abundance of Indian figs, the pulp of which was as ſweet as honey. The Dutch ſaw in this iſland no other animals than birds of all ſorts; but thought it probable that in the heart of the country were cattle and beaſts of various kinds; becauſe when they ſhewed the Indians ſome hogs on board their ſhips, they let them know by ſigns that they had ſeen ſuch animals before.

Every tribe or family ſeemed to have a ſeparate village, compoſed of huts that were from forty to about ſixty feet long, in which they had few moveables, and thoſe of no great value, except ſome red and white coverlets that ſerved them when walking for cloaths, and when ſleeping for quilts: the ſtuff was as ſoft to the touch as ſilk, and to all appearance was of their own manufacture. They make uſe of earthen pots to dreſs their meat in, and have round their villages little plantations ſtaked out, and very neatly divided.

Nova Britannia, or New Britain, was for ſome time thought to be contiguous to New Guinea, till captain Dampier found it to be an iſland. It lies forty miles to the eaſtward of the eaſtermoſt part of New Guinea. The northermoſt point is in the ſecond degree thirty minutes north latitude, and the ſouthermoſt in the ſixth degree thirty minutes ſouth latitude, and it extends about five degrees ſixteen minutes in length; appearing to be for the moſt part high land mixed with valleys, and every where abounding with large and ſtately trees. The mountains and low lands are pleaſantly mixed with woodlands and ſavannas, and on the ſides of the hills are many large plantations of cleared lands. The country is well inhabited by a ſtrong well-limbed people, of a very dark complexion.

Round Nova Britannia are ſeveral ſmaller iſlands, ſome of them full of cocoa-nut trees, particularly on the north-eaſt ſide; among theſe are Gerret Dennis's iſle, which is about fourteen or fifteen leagues round, high, mountainous, and very woody; but the ſides of the hills are thick ſet with plantations, and the bays by the ſea-ſide well ſtored with cocoa-nut trees, intermixed with a few houſes.

This iſland is very populous, the natives are like the former, black, ſtrong, well-limbed, with large heads, and their hair, which curls naturally, is ſhaved into ſeveral forms, and dyed of various colours. They diſfigure themſelves by painting, and are repreſented as deforming their faces by thruſting ſomething through the noſe, which comes out on each ſide by the cheek bone. They have alſo great holes in their ears, ſtretched open by the ſame prepoſterous kind of fancied ornament as that in their noſes. Their weapons are chiefly lances, ſwords, ſlings, and ſome bows and arrows. They uſe proas, ſomewhat reſembling thoſe we have deſcribed in treating of the iſland of Tinian; but the ends, which ſerve for the head and ſtern, are higher than the reſt, and carved into many devices, as a fowl, a fiſh, or the head of a man; theſe they manage very dexterouſly with neat paddles.

Antony Cove's iſland, as it is called in the Dutch draughts, lies in the third degree twenty-five minutes ſouth latitude, and is a high land about four or five leagues round, very woody; it is full of plantations upon the ſides of the hills, and near the bays are abundance of cocoa-nut trees. On the ſouth-eaſt part of it are three or four ſmall woody iſlands, one riſing high, and others low and flat, all covered with cocoa-nut trees, and other wood. Theſe are all well inhabited. On the north is another iſland of an indifferent height, and a little larger than Anthony Cove's iſland. Some canoes from this laſt iſland came aboard captain Dampier's ſhip; they had proas made of one tree, the hollow part cut out, and had out-layers on each ſide; the ſhore was covered with men, who went along as he ſteered by the coaſt. To three of the natives who came aboard he gave each a knife,

a knife, a ſmall looking-glaſs, and a ſtring of beads. He ſhewed them pompions and cocoa-nut ſhells, making ſigns to them to bring ſome on board, and they gave him three cocoa nuts out of one of the canoes. He ſhewed them nutmegs, and by their ſigns he gueſſed they had ſome on the iſland. He alſo ſhewed them ſome gold duſt, which they ſeemed to be acquainted with, calling out, Maneel, maneel, and pointing toward the land.

The iſlands of Moa and Arimoa lie in the third degree of latitude. The latter is the biggeſt of the two, but they are both very well peopled, and abound with cocoa-nuts, Indian figs, and various kinds of roots. The inhabitants have a prodigious number of canoes, and go well armed with bows and arrows; and this is ſaid to be the caſe even of the women and children. Moa is not ſo populous as Arimoa, though both iſlands are equally pleaſant and fertile.

To the weſtward of the iſlands laſt deſcribed, the ſea is ſo very full of iſlands, that commodore Roggewein and his people finding it difficult, if not impoſſible, to count them, gave them the name of the Thouſand iſlands. The inhabitants are negroes, of a ſhort ſquat make, and their heads covered with thick curled hair. They all go naked, except having a kind of belt, adorned with what they eſteem ornaments, faſtened round their waiſt; only ſome of them have bracelets, and others wear on their heads a kind of light ſtraw-hats adorned with the feathers of the birds of Paradiſe. They are repreſented by commodore Roggewein as bold, miſchievous, and untractable. They are ſaid to have a bit of ſtick of the ſize of a tobacco-pipe, and of the length of one's finger, which they run through the griſtle of the noſe, and this they are ſaid to look upon as a means of making them appear fierce and terrible to their enemies.

The iſle of Recreation is in the ſixteenth degree of ſouth latitude, and about the hundred and forty-ſeventh degree of weſt longitude. It is about twelve leagues in extent, and extremely fertile, it producing great quantities of trees, but more eſpecially palms, cocoas, and iron-wood. The Dutch thought they had reaſon to believe, that in the heart of the country were rich mines. The inhabitants are of a middle ſize, robuſt, and active; they are warlike, and have the character of being very treacherous, eſpecially the women; for ſeizing an opportunity, they killed ſeveral Dutchmen. Their hair is black, long, and ſhining, which is chiefly owing to their anointing it with the oil of cocoas. They paint their bodies, like the natives of Paſch iſland, and the men faſten round the waiſt a kind of net-work, which they draw between their legs, and tuck up behind. But the women are covered with a kind of mantle of their own manufacture, which nearly reſembles ſilk, and on their necks and wriſts they wear ſtrings of pearls.

Bowman's iſlands are ſituated in the twelfth degree ſouth latitude, and in the hundred and fifty-ſecond degree weſt longitude from London. They appear very beautiful at a diſtance, are well planted with fruit-trees of all ſorts, and produce herbs, corn, and roots in great plenty; the land towards the coaſt being laid out in large and regular plantations. When commodore Roggewein approached theſe iſlands, the Indians, on ſeeing the ſhips, came in their boats, and brought them fiſh, cocoa-nuts, Indian figs, and other refreſhments; in return for which the Dutch gave them, as uſual, ſmall looking-glaſſes, ſtrings of beads, and other toys. They ſoon found that theſe iſlands were very populous; for many thouſand men and women, the former generally armed with bows and arrows, came down to the ſhore to look at them. Among the reſt they ſaw a majeſtic perſonage, who, from the dreſs he wore, and the honours that were paid him, they eaſily diſcovered to be the ſovereign of the nation. He ſtepped into a canoe, accompanied by a young woman who ſat cloſe by his ſide. His canoe was inſtantly ſurrounded by a vaſt number of other veſſels, that crowded about it, and ſeemed intended for a guard. All the inhabitants of theſe iſlands are whites, and of the ſame complexion as the Europeans, except their appearing ſun-burnt. They ſeem to be a very innocent and harmleſs people; they are briſk and lively, and treat each other with viſible marks of civility, diſcovering nothing wild or ſavage in their behaviour. Inſtead of ſhewing the marks of terror at the arrival of the Dutch, they expreſſed the utmoſt joy and ſatisfaction, treating them with a kindneſs and reſpect not to be deſcribed; they even ſhewed a deep concern, when they perceived that in ſpight of all their care to oblige and ſerve thoſe ſtrangers, they could not prevail on them to ſtay among them. Their bodies were not painted like thoſe of the other people the Dutch had ſeen before; but were handſomely cloathed from the girdle downwards, with a ſort of ſilk fringes, neatly folded. On their heads they wore hats of a handſome ſort of ſtuff, which were very large, in order to keep off the heat of the ſun, and about their necks they had ſtrings of beautiful odoriferous flowers. The land appeared exquiſitely charming, every one of the iſlands being agreeably diverſified with hills and valleys, and ſeemed as beautiful as imagination can paint. Some of theſe iſlands were ten, ſome fifteen, and others twenty miles in compaſs. Each family, or tribe, ſeemed to have its particular diſtrict, and to form a ſeparate government. The land in each was laid out in neat and regular plantations.

Between the fifteenth and ſixteenth degrees of ſouth latitude are four iſlands, each of them four or five leagues in compaſs, with a continued chain of ſteep rocks between them. Theſe iſlands are ſo cloſe together, that there is hardly room for a ſhip to paſs between them; and there one of commodore Roggewein's ſhips was loſt; whence the iſland on which it was wrecked was called Miſchievous iſland; the two next to it were named the Brothers, and the fourth the Siſter. All four were covered with a verdure inexpreſſibly charming, and abound with fine tall trees, eſpecially cocoas. The herbs were ſo refreſhing and ſalutary, that the ſhip's crew, many of whom were ill of the ſcurvy, were ſurpriſingly recovered by them. They likewiſe found there a prodigious plenty of cockles, muſcles, mother of pearl, and pearl oyſters. Theſe iſlands are extremely low, ſo that ſome parts of them muſt be frequently overflowed; but the inhabitants are well provided againſt ſuch accidents, ſince they have not only good canoes, but ſtout barks, with cables and ſails. The natives are ſaid to be of an extraordinary ſize; their bodies are painted of various colours, and they are armed with long pikes or lances.

Cocoa iſland lies in the ſixteenth degree ten minutes ſouth latitude, and had its name from its abounding extremely in cocoa trees. It is properly a high mountain; and two leagues to the ſouth of it is another long, but low iſland, to which Schouten, from the treachery of the inhabitants, gave the name of Traitors iſland. Each of them ſeems to be under the government of a particular chief, or king. Hope iſland is ſeated about fifty leagues to the weſt of theſe, and was thus called by the Dutch from their hoping to get freſh water there: but it being encompaſſed with rocks, againſt which the ſea beats with great fury, they could not land there. It produces cocoa and other trees. The iſland is covered with hills, and there were ſeen a large village, with ſeveral houſes on the coaſt.

Hoorn iſlands lie to the north-weſt in about the fourteenth degree of ſouth latitude. The inhabitants, who are of a yelloviſh brown complexion, are tall, luſty, ſtrong, well proportioned, ſwift of foot, and very expert at ſwimming and diving. They are very ingenious, and take a pride in adorning their hair. The women are, however, very homely, ill-ſhaped, and very ſhort: their breaſts are extremely diſagreeable, and hang, like leathern bags, down to their bellies; yet they are very laſcivious. Theſe people are governed by a king, or chief, to whom they ſeem to pay very great reſpect. They have no notion of trade, and though they gave the Dutch many hogs, and other proviſions, it proceeded merely from their humanity and good-nature; however, the Dutch proportioned the preſents they made them to the proviſions they received. Theſe people are ſaid neither to till, ſow, nor perform any other labour; but gather only what the earth ſpontaneouſly produces, as cocoa-nuts, and ſome other fruits.

Beſides the iſlands we have here mentioned, many others have been diſcovered, and a great number of them are ſcattered over the Pacific Ocean. To conclude, this great continent thus imperfectly diſcovered, and whoſe limits are unknown, with the numerous iſlands in this remote part of the globe, will, perhaps, in future ages become the ſettlements of ſome European or American power; and probably may in part become ſubject to Spaniſh America, if ever that ſhould be ſeparated from the dominions of Spain. Whenever that event, or any other of a like nature, takes place, may the lives, the liberties, the poſſeſſions, and the happineſs of the poor inhabitants be ſecured; and theſe now almoſt unknown parts of the earth unacquainted with the ravages, the murders, and deſolation that great part of America has ſuffered! Mean while this continent, and the numerous iſlands in the Pacific Ocean, remain a fund of geographical knowledge and of natural hiſtory, concealed from the view of Europe; but which new and more perfect diſcoveries will at length reveal.

The END of the SECOND VOLUME.

INDEX.

INDEX

TO THE

SECOND VOLUME.

CONTAINING

EUROPE and AMERICA.

A.

ABANO, baths of, 356
Abbeville, 465
Aberconway, or Conway, 572
Aberiſtwyth, 574
Aberdeen, city of, 590
Aberdeenſhire, county of, ib.
Abergavenny, 532
Abernethy, 590
Abingdon, 521
Abo, 87
Abruzzo Citra, 407
——— Ultra, ib.
Acadia, or Nova Scotia in general deſcribed, 634
Acapulco, 734
Acerenza, 405
Acroteri iſland, 24
Aderholm iſland, 95
Adliſberg, 154
Adrianople, 16
Adur or Beeding river, 509
Ægades, or Ægates, iſlands of, 410
Ætna, a deſcription of that volcano, 408
Agen, 474
Agnano, lake of, 402
Aichſtadt, biſhopric of, 225
——— city of, ib.
Aileſbury, 537
Aire, 464
—— the ſhire of, in general, 586
—— town of, ib.
Aix la Chapelle, 258
Aix, capital of Provence, 454
—— in Savoy, 335
Alaba, province of, 431
Alais, 472
Aland, 88
Alavanches, or monſtrous ſnow-balls, 333
Albania, or Arnaut in general deſcribed, 27
Albano, 394
Alban's, St. 548
Albany, 653
Albigois, diſtrict of, 472
Albourg, general government of, 122
——— its capital deſcribed, ib.
Alby, 472
Alcantara, 433
Alderney, iſle of, 518
Alentejo, province of, 442
Aleſſandria, 340
Aleſſio, 27
Algarve, province of, 441
Alicant, 423

Alligators of Guayaquil deſcribed, with the manner of their laying their eggs, &c. 756
Algeziras, 435
Alloa, or Alloway, 596
Alloway caſtle deſcribed, ib.
Alnwick, 565
Alps deſcribed, 299
Alſace, country of, 458
Alſen, iſland of, 123
——— town of, ib.
Altdorf, or Altorf, 225
Alſtadt ſuburb, 77
Altdorf, or Altorf, 309
Altena, 199
Altenburg, city of, 190
——— principality of, ib.
Altendorf, 310
Altenkirchen, 260
Altorf, or Altdorf, 225
Altſohl, county of, 131
Altſtetten, 316
Amal, 90
Amalfi, 405
Amber of Pruſſia, 75
Amberg, 215
Amboiſe, 478
Ambrun, 457
America in general deſcribed, 625
——— diſcovered to extend a-croſs the Pacific ocean, almoſt to Aſia, 780
Amersfort, 294
Amiens, 465
Amorgo, iſland of, 23
Amſterdam, 290
Anclam, 185
Ancona, marquiſate of, 381
——— city of, 382
Andaluſia, province of, 434
——— New, 747
Andes, Cordilleras of, deſcribed, 759
Andover, 517
Andra iſland, 21
Anjou, government of, 480
Andrew, St. city of, 592
Andujar, or Anduxar, 436
Angerburg, 79
Angermanland, province of, 96
Angers, 480
Angleſey, iſle of, 572
